Woodfibre LNG

Preamble

The Woodfibre Liquified Natural Gas Project (the Project) is a liquefied natural gas export facility being constructed on the former Woodfibre Pulp and Paper Mill site in Nexwnéwu7ts Átlk̲’a7tsem (Howe Sound), approximately seven kilometres south of Skwxwú7mesh (Squamish). The Project is on the historical location of a Sk̲wx̲wú7mesh Úxwumixw (Squamish Nation) village known as Swiy̓át. Swiy̓át and Nexwnéwu7ts Átlk̲’a7tsem (Howe Sound) are tied to the cultural well-being of Sk̲wx̲wú7mesh Úxwumixw (Squamish Nation) members, their ancestors, and their descendants, and to other Indigenous Groups as defined in the Project's Environmental Assessment Certificates. Woodfibre LNG General Partner Inc. recognizes the importance of these areas to the Skwxwú7mesh stélmexw (Squamish People), and other Indigenous Groups. Woodfibre LNG General Partner Inc seeks to construct and operate the Project in a manner that is respectful of Indigenous values. This Operations Stormwater Drainage Management Plan is primarily written in English with important place names, species, phrases, and passages provided in the Sk̲wx̲wú7mesh Sníchim (Squamish language).

Temíxwiy̓ik̲w chet wa naantem chet ti temíxw Swiy̓át

Chet wa sméṅhemswit kwis ns7éyx̲nitas chet ti temíxw

We7ú chet kwis t’íchimwit iy íẇas chet ek̲’ I tti.

Our ancient ancestors named this place Swiy̓át

We, as their descendants safeguard these lands

We will continue to swim and fish in these clear waters.

1.0 INTRODUCTION

Woodfibre LNG General Partner Inc. (Woodfibre LNG) will operate the Woodfibre Liquefied Natural Gas Project (the Project). The Project has the capacity to liquefy up to 2.1 million tonnes per year of natural gas and a storage capacity of 250,000 cubic metres (m^3) and will export the liquefied natural gas (LNG) via LNG carriers.

1.1 PURPOSE

The purpose of this Operations Stormwater Drainage Management Program (SWDMP) is to outline the plans for managing the stormwater drainage system during Operations.

The SWDMP was developed to support the waste discharge authorisation (WDA) permit application to the BC Energy Regulator (BCER) under the BC *Environmental Management Act* for the discharge of effluent from the stormwater drainage systems to the environment.

1.2 SCOPE

The following elements are provided herein to support the WDA permit application:

- **Stormwater Drainage Management**: Describes the stormwater drainage management system and procedures implemented during normal operations prior to the discharge into Howe Sound.
- **Oily Water Treatment System (OWTS) Management**: References the operations and maintenance manual and describes the plan for managing treatment residuals.
- **Contingency Plan**: Describes the plan for managing the stormwater drainage system if the water quality does not meet the permit requirements, and/or if there is an interruption to normal operations of the OWTS (also referred to as the “Oily Water Treatment Package”).
- **Episode Management Plan**: Describes the approach for managing natural and environmental events that may impact the stormwater drainage system.
- **Trigger and Response Plan**: Describes the monitoring triggers and responses in the event that environmental benchmarks are exceeded.
- **Adaptive Management Plan:** Describes the adaptive management process and addresses outstanding key uncertainties of potential effects of the discharge following a cyclical process.

1.3 PROJECT LOCATION

The Project area (the site) is located approximately seven kilometres (km) southwest of Sḵwx̱wú7mesh (Squamish), British Columbia (BC) on the northwestern shoreline of Nexwnéwu7ts Átlk’a7tsem (Howe Sound). The site is within the Traditional Territory of the Skwxwú7mesh Úxwumixw (Squamish Nation) at the historical site of Swiẏát, a Skwxwú7mesh Úxwumixw (Squamish Nation) village.

The site comprises of fee simple, industrially zoned, brownfield temíxw (land), along with existing stak̓w (water) lots (refer to Figure 1-1). The site previously operated as a pulp mill facility from 1912 until 2006.

The site is mostly at sea level, surrounded by steep, mountainous terrain with no temíxw (land) or road access. All personnel, equipment and supplies are brought in by vessel via Nexwnéwu7ts Átlk'a7tsem (Howe Sound).

The site is located within portions of three watersheds, Woodfibre Creek, Mill Creek and East Creek.

1.4 ROLES AND RESPONSIBILITIES

The Plant Manager will be accountable for the LNG facility, including the stormwater drainage management system; and will be supported by various Managers who are responsible for leading different divisions (e.g., Operations Manager, Maintenance Manager, Engineering Manager, Environment Manager). Supervisors (who report to the Managers) will be responsible for directing operators to execute the day-to-day activities including water quality assessments prior to discharge to the environment.

In the event of a potential regulatory non-compliance, the operator will notify a Health, Safety and Environment (HSE) specialist (or project approved designate) who will subsequently notify the BCER and/or applicable regulatory agency.

1.5 EXCLUSIONS

This SWDMP does not contain the following:

- Stormwater management during Construction
- Commissioning of the permanent stormwater management system. Refer to the "Technical Assessment Report for Stormwater Effluent from the Woodfibre LNG Facility" (WLNG-W0001-RE-RP-00287) for details on the transition from the temporary stormwater drainage system (supporting construction activities) to the permanent stormwater drainage system.
- Operating procedures (OPs) that will be used to execute the program. Rather these are referred to herein only and are available to operators as part of the broader WLNG management system.
- Stormwater monitoring and reporting program. The requirements will be defined in the WDA PE-113093.

1.6 REVIEW AND UPDATE

The Environment Manager (or project approved designate) shall review this SWDMP annually and in response to a WDA permit non-compliance to determine if updates are required to this program to support the effective management of the stormwater drainage system.

2.0 STORMWATER DRAINAGE MANAGEMENT

The stormwater drainage system was designed to protect the LNG facility from design storm events based on applicable codes, standards and regulations.

2.1 CLIMATE

The monthly estimates for temperature and precipitation are provided in Table 2-1.

Table 2-1: Monthly Temperature and Precipitation Estimates for Lower Elevations of Mill Creek, Woodfibre Creek and East Creek

Month	Temperature (°C)			Precipitation (mm)		
	Daily Average	Daily Maximum	Daily Minimum	Rainfall	Snowfall (SWE)	Total Precipitation
Jan	2.7	5.6	-0.3	300.2	25.9	326.1
Feb	4.6	8.7	0.4	179.7	13.1	192.8
Mar	6.7	11.3	2.1	198.4	8.1	206.5
Apr	9.9	15.1	4.6	152.5	0.1	152.6
May	12.9	18.1	7.6	115.7	0	115.7
Jun	15.5	20.5	10.4	82.6	0	82.6
Jul	17.8	23.1	12.4	59.3	0	59.3
Aug	17.8	23.3	12.2	66.2	0	66.2
Sep	15	20.7	9.2	82.6	0	82.6
Oct	10.3	14.6	5.9	255.5	0	255.5
Nov	5.5	8.7	2.3	382.2	9.2	391.3
Dec	2.5	5.2	-0.2	268.4	30.6	299.0
Annual	**10.1**	**14.6**	**5.5**	**2,143**	**87**	**2,230**

Notes:
These estimates (particularly precipitation estimates) are most applicable to the lower elevations of the study area.
Data Source: ECCC's 1981-2000 Climate Normals
[Table Source: Document WLNG-S0003-EV-EDG-0003]

As further described in Section 2.3, the stormwater drainage systems are designed to convey runoff from either the 10-year or 100-year return period. The rainfall intensity-duration frequency curves for these durations are provided in Table 2-2.

Table 2-2: Intensity-Duration-Frequency for Mill Creek, Woodfibre Creek and East Creek with Climate Change Considerations[1] (mm)

Duration	Return Period	
	10-year	100-year
5 min	6.5	15.4
10 min	8.3	17.8
15 min	9.1	17.8
30 min	11.6	18.7
1 hour	18.5	29.1
2 hour	28.8	41.3
6 hour	66.8	99.5
12 hour	112.2	148.5
24 hour	187.1	257.8
24 hour (rain on snow)[2]	221.6	297.2

Notes:

1. For climate change considerations, for each duration and return period, the maximum of the following two precipitations depths were used in the table:
    a. Precipitation depth estimated by the UWO (2020) tool for the Squamish Airport with the ensemble of global climate models for climate change until 2100 under the moderate intensity scenario (RCP 4.5)
    b. Precipitation depth based on the historical IDF curve for the Squamish Airport, plus 10% for climate change, consistent with the EGBC (2018) guidelines.
2. Rain-driven snowmelt rates based on Coulson (1991) were added to the 24-hr rain events to calculate the total rain-on-snow events.

[Table Source: Document 350106-000-CS-PH-00001; WLNG-S0003-EV-EDG-0003]

2.2 CATEGORIZATION

Surface water runoff from the site is classified into the categories outlined in Table 2-3.

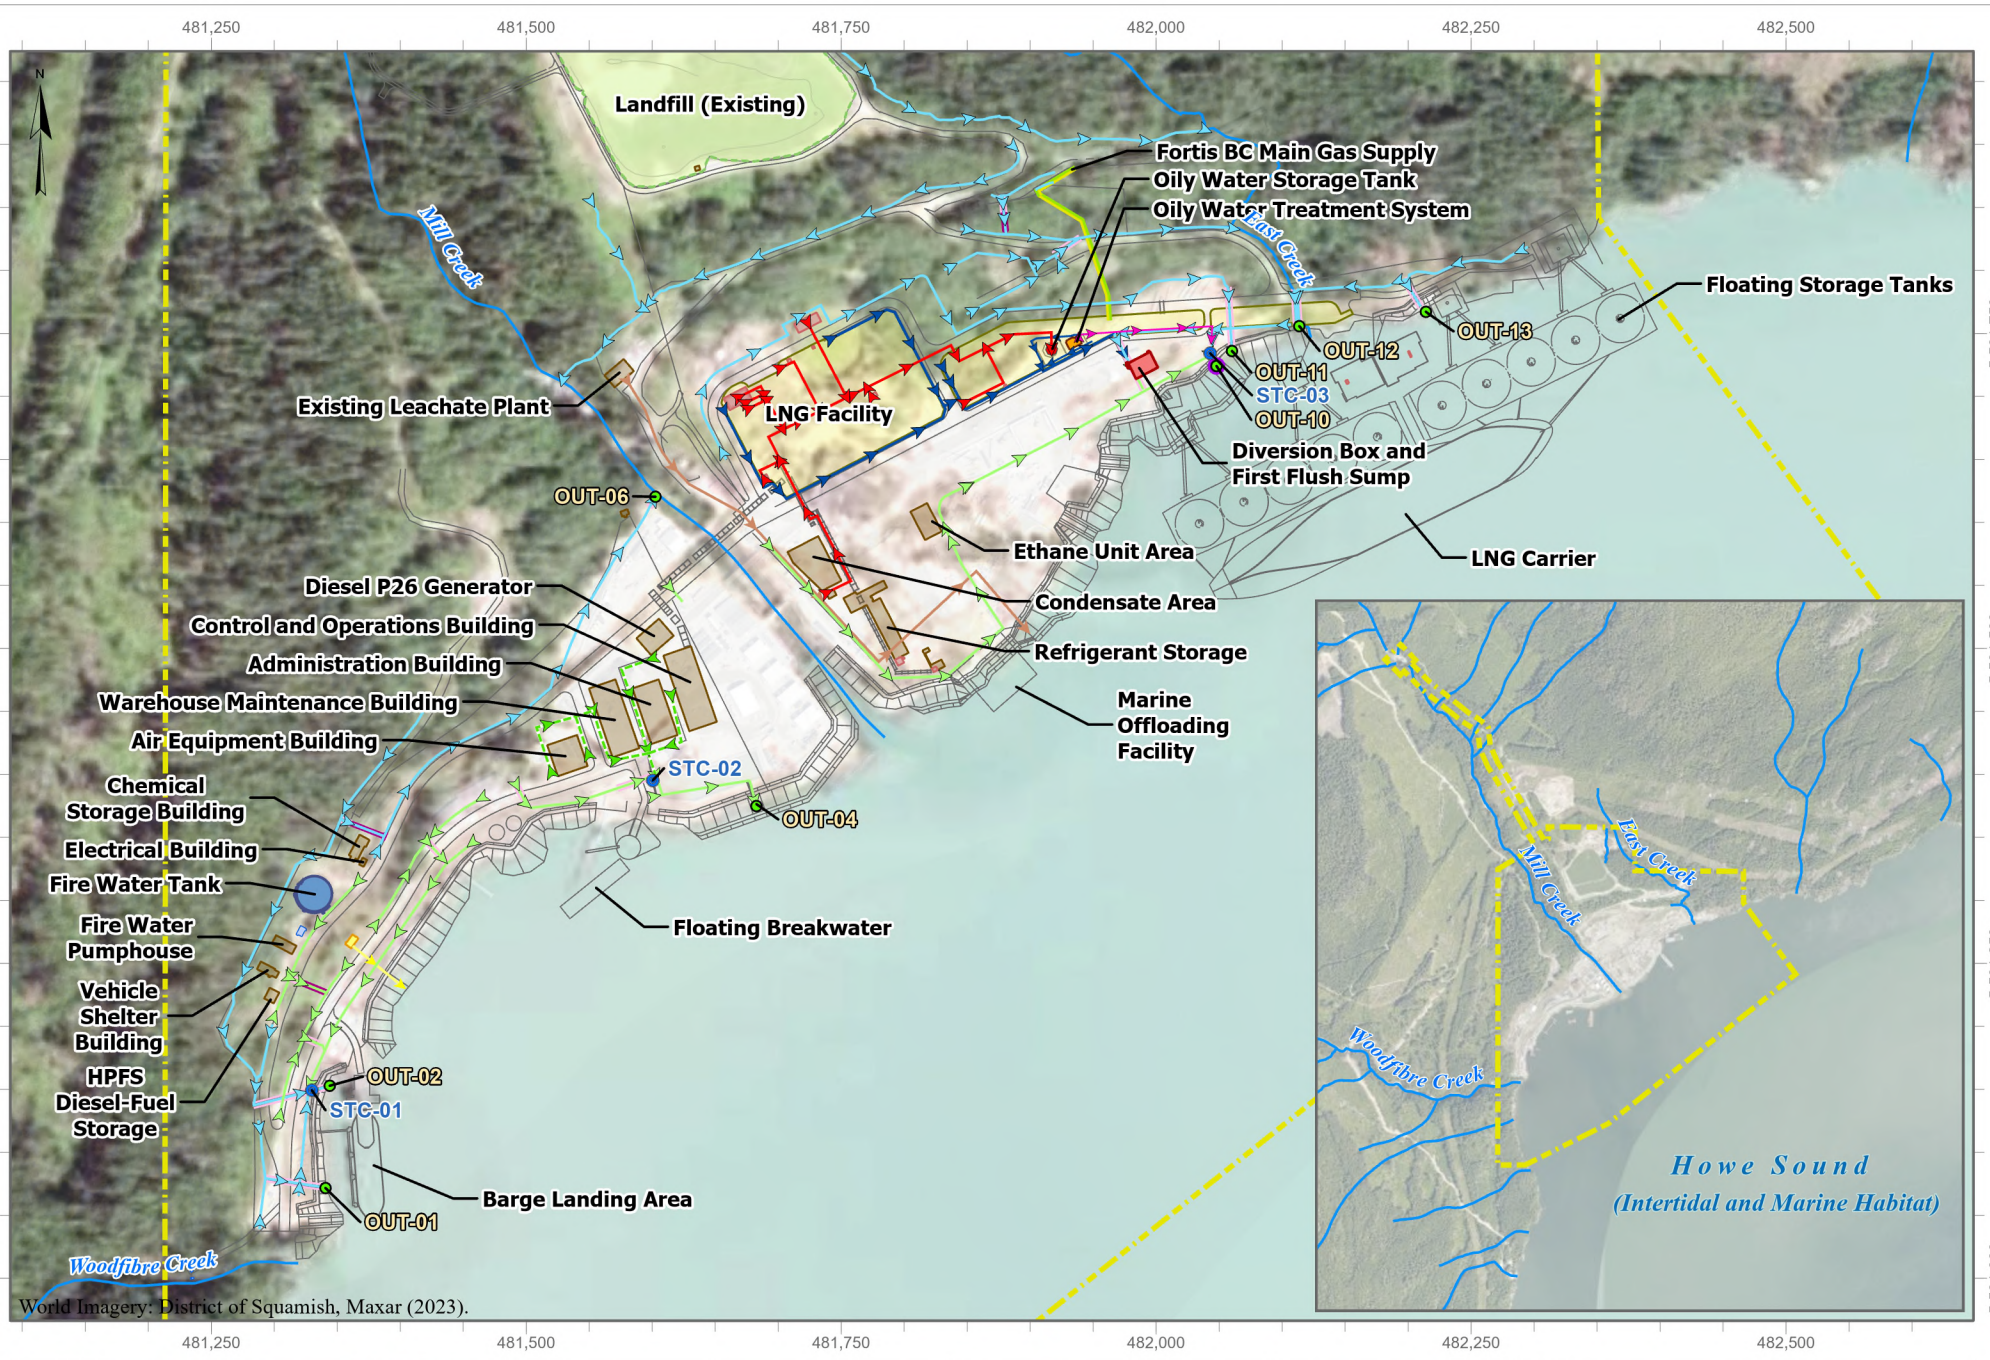
Table 2-3: Stormwater Runoff Categories

Classification	Description
Non-Contact Water	Water generated from outside the footprint of the LNG facility which does not come into contact with any part of the facility before entering the receiving environment. This also includes water originating from undeveloped / non-developable periphery areas of the site located along the creeks and Howe Sound shoreline which drain directly to those water bodies.
Contact Water	Water generated from within the facility footprint either naturally or from facility operations. Contact water is further divided into three classifications as outlined below.
Contaminated Contact Water	Water originating from operational process areas, such as amine unit, hydrocarbon loading/unloading stations, hydrocarbon storage areas, and any other areas surface runoff from oily equipment base plates, lubrication skids, and piping drains.
Potentially Contaminated Contact Water	Water which potentially comes into contact with the LNG process and other process areas. This water is collected in the paved areas beneath the process modules and equipment.
Non-Contaminated Contact Water	Water originating from within the facility that does not come into contact with any potential contaminant sources.

2.3 DRAINAGE SYSTEM

Figure 2-1 illustrates the routing of non-contact and contact water around the site to the eight discharge outfalls; there are seven stormwater drainage outfalls into Howe Sound (OUT-01, -02, -04, -10, -11, -12 and -13) and one stormwater drainage outfall into Mill Creek that subsequently flows into Howe Sound (OUT-06). Further breakdown of the discharge via each outfall is provided in Section 2.3.5. Figure 2-2 illustrates the management approach for the various elements of the stormwater drainage system.

The process flow diagrams associated with these systems have been submitted to the BCER as part of the Facility Permit/*LNG Facility Regulations*, which are:



- 350106-1200-64-PR-DWG-UFD-0001 – Utility Flow Diagram Unit 64 Effluent and Wastewater Treatment Oily Water Collection and Treatment System

- 350106-1200-64-PR-DWG-UFD-0002 – Utility Flow Diagram Unit 64 Effluent and Wastewater Treatment Oily Water Collection System
- 350106-1200-64-PR-DWG-UFD-0004 – Utility Flow Diagram Unit 64 Effluent and Wastewater Treatment Jetty Area Impoundment Sump and Clean Stormwater System
- 350106-1200-64-PR-DWG-UFD-0005 – Utility Flow Diagram Unit 64 Effluent and Wastewater Treatment Process Area Impoundment Sump and Clean Stormwater System

There will be a mixture of site surface coverings, including:

- Paving (asphalt or concrete) for the operational process areas, containment areas, buildings, and primary access roads
- Granular base for non operating areas near the material offloading facility (MOF)
- Rip rap for shoreline protection and on the north side of the process / operating areas
- Forested hillslopes

For the predicted water quality in these drainage systems, refer to the “Technical Assessment Report for Stormwater Effluent from the Woodfibre LNG Facility” (WLNG-W0001-RE-RP-00287).

TITLE: Location of Woodfibre LNG Facilities within the Project Site

PROJECT #: A825-1

FIGURE: 2-1

P:\@202506\Woodfibre\Drafting Figures\APRX\TAR - Operations Phase\TAR - Operations Phase\TAR - Operations Phase.aprx Figure 2-1 Project Area and Facilities

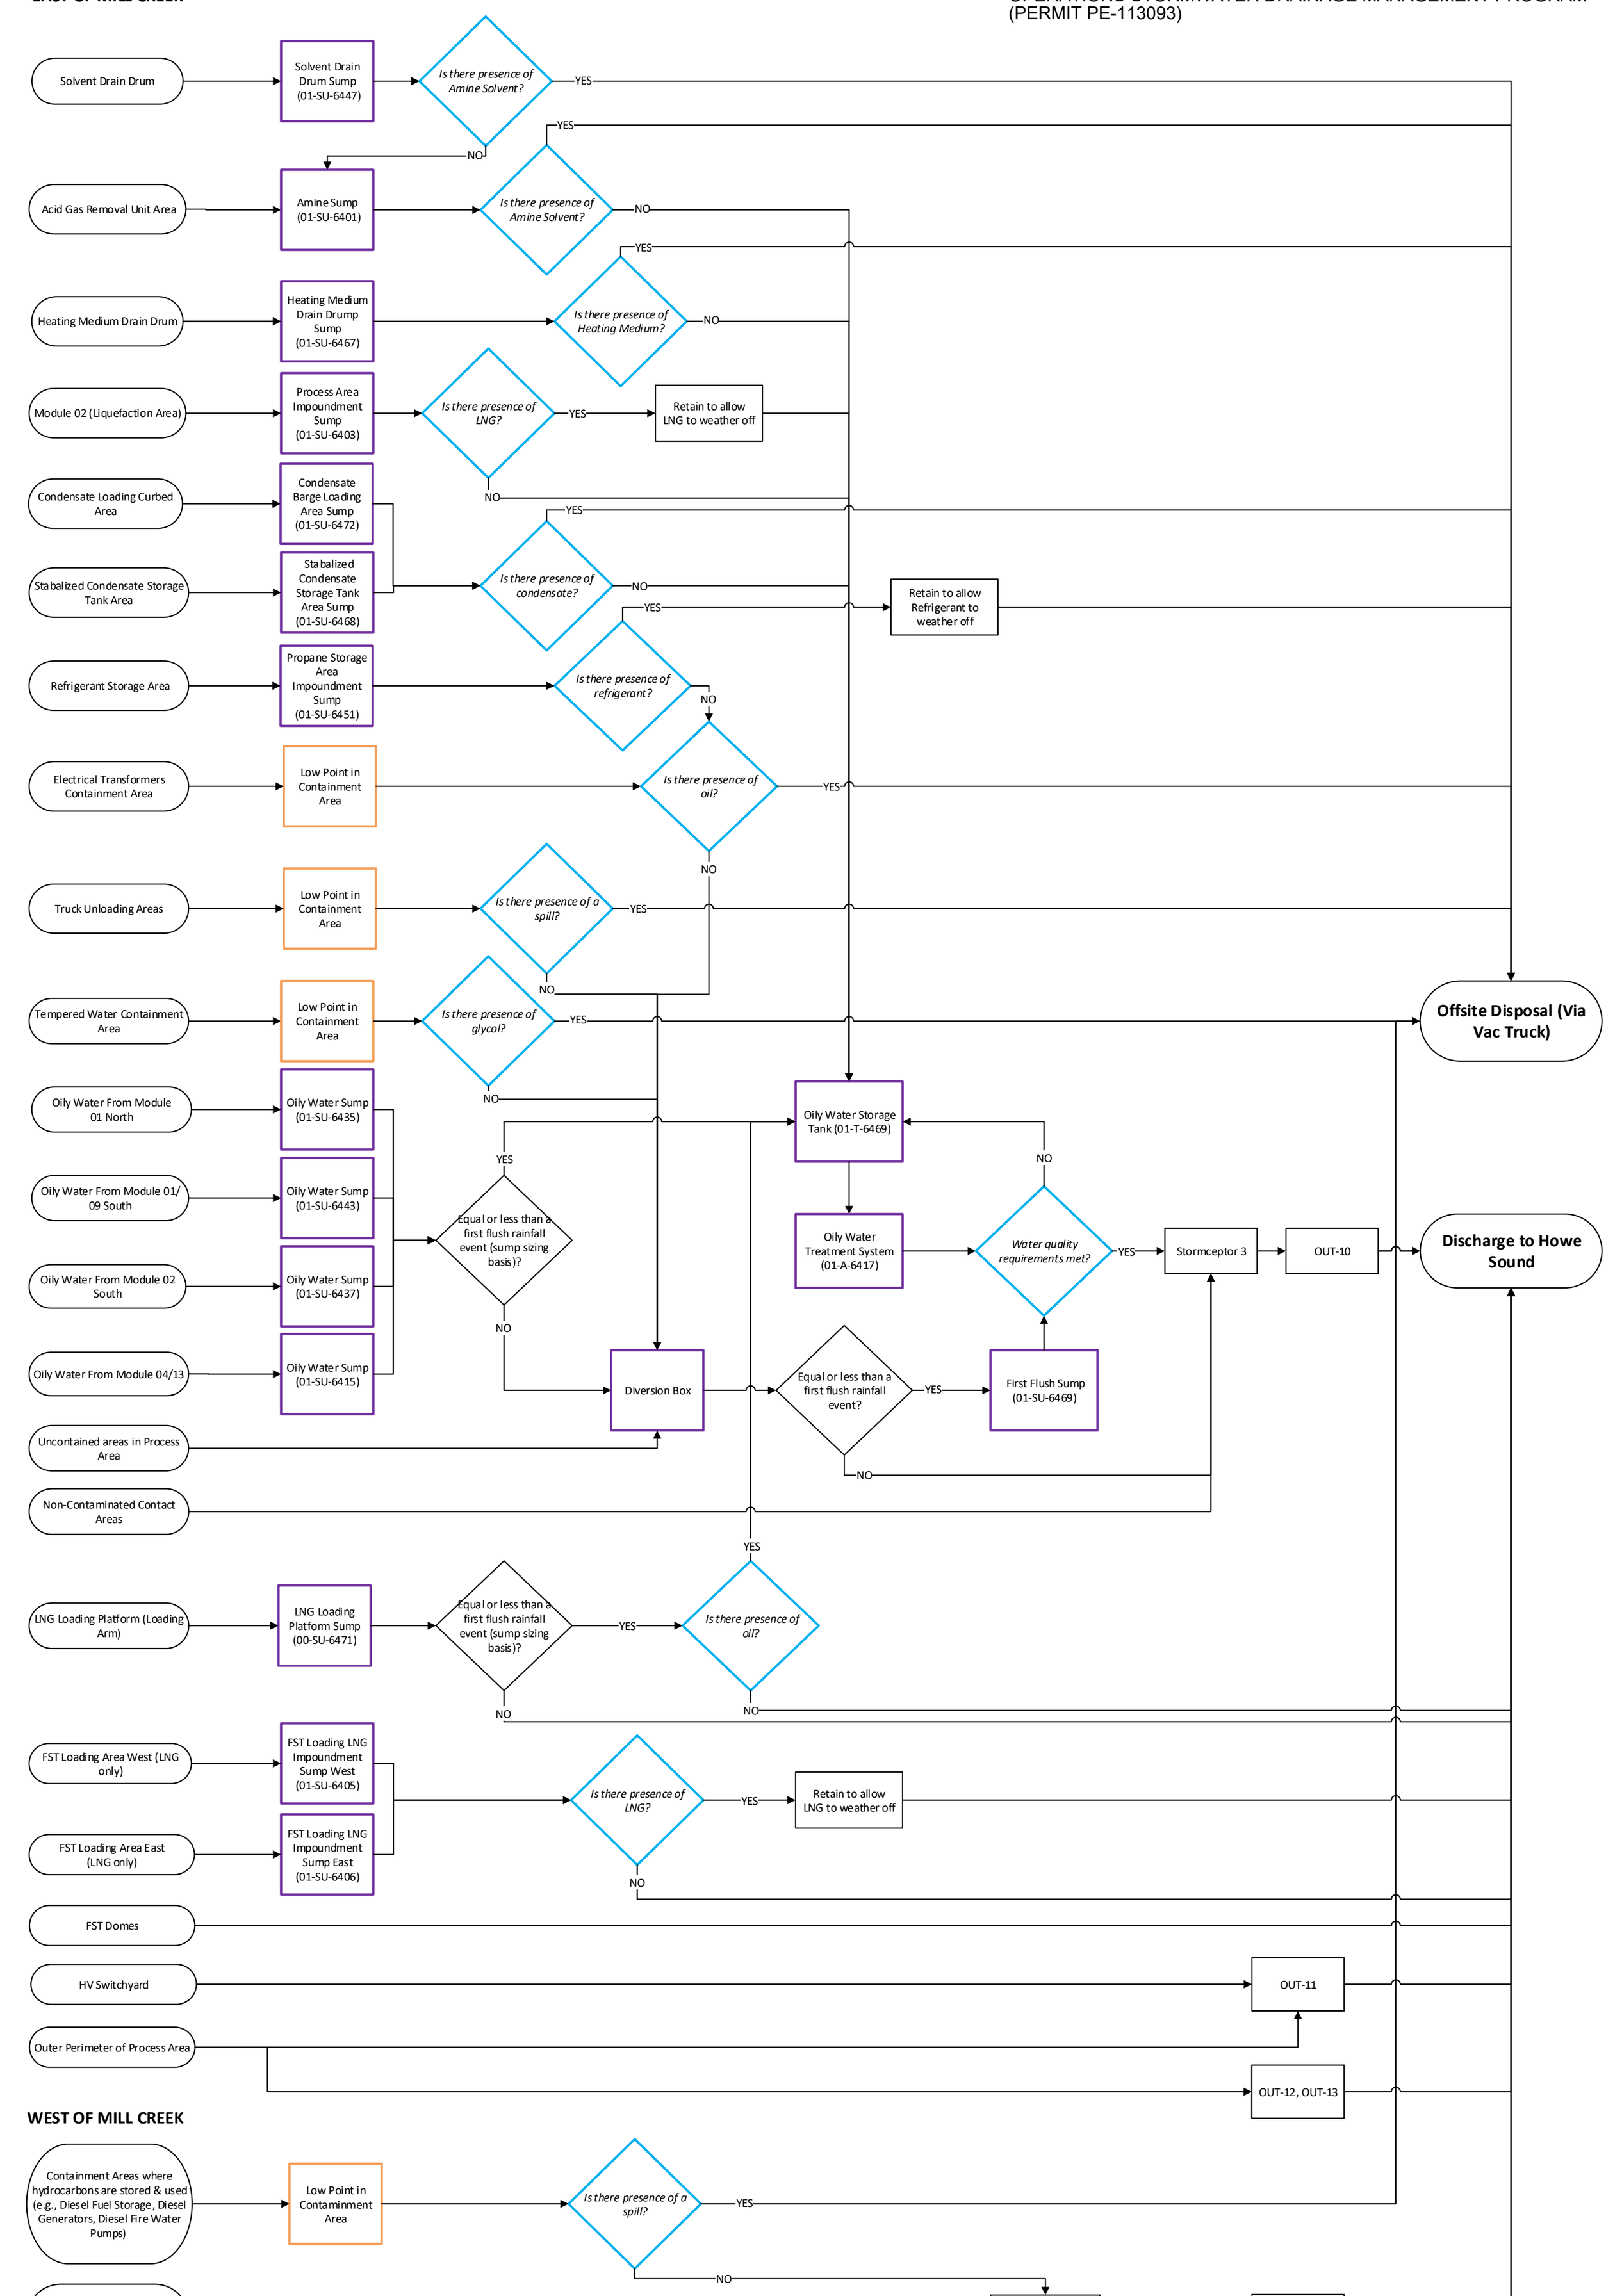

Figure 2 2: Schematic of the Management Approach for the Stormwater Drainage System

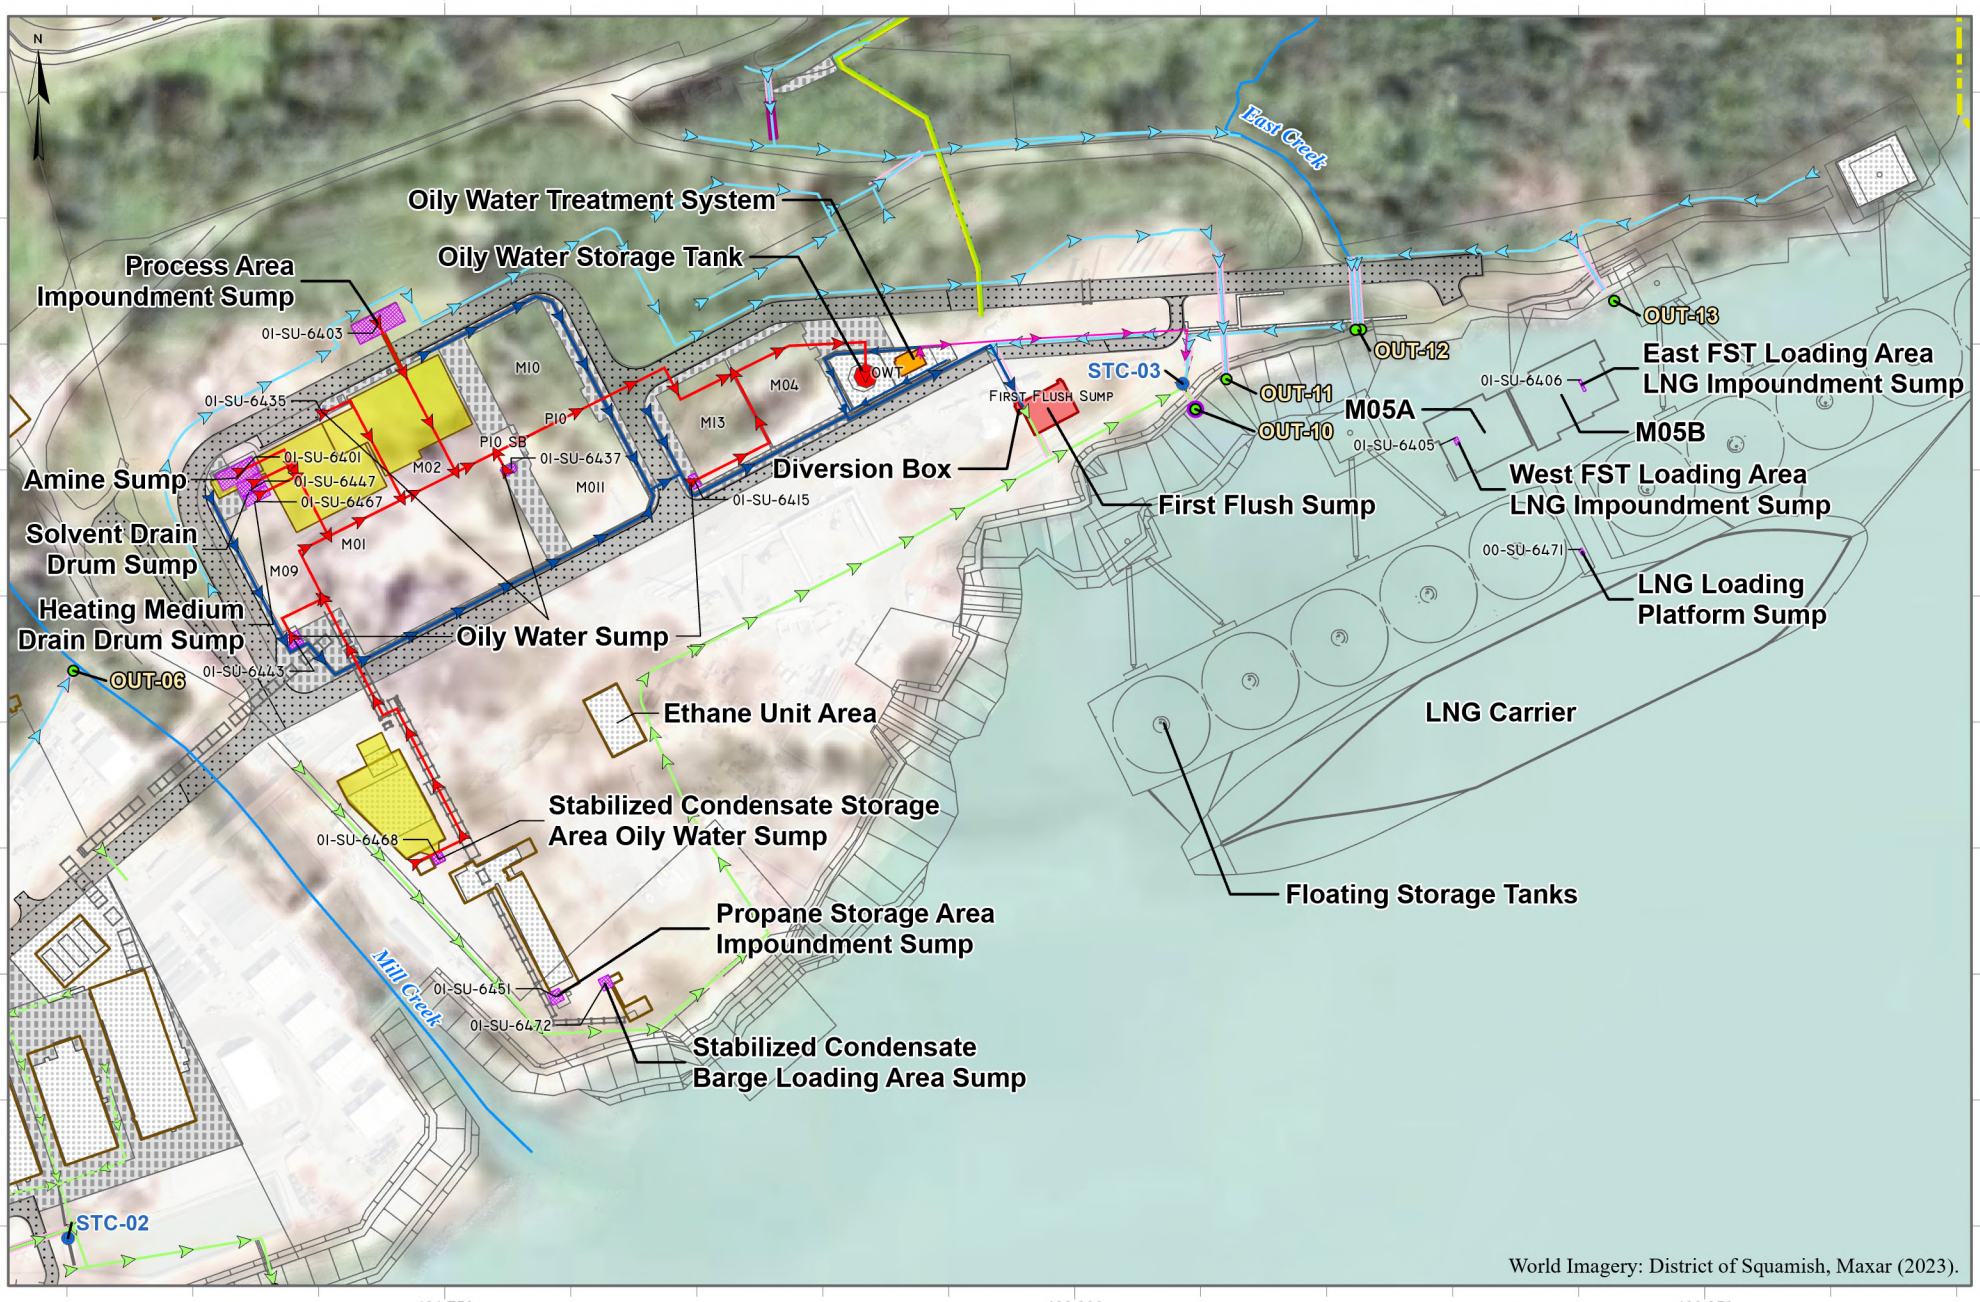
2.3.1 Non-Contact Water

Non-Contact Water that drains directly to the local creeks or Howe Sound (outside of the Project) will continue to drain via their existing natural patterns.

Diversion ditches along the outer perimeters of the site will intercept the upstream stormwater and divert this non-contact water to various culvert outfalls (OUT-01, OUT-02, OUT-06, OUT-11, OUT-12, and OUT-13) which discharge directly to Howe Sound or Mill Creek (refer to Figure 2-1).



Stormwater from within the vegetated Green Zone along Mill Creek will also flow directly into Mill Creek or Howe Sound.

2.3.2 Contaminated Contact Water

As noted in Table 2-3, Contaminated Contact Water is sourced from operational process areas where there is equipment that contains hydrocarbons and other potential sources of contaminants that will interface with surface water runoff. This is commonly referred to as the “oily water system” given the oily water system collects, conveys and treats oily water from equipment and piping drains.

The Contaminated Contact Water will be contained within paved curbed areas that discharge into in-ground, closed concrete oily water sumps (inner walls have an epoxy coating) that are vented to safe locations. Figure 2-1, Figure 2-2, Figure 2-3 and Table 2-4 outlined where the Contaminated Contact Water will be collected within the LNG facility. There are two sumps that have an alternative design:

- **Amine Sump:** There are additional protections in place in the Acid Gas Removal Unit (AGRU) where amine will be used. The AGRU area has a dedicated containment area with an in-ground reinforced concrete sump with the inner walls compatible with the amine solvent. The amine truck unloading areas also drain to this sump.
- **Process Area Impoundment Sump:** It is an in-ground basin, constructed of insulating perlite concrete and filled with a layer of Foamglas cubes to suppress vapor dispersion and pool fires in the event of a spill.

Table 2-4: Contaminated Contact Water Collection Systems

Location	Collection System[1]
Oily Water Collection System	
Module 01 North (excluding the AGRU area)	Oily Water Sump (01-SU-6435) + Pump (01-P-6436)
Module 01/09 South	Oily Water Sump (01-SU-6443) + Pump (01-P-6444)
Module 02 South	Oily Water Sump (01-SU-6437) + Pump (01-P-6438)
Module 04/13	Oily Water Sump (01-SU-6415) + Pump (01-P-6416)
Amine + Oily Water Collection System	
Module 01 – Surface Runoff from under Amine Equipment (AGRU area)	Amine Sump (01-SU-6401) + Pump (01-P-6425)
Solvent Drain Drum (north of Module 09)[2]	Solvent Drain Drum Sump (01-SU-6447) + Pump (01-P-6448)
Heating Medium + Oily Water Collection System	
Heating Medium Drain Drum (north of Module 09)[3]	Heating Medium Drain Drum Sump (01-SU-6467) + Pump (01-P-6468)
LNG + Oily Water Collection System	
Module 02 North	Process Area Impoundment Sump (01-SU-6403) (drain via an open trench system) + Pump (01-P-6404-A/B)
Condensate + Oily Water Collection System	
Stabilized Condensate Storage Tank Area	Stabilized Condensate Storage Tank Area Sump (01-SU-6468) + Pump (01-P-6483)

Notes:

1. There is the ability to hook up a temporary pump for each pump, plus a truck out connection.
2. All amine containing equipment and piping drains will be collected by a closed drain system that shall gravity drain to a Solvent Drain Drum. Material collected in the Solvent Drain Drum will be returned to the AGRU for reuse. The Solvent Drain Drum is located within the Solvent Drain Drum Sump.
3. The heating medium equipment and piping drains will be collected by a closed drain system that shall gravity drain to a Heating Medium Drain Drum. The system loss due to leakage or maintenance losses in the Heating Medium system will be made up by using Heating Medium stored in the Heating Medium Drain Drum. The Heating Medium Drain Drum is located within the Heating Medium Drain Drum Sump.

As the equipment and piping drains, such as feed gas and fuel gas knockout drums, pumps, compressors and hydrocarbon containing equipment, will be controlled operations, the oily water drain lines are sized for the peak surface runoff flow rate from the paved and curbed area. The oily water sumps are sized to accommodate the first 25 mm of runoff within the potentially contaminated area, which exceeds the first 15 minutes of a 10-year hourly design rainfall event (9.1mm) and the 10-year, 60-minute rainfall event (18.5mm) (refer to Table 2-2). The sumps have an under-weir to keep oily water in the sump as in the event of a larger rainfall, the excess stormwater will be routed by the overflow line into a potentially contaminated contact water trench (refer to Section 2.3.3). The following two sumps have an alternative design:

- **Amine Sump:** The curbed area in the AGRU area and sump will contain the 100-year, 24-hour storm event to ensure that no amine solvent is inadvertently released to the OWTS.
- **Process Area Impoundment Sump:** Capacity to handle 10-year, 24-hour rain event prior to overflow to the potentially contaminated stormwater system.

Most of the oily water sumps will contain pneumatic sump pumps with a design flow of 5 m^3/hr that will pump the sump contents to the Oily Water Storage Tank and subsequently the OWTS (refer to Section 3.1). The Amine Sump, Process Area Improvement Sump and Stabilized Condensate Storage Tank Area Sump will have electric motor driven pumps with a design flow of 30 m^3/hr. The pumps have a manual start and manual/auto stop control as regulated by the liquid level in the sump and can be initiated/stopped by an operator from the control room. If the sump reaches high level after a rainstorm, the operator will be able to manually start the oily water sump pump remotely by a hand switch (to open the air supply valve) to send the oily water to the Oily Water Storage Tank via the oily water collection header. These sumps have a low-low level which indicates the minimal level requirement of the water seal. In case of this low-low level, the operator may need to add service water to the sump to maintain the minimum water seal level. Each sump pump type will be supplied with common warehouse spares. The following sumps have alternative / additional procedures:

- **Heating Medium Drain Drum Sump:** If the contents of the sump reach a defined high level after a rainstorm, the operator will inspect the sump to ensure that there is no heating medium present from leaks or spills. If no heating medium is observed, the operator will manually start the sump pump, which will pump the water to the Oily Water Storage Tank via the oily water collection header. If heating medium is observed, the contents of the sump will be removed using a hydro-vac truck for offsite disposal.
- **Solvent Drain Drum Sump:** If the contents of the sump reach a defined high level after a rainstorm, the operator will inspect the sump to ensure that there is no solvent present from leaks or spills. If no solvent is present, the operator will manually start the sump pump, which will pump the water to the Amine Sump. If solvent is observed, the contents of the sump will be removed using a hydro-vac truck for offsite disposal.
- **Amine Sump:** The operators will monitor the level in the amine sump and there is also a high level alarm. The operator will inspect the sump to ensure that there is no amine present from leaks or spills. If the water is free of amine, then the contents of the sump will be pumped to the Oily Water Storage Tank via the oily water collection header (the pump will automatically stop on low level). If amine solvents are identified, the contents of the sump will be removed using a hydro-vac truck for

offsite disposal. The Amine Sump Pump is sized to empty the full sump storm water volume in about 12 hours.

- **Process Area Impoundment Sump:** After each rain event, the Process Area Impoundment Sump contents will be manually inspected and tested for contaminants of concern before the contents are pumped to the Oily Water Storage Tank via the oily water collection header. In case of LNG leaks or spills, the fluid will be retained for slow weather off before discharged to the Oily Water Storage Tank via the oily water collection header. The Process Area Impoundment Sump contains a level indicator, and an automatic low temperature and flammable gas detection interlock system to prevent pump operation when exposed to low LNG temperature (below zero degrees Celsius (°C)) to avoid LNG from being pumped to the oily water system.
- **Stabilized Condensate Storage Tank Area:** If sump reaches high level after a rainstorm, the operator will inspect the sump to ensure that there is no stabilized condensate present from leaks or spills (which would include small amounts of the BTEX that was in the natural gas feed). If no condensate is present, the operator will manually start the sump pump, which will pump the water to the Oily Water Storage Tank via the oily water collection header. If stabilized condensate is observed, the contents of the sump will be removed using a hydro-vac truck for offsite disposal.

2.3.3 Potentially Contaminated Contact Water

Potentially Contaminated Contact Water is sourced from several areas of the site and routed to sumps/curbed areas where operator action is required to manage the discharge based on the quality of the surface water runoff (refer to Figure 2-1 to Figure 2-4 and Table 2-5).

Typically, when the high level alarm in the sump is triggered, the operator will be required to inspect the contents of the sump to determine if the water will be either removed offsite for disposal, routed to the Oily Water Storage Tank, routed to the First Flush Sump, routed to the Non-Contaminated Contact Water trench system, or directly discharged into Howe Sound (pending the location and contents, as outlined in Table 2-5).

The First Flush Sump (01-SU-6469) has a capacity of 500 m^3 and is sized to accommodate the initial 25mm of surface water runoff (i.e., the first flush volume) within a potentially contaminated area.

When the contents of the second chamber of the First Flush sump reaches a high level (set lower than the overflow line to the stormwater system), an alarm is triggered, and the operator will inspect the contents. If there is oily water collected in the sump, the operator will manually start the First Flush Oily Water Sump Pump (01-P-6484) and send the oily water to the Oily Water Storage Tank via the oily water collection header. Otherwise, the operator will manually start the Clean Stormwater Sump Pump (01-P-6485) to pump the clean storm water to discharge to the Non-Contaminated Contact Water system for discharge into Howe Sound. Both these pumps will be electric motor driven with a design flow of 30 m^3/hr therefore there will be common warehouse spares available if required.

Figure 2-4 in SWDMP

Table 2-5: Potentially Contaminated Contact Water Collection Systems

Location	Water Management
Overall LNG Process Module Areas	Any surface runoff from within these areas that is not contained within the contaminated contact water collection system or in the tempered water area, will drain into a concrete trench system. This includes the HVAC condensate drains from each module. A concrete trench system with catch basins is aligned around the outside of the process modules (i.e. west side of Module 09, south side of Module 01, 02, 11, 13 and 04; north side of Module 10, and east side of Module 10 and 11) and to the south of the OWTS area; excluding the north side of Module 01 and 02 which are part of the contaminated contact water collection system. The surface water runoff will gravity drain to the First Flush Sump.
Refrigerant Storage Area	This area is contained by curbs, sized to contain the volume of 110% largest fuel storage plus runoff volume of a 25-year, 24-hour storm event that will collect in the Propane Storage Area Impoundment Sump (01-SU-6451). The Propane Storage Area Impoundment Sump contains a level indicator and has a high level alarm. This sump has the same design as the Process Area Impoundment Sump, constructed of insulating perlite concrete and filled with a layer of Foamglas cubes to suppress vapor dispersion and pool fires in the event of a spill, with a low temperature indicator that will alarm in the event of a refrigerant spill. If the sump reaches high level after a rainstorm, the operator will use a vacuum truck to empty the sump after manual inspection. If refrigerant is observed, the water will be retained to allow the refrigerant to vaporize and disperse to the atmosphere prior to removal by a hydro-vac truck for offsite disposal. If there is only oil observed, the water will be pumped to the Oily Water Storage Tank via a hydro-vac truck, otherwise the water will be routed to the Non-Contaminated Contact Water trench system for discharge to Howe Sound. Stormwater overflow will be discharged to the local stormwater trench.
Condensate Loading Area	This area is contained by curbs, sized to contain the volume of 110% largest fuel storage plus runoff volume of a 25-year, 24-hour storm event that will collect in the Condensate Barge Loading Area Sump (01-SU-6472). If the contents of the sump reach the high level, the high-level alarm will be triggered. The contents of the sump will be removed using a hydro-vac truck; the operator will manually inspect the sump liquid for leaks or spills; if condensate is observed, the contents of the sump will be sent for offsite disposal; otherwise will be discharged into the Oily Water Storage Tank. This sump does not have an overflow to the stormwater system.

Location	Water Management
Tempered Water Storage (Module 09)	The area under the Tempered Water Header Tank, Filter and Pump in the Tempered Water System will be paved and curbed to contain any glycol (triethylene glycol) spills or leaks. The secondary containment areas are provided with low point corner sumps/area and drain lines with normally closed isolation valves connecting to the stormwater drainage system. The contents will be inspected and/or tested for potential contaminants of concern (e.g., glycol); if detected above applicable regulatory requirements[1], the water will be removed by a hydro-vac truck for offsite disposal; otherwise the water will be routed to the Non-Contaminated Contact Water trench system for discharge to Howe Sound.
Electrical Transformers	Electrical transformers will be located in curbed containment areas sloping to a common trench to drain and collect runoff away from the equipment. The secondary containment areas will be provided with low point corner sumps/area and drain lines with normally closed isolation valves connecting to the stormwater drainage system. The secondary containment will be sized to contain 110% of the contents of the largest transformer. The contents will be inspected and/or tested for potential contaminants of concern; pending the outcome, the water will either be released to the nearest clean storm water drainage ditch, oily water system via the manual valve, or the contents of the low point corner sumps removed by hydro-vac for offsite disposal or may discharge at the Oily Water Storage Tank (alternative).
LNG Loading Platform (Loading Arm)	For the LNG Loading Platform, the LNG will slowly weather off in the containment area. Due to the potential contamination from biodegradable hydraulic fluid used in the LNG Loading Arms, the first inch of potentially contaminated stormwater that contacts the area with hydraulic fluid will be contained in the metallic LNG Loading Platform Sump (00-SU-6471) that has an underflow-weir and overflow with additional water seal for clean stormwater to discharge to Howe Sound. If the contents of the sump reach the high level, the high-level alarm will be triggered for operation intervention. The operator will be required to clean out any potential clog of the overflow line in case of a high level in the sump. At the high level alarm, if oily water is observed, it will be pumped out for discharge at the Oily Water Storage Tank; otherwise it will discharge to Howe Sound.

[1] BC has Working Water Quality Guidelines for ethylene glycol for freshwater aquatic life only, based on the Canadian Council of Ministers of the Environment (CCME). There is no recommended guideline for marine aquatic life (CCME, 1999). In the absence of a regulatory limit, the Project will define this limit.

Location	Water Management
Truck Unloading Areas	The truck unloading areas for amine, heating medium and tempered water will be paved and sloped to the centre to a catch basin or curbed area for secondary containment. The catch basin will be provided with grated cover and a drain line with an isolation valve to the clean stormwater system for heating medium/tempered water catch basin and to the amine sump for amine/heating medium catch basin. The valve will be open during normal operations. During truck unloading operations, the valve will be closed to contain any spills. Spilled liquid will be collected and removed for appropriate offsite waste management or discharged at the Oily Water Storage Tank for treatment (alternative). The Diesel Fuel loading area will also be contained in a curbed area. Spilled liquid will be collected for off-site disposal or discharged at the Oily Water Storage Tank for treatment.
West of Mill Creek where hydrocarbons are stored / used	There will be containment areas around the firewater pumps, diesel generators, diesel storage area, and any other areas identified to have a high probability of exposure of stormwater to hydrocarbons. Each containment curbed area is sized to contain volume of 110% largest fuel storage plus runoff volume of 25-year, 24-hour storm event; contaminated water is removed by hydro-vac truck for off-site disposal or discharged at the Oily Water Storage Tank for treatment if accidental leakage occurred.

2.3.4 Non-Contaminated Contact Water

There will be Non-Contaminated Contact Water in several areas of the site that does not require operator intervention to manage the discharge (refer to Figure 2-1 to Figure 2-4 and Table 2-6).

The drainage ditches are sized for the 1 in 100 year rainfall event, are trapezoidal in shape with slopes of 2 to 1 (or flatter) and will be lined with rip rap to provide erosion protection and sediment control. There are also vertical-wall concrete trenches with grating covers in areas where space constraints prevent accommodation of a trapezoidal ditch with 2:1 side slope.

The Non-Contaminated Contact Water will be routed through stormceptors prior to discharge into Howe Sound. Stormceptors are equipped with oil/grit separators, intended to remove sediments and surficial oil from smaller but more frequent rainfall events. During larger events, flow in excess of the Stormceptor capacity will be bypassed and will discharge through the outfall to Howe Sound through an overflow weir structure (refer to Figure 2-5). The Stormceptors will have an inside diameter of approximately 3.7 metres, with a depth of 3.8 m below the outlet pipe invert and 3.0 m below the drop pipe. Stormwater will enter the Stormceptor upper chamber through the inlet pipe; a specially designed insert reduces the influent velocity by creating a pond upstream of the insert's weir. Sediment particles will immediately begin to settle; swirling flow will sweep water, sediment, and floatables across the sloped surface of the insert to

the inlet opening of the drop pipe, where a strong vortex will draw water, sediment, oil, and debris down the drop pipe cone. Free oils and other floatables will rise up and be trapped beneath the insert, while sediment will settle. Treated effluent will enter the outlet riser, move upward, and discharge to the top side of the insert downstream of the weir, where it will flow out the outlet pipe.

Table 2-6: Non-Contaminated Contact Water Collection Systems

Location	Water Management
East of Mill Creek	Surface runoff from uncontained paved and unpaved areas with no risk of surface contamination will sheet flow to open drainage ditches. This area is south of the First Flush Sump, and east of the Refrigerant Storage Area. The water will discharge through Stormceptor 3 (01-U-6403) prior to discharging to Howe Sound via an outfall (OUT-10). This may also include chlorinated service water and fire water (if discharged). Chlorination is carried out as a batch operation by Operations, as required, to prevent algae growth in the Fire Water tank. During these periodic treatments, chlorine tablets are added and the tank contents are recirculated to ensure adequate mixing.
West of Mill Creek	Surface runoff from uncontained paved and unpaved areas, including building areas, with no risk of surface contamination will sheet flow to concrete trenches or line riprap ditches, and catch basins with underground pipes. The collected water will drain through Stormceptor 1 (01-U-6401) or Stormceptor 2 (01-U-6402), and ultimately discharge through an outfall (OUT-02 or OUT-04) to Howe Sound. HVAC condensate drains are routed to this stormwater system. This may also include chlorinated service water and fire water (if discharged).
Floating Storage Tank (FST) Loading Area (East and West)	As the FST Loading LNG Impoundment Sump West (01-SU-6405) and FST Loading LNG Impoundment Sump East (01-SU-6406) would only contained LNG (that will slowly vaporize and disperse to the atmosphere), the stormwater is considered non-contaminated contact water and discharged directly into Howe Sound. These sumps are steel tanks, filled with a layer of Foamglas cubes to suppress vapor dispersion and pool fires in the event of an LNG spill, with a low temperature indicator that will alarm in the event of a LNG spill. There are drain lines that connect to the FST domes, and local HVAC condensate systems to facilitate drainage into Howe Sound.

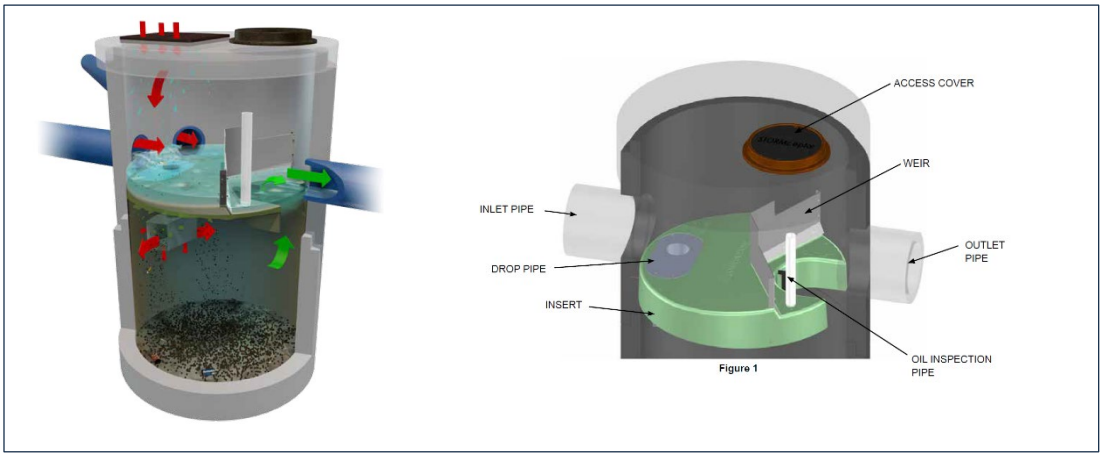

Figure 2-5: Stormceptor Process

2.3.5 Outfall Summary

Table 2-7 contains a summary of the drainage systems that will connect to each outfall on site (refer to Figure 2-1). The minimum invert elevations (IE) of all proposed culverts are set at 2.0 metres (m), which is slightly higher than the Higher High-Water Level – Large Tide in the Squamish area (1.95 m, measured using Geodetic Datum). This approach is intended to reduce the potential for marine water to reach the infrastructure and reduce the capacities of the drainage system during high tide periods and to make the culverts inaccessible to fish and other marine fauna at tide levels below 2.0 m.

Table 2-7: Drainage Outfall Summary

Outfall #	Culvert Design & Invert Elevation	Discharge	Water Management
West of Mill Creek			
OUT-01	900mm diameter corrugated high density polyethylene (HDPE) pipe with headwall IE: 2.00m	Howe Sound	Non-Contact Water from the area adjacent to Woodfibre Creek. There is approximately 31 hectares (ha) of forested hillslope catchment that will discharge via this outfall.
OUT-02	900mm diameter corrugated HDPE pipe with headwall IE: 2.00m	Howe Sound	Non-Contact Water from the area upstream of the fire water tank, diesel fuel and chemical storage area. Stormceptor 1 is located upstream of the outfall. There is approximately 22.5 ha of predominately forested hillslope catchment that will discharge via this outfall.
OUT-04	900mm diameter corrugated HDPE pipe with headwall IE: 2.03m	Howe Sound	Non-Contaminated Contact Water from approximately 2.4 ha of developed areas including roadways and buildings (which are served by a dedicated stormwater drainage network). Stormceptor 2 is located downstream of the developed area which then discharges into a ditch that routes the drainage to the outfall.
OUT-06	1000mm diameter; flap gate mounted on the flood wall IE: N/A	Mill Creek	Non-Contact Water from the area upstream of the utilities area (e.g., fire water tank) is routed in a diversion trapezoidal ditch. There is approximately 9 ha of prominently forested hillslope catchment that will discharge via this outfall.

Outfall #	Culvert Design & Invert Elevation	Discharge	Water Management
East of Mill Creek			
OUT-10	900mm pipe with headwall IE: 2.02m	Howe Sound	Contaminated Contact Water (downstream of the OWTS): - Underground piping from the OWTS to the catch basin upstream of Stormceptor 3. Potentially Contaminated Contact Water (downstream of the First Flush Sump): - Approximately 20 m of 600mm diameter corrugated HDPE pipe with precast headwall that discharges into the Non-Contaminated Contact Water trapezoidal ditch. Non-Contaminated Contact Water: - From the area south of the First Flush Sump: 600mm riprap lined trapezoidal ditch that discharges into Stormceptor 3 (with approximately 30 m of 600 mm diameter corrugated HDPE pipe under the paved access road to the FST). - From area south of the LNG Loading Line piperacks; with concrete trench and culverts connecting into Stormceptor 3. The discharge from Stormceptor 3 is routed to this outfall.
OUT-11	900mm diameter corrugated HDPE pipe with headwall IE: 3.50m	Howe Sound	Non-Contact Water from upstream of the LNG loading lines, including the access road. There is approximately 4.7 ha of prominently forested hillslope catchment that will discharge via this outfall.

Outfall #	Culvert Design & Invert Elevation	Discharge	Water Management
OUT-12	2 x 1200mm diameter corrugated HDPE pipe IE: 6.23m	Howe Sound	Potentially Contaminated Contact Water from the elevated Switchyard area (graveled), and Non-Contact Water from upstream of the LNG loading lines (East Creek), including the access road. There is approximately 62 ha of prominently forested hillslope catchment that will discharge via this outfall.
OUT-13	900mm diameter corrugated HDPE pipe with headwall IE: 3.08m	Howe Sound	Non-Contact Water from the access roadway near FST 1 Moorings Structure 3 and 4. There is approximately 2.7 ha of predominately forested hillslope catchment that will discharge via this outfall.

Note

- There are additional outfalls on site associated with the leachate from the landfill and sewage treatment system. These outfalls are not included herein as they are already permitted for use under the *Environmental Management Act*.

2.3.6 Operations and Maintenance Activity Summary

In general, the oily water system does not have a set startup procedure. Once the required preparation and checking of the sump and sump pumps is completed, the sumps will be ready to receive drainage from their corresponding containment area or curbing.

Figure 2-2 contains an overview of key decisions to be made by operators to inform the discharge approach of each stream. There will be OPs that address aspects of the stormwater drainage system that require an activity and/or decision by an operator. The OPs will include activities such as:

- Actions to take for the alarms at every location.
- Water quality sampling/observations required for each applicable sump to determine discharge approach, including the project approved testing methodology. If testing equipment requires calibration, then the OPs will reference the applicable requirements.

There will be potential leak points of effluent and wastewater, including flanges, pump seals, and manually operated vacuum trucks. These locations will be monitored regularly to identify any leaks and take necessary corrective actions to prevent contamination of the curbed or surrounding areas.

Scheduled checklists will be used to support routine inspections and maintenance activities. For example, the process/checklist to inspect the Stormceptors will outline that sediment depth inspections are performed through the outfall riser, oil presence is determined through the oil inspection pipe, with sediment to be regularly removed by a vac truck for offsite disposal.

The preventative and predictive maintenance program will support the planning and execution of routine maintenance activities at defined frequencies appropriate to the activity and associated risk. Where unscheduled maintenance is required, a work order will be generated and managed through the enterprise resource planning system, with prioritization determined in accordance with the WLNG risk matrix. All maintenance activities and records will be documented and retained within the enterprise resource planning system.

Operations and maintenance activities will be executed by fully trained and competent personnel, with training and competency records maintained. Supporting documentation, including OPs, maintenance procedures, guidelines, and original equipment manufacturer requirements will be controlled, centrally stored and reviewed periodically to ensure ongoing accuracy and applicability.

Refer to Section 3.2 for further specific information related to the operation and maintenance of the OWTS.

3.0 OILY WATER TREATMENT SYSTEM MANAGEMENT

3.1 DESIGN

3.1.1 Oily Water Storage Tank

The Oily Water Storage Tank (01-T-6469) is an above ground tank with an atmospheric vent (to a safe location) and working capacity of approximately 450 m^3. This tank will hold the incoming flow from various sources on site (refer to Section 2.3), allowing the downstream OWTS to operate in a stable condition. The Oily Water Storage Tank has a skimming facility to skim-off oil (refer to Table 3-1 for the management of the treatment residue).

The Oily Water Storage Tank has heating coils to maintain temperature with low and high temperature alarms that will start/stop the heading medium supply to the tank heating coils. There is a process shutdown isolation valve on the heating medium supply that will be triggered in process upset conditions.

If the contents of the Oily Water Storage Tank reach the high level or high-high level, the alarm will be provided for operation intervention.

The contents of the Oily Water Storage Tank will be pumped to the downstream skid mounted OWTS (01-A-6417) by a 30 m^3/hr inlet feed pump when initiated by the operator (refer to Section 3.1.2 for further details). When the contents of the Oily Water Storage Tank reach the low level, the inlet feed pump will be stopped for pump protection.

There is a sampling point on the piping between the Oily Water Storage Tank and the inlet feed pumps; samples will be analysed to determine the composition of the oily water feed into the OWTS for comparison against the treated effluent from the OWTS to verify treatment efficiency.

3.1.2 Oily Water Treatment System

The purpose of the OWTS is to remove free and dispersed oil, and settleable and suspended solids from the oily water received from the Oily Water Storage Tank.

The OWTS will undertake 12-hour batch operations, which will be operator initiated by the unit control panel (UCP) that is connected to the DCS. The operator will plan the start of the batch operation with consideration to the weather forecast and the level of contents in the Oily Water Storage Tank. Typically, the OWTS will be started when the Oily Water Storage Tank level reaches around 70% to prevent overwhelming the Oily Water Storage Tank especially if there is an anticipated rain event.

The OWTS comprises of (refer to Figure 3-1):

- Two 30 m^3/hr inlet feed pumps (01-P-6417-21A/B) (one pump operating, one in standby)
- Corrugated Plate Interceptor (CPI) Separator (01-H-6417-41)
- Two treated water forwarding pumps (01-P-6417-22A/B) (one pump operating, one in standby)
- Piping, wiring, instrumentation and controls

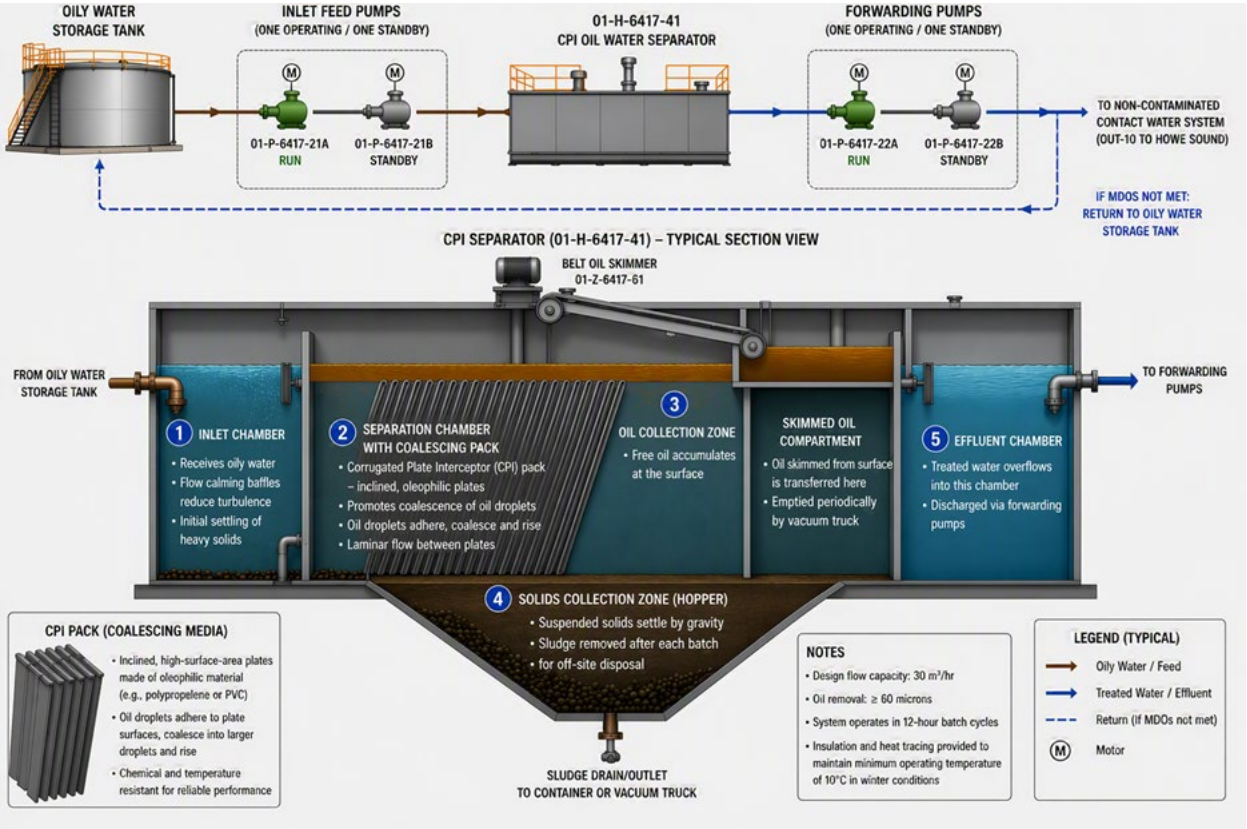

Figure 3-1: Conceptual Schematic of an OWTS (*for illustrative purposes only)*

The CPI Separator is designed to separate oil with droplet size of 60 microns and bigger at a maximum flowrate of 30 m^3/hr (inlet feed pump capacity). There is a high-high level indicator in the CPI separator; once triggered, the inlet feed pump will stop.

When the oily water flows through the CPI packs (multiple parallel plates), the oil will rise to the liquid surface while the suspended solids settle to the bottom of the separator (hopper). The oil skimmer (01-Z-6417-61) will automatically start when the OWTS starts and will operate continuously, collecting oil on the surface and depositing it to the skimmed oil compartment (which is part of CPI separator) (refer to Table 3-1 for the management of the treatment residues).

The treated water from the separator will overflow the weir directly into the treated water compartment. The treated water compartment will be emptied using a Treated Water Forwarding Pump that is started/stopped using the guided wave radar level transmitter. When the contents of the treated water compartment reaches the low level, the pump will be stopped for pump protection.

The discharge line of the Treated Water Forwarding Pump will be equipped with two oil-in-water analyzers. When the water meets the specification (which will be at or below the WDA permit discharge limit for Extractable Petroleum Hydrocarbon (EPH)), the appropriate valve will open to route the water via underground piping to Stormceptor 3, upstream of OUT-10, for discharge to Howe Sound. If the treated water does not meet the specification, the appropriate valve will open to route the water back to the Oily Water Storage Tank.

There is a sampling port on the piping before the valves that direct the treated water to either Howe Sound or the Oily Water Storage Tank to facilitate periodic grab sampling activities to verify the effectiveness of the treatment system.

The process variables and alarms will be displayed on the UCP, as part of the standard configuration. Instruments with process variable alarms include (but not limited to):

- CPI Separator (including the different compartments):
  - Temperature: Low-Low, Low, High and High-High (which automatically start or stop the electric heater; the system has electrical heat tracing and insulation to maintain a minimum operating temperature of 10°C; and a maximum temperature of 38°C).
  - Level: Low-Low, Low, High and High-High (which automatically start or stop various pumps).
  - Timers: Sludge and oil removal.
- Treated water forwarding pump discharge line:
  - High and low oil concentration of oil.

The OWTS can be operated in Automatic or Manual mode or can be put in off-line mode (via the UCP).

- Automatic mode: All unit operations/equipment (pumps, skimmers heaters etc.) are controlled started/stopped by the UCP; this is the normal mode operation.
- Manual mode: The operator controls all equipment operations (start/stop the pumps, skimmer and electrical heaters) regardless of set point. In case any set point is reached, the pumps, skimmer and electrical heaters will not automatically start/stop. The operator must take action to start/stop or energize the equipment to ensure proper operation of the unit. Manual mode is provided only for flexibility and maintenance purposes.

At the end of the 12-hour batch operation or when the operation timer expires, the system will automatically stop all the equipment in the OWTS. The operator will assess the contents level in the Oily Water Storage Tank level to plan for batch operation. The operator will also confirm that the treated effluent valve that allows the clean water discharge to Howe Sound has been automatically closed.

3.2 OPERATIONS AND MAINTENANCE SUMMARY

The vendor who supplied the OWTS provided an Operating and Maintenance Manual (350106-PO-11417-02-SD-000082) that compiles the:

- Design drawings and datasheets.
- Installation procedures and commissioning instructions.
- Operating information (control philosophy and logic diagram, cause and effect charts, modbus list and operating training and qualifications).
- Maintenance information (inventory of spares; and lube oil and operating fluids schedule).
- Detailed installation, operating and maintenance manuals from vendors' equipment suppliers, including pumps, pump motors, temperature/flow/level transmitters, analyzers, valves, pressure gauges, heaters, skimmers, UCP, insulation and heat tracing.

The vendor provided Operating and Maintenance Manual contains the vendor's commitment to three days of training of up to ten of WLNG's technical personnel. Operator training enables operators to

acquire the skills needed to handle the package safely and efficiently. The primary goal is to prepare operators to handle real-world situations, including emergency situations, without putting the plant or personnel at risk. The training consists of theoretical lessons (with the help of explanatory slides) and practical lessons (with simulation of operation in UCP) provided by the vendor qualified site supervisor.

The Operating Manual (350106-000-CM-MA-00018) contains further details related operations of the OWTS, including the initial startup and shut down procedures, and normal operations and maintenance requirements. Due to batch operation of the OWTS, maintenance can be scheduled and performed to address emergent issues without affecting environmental aspects.

A normal shutdown can be either a scheduled shutdown such as for an annual turn-around, or one that is made in an orderly manner for reasons other than emergencies or process trips. The actions to be taken prior to a shutdown are dependent upon which equipment items are being taken out of service and the expected duration. A normal shutdown should be done in coordination with all the other units as the corresponding downstream process units will be unable to function with the shutdown of the OWTS. The oily water systems are required to be operational during rain events (plus the stormwater drainage systems) therefore only small sections should be shut down for short periods of time.

As noted in Section 2.3.6, operations and maintenance activities will be performed by fully trained workers and records will be retained.

3.3 TREATMENT RESIDUAL WASTES

Table 3-1 provides an overview of the sources of treatment residual waste and the approach for disposal. The waste will be transported by truck and barges to an off-site third party waste facility that is licensed to accept the material based on the quality. There are several provincially licensed waste facilities in the BC Lower Mainland that can receive treatment system residuals, including GFL in Squamish, Secure Energy in Richmond, Sumas Environmental in Burnaby, and Clean Harbours in Delta. The frequency of waste shipments will vary based on the season with the highest frequencies expected during the high rainfall months.

Wastes will be managed in accordance with the Operations Waste Management Plan, developed in accordance with the Environmental Assessment Certificate.

Table 3-1: Treatment Residual Waste Overview

Source	Waste Type	Management Action
Oily Water Storage Tank	Skimmed oil	Skimmed oil from the tank will be routed from the skimmer to temporary containment via piping; and then sent offsite for disposal.

Source	Waste Type	Management Action
OWTS	Skimmed oil	The recovered oil (concentration 70%) stored in the skimmed oil compartment will be emptied after approximately ten 12-hour batch operations by a vacuum truck equipped with vacuum suction pump and sent offsite for disposal. The level in skimmed oil compartment will be monitored by level transmitter and is equipped with a sight glass for local indication. A high level alarm will indicate when the skimmed oil compartment is to be emptied; and a low level alarm will indicate that the operator can stop emptying the skimmed oil compartment. The skimmed oil compartment is provided with a safety margin to allow five additional 12-hour batch operations before overflow.
OWTS	Sludge (suspended solids that settle)	The sludge holding capacity in the CPI tank is 3 m^3. The hopper will be emptied of sludge after every single 12 hour batch operation by vacuum truck and transferred into suitable containers for temporary storage onsite prior to offsite disposal. The sludge stored in the hopper will be at 1% concentration and therefore cannot be detected with a level transmitter; the hopper is equipped with a sight glass for local indication. There is a timer that triggers every 12 hours to alarm the operator. The hopper has a safety margin to allow an additional 6 hours before overflow; after this time in operation, sludge dragging in the treated effluent could occur. Grab samples of the sludge will be analyzed for the parameters required by the disposal receiving facility.
Stormceptor	Sludge	The stormceptors will be emptied by vacuum truck and transferred into suitable containers for temporary storage onsite prior to offsite disposal. Grab samples of the sludge will be analyzed for the parameters required by the disposal receiving facility.

Reporting will adhere to relevant requirements outlined in the WDA Permit, and will typically include:

- Description of residuals generated, including quantities.
- Summary of any sampling performed, including the laboratory results.
- How/where the residuals were disposed.

4.0 CONTINGENCY PLAN

In the event of a facility emergency scenario, the Emergency Response Plan will be implemented which is shared separately with the BCER in accordance with the *LNG Facility Regulation* and *Emergency Management Regulation.*

The purpose of this Contingency Plan is to outline the plan for managing the stormwater drainage system when it is unable to be operated or if the proposed discharge fails to meet the regulated quality requirements. There are several scenarios that may trigger implementation of the Contingency Plan, which are provided in Table 4-1.

There are no automated emergency shut down actions for the stormwater drainage systems. There is an emergency stop button on the on the power distribution board for the OWTS; if pressed, the whole OWTS will go into off-line mode. The OWTS has a process discharge isolation valve (Tag 01-XV-64098) that is triggered due to process upset conditions and two overpressure protection valves (Tag 01-PRV-64222; 01-PRV-64223) that are sized on the basis of a blocked outlet.

Woodfibre LNG will comply with the notification and reporting requirements in the WDA permit.

Table 4-1: Contingency Plan – Management Actions

Line #	Scenario	Management Actions
Contaminated Contact Water System		
1	Failure of the OWTS (due to equipment failure, power failure, blockages, unable to maintain minimal operating temperature, failure of flow meter etc.), therefore unable to remove the free and dispersed oil and settleable and suspended solids in the stormwater drainage effluent collected in the Oily Water Storage Tank.	• The discharge from the Oily Water Storage Tank to the OWTS will be stopped. • The effluent within the OWTS will either remain within the system (pending the type of failure) or be pumped back to the Oily Water Storage Tank if there is capacity. • When nearing the capacity of the Oily Water Storage Tank, the water will be pumped into temporary storage containers and either temporarily stored on site and/or sent offsite for disposal.
2	Failure of both oil in water analyzers in the OWTS therefore unable to verify if the discharge water meets the specification.	• Effluent will be recirculated back to the Oily Water Storage Tank, on the basis that if the water quality can not be verified, the effluent is deemed as not meeting the discharge specification.
3	Influent from the Oily Water Storage Tank exceeds the design specification for total suspended solids and/or free and dispersed oil.	• Treatment process will continue; the effluent will be recirculated back to the Oily Water Storage Tank if it does not meet the discharge specification.
4	Failure of both inlet feed pumps (i.e. the one in service and the spare failures) preventing discharge into the OWTS.	• Repair one of the two inlet feed pumps if possible, pending the failure. • Temporary pump solutions will be evaluated to pump the oily water from the Oily Water Storage Tank to the OWTS if one inlet feed pump cannot be brought back online in the timeframe needed to manage the water level within the Oily Water Storage Tank.

Line #	Scenario	Management Actions
5	Oily Water Storage Tank overfills; resulting in the loss of containment and release of oily water to the contained area around the Oily Water Storage Tank.	• The released oily water would flow to the low spot within the containment area. • Internal incident event process will be triggered to manage the spill and undertake the required actions for reporting and cleanup.
6	Failure of a sump pump / level indicator in the contaminated contact water, resulting in the stormwater drainage being unable to be pumped to the Oily Water Storage Tank.	• The failed pump will be replaced by a spare pump (common warehouse spares are available for the 5 and 30 m^3/hr pumps). • Any excess oily water will remain within the containment area and subsequently be removed using the spare pump. • If required, the operator will use a vacuum truck to transfer the oily water from the sump to the Oily Water Storage Tank or offsite for disposal (pending quality).
7	Errors in the management of the amine sump, resulting in amine solvents being pumped to the Oily Water Storage Tank.	• Oily Water Storage Tank will be emptied using a vacuum truck and the contents disposed offsite at an approved facility after sampling has been completed.
Potentially Contaminated Contact Water System		
8	Failure in the First Flush Oily Water Sump Pump at the First Flush Sump, preventing the routing of the stormwater back to the Oily Water Storage Tank.	• The failed pump will be replaced by a spare pump (common warehouse spares are available for the 30 m^3/hr pumps). • If required, the operator will use a vacuum truck to transfer the oily water from the sump to the Oily Water Storage Tank or offsite for disposal (pending quality).
9	Errors in the management of the Tempered Cooling Water secondary containment area, resulting in glycol being pumped to the First Flush Sump.	• Effected chamber(s) of the First Flush Sump will be emptied using a vacuum truck and the contents disposed off site at an approved facility after sampling has been completed.

5.0 EPISODE MANAGEMENT PLAN

The purpose of this Episode Management Plan is to outline the plan for managing environmental episodes that may occur (e.g., spills, nuisance, litter, odour, fire, and flooding) in the context of operating the stormwater drainage system.

5.1 SPILL RESPONSE PLAN

The Contaminated Contact Water system and Potentially Contaminated Contact Water systems are designed to contain spills and leaks of hydrocarbons from equipment and truck unloading areas.

As noted in Section 2.3.6, the preventative and predictive maintenance program will be implemented, along with routine inspections of equipment to identify any leaks and take necessary corrective actions to prevent contamination of the curbed or surrounding areas.

The general spill response procedure is as follows:

- **Assess the Situation** – Immediately cease work, assess the hazards and safety risk, determine the source and type of material spilled, and secure the area. If there is immediate danger of explosion, the emergency response plan would be activated (refer to Section 5.2).
- **Stop the Source** – If safe to do so, stop the source of the spill. This will be undertaken in accordance with the relevant OP.
- **Notify** – Immediately notify the applicable Supervisor and/or Manager and HSE representative of the spill.
- **Contain the Spill** – Contain the spill in an appropriate manner based on the location. This may include using absorbent products (e.g., spill pads, socks, booms), drip trays and/or containment berms. For spills to water that cannot managed and contained internally, Woodfibre LNG may engage the Western Canada Marine Response Corporation (WCMRC) to support (who may have already been triggered through the emergency response plan or regulatory reporting activities).
- **Clean-up and Dispose Impacted Materials** – Approach is dependent on the released material and location of the spill (e.g., oil within a sump/containment area may be routed to the OTWS or removed using a hydro-vac truck for offsite disposal based on the OPs). Woodfibre LNG may also engage a third party to support clean-up activities. Impacted material (e.g., soil) will be cleaned up; and absorbent products and impacted material may be temporarily stored on site prior to disposal offsite in accordance with applicable regulations.
- **Report –** All spills are reportable to the environmental representative, regardless of size. Refer to the below for further information on regulatory reporting requirements.
- **Restock the Spill Kit** – Replace any absorbent materials that were used during clean-up.

If there is a spill to water or ground (regardless of if it is within secondary containment) of a prescribed substance in a reportable quantity under the *BC Spill Reporting Regulation,* Woodfibre LNG will report it by calling 1-800-663-3456 (Ministry of Emergency Management and Climate Readiness (EMCR)) and obtain the Dangerous Goods Incident Report (DGIR) number that will be used in all future

correspondence with regulatory agencies. Based on the information provided to EMCR, EMCR will determine which other provincial and federal regulatory agencies need to be informed.

Further reporting may be required as follows (but not limited to):

- If the spill occurs within BCER jurisdiction, then Woodfibre LNG will report it to the BCER after contacting EMCR. Minor incidents must be reported to the BCER within 24 hours, while level 1-3 incidents must be reported to the BCER immediately (within one hour) and local First Nations as soon as possible, after having taken any immediate actions necessary for public safety or to minimize immediate environmental impacts[2].
- If a spill occurs in the marine environment (e.g., pollution from a vessel), the Canadian Coast Guard will be contacted by calling 1-800-889-8852 (Western Region) or via VHF radio (Marine Communications and Traffic Services centre on channel 16), after contacting EMCR.
- If there is a risk of fish mortality or potential HADD (harmful alteration, disruption or destruction), the Fisheries and Oceans Canada (DFO) Observe, Record and Report (ORR) hot line will also be contacted (1-800-465-4336) or emailed (DFO.ORR-ONS.MPO@dfo-mpo.gc.ca) after contacting EMCR.

Any spill/release that threatens to enter, or enters, the terrestrial, fresh water and/or marine environment must be reported directly to the appropriate First Nations representative.

5.2 FIRE AND FLOOD RESPONSE PLAN

There will be an Emergency Response Program prepared and maintained for this site; which will be shared with the BCER and implemented in the event of an emergency in accordance with the *LNG Facility Regulation*.

A fire or flood in the vicinity of the OWTS would trigger this Emergency Response Program given the potential risk to the integrity of the operating LNG facility and operating personnel.

5.3 LITTER RESPONSE PLAN

Woodfibre LNG will implement waste management practices that includes a waste collection system that segregates waste streams for offsite reuse, recycling or disposal. As noted in Section 3.3, wastes will be managed in accordance with the Operations Waste Management Plan, developed in accordance with the Environmental Assessment Certificate.

Woodfibre LNG will educate the workforce about the importance of waste management and the waste segregation system being implemented on site. If litter is observed, it will be addressed and disposed of appropriately.

5.4 ODOUR AND NUISANCE RESPONSE PLAN

A nuisance can be defined as light and/or noise pollution affecting nearby communities. The town of Squamish, BC and the unincorporated community of Britannia Beach, BC are located approximately 7 km west/southwest and approximately 5 km southeast, respectively from the site; and there are no other

[2] Source: https://www.bc-er.ca/data-reports/data-narratives/incidents/

nearby communities. Due to the relative geographical isolation of the site, any odour, noise or light associated with the stormwater drainage system would not be deemed a nuisance to the local community therefore no additional odour and nuisance response plan is required.

6.0 TRIGGER AND RESPONSE PLAN

The WDA permit will identify the authorized discharge limit for several parameters and point(s) of compliance. The environmental monitoring program will be based on the WDA permit which will include the:

- Location(s) of monitoring stations
- Indicators being monitored and associated analysis methodology
- Frequency of monitoring and sampling

“Triggers” are thresholds that proactively trigger a course of action (response) to investigate the changing conditions and to implement change to prevent a WDA permit exceedance/harm to people and/or the environment. The framework for the trigger action level responses is provided in Table 6-1.

If there are changes to the discharge limits in the WDA permit, the Trigger and Response Plan will be updated accordingly.

The monitoring results will be reviewed in a timely manner to determine if a trigger action level is to be activated.

Woodfibre LNG will comply with the reporting requirements in the WDA permit.

Table 6-1: Framework Action Level Response

Action Response Level	Basis	Management Action	
		Notify	Action
OUT-10: Field Sampling - Turbidity – Based on Regression Curve of Turbidity to TSS			
Level 1	Turbidity equivalent of 80% of the TSS Permit Limit	Environment Manager (or approved designate)	• Repeat field measurement to verify value • Investigate the potential source(s) contributing to the elevated measurement (e.g., review of the monitoring data from outlet of the OWTS and undertake further monitoring at the First Flush Sump if warranted) • Identify and implement mitigation actions if there is potential for the concentration of the parameter to continue to increase • Increase the monitoring frequency at OUT-10 until exceedance of WDA limits are no longer a concern (to be defined based on the potential source(s) and mitigation measures being implemented)
Level 2	Turbidity equivalent of 95% of the TSS Permit Limit	Environment Manager and Operations Manager	• Level 1 activities • Implement contingency planning (where applicable) to cease or minimize discharge to Howe Sounds until there is a reduction in turbidity levels

Action Response Level	Basis	Management Action	
		Notify	Action
OUT-10: Laboratory Analysis - EPH and TSS			
Level 1	80% permit limit	Environment Manager (or approved designate)	• Review laboratory certificate Quality Assurance/Quality Control (QA/QC) reports. Validate original result, or re-run sample within 24 hours if a laboratory error was identified • Undertake confirmatory monitoring / sampling • Investigate the potential source(s) contributing to the elevated parameters (e.g., review the turbidity measurements, assess the OTWP) • Identify and implement mitigation actions if there is potential for the concentration of the parameter to continue to increase • Increase the monitoring frequency at OUT-10 until exceedance of WDA limits are no longer a concern (to be defined based on the potential source(s) and mitigation measures being implemented).
Level 2	95% permit limit	Environment Manager and Operations Manager	• Level 1 activity • Implement contingency planning (where applicable) to cease or minimize discharge to Howe Sounds until verification that the mitigation measures are addressing the elevated parameter concentrations. • If the event has potential to exceed permit limits, engage with a qualified professional (QP) for the evaluation of potential effects to aquatic resources, which will support non-compliance notifications to the BCER (if triggered).

7.0 ADAPTIVE MANAGEMENT PLAN

This section describes the general approach for development and implementation of adaptive management, which is used to address uncertainties of potential effects of the discharge following a cyclical process.

Adaptive management is a systematic process for continually improving management policies and practices by learning from the outcomes of operational programs (ENV 2025). There are six stages of the adaptive management cycle (ENV 2022) as described below:

- **Stage 1 & 2 – Assess & Design:** The stormwater drainage system has been designed to achieve the design objectives and permit limits defined by the WDA permit. The monitoring program has been designed to monitor the potential contaminants of concern associated with the stormwater drainage system during operations.
- **Stage 3 – Implement:** The management actions (i.e. OPs) and mitigation measures will be implemented, with deviations recorded as part of management of change. This includes the implementation of the Trigger and Response Plan, as outlined in Section 6.0.
- **Stage 4 – Monitor:** The effectiveness of the design / management actions and mitigation measures will be monitored by undertaking inspections and point of compliance / receiving environment monitoring programs (with scope and frequency defined under the WDA permit).
- **Stage 5 & 6 – Evaluate & Adjust:** The monitoring results will be compared to the predictions and permit limits, which will determine if adaptive measures are necessary. This is a key aspect in early operations, given the monitoring results in the first year(s) will either verify that the design and planned implementation activities are adequate to address the potential effects of the discharge, or if additional measures need to be identified and implemented. This evaluation is typically undertaken on an annual basis however adaptive management may also be triggered for any other potential noncompliance's under the WDA permit. Unexpected outcomes are investigated and learnings identified, which may result in adjustments to the design, implementation or monitoring programs to better achieve the objectives.

Woodfibre LNG will engage with a QP to support the implementation of adaptive management depending on the event. The implementation of adaptive management associated with non compliances to the WDA permit will be noted in reports submitted to the BCER.

Reference: Operations Phase Stormwater Drainage Hydrology and Hydraulics Model

1 Introduction

CB&I LLC (McDermott) is in the process of constructing the Woodfibre LNG (WLNG) Project ("the Project") for Woodfibre LNG Limited in Squamish, British Columbia and has retained Stantec Consulting Ltd. (Stantec) to update an existing hydrologic and hydraulic model prepared for the Construction Stormwater Management Environmental Protection Plan (SWMEPP, Stantec February 2024).

The SWMEPP for the Construction Phase of the LNG Facility is primarily focused on the removal of total suspended solids (TSS) from non-contaminated onsite stormwater runoff and required construction of two temporary sedimentation ponds, one on each side of Mill Creek. For potentially contaminated onsite stormwater runoff water, treatment facilities are provided for the removal of the contaminant. A Waste Discharge Authorization (WDA), pursuant to Section 14 of the BC Environmental Management Act (SBC 2003, c. 53), has been acquired for the discharge of the stormwater runoff and treated effluent into Howe Sound for the Construction Phase.

The Operations Phase will follow the Construction Phase for the LNG Facility, which is expected to be completed in late 2027. The Operations Phase is expected to last at least 25 years. During the Operations Phase, the LNG facility is not expected to generate any significant amount of sediment from the site due to the permanent infrastructure surfaces such as concrete, asphalt, compacted gravel and grassed/landscaped areas which will limit sediment generation; hence, the sedimentation ponds constructed for construction will not be required and will be removed prior to the Operations Phase beginning. The stormwater management and discharge water quality approach for the Operations Phase is discussed in the *Storm Water Drainage Philosophy* document prepared by McDermott (June 2024). It is understood that a regulatory approval for stormwater and effluent discharge for the Operations Phase will be required and addressed separately by WLNG.

The purpose of this technical memorandum is to summarize the update of the existing stormwater model for the Operations Phase incorporating various changes to the site design, grading, and surface finishes to identify any stormwater conveyance system deficiencies and recommend mitigations. Note, FST drainage will be treated as a secondary containment as part of the offshore scope of work. All surface runoff will be collected in a common sump/tank for treatment/disposal.

2 Information Gathering and Review

The following sources of data and other information were collected and reviewed prior to updating the hydrologic and hydraulic model for the Operations Phase:

- Storm Water Drainage Philosophy – Woodfibre LNG (350106-000-CS-PH-00001), McDermott, June 20, 2024

- Construction Stormwater Management Environmental Protection Plan (350106-SC-EN-013-SD-000018), Stantec, February 9, 2024
- Unit 64 – Effluent and Wastewater Treatment System – Process Design Basis (350106-0000-64-EV-GEN-PDB-0001), McDermott, March 20, 2024
- Basis of Design for Impoundment Sumps (350106-000-SE-BD-00001), McDermott, July 18, 2024
- Woodfibre LNG Operations Phase Waste Discharge Authorization – Review of Similar ENV/OGC Authorizations and Recommendations for Application, Stantec, February 15, 2023
- District of Squamish Subdivision and Development Control Bylaw No. 2649 (Section 4 - Stormwater Management), 2018 (updated October 2022)
- Land Development Guidelines for the Protection of Aquatic Habitat, Fisheries and Oceans, 1993
- BC Supplement to TAC Geometric Design Guide, BC Ministry of Transportation and Infrastructure, 2019
- Stormwater Planning – A Guidebook for British Columbia, Ministry of Water, Land and Air Protection, 2002
- Best Achievable Technology Assessment (BATA) to Support the Construction Effluent Waste Discharge Authorization (350106-SC-EN-013-SD-000048), Stantec, 2022
- Draft Hydrometeorology Data Analysis for Flood Assessment – Woodfibre LNG Project – Draft Memorandum, Stantec, 2020
- Woodfibre Hydrometeorology Baseline Report – Mill Creek, Woodfibre Creek and East Creek Draft Report, Stantec, 2020
- Environmental Design Guidelines for Water (WLNG-S0003-EV-EDG-0003), Stantec, 2021

The following sets of design drawings for the Project were also reviewed:

- Georeferenced Imagery 20cm Resolution
- Light detection and ranging (LiDAR) data (2017) 1.0 m resolution
- Overall Plot Plan (350106-0000-00-PI-DWG-P0A-0002, Rev. 6 – Issued for Construction August 16, 2024)
- Roads Plan/Profiles/Sections
- Rough and Final Grading Plans/Sections

The following drawings were provided by McDermott for the development of the hydrologic and hydraulic model:

- 350106-1104-00-CV-DWG-C26-0190, Concrete Precast Trenches Plan East Side, Issued for Construction Drawing, McDermott, June 14, 2024
- 350106-4102-00-CV-DWG-P40-0001, Stormwater Underground Drainage Industrial Area Plan, Issued for Construction Drawing, McDermott, June 21, 2024
- 350106-4102-00-CV-DWG-P40-0002, Stormwater Underground Drainage Industrial Area Details, Issued for Construction Drawing, McDermott, Sept 20, 2024
- 350106-4104-00-CV-DWG-C26-0009, Concrete Precast Trenches Plan West Side, Issued for Construction Drawing, McDermott, Jan 05, 2024
- 350106-4304-00-CV-DWG-C26-0029, Concrete Precast Trenches Switch Yard Area Plan, Issued for Construction Drawing, McDermott, Jan 05, 2024

Stantec also held meetings and corresponded with the McDermott civil design team member to verify proposed stormwater drainage system design and assumptions for hydrologic and hydraulic model development.

3 Operations Phase Design Basis

The Operations Phase stormwater drainage system design basis is intended to identify requirements for the design of major conveyance, storage, and treatment system components for use during operation of the LNG Facility.

3.1 Design Requirements

A summary of the key stormwater drainage system design requirements, established based on various regulatory and previously prepared documents, are as follows:

- All stormwater drainage system components will be sized using the rain-on-snow design rainfall event data provided in Appendix 1 of the "Storm Water Drainage Philosophy" (350106-000-CS-PH-00001).
- The District of Squamish Bylaw No. 2649 (Schedule B Design Criteria, Section 4.0 – Stormwater Management) requires that minor systems of a storm water management system (i.e., underground conduits and appurtenances) must be capable of conveying runoff from the 10-year return period storm and major systems of the stormwater management plan (surface flow paths within roadways and walkways, and open channels) will be capable of storing and/or conveying that portion of the runoff from the 100-year return period storm over and above the capacity of the minor system. For the Project site, permanent conveyance system components will be sized in compliance with the District's Bylaw:
    - Minor system including concrete trenches, underground stormwater pipes, catch basins and Stormceptors
    - Major system including sheet flow within roadways and walkways, diversion ditches and open channels, and culverts
- All onsite and diversion ditches will be trapezoidal in shape with a minimum bottom width of 0.5 m, side slopes of 2H:1V (or flatter) and a minimum longitudinal slope of 0.5%. However, for ditches along shorelines where topography is very flat and 0.5% slope is not achievable, minimum longitudinal slope can be reduced to 0.2%.
- The maximum longitudinal slope will be 6% for channels where energy dissipation structures are not installed. Longitudinal slopes of diversion ditches will be governed by topography and may exceed 10% in some places. For the steep-sloped ditches, erosion control measures such as rock lining will be required.
- Vertical-wall concrete trenches with grating covers may also be used in areas where space constraints prevent accommodation of a trapezoidal ditch with 2:1 side slope.
- The minimum depth of ditches will be 1.0 m at the downstream end and 0.5 m depth at the upstream end.
- A minimum diameter of 450 mm will be used for culverts to reduce the risk of blockage and facilitate ease of maintenance.

- The freeboard for open channels and culverts will be estimated based on the predicted hydraulic flow conditions of the conveyance structure; typical minimum values reported in literature include 0.3 m or 20% of the flow depth.
- Runoff from the first 25 mm of rainfall in the Process Module Area (contaminated contact water) will be collected in oily water sumps and then will be pumped to the Oily Water Treatment Package for treatment. Excess runoff will be conveyed to the First Flush Sump through a gravity trench drain system. The oily water drainage and treatment system is being designed by McDermott. Piping and instrumentation diagram (P&ID) drawings were provided by McDermott. Detailed description of oily water sumps is provided in "Unit 64 – Effluent and Wastewater Treatment System – Process Design Basis" (50106-0000-64-EV-GEN-PDB-0001).
- Runoff from potentially contaminated contact water (due to accidental spills) will be temporarily stored in impoundment sumps, i.e. secondary containment system. In general, the impoundment sumps will be sized for 110% of largest fuel storage plus runoff volume of 25-year 24-hour storm event, facilitating with sumps where contaminated water is removed by hydro-vac truck for disposal if accidental leakage has occurred. Detailed description of the impoundment sumps is available in "Basis of Design for Impoundment Sumps" (350106-000-SE-BD-00001).
- For TSS management from non-contact runoff, Stormceptors (i.e. an oil-and-grit separator or OGS product) will be provided before the concerned outfalls. Stormceptors will retain TSS from the smaller intensity rainfall events while larger rainfalls will be allowed to directly discharge to Howe Sound through an overflow weir structure. The sizing of the Stormceptors were determined by the Stormceptor manufacturer in coordination with McDermott and are provided in Appendix A. The OGS devices are sized to provide stormwater quality treatment based on treating a minimum of 90 percent of the average annual runoff volume and a minimum removal of an annual average 60% of the TSS load for a specific particle size distribution.
- The minimum invert elevations of all proposed onsite ditches and culverts are set at 2.0 m, which is slightly higher than the Higher High-Water Level – Large Tide in the Squamish area (i.e. 1.95 m measured using Geodetic Datum). This approach is intended to reduce the potential for marine water to reach the infrastructure and reduce the capacities of the onsite drainage system during high tide periods and to make the culverts inaccessible to fish and other marine fauna at tide levels below 2.0 m.
- Materials not affected by salinity-induced corrosion will be used for all outlet culverts, control manholes and accessories (i.e., control gates) that will be installed at or below 2.0 m elevation.

The most applicable guideline criteria are used to assess the model results for the proposed drainage system design by McDermott.

3.2 Water Quality Design Criteria & Components

For stormwater discharge water quality to Howe Sound, the "Woodfibre LNG Operations Phase Waste Discharge Authorization – Review of Similar ENV/OGC Authorizations and Recommendations for Application" by Stantec dated February 15, 2023 establishes regulatory framework for Woodfibre LNG effluent discharges. The findings of this are summarized in "Regulatory Framework Guidance for the Woodfibre LNG Effluent Discharge Memo" (350106-SC-EN-013-SD-000061), dated May 13, 2022. The BATA (350106-SC-EN-013-SD-000048) defines minimum discharge objectives (MDOs) for the Construction Phase of the Woodfibre LNG Project based on federal and provincial water quality guidelines (WQGs). For Operations Phase the MDOs similar to Construction Phase will be established based on the Operations Phase effluent Waste Discharge Authorization (WDA).

To address the water quality requirements, the stormwater drainage design incorporates the following system components:

- **Impoundment Sumps** (Secondary Containments): Designed to store accidental spill of hydrocarbon from storage tanks and handling facilities to reduce the potential damage to other adjacent facilities and waterways. Spill sump or impoundment area is required for each spill source area. Each sump is sized to contain the maximum spill volume without overfilling. During rainfall events, the secondary containment areas trap stormwater which needs to be checked for water quality prior to being released through stormwater outfalls.
- **Oily Water Sumps:** The first-flush stormwater runoff from potentially contaminated areas due to lubrication or hydrocarbon service, within paved process and utility areas will be collected in Oily Water Sumps for containment and treatment prior to discharge to Howe Sound. Oily Water Sumps will be sized to contain the first-flush water volume for their respective contributing areas. Industry best practices consider the first-flush water to be defined as the greater of the runoff volume from the first 15 minutes of a 10-year storm event across a contained area, and the runoff volume from 25 mm of stormwater across a contained area. Section 5e of BC Reg. 168/94 of the EMA (for Petroleum Storage and Distribution Facilities) dictates that oil-separator systems be sized for a 10-year, 60-minute rain event. Hence, the Oily Water Sumps are sized for a first-flush of 25 mm of runoff, as this exceeds the 15-minute precipitation depths from the 10-year (9.1 mm) as well as the 10-year, 60-minute depths stated in the regulations (18.5 mm). Stormwater runoff from potentially contaminated areas will be collected and tested to check that water quality specifications are met prior to discharge to stormwater outfalls.
- **Oily Water Treatment**: Stormwater runoff from contaminated areas due to lubrication or hydrocarbon service will be treated by an oil water separator which abides by regulations and industry best practices, prior to discharge to the environment.
- **Offsite Area Drainage**: Stormwater runoff generated from areas outside of the LNG Facility such as hillslope catchment areas are considered non-contact and non-contaminated water. Stormwater runoff from these areas is diverted to receiving waters untreated via periphery ditches to the creeks and Howe Sound.

Runoff is considered to fall into one of four categories for the purposes of this design:

- **Non-Contact Water**: Runoff water originating from undeveloped / non-developable periphery areas of the Site located along the creeks and Howe Sound shoreline which drains directly to those water bodies. Note some additional areas of the previous industrial facility, such as the Green Zone around Mill Creek, will be restored to a native or vegetated condition. After the restoration is completed, stormwater runoff from these areas will be considered non-contact water and will be allowed to drain directly to the creeks or Howe Sound. Also, non-contact water which currently drains directly to the creeks or Howe Sound will continue to drain to the existing receiving waterbodies.
- **Contaminated Contact Water:**
    - **East of Mill Creek**: Water containment areas are provided within process/utility curbed areas based on likelihood of exposure. For acid gas removal unit, amine solvent containment area is provided where all amine-containing equipment and piping will be contained within a curbed area and all surface runoff in this area with volume of 100-year 24-hour event will be collected in the sump. The contents of the sump will be tested for the presence of amine solvents. If the water is free of solvent, it will be pumped to the oily water treatment unit. If amine solvents are identified in the sump, the water will be treated as per amine-specific spill response procedure or will be taken away for offsite treatment and disposal.

      For all other containment areas contact water contaminated by operational and maintenance fluids, and lube oils, hydrocarbon services, or other oil contaminant sources will be collected in curbed areas. Contaminated runoff in the curbed area will be directed to an oily water sump and will be pumped to the oily water treatment unit.

- **West of Mill Creek**: No process equipment is located west of Mill Creek and as a result, contaminated contact water system is not required. Note, secondary containment will be provided for the pumps, diesel storage tanks and equipment that will be located in the west of Mill Creek area.

- **Potentially Contaminated Contact Water:**
  - **East of Mill Creek**: Potentially contaminated contact water systems are as follows:

    Refrigerant Storage Area and Condensate Loading Area: the containment curbed area is sized to contain volume of 110% largest fuel storage plus runoff volume of 25-year 24-hour storm event, facilitating with sump where oily water is removed by hydro-vac truck for disposal if accidental leakage has occurred.

    LNG Process Area: the water contained in the LNG sump will be checked for contamination or sheen prior to being pumped to the oily water treatment unit. The runoff volume in excess of the 10-year 24-hour storm event will be conveyed though overflow pipe by gravity to the concrete trench.

    All other areas except water for amine solvent containment and the specific oily water in the curbed areas described above, runoff collected from ISBL modules and equipment areas will drain on surface pavement to concrete trenches at the outside edges of these areas.
  - The runoff of first-flush from the ISBL module and equipment areas in trenches will flow to the common first-flush sump via the diversion box with under-weir overflow configuration. Runoff in excess of first-flush runoff is deemed as noncontaminated contact water and will drain through the above noted diversion box and will discharge through a proposed outfall (OUT-10) to Howe Sound.
  - Following each storm event, the operator will test the collected water in the first-flush sump for compliance with the discharge limits. If it is compliant with the discharge limits, the collected water will be pumped to the non-contaminated contact water system. If it is noncompliant, the water will be pumped to the oily water treatment unit for treatment.
  - **West of Mill Creek**: water containment areas will be constructed around the firewater pumps, diesel generators, diesel storage area, and any other areas identified to have a high probability of exposure of stormwater to hydrocarbons. Each containment curbed area will be sized to contain a volume of 110% of the largest fuel storage plus the runoff volume from a 25-year24-hour storm event. Any contaminated water will be removed by hydro-vac truck for disposal if accidental leakage has occurred.
  - **Marine Terminal:** Areas with hydraulic systems containing oil will include double-wall containment and will utilize biodegradable oil. Any accidental oil contaminated water will be contained in the sump and pumped to the oily water treatment unit for treatment.

- **Non-Contaminated Contact Water**: Runoff water originating from within the facility area which does not come into contact with any potential contaminant sources.
  - **East of Mill Creek**: Surface runoff from uncontained paved and unpaved areas with no risk of surface contamination will flow by gravity sheet flow to open drainage ditches. The water will discharge through a Stormceptor prior to discharging to Howe Sound via a proposed outfall (OUT-10).
  - **West of Mill Creek**: Surface runoff from uncontained paved and unpaved areas, including building areas, with no risk of surface contamination will be routed by gravity sheet flow to concrete trenches or ditches, and catch basins with underground pipes. The collected water will drain through a Stormceptor, and prior to discharging to Howe Sound through outfalls (OUT-02 or OUT-04).

- **Marine Terminal:** Surface runoff from the marine terminal modules & Floating Storage Tank (FST) surfaces has no risk of surface contamination and is considered non-contaminated contact water. The rainfall is not required to be collected or contained and will be allowed to discharge directly to Howe Sound without any treatment.

4 Hydrology and Hydraulic Model Update

The hydrology and hydraulic model developed for the Construction Phase of the project was updated to incorporate the latest changes to the site and detailed design of the drainage system components. The existing model was developed using Personal Computer Storm Water Management Model (PCSWMM) (version 7.4) software; this version was also used for the Operations Phase model update. The PCSWMM software is a Geographic Information System (GIS) enabled modelling package that allows hydrology, hydraulics, groundwater and surface water quality modelling to be run on the same platform. PCSWMM utilizes the Environmental Protection Agency Storm Water Management Model (EPA SWMM) engine for modeling calculations and its integrated GIS tools help to automatically delineate catchments and create cross-sections of a creek/channel from an attached surface (i.e., digital elevation model).

For hydrologic computations, the 'Kinematic Model' was used to apply rainfall data to a catchment and then apply infiltration and evaporation losses. The excess rainfall, after infiltration and evaporation losses, generates runoff using the Kinematic equation. Computed runoff depends on assigned hydrologic parameters i.e., catchment geometry, slope, surface roughness and other factors. Ditches, culverts, and underground pipes were incorporated based on the latest design drawings provided by McDermott in the hydraulic module of PCSWMM, which solves the Saint-Venant equations to route hydrographs generated by the hydrologic model through the system components.

Catchments for diversion ditches were previously delineated using LiDAR data in PCSWMM using GIS tools. Operations Phase flow patterns on the Site were determined using the latest grading plan provided by McDermott. Operations Phase catchments for the Site were manually delineated in PCSWMM based on the site development layout and grading plans.

Intensity-Duration-Frequency (IDF) curves presented in the Woodfibre Hydrometeorology Baseline Report (Stantec, 2020) were applied to generate design rainfall event hyetographs. These IDF curves considered climate change and orographic effects. Three different rainfall distributions and durations were considered: (1) Soil Conservation Service (SCS; now NRCS) Type 1A distribution with 24-hour duration, (2) Atmospheric Environmental Service (AES) distribution with 1-hour duration, and (3) AES distribution with 2-hour duration. The types of rainfall distribution were selected based on the City of Vancouver Engineering Design Manual (2019) and are considered typical design storm events for the Project area. It was found that the SCS/NRCS Type 1A distribution with 24-hour duration provided the maximum flow rate and was therefore utilized in sizing the conveyance system and sedimentation ponds. The rain-on-snow IDF curve was utilized given that larger storm (rainfall) events occur in winter along with snowfall in the Squamish region. The IDF curves and design rainfalls with distributions are presented in Appendix B.

Ground infiltration for the post-development conditions was modelled using the US Natural Resources Conservation Service (NRCS)'s Curve Number method. Curve Number is a parameter of soil infiltration properties that considers the effect of both land use/cover and soil type, there are NRCS developed Curve Numbers for 49 different land uses, each divided into four different soil types. The selected Curve Numbers for different land covers and soil types and the derived runoff coefficient for the 1-in-100 year 24-hour rainfall event are presented in **Table 1**. The selected Curve Numbers are based off "Estimating Runoff Volume and Peak Discharge, Part 650 Engineering Field Handbook" published by NRCS (2021).

Table 1 Land Use/Cover and Hydrologic Parameters

Land Use	Soil Types	Curve Number	Imperviousness (%)	Surface Roughness	Derived Runoff Coefficient[1]
Forest (hillslope catchments)	Silty Clay	70	0	0.40	0.70
Graveled Road and Yard Areas	Compacted Gravel	85	5	0.024	0.85
Landfill (capped and vegetated)	Topsoil over Clay Cap	74	5	0.24	0.75
Asphalt, Buildings	N/A	N/A	100	0.013	1.00

[1] Runoff coefficients are computed by dividing the runoff volume by the total precipitation volume for the 1 in 100-year 24-hour duration rain-on-snow event (total precipitation depth = 297.2 mm).

In discussions with McDermott, it was decided not to model the impoundment (containment) and oily water sump storages in the hydraulic model due to insufficient operation details at the time of the model development. Exclusion of these storage components is expected to result in slightly conservative design of the major conveyance system components.

5 Stormwater Drainage System Analysis Results

This section provides a summary of stormwater drainage system model simulation analysis for the Operations Phase of the facility. The proposed drainage arrangement is shown schematically in Figure 1.

The stormwater management for marine Floating Storage Tanks (FSTs) is not covered in this study scope. However, it is understood that runoff generated from FSTs is not at risk of contamination and will not be contained. However, LNG leaks in the FST platforms will be collected in impoundment sumps where the spilled LNG will be vaporized naturally.

5.1 Offsite Area Flow Diversion

Under pre-development conditions, runoff from some hillslope catchments discharge through the Site to Howe Sound via a combination of overland and underground sewer systems. Runoff from these hillslope catchments will be diverted to Howe Sound through diversion ditches and culverts, which will be installed during the Construction Phase. Timing for installation of the diversion ditches and culverts will be determined based on the construction sequencing requirements.

Approximately 8.95 ha of hillslope catchment west of Mill Creek will continue to discharge at OUT-06 into Mill Creek via an upgraded ditch and culvert with flap gate mounted on the Flood Wall as shown on Figure 1. Another approximately 22.45 ha of hillslope catchment west of Mill Creek, that primarily drained through the Site under the existing condition, will be diverted to an existing culvert (OUT-02) discharging to Howe Sound. The catchment areas (30.97 ha) of an existing culvert (OUT-01) located beside Woodfibre Creek and discharging to Howe Sound will remain primarily unchanged. The culverts at OUT-01 and OUT-02 will be replaced with new materials, but the outfall locations will remain unchanged.

East of Mill Creek, runoff from approximately 4.69 ha of hillslope catchment, shown on Figure 1, will be diverted to Howe Sound through a proposed diversion ditch system. Under the existing development condition, this catchment discharges to Howe Sound through the Site. Note that the approximately 0.42 ha

Switch Yard area located above the rock cut will be used for transformer installation and a crane pad during construction. This area will discharge through an existing channel to East Creek (OUT-12).

Runoff from offsite areas on the east side of Mill Creek will be routed through a diversion ditch system to discharge directly to Howe Sound through a new culvert (OUT-11).

The proposed offsite drainage plan is shown on Figure 1. Appropriately sized diversion ditches for a 1-in-100 year rainfall event will be constructed, at approximately the locations depicted on Figure 1, along with outlets to the respective watercourses. These ditches will be lined appropriately to provide erosion protection and sediment control.

The undeveloped/non-developable periphery areas of the Site located along the creeks and Howe Sound shoreline will continue to drain as per existing conditions. Surface runoff from these areas is also considered non-contact water. To reduce shoreline erosion potential, shoreline restoration work will also be completed as shown on Figure 1. At few locations along the shoreline, onshore anchoring structures will be constructed to support operation of the proposed facilities. Runoff from these anchoring structures will discharge directly to Howe Sound.

5.2 East Plant Site

5.2.1 Conveyance System

The east plant conveyance system includes trench drains, culverts, ditches, a first-flush sump with a pump and a diversion structure, Stormceptor and outfalls, as shown in **Figure 1**.

The diversion ditches located north of the Site are designed to intercept offsite runoff and runoff from approximately half of the center crowned road around the main Process Module area and direct the runoff towards a proposed outfall (OUT-11).

Runoff from the main Process Module area, including the truck loading zone and half of the center crowned road sections is collected by trench drains. This water is then directed to the first-flush sump for initial quality assessment via culverts before being released through a pump with a rated capacity of 35 m^3/hr to a proposed outfall (OUT-10). The first-flush system will allow contaminants in the first runoff to be treated or stored before being discharged, enhancing water quality control.

A diversion structure is installed at the first-flush sump location to handle significant rainfall events. During larger rainfall event, this structure redirects excess water to a ditch located south of the main Process Module area, which ultimately discharges into a proposed outfall (OUT-10) through a Stormceptor system. The Stormceptor provides additional treatment to remove sediment and pollutants before discharging to Howe Sound, ensuring compliance with environmental standards.

The switch yard area drains to its trench drains, which then convey runoff southward through two culverts in series. The runoff eventually flows into the diversion ditch system, which then conveys runoff towards the proposed outfall (OUT-11).

The west MOF gravel area located south of the main Process Module area is designed to drain south and will be collected via ditch along the shore which will convey the flow to a Stormceptor before discharging to Howe Sound through a proposed outfall (OUT-10). The runoff from the east MOF gravel area located south of the main Process Module area is intercepted by a south ditch, which also directs runoff to the Stormceptor before discharging to Howe Sound through a proposed outfall (OUT-10).

The condensate and refrigerant storage area located on the west MOF gravel area is designed to be self-contained with any runoff or spillages being collected and removed by truck vacuum systems, preventing direct discharge to the ocean.

The pipe rack area located east of the main Process Module is managed by a drainage swale, which directs water into a catch basin before it is routed to a Stormceptor and then discharged to Howe Sound via an outfall (OUT-10).

Lastly, the area east of East Creek consisting a portion of the access road and offsite forested areas will drain through a culvert (OUT-13) under the access road directly to Howe Sound.

5.3 West Plant Site

5.3.1 Conveyance System

The west plant conveyance system includes trench drains, culverts, ditches, underground pipe network, a Stormceptor and outfalls, as shown in Figure 1.

The offsite area can be divided into three distinct segments based on the drainage patterns:

1. Northeast Offsite Area: Runoff from this area of 8.95 ha is captured by a diversion ditch, which directs runoff eastward towards Mill Creek via an existing outfall (OUT-06), as shown on Figure 1.

2. Northwest Offsite Area: This area of 30.97 ha is drained by roadside ditches located south of the Fire Water and Generator area. The runoff is conveyed through these ditches and directed to Howe Sound via a 900mm culvert (OUT-01) to the south of the Site, as shown on Figure 1.

3. Central Offsite Area: Runoff from this section is intercepted by a perimeter trench drain located northwest of the Fire Water and Generator area. The runoff is directed southwest to a ditch and then flows into a 900mm culvert (OUT-02). After passing through a Stormceptor for treatment, the runoff is discharged into Howe Sound. The total catchment area of OUT-02 is 25.22 ha including offsite and onsite contributing areas as shown on Figure 1.

Runoff from the Fire Water and Generator area is collected by a trench drain located southeast of the area, then conveyed through a 450 mm culvert leading to a ditch located north of the shoreline road. The runoff is then directed to a swale located immediately north of the shoreline via another trench drain system and continues to the swale before being treated in a Stormceptor and discharged to Howe Sound via a 900 mm culvert (OUT-02).

The swale system immediately north of the shoreline collects runoff from half of the center-crowned road and discharges to an outfall (OUT-02) through a Stormceptor. In a larger rainfall event, runoff from this swale may also seep to Howe Sound through the riprap shore protection works.

The Utility and Administration Building areas located west of Mill Creek are serviced by a dedicated stormwater drainage network. This network directs runoff into a series of storm pipes that conveys the runoff to a Stormceptor for treatment. From there, the runoff flows further east to a drainage ditch, which ultimately discharges to Howe Sound through a proposed outfall (OUT-04).

5.4 Stormceptors

A total of three Stormceptors are proposed to be installed upstream of OUT-02, OUT-04, and OUT 10. The Stormceptors are intended to remove sediments and surficial oil from smaller but more frequent rainfall events. During larger events, flow in excess of the Stormceptor treatment capacity will be bypassed and will be discharged through the outfall.

The sizing of the Stormceptors were determined by the Stormceptor manufacturer in coordination with McDermott and are provided in Appendix A. The OGS devices are sized to provide stormwater quality

treatment based on treating a minimum of 90 percent of the average annual runoff volume and a minimum removal of an annual average 60% of the TSS load for a specific particle size distribution.

5.5 Outfalls

The simulated service areas and discharge rates for the 10- and 100-year 24-hour rainfall events are summarized in **Table 2**.

Table 2 Summary of Outfall Service Areas and Simulated Discharge Rates

Description	Stormwater Outlets							
	OUT-01	**OUT-02**	**OUT-04**	**OUT-06**	**OUT-10**	**OUT-11**	**OUT-12**	**OUT-13**
Total Catchment Area (ha)	30.97	25.22	2.37	8.95	7.36	4.69	62.10	2.68
Forested Area (ha)	30.76	22.45	-	8.05	-	3.66	55.87	2.61
Graveled Area (ha)	0.14	1.59	0.93	0.66	4.36	0.58	5.00	
Impervious Area (ha)	0.07	1.18	1.44	0.24	3.00	0.45	1.24	0.07
Discharge Location	Howe Sound	Howe Sound	Howe Sound	Mill Creek	Howe Sound	Howe Sound	Howe Sound	Howe Sound
Catchment Characteristics	Offsite Forested Catchments	Offsite Forested Catchments, Plant Area	Plant Area	Diverted Hillslope Catchments	Plant Area	Offsite Forested Area, Access Road	Offsite Forested Area, Gravelled Road	Offsite Forested Areas, Access Road
Peak Flow Rate at 1 in 10-Year 24-Hour Event (m^3/s)	1.08	0.93	0.15	0.31	0.44	0.21	2.30	0.10
Maximum Velocity during 1 in 10-Year 24-Hour Event (m/s)	1.41	1.91	1.14	1.15	1.26	1.12	1.57	0.99
Peak Flow Rate at 1 in 100-Year 24-Hour Event (m^3/s)	1.70	1.40	0.20	0.49	0.61	0.32	3.66	0.16
Maximum Velocity during 1 in 100-Year 24-Hour Event (m/s)	1.65	2.65	1.17	1.31	1.39	1.23	1.86	1.11

5.6 Oily Water Treatment Package Design

The Oily Water Treatment Package (01-A-6417) will be provided to remove free and dispersed oil, and settleable and suspended solids from contaminated contact water. The package will consist of a retention buffer vessel, and an oil-water separator. The retention buffer vessel will be designed with adequate retention time to remove settleable and suspended solids. The oil-water separator will be of the enhanced gravity separation type, such as a compact floatation unit, complete with coalesce pack and associated instrumentation and controls to remove oil droplets.

The treatment package will be installed above ground, with effluent gravity-draining to the outfall at Howe Sound. The oil-water separator will be provided with an integrated compartment to contain the separated oil and oil transfer pump. The separated oil will be removed periodically by the oil transfer pump into suitable containers or vacuum trucks for off-site disposal to a licensed waste facility, such as GFL in Squamish, Secure Energy in Richmond, Sumas Environmental in Burnaby, or Clean Harbours in Delta, BC. The oil transfer pump will be sized for 1 m^3/hour to empty the recovered oil compartment in 15 minutes. Sludge accumulated in the treatment package will also be transferred into suitable containers or vacuum trucks for off-site disposal.

The treated effluent from the Oily Water Treatment Package will meet the regulatory discharge specifications of 15 mg/L of total extractable hydrocarbon. The influent and effluent lines of the treatment package will be provided with access ports for periodic grab sampling, as well as an in-line analyzer downstream of the package. If the effluent does not meet the specifications, the effluent will be re-routed back to the buffer vessel for additional treatment, until regulatory specs are met.

6 Closure

This memorandum summarizes the updated hydrologic and hydraulic model development and analysis for the Operations Phase. The hydrologic and hydraulic model excludes various containment and oily water collection system components as they make up relatively minor portions of the overall site area. Some system performance deficiencies were identified and reviewed with the McDermott civil design team and were addressed through the design update. Consequently, the final hydrologic and hydraulic analysis results indicate that the overall stormwater conveyance system components are adequately sized.

Reference: Operations Phase Stormwater Drainage Hydrology Hydraulics Model

In order to confirm the operation phase stormwater management plan, appropriate approval process from various regulatory agencies including Waste Discharge Authorization (WDA) should be initiated.

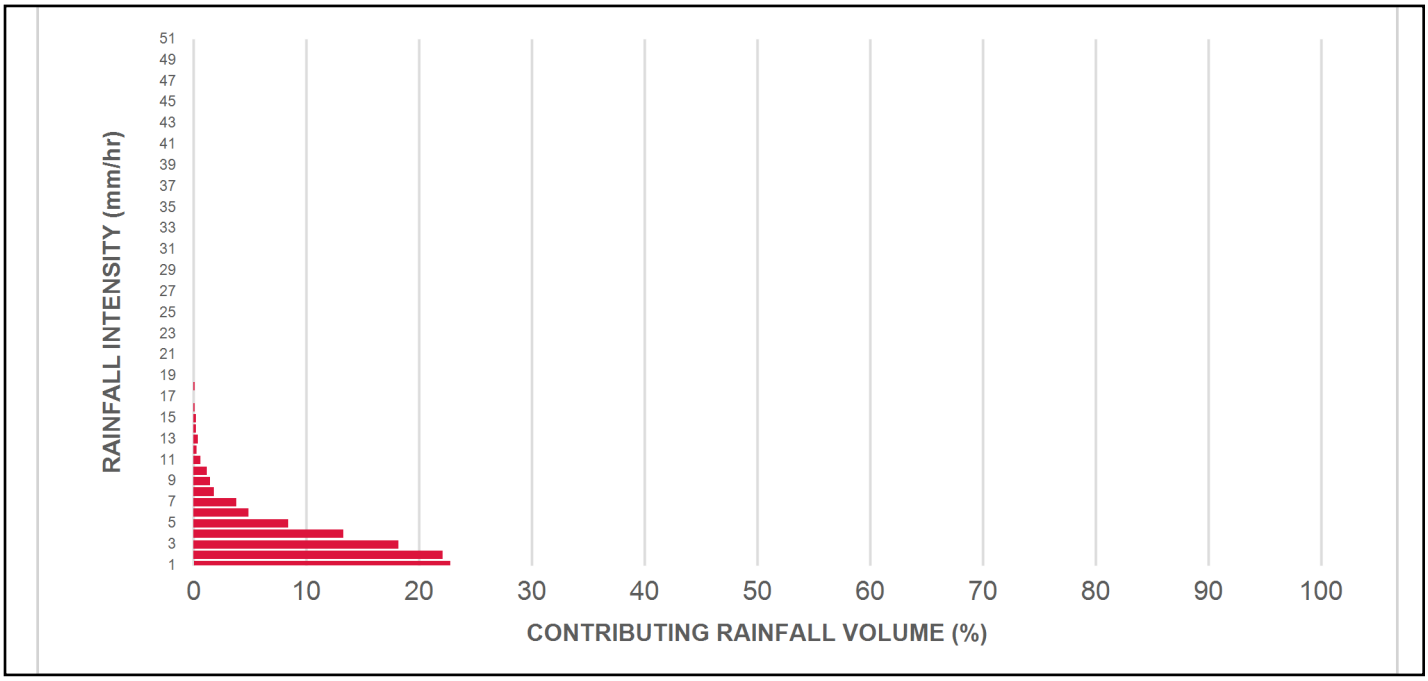
THIRD-PARTY TESTING AND VERIFICATION

►**Stormceptor® EF and Stormceptor® EFO** are the latest evolutions in the Stormceptor® oil-grit separator (OGS) technology series, and are designed to remove a wide variety of pollutants from stormwater and snowmelt runoff. These technologies have been third-party tested in accordance with the Canadian ETV **Procedure for Laboratory Testing of Oil-Grit Separators** and performance has been third-party verified in accordance with the **ISO 14034 Environmental Technology Verification (ETV)** protocol.

PERFORMANCE

►**Stormceptor® EF and EFO** remove stormwater pollutants through gravity separation and floatation, and feature a patent-pending design that generates positive removal of total suspended solids (TSS) throughout each storm event, including high-intensity storms. Captured pollutants include sediment, free oils, and sediment-bound pollutants such as nutrients, heavy metals, and petroleum hydrocarbons. Stormceptor is sized to remove a high level of TSS from the frequent rainfall events that contribute the vast majority of annual runoff volume and pollutant load. The technology incorporates an internal bypass to convey excessive stormwater flows from high-intensity storms through the device without resuspension and washout (scour) of previously captured pollutants. Proper routine maintenance ensures high pollutant removal performance and protection of downstream waterwavs.

PARTICLE SIZE DISTRIBUTION (PSD)



►The **Canadian ETV PSD** shown in the table below was used, or in part, for this sizing. This is the identical PSD that is referenced in the Canadian ETV ***Procedure for Laboratory Testing of Oil-Grit Separators*** for both sediment removal testing and scour testing. The Canadian ETV PSD contains a wide range of particle sizes in the sand and silt fractions, and is considered reasonably representative of the particle size fractions found in typical urban stormwater runoff.

Particle Size (µm)	Percent Less Than	Particle Size Fraction (µm)	Percent
1000	100	500-1000	5
500	95	250-500	5
250	90	150-250	15

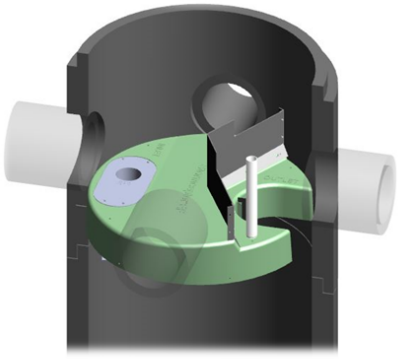
RAINFALL DATA FROM N VANCOUVER SONORA DR RAINFALL STATION

INCREMENTAL AND CUMULATIVE TSS REMOVAL FOR THE RECOMMENDED STORMCEPTOR® MODEL

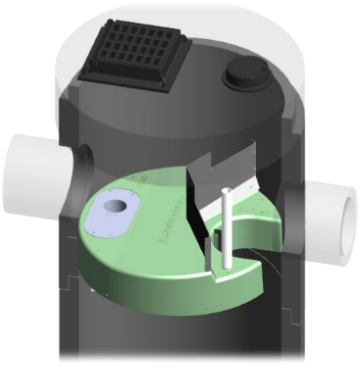
Maximum Pipe Diameter / Peak Conveyance

Stormceptor EF / EFO	Model Diameter		Min Angle Inlet / Outlet Pipes	Max Inlet Pipe Diameter		Max Outlet Pipe Diameter		Peak Conveyance Flow Rate	
	(m)	(ft)		(mm)	(in)	(mm)	(in)	(L/s)	(cfs)
EF3 / EFO3	0.9	3	90	457	18	457	18	340	12
EF4 / EFO4	1.2	4	90	609	24	609	24	425	15
EF6 / EFO6	1.8	6	90	914	36	914	36	990	35
EF8 / EFO8	2.4	8	90	1219	48	1219	48	1700	60
EF10 / EFO10	3.0	10	90	1828	72	1828	72	2830	100
EF12 / EFO12	3.6	12	90	1828	72	1828	72	2830	100

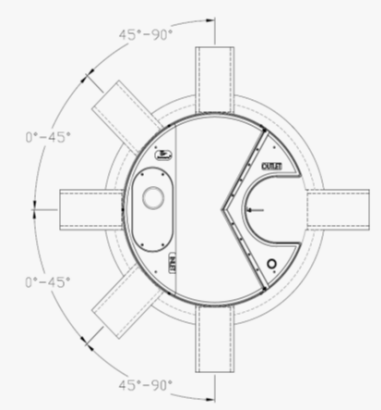
SCOUR PREVENTION AND ONLINE CONFIGURATION



►**Stormceptor® EF and EFO** feature an internal bypass and superior scour prevention technology that have been demonstrated in third-party testing according to the scour testing provisions of the Canadian ETV **Procedure for Laboratory Testing of Oil-Grit Separators**, and the exceptional scour test performance has been third-party verified in accordance with the ISO 14034 ETV protocol. As a result, Stormceptor EF and EFO are approved for online installation, eliminating the need for costly additional bypass structures, piping, and installation expense.



DESIGN FLEXIBILITY



►**Stormceptor® EF** and **EFO** offers design flexibility in one simplified platform, accepting stormwater flow from a single inlet pipe or multiple inlet pipes, and/or surface runoff through an inlet grate. The device can also serve as a junction structure, accommodate a 90-degree inlet-to-outlet bend angle, and can be modified to ensure performance in submerged conditions.

OIL CAPTURE AND RETENTION

►While Stormceptor® EF will capture and retain oil from dry weather spills and low intensity runoff, **Stormceptor® EFO** has demonstrated superior oil capture and greater than 99% oil retention in third-party testing according to the light liquid re-entrainment testing provisions of the Canadian ETV **Procedure for Laboratory Testing of Oil-Grit Separators**. Stormceptor EFO is recommended for sites where oil capture and retention is a requirement.

INLET-TO-OUTLET DROP

Elevation differential between inlet and outlet pipe inverts is dictated by the angle at which the inlet pipe(s) enters the unit.
0° - 45° : The inlet pipe is 1-inch (25mm) higher than the outlet pipe.
45° - 90° : The inlet pipe is 2-inches (50mm) higher than the outlet pipe.

HEAD LOSS

The head loss through Stormceptor EF is similar to that of a 60-degree bend structure. The applicable K value for calculating minor losses through the unit is 1.1. For submerged conditions the applicable K value is 3.0.

Pollutant Capacity

Stormceptor EF / EFO	Model Diameter		Depth (Outlet Pipe Invert to Sump Floor)		Oil Volume		Recommended Sediment Maintenance Depth *		Maximum Sediment Volume *		Maximum Sediment Mass **	
	(m)	(ft)	(m)	(ft)	(L)	(Gal)	(mm)	(in)	(L)	(ft^3)	(kg)	(lb)

STANDARD STORMCEPTOR EF/EFO SPECIFICATION

For specifications, please visit http://www.imbriumsystems.com/stormwater-treatment-solutions/stormceptor-ef

STANDARD PERFORMANCE SPECIFICATION FOR "OIL GRIT SEPARATOR" (OGS) STORMWATER QUALITY TREATMENT DEVICE

PART 1 – GENERAL

1.1 WORK INCLUDED

This section specifies requirements for selecting, sizing, and designing an underground Oil Grit Separator (OGS) device for stormwater quality treatment, with third-party testing results and a Statement of Verification in accordance with ISO 14034 Environmental Management – Environmental Technology Verification (ETV).

1.2 REFERENCE STANDARDS & PROCEDURES

ISO 14034:2016 Environmental management – Environmental technology verification (ETV)

Canadian Environmental Technology Verification (ETV) Program's **Procedure for Laboratory Testing of Oil-Grit** S**eparators**

1.3 SUBMITTALS

1.3.1 All submittals, including sizing reports & shop drawings, shall be submitted upon request with each order to the contractor then forwarded to the Engineer of Record for review and acceptance. Shop drawings shall detail all OGS components, elevations, and sequence of construction.

1.3.2 Alternative devices shall have features identical to or greater than the specified device, including: treatment chamber diameter, treatment chamber wet volume, sediment storage volume, and oil storage volume.

1.3.3 Unless directed otherwise by the Engineer of Record, OGS stormwater quality treatment product substitutions or alternatives submitted within ten days prior to project bid shall not be accepted. All alternatives or substitutions submitted shall be signed and sealed by a local registered Professional Engineer, based on the exact same criteria detailed in Section 3, in entirety, subject to review and approval by the Engineer of Record.

PART 2 – PRODUCTS

2.1 OGS POLLUTANT STORAGE

The OGS device shall include a sump for sediment storage, and a protected volume for the capture and storage of petroleum hydrocarbons and buoyant gross pollutants. The minimum sediment & petroleum hydrocarbon storage capacity shall be as follows:

2.1.1	4 ft (1219 mm) Diameter OGS Units:	1.19 m^3 sediment / 265 L oil
	6 ft (1829 mm) Diameter OGS Units:	3.48 m^3 sediment / 609 L oil
	8 ft (2438 mm) Diameter OGS Units:	8.78 m^3 sediment / 1,071 L oil
	10 ft (3048 mm) Diameter OGS Units:	17.78 m^3 sediment / 1,673 L oil
	12 ft (3657 mm) Diameter OGS Units:	31.23 m^3 sediment / 2,476 L oil

PART 3 – PERFORMANCE & DESIGN

3.1 GENERAL

The OGS stormwater quality treatment device shall be verified in accordance with ISO 14034:2016 Environmental management – Environmental technology verification (ETV). The OGS stormwater quality treatment device shall

remove oil, sediment and gross pollutants from stormwater runoff during frequent wet weather events, and retain these pollutants during less frequent high flow wet weather events below the insert within the OGS for later removal during maintenance. The Manufacturer shall have at least ten (10) years of local experience, history and success in engineering design, manufacturing and production and supply of OGS stormwater quality treatment device systems, acceptable to the Engineer of Record.

3.2 SIZING METHODOLOGY

The OGS device shall be engineered, designed and sized to provide stormwater quality treatment based on treating a minimum of 90 percent of the average annual runoff volume and a minimum removal of an annual average 60% of the sediment (TSS) load based on the Particle Size Distribution (PSD) specified in the sizing report for the specified device. Sizing of the OGS shall be determined by use of a minimum ten (10) years of local historical rainfall data provided by Environment Canada. Sizing shall also be determined by use of the sediment removal performance data derived from the ISO 14034 ETV third-party verified laboratory testing data from testing conducted in accordance with the Canadian ETV protocol Procedure for Laboratory Testing of Oil-Grit Separators, as follows:

3.2.1 Sediment removal efficiency for a given surface loading rate and its associated flow rate shall be based on sediment removal efficiency demonstrated at the seven (7) tested surface loading rates specified in the protocol, ranging 40 L/min/m^2 to 1400 L/min/m^2, and as stated in the ISO 14034 ETV Verification Statement for the OGS device.

3.2.2 Sediment removal efficiency for surface loading rates between 40 L/min/m^2 and 1400 L/min/m^2 shall be based on linear interpolation of data between consecutive tested surface loading rates.

3.2.3 Sediment removal efficiency for surface loading rates less than the lowest tested surface loading rate of 40 L/min/m^2 shall be assumed to be identical to the sediment removal efficiency at 40 L/min/m^2. No extrapolation shall be allowed that results in a sediment removal efficiency that is greater than that demonstrated at 40 L/min/m^2.

3.2.4 Sediment removal efficiency for surface loading rates greater than the highest tested surface loading rate of 1400 L/min/m^2 shall assume zero sediment removal for the portion of flow that exceeds 1400 L/min/m^2, and shall be calculated using a simple proportioning formula, with 1400 L/min/m^2 in the numerator and the higher surface loading rate in the denominator, and multiplying the resulting fraction times the sediment removal efficiency at 1400 L/min/m^2.

The OGS device shall also have sufficient annual sediment storage capacity as specified and calculated in Section 2.1.

3.3 CANADIAN ETV or ISO 14034 ETV VERIFICATION OF SCOUR TESTING

The OGS device shall have Canadian ETV or ISO 14034 ETV Verification of third-party scour testing conducted in accordance with the Canadian ETV Program's **Procedure for Laboratory Testing of Oil-Grit Separators.**

3.3.1 To be acceptable for on-line installation, the OGS device must demonstrate an average scour test effluent concentration less than 10 mg/L at each surface loading rate tested, up to and including 2600 L/min/m^2.

3.4 LIGHT LIQUID RE-ENTRAINMENT SIMULATION TESTING

The OGS device shall have Canadian ETV or ISO 14034 ETV Verification of completed third-party Light Liquid Re-entrainment Simulation Testing in accordance with the Canadian ETV **Program's Procedure for Laboratory Testing of Oil-Grit Separators,** with results reported within the Canadian ETV or ISO 14034 ETV verification. This re-entrainment testing is conducted with the device pre-loaded with low density polyethylene (LDPE) plastic beads as a surrogate for light liquids such as oil and fuel. Testing is conducted on the same OGS unit tested for sediment removal to

assess whether light liquids captured after a spill are effectively retained at high flow rates.

3.4.1 For an OGS device to be an acceptable stormwater treatment device on a site where vehicular traffic occurs and the potential for an oil or fuel spill exists, the OGS device must have reported verified performance results of greater than 99% cumulative retention of LDPE plastic beads for the five specified surface loading rates (ranging 200 L/min/m^2 to 2600 L/min/m^2) in accordance with the Light Liquid Re-entrainment Simulation Testing within the Canadian ETV Program's **Procedure for Laboratory Testing of Oil-Grit Separators.** However, an OGS device shall not be allowed if the Light Liquid Re-entrainment Simulation Testing was performed with screening components within the OGS device that are effective at retaining the LDPE plastic beads, but would not be expected to retain light liquids such as oil and fuel.

DETAIL 1

TO WITHSTAND CL-625 TRAFFIC LOADING

NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETERS UNLESS NOTED OTHERWISE.
2. FOR CIVIL GENERAL NOTES & REFERENCE DWGS. SEE DWG. 350106-000-CV-01-000001.
3. FOR CONCRETE GENERAL NOTES SEE DWG. 350106-000-CV-01-000002.0001 & 000002.0002.
4. PRECAST REINFORCED CONCRETE SHALL MEET ASTM C-1433.
5. CONCRETE SHALL BE 40 MPa, 28 DAY STRENGTH.
6. REINFORCING STEEL TO CONFORM TO CSA G30.18.
7. PRECAST TRENCHES / CHANNELS TO BE LAP JOINT TYPE.
8. REFER TO SPECIFICATION FOR LOW DENSITY PERLITE INSULATION CONCRETE 350106-000-CV-SP-00007. THICKNESS TO BE DETERMINED BY VENDOR.
9. GRATING SHALL BE FLUSH WITH PAVING.
10. TRENCH REBAR ARRANGEMENT AND CONCRETE WALL THICKNESS BY VENDOR.
11. CONCRETE COVER SHALL BE DESIGNED TO CL-625 TRAFFIC LOADS.
12. GRATING SIZE TO BE CONFIRMED BY VENDOR BASED ON TRENCH SIZE.
13. FOR PRECAST CONCRETE TRENCH DESIGN AND MANUFACTURING, REFER TO SPECIFICATION FOR PRECAST CONCRETE LNG/STORM WATER TRENCH/DUCT BANKS 350106-000-CV-SP-00028.0001.

1.0 INTRODUCTION

Woodfibre LNG Limited (WLNG) is in the process of planning and designing the Woodfibre LNG Project (the "Project"), a liquefied natural gas (LNG) export facility on the west side of Nexwnnewu7ts atll'a7tsem (Howe Sound) at the former Woodfibre Pulp Mill property in Skwxwu7mesh (Squamish), British Columbia (the "Site"). The Project is on the historical location of a Skwxwú7mesh Úxwumixw (Squamish Nation) village known as Swĺyat. CB&I LLC, a subsidiary of McDermott International, Ltd. (McDermott) is the Project's Engineering, Procurement and Construction (EPC) contractor. The Project will require a Waste Discharge Authorization (WDA) pursuant to Section 14 of the BC *Environmental Management Act* (EMA) to discharge effluent into Howe Sound.

Stormwater runoff will require Oil-Water Separation for discharge to Howe Sound or capture for offsite disposal. The contaminated waste runoff is a result of local precipitation washing plant concrete pads and surfaces. Typically, it includes accidental spillage of lube oils from rotating equipment which are placed in contained area. The selected lube oil is heavy hydrocarbon-containing, with no volatile components.

This assessment evaluates various readily available treatment technologies deemed capable of removing Contaminants of Concern (COCs) prior to discharge offsite or to Howe Sound. The facility produces no oily water from the process units which would contain dissolved hydrocarbon and stormwater runoff is expected to contain very little hydrocarbon, hence, dissolved hydrocarbon treatment is not required.

The purpose of the Best Achievable Technology Assessment (BATA) is to review readily available technologies to address potentially contaminated water that is generated through precipitation and washdown. The chosen technologies have been shown to be effective in similar applications. This BATA will select the best treatment approach considering feasibility, reliability, control and cost, to meet the requirements to discharge into Howe Sound.

The BC Ministry of Environment and Climate Change Strategy (ENV) provides guidance on completing a BATA in their document titled "Best Achievable Technology Assessment to Inform Waste Discharge Standards Handout" (ENV, October 2021), which outlines the following steps:

Step 1: Identification of information to be gathered for the BATA

Step 2: Identify all potential technologies or options

Step 3: Screening for feasible options

Step 4: Describe and compare the reliability of each option

Step 5: Describe and compare the control effectiveness of each option

Step 6: Describe and compare the cost effectiveness of each option

Step 7: Select the Best Achievable Technology

This BATA has been completed following the guidance provided by BC ENV (2021).

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

2.0 BACKGROUND

2.1 Project Description

The Site is being redeveloped into an LNG export facility at the former Woodfibre Pulp Mill location, seven kilometers (7 km) southwest of Squamish, on the foreshore of Howe Sound. The Site consists of five legal lots (measuring approximately 94 hectares) and three water lots. It is situated at the base of the Mill Creek, Woodfibre Creek, and East Creek watersheds, which drain into Howe Sound (see Figure 1).

The Project underwent an environmental assessment process between 2013 and 2015, receiving an environmental assessment certificate (EAC) under EMA (BCEAA; EAC #E15-02) in 2015, an environmental assessment approval from Skwxwú7mesh Úxwumixw (Squamish Nation) through the Squamish Nation Environmental Assessment Agreement (SNEAA) in 2015, and a positive federal Decision Statement under the Canadian Environmental Assessment Act, 2012 (CEAA 2012) in 2016. The provincial, Squamish Nation and federal environmental assessment processes have all yielded conditions of approval.

Two EAC amendments have been granted by the BC Environmental Assessment Office (EAO) in 2017 (Amendment #1) and 2019 (Amendment #2), and the federal Decision Statement was reissued in 2018 in response to changes to the Designated Project. In October 2020, Woodfibre LNG received an extension of the EAC under Section 31 of BCEAA, extending the date by which the Project must be substantially started to October 26, 2025. The Project's Construction-phase WDA was granted in February 2024.

The facility is planned to liquefy up to 2.1 million tonnes per year of natural gas and have an LNG storage capacity of 250,000 cubic meters (m^3).

2.2 Meteorology and Climate

The Site is located within portions of three watersheds, Woodfibre Creek, Mill Creek and East Creek. The majority of the Site is within the Mill Creek watershed within the southern subzone of the Coast Mountains hydrologic zone (Zone 27 and boundary of Zone 26), which is characterized by steep sloped mountains. The highest peak in the Mill Creek watershed is Mount Sedgewick at 2,078 meters above sea level (masl). The climate of the lower elevations of Howe Sound is characterized as mild, generally warm, and temperate.

The prevailing westerly storm track across the North Pacific, combined with orographic lift from the Coast Mountains, produces high annual precipitation amounts throughout the region. There is substantial rainfall throughout the year in Squamish. The average annual precipitation between 1981 to 2010 was 2,230 millimeters (mm), with the greatest amount of precipitation on average occurring in November (391 mm), and the least amount of precipitation on average occurring in July (59.3 mm) (ECCC 2025).

See the following table for details on precipitation estimates for lower elevations of Mill Creek, Woodfibre Creek, and East Creek from Squamish STP Central Climate Station (ID 1047671).

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

Table 1: Precipitation Estimates for Lower Elevations of Mill Creek, Woodfibre Creek, and East Creek

Month	Precipitation (mm)		
	Rainfall	Snowfall (SWE)	Total Precipitation
Jan	300.2	25.9	326.1
Feb	179.7	13.1	192.8
Mar	198.4	8.1	206.5
Apr	152.5	0.1	152.6

[Table Source: Document WLNG-S0003-EV-EDG-0003]

2.3 Oceanography

The Site is located immediately adjacent to Howe Sound, which is a coastal fjord located in the Strait of Georgia between West Vancouver and the Sunshine Coast. Howe Sound extends 42 km from the mouth of the Squamish River to its connection to the Strait of Georgia. The area supports steep rocky walls that descend to a maximum water depth of approximately 280 meters (m). At an approximate depth of 70 m, there is a sill near Anvil Island, about 11 km southwest of the Site. This sill restricts the mixing of deeper water, although tidal exchange occurs above. As such, water columns experience infrequent flow renewals with exchanges occurring approximately once every three to four years. Tides in the area are defined as mixed semi-diurnal with a mean range of 3.2 m and mode range of 5 m (Golder 2014).

In general, the combination of freshwater inputs and shallow sill dictate the trends observed in temperature, salinity, and dissolved oxygen in the water columns of Howe Sound. Temperatures near the surface vary seasonally with highs during the summer months and lows during the winter months; however, temperatures in the deeper water remain consistently cold year-round. Thermoclines are most pronounced in the spring and summer months and disappear in the fall and winter when mixing occurs. A second thermocline can occur during spring freshet when Howe Sound receives extensive freshwater input from the Squamish River which has an annual mean discharge of 300 m^3/second (s), as well as from many other watercourses in the area. Peaks of freshwater inputs occur in the summer due to ice and snow melt runoff and in the fall due to higher precipitation levels (Golder, 2014). Salinity varies widely (4.5 parts per thousand (‰) to 28.3‰) in the surface waters of Howe Sound and corresponds to the timing of freshwater inputs. As such, salinity near the surface is lowest during spring freshet and increases when freshwater runoff is reduced. Dissolved oxygen varies with freshwater inputs in surface waters, whereas deep water dissolved oxygen ranges from 0 to 4.5 milligram (mg) / liter (L) with water becoming hypoxic between mixing events.

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

2.4 Baseline Marine Water Quality

Baseline water quality studies in Howe Sound were completed in 2013 and 2014 (Golder, 2014), which identified exceedances of the BC WQG for protection of marine life for total metals, including boron, cadmium, copper, and zinc. Additional baseline studies were completed by Keystone in 2020 and 2021, which identified exceedances of the BC WQG and/or CCME WQG for pH; nitrate; total metals, including cadmium, chromium, copper, lead, mercury, and zinc; and benzo(a)pyrene (Lorax, 2022).

Baseline marine water quality monitoring conducted by Keystone in 2022 showed conditions generally consistent with previous years (2020 and 2021). Most parameters met BC and Federal WQGs for marine life, though exceedances were observed for pH, dissolved oxygen, and boron, which are commonly influenced by natural stratification and oceanic conditions in Howe Sound. Occasional exceedances were also noted for metals (cadmium, copper, lead, nickel, selenium) and hydrocarbons (benzo[a]pyrene, chrysene, naphthalene), often linked to detection limits exceeding guideline thresholds. Overall, water quality remained stable and comparable across stations (Lorax, 2023).

2.5 Stormwater Management System

The stormwater management system will collect contaminated water from process equipment and pads and remove the COCs through: a) off-site disposal in an approved facility, or b) the selected BAT treatment system, prior to discharge to Howe Sound.

The stormwater collection system consists of curbed areas to collect contaminated water from equipment and piping drains, in addition to potentially-contaminated surface runoff and open hub collection headers, that will drain to a series of sumps. The water will be conveyed from the sumps to a storage tank upstream of the selected BAT treatment system to provide storage capacity that will allow for stable operation of the treatment system.

Stormwater originating from the mountain north of the site is intercepted by perimeter diversion ditches. These ditches route the water around the LNG facility, minimizing contact with operational areas and reducing the volume of contact water. The diverted stormwater is discharged directly to outfalls into Howe Sound.

Within the facility, non-contaminated contact water, including clear rainwater from parking areas, building roofs, and paved surfaces, will be collected through a dedicated drainage system. This water will be conveyed through stormceptors, which are equipped with oil/grit separators designed to remove trace amounts of oil and suspended solids. The water will then be discharged to Howe Sound via designated outfalls.

2.6 Existing Discharge Permits for the Site

The following existing discharge permits have been issued under the EMA for the Site:

1. Discharge Permit E1239 – Authorizes the discharge of treated leachate from the former pulp mill refuse Site. The permit was issued on July 31, 1975 and has been amended four times. The most recent amendment was issued on July 17, 2019.
2. Discharge Permit PE-2334 – Authorizes the discharge of effluent water from the sewage treatment plant within the former pulp mill. The permit was issued on July 24, 1975 and was amended twice. The most recent amendment was on February 26, 2015.
3. Discharge Permit PR-07332 – Authorized landfill discharge of refuse material. The permit was issued on March 30, 2005.
4. Effluent Permit PE-111578 – Construction Phase Waste Discharge Authorization (WDA). The permit was issued February 9th, 2024.

3.0 BEST ACHIEVABLE TECHNOLOGY ASSESSMENT

The BC Ministry of Environment and Climate Change Strategy (ENV) provides guidance on completing a BATA in their document titled "Best Achievable Technology Assessment to Inform Waste Discharge Standards Handout" (ENV, October 2021), which outlines the following steps:

Step 1: Identification of information to be gathered for the BATA (Section 3.1);

Step 2: Identify all potential technologies or options (Section 3.2);

Step 3: Screening for feasible options (Section 3.3);

Step 4: Describe and compare the reliability of each option (Section 3.4);

Step 5: Describe and compare the control effectiveness of each option (Section 3.5);

Step 6: Describe and compare the cost effectiveness of each option (Section 3.6); and

Step 7: Select the Best Achievable Technology (Section 3.7).

3.1 Step 1: Identification of Information to be Gathered for the BATA

The purpose of Step 1 is to identify the relevant information necessary to complete the BATA. This includes identifying Potential Contaminants of Concern (PCOCs), Contaminants of Concern (COCs), Minimum Discharge Objectives (MDOs), and sources of contamination.

3.1.1. Professional Qualifications of Best Achievable Technology Assessors

This BATA was prepared and reviewed by the following individuals:

Main Author: Mr. John Herring

Mr. Herring received a B.Eng. in Mechanical Engineering from the Vanderbilt University. Mr. Herring received his M.Sc. in Environmental Engineering from the University of Houston. He has over 40 years of experience in water and wastewater design and environmental support in markets such as Municipal, LNG, Power, Petrochemical, Refining and Offshore. While he was with KBR in Houston (15+ years), Mr. Herring was the Company's water and wastewater Subject Matter Expert (SME), supporting process definition, design, and execution for foreign and domestic projects.

Main Reviewer: Mr. Clint Strittmatter

Mr. Strittmatter received a B.Sc. in Chemical Engineering with a minor in Environmental Engineering from the Pennsylvania State University with distinction. He has over 24 years of experience with increasing levels of responsibility in process plant design across various industries, such as, LNG, Gas Processing, and Refining including wastewater treatment design and permitting support associated with those facilities. Mr. Strittmatter is also recognized as a speaker at prominent industry conferences such as LNG2023 and GasTech.

Secondary Reviewer: Dr. Hemraj Gaidhani

Dr. Gaidhani is a seasoned engineering and LNG professional with over two decades of experience in sectors including oil & gas, energy infrastructure, and project development. He has held leadership and technical roles across multiple major companies—from serving as a Senior Principal Process Engineer with offshore responsibilities to taking on roles such as Head of Engineering & Operations, and more recently as Process and Safety Lead for LNG at Woodfibre

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

LNG, where he also functions as Risk Manager. He holds a PhD in Chemical Engineering from Heriot-Watt University, UK and is a Chartered Engineer, underscoring both his academic excellence and professional credibility. Dr. Gaidhani is also recognized as a speaker at prominent industry conferences, such as the EPC Show 2026, where he shares insights on enhancing the capacity of production facilities through small capital projects—highlighting his deep expertise in project execution from concept to delivery.

3.1.2. Identify Potential Contaminants of Concern (PCOCs)

The table below outlines typical Potential Contaminants of Concern (PCOCs) associated with LNG facilities and indicates their relevance to the Woodfibre LNG Facility. Site-specific applicability was determined based on the planned use of chemical products during the Operations phase, as outlined in the List of Catalysts and Chemicals (Appendix A).

Table 2: Potential Contaminants of Concern (PCOCs)

PCOC	Potential Impact on Marine Environment	Regulatory Concern	WLNG Applicable Yes or No
Extractable Petroleum Hydrocarbons (EPH), including Diesel and Heating Medium (Dowtherm Q)	Toxic to fish	MARPOL Annex I, Canadian Oil Pollution Prevention Regulations	Yes.
Polycyclic Aromatic Hydrocarbons (PAHs)	Persistent, carcinogenic, highly toxic to fish and benthic life	CEPA toxic substance list	Yes.
Heavy Metals (e.g., mercury, lead, cadmium, arsenic, zinc)	Bioaccumulation, toxic to aquatic life and humans	Fisheries Act, CEPA	Yes. Metals may be bound to TSS in stormwater
Phenols	Toxic to fish and affect reproduction	Controlled under CEPA and wastewater effluent regulations	No. None expected on-site.
Surfactants and Detergents	Can reduce oxygen transfer, toxic to aquatic organisms	May be regulated under site-specific permits	Yes.
BTEX (Benzene, Toluene, Ethylbenzene, Xylene)	Toxic and volatile, impact fish sensory systems and spawning	CEPA Schedule 1 substances	Yes.
Aliphatic Amine	Deleterious substance for fish	CEPA toxic substance list	Yes.
Un-ionized Ammonia	Deleterious substance as defined in Fisheries Act	Fisheries Act Section 36	No. Not planned for use on-site.
Sulfides	Reduce oxygen availability, toxic in high concentrations	Regulated as part of effluent quality	No. Not planned for use on-site.
Total Suspended Solids (TSS)	Smother benthic habitats, carry adsorbed pollutants	Covered under MMER and effluent limits in *Fisheries Act*	Yes
Chlorides / Salinity Changes	Alters habitat, affects osmoregulation in marine species	Relevant in brine/oily discharge situations	No. Not planned for use on-site.

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

PCOC	Potential Impact on Marine Environment	Regulatory Concern	WLNG Applicable Yes or No
Glycol (ethylene glycol)	Reduce oxygen availability	Section 53 of the CEPA	Yes.
pH	May be deleterious to fish.	Fisheries Act, WSER	Yes, low pH is a natural background condition.
BOD/COD	Reduce oxygen availability	Regulated as part of effluent quality	No
Volatile Petroleum Hydrocarbons (VPHs)	Toxic to fish and aquatic invertebrates	Fisheries Act, CEPA	Yes
Chlorine	Toxic to fish and aquatic organisms	Fisheries Act, WSER	Yes, a chlorinator is used on site.
Canadian Regulations to Note:			
1. Fisheries Act (Section 36) – Prohibits deposit of deleterious substances in water frequented by fish.			
2. MARPOL Annex I (via Canada Shipping Act, 2001) – Limits on oily water discharge from ships (15 ppm max).			
3. Wastewater Systems Effluent Regulations (WSER) – Relevant for onshore facilities with discharges.			
4. Metal and Diamond Mining Effluent Regulations (MDMER) – If applicable.			
5. Canadian Environmental Protection Act (CEPA) – Controls on toxic substances like PAHs, BTEX, phenols.			
6. B.C. Regulation 177/2023			

3.1.3. Identify Contaminants of Concern (COCs)

The applicable PCOCs were then analyzed for mitigation methods to determine the Contaminants of Concern (COCs) that will be carried forward in this assessment.

Mitigation for PCOCs

1. BTEX Mitigation
   It is anticipated that the natural gas feed to the facility will contain a small amount of BTEX. That BTEX will be present in the condensate product which is a closed system. The facility areas where condensate will be present will be fully curbed. Spills will be contained and cleaned as needed. Stormwater collected from these areas will be inspected for visible sheen prior to pumping to on-site treatment. If a visible sheen is found, the contaminated water will be collected by hydrovac truck and shipped offsite for treatment.
2. Amine Mitigation
   Amine used in the acid gas removal unit is contained in a closed system with dedicated curb and amine sump for accidental spills. The water collected in the dedicated amine sump will be tested prior to pumping the water to the stormwater management system. If the collected water is found to be contaminated with amine, it will be collected by hydrovac truck and shipped offsite for treatment.
3. Glycol Mitigation
   Glycol (ethylene glycol) is used as a cooling medium and is contained in a closed system with curb and sump for accidental spills. The water collected in the sump will be tested prior to pumping the water to the stormwater management system. If collected the water is found to be contaminated with glycol, it will be collected by hydrovac truck and shipped offsite for treatment.

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

4. Surfactants and Detergents
   Expected surfactants and detergents will be biodegradable and concentrations in effluent water are expected to be extremely low. Soapy water from sinks/showers will be processed in the sanitary sewer system.

   Vehicle wash water will be in a bunded area that will be routed to the BAT treatment system for removal of oil and suspended solids. Quick-break (i.e. self de-emulsifying) detergents shall be used for cleaning upstream of the BAT treatment system.
5. Heavy Metals Mitigation
   Heavy metals are not generated by Project operations; rather, they are associated with TSS in stormwater runoff. As metals are particulate-bound and TSS is carried forward as a COC for treatment, no additional metals-specific treatment is required.
6. Polycyclic Aromatic Hydrocarbons Mitigation
   Similar to metals, PAHs may be associated with TSS in stormwater runoff. With TSS carried forward as a COC, PAH-specific treatment is not required. Diesel used on site (e.g., for vehicles and generators) contains PAHs and will be managed separately, with any potentially contaminated water transported off-site for appropriate disposal.
7. Volatile Petroleum Hydrocarbons
   Volatile petroleum hydrocarbons are present within the LNG facility. These PCOCs will be managed through secondary containment and dispersed via evaporation or off-site disposal.
8. Chlorine Mitigation
   Chlorine tablets are used periodically at dosages consistent with industry best practices to prevent algae growth in the Raw Water/Fire Water Storage Tank.
9. pH Mitigation
   Stormwater runoff may reflect the naturally low background pH conditions in the Project area. As Project operations do not alter the pH of discharge waters, pH is not carried forward as a COC.

Identified Contaminants of Concern (COCs)

The Contaminants of Concern (COCs) consist of the unmitigated PCOCs, which are identified as:

1. Extractable Petroleum Hydrocarbons (EPH); and
2. Total Suspended Solids (TSS).

Water management at the Site is an integral component to the Project. After the construction phase, water will be generated onsite through precipitation runoff and may encounter potentially contaminated areas. This run-off may consist of free-phase oils and solids. Contaminated water originating as surface runoff from operational process areas, such as hydrocarbon loading/unloading stations, hydrocarbon storage areas, oily equipment base plates, and lubrication skids, will be collected in curbed areas.

3.1.4. Estimated Influent Volumes and Water Quality

The influent sources for the selected BAT system consist of contaminated and potentially contaminated contact water generated within the facility. Estimated influent volumes reporting to the BAT system were derived from historical precipitation data for Squamish STP Central Climate Station (ID 1047671). As noted in Section 2.2, the highest average monthly precipitation

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

occurs in November (391 mm) (ECCC, 2025). Accordingly, November's average precipitation was adopted as a conservative design basis. In addition, the potentially contaminated process area (approximately 20,000 m²) was assumed as a conservative scenario, recognizing that not all precipitation on this area will require treatment. To ensure adequate treatment capacity during peak rainfall and allow for routine maintenance without impacting performance, the target utilization of the BAT system is set at 50%. Incorporating a 10% uncertainty margin, the minimum required design flow rate for the BAT system is approximately 24 m³/h.

Contaminated runoff in the curbed areas will be directed to sumps and then either taken offsite for disposal or conveyed to a storage tank upstream of the selected BAT treatment system. Due to the residence time in the tank, the expected Extractable Petroleum Hydrocarbons (EPH) are expected to be approximately 50 ppmv (50 mg/L). The selected treatment package will be specified with an inlet of 200 ppmv (200 mg/L) EPH to provide a conservative operating envelope.

Along with entraining oil, precipitation will also scour concrete surfaces of lose particulate, although since the areas are mostly paved, the amount of solids is expected to be low. These solids will enter drains and sumps before being pumped into the pre-treatment storage tank. Due to the residence time in the tank, the expected Total Suspended Solids (TSS) is expected to be approximately 100 ppm (100 mg/L). If applicable, the selected treatment package will be specified with an inlet of 200 ppmv (200 mg/L) TSS to provide a conservative operating envelope.

The minimum discharge objectives for the COCs are addressed in the following section.

3.1.5. Minimum Discharge Objectives

In the Province of British Columbia, all discharges to the environment are subject to EMA, and therefore this BATA considers the recommended guidelines for discharge of suspended solids and oils.

Discharge specifications are available in LNG Facility regulations for Extractable Petroleum Hydrocarbons (EPH) (i.e. no free oil) in water. The typical world-wide industrial free oil in water discharge specification is 29 ppmv (29 mg/L) or 30mg/L, as referenced in Table 3. However, the conservative approach of 15 ppmv (15 mg/L) EPH was selected, based on EPH limits provided in B.C. Reg. 177/2023.

Table 3: Typical Industrial EPH in Water Discharge Specifications

Jurisdiction	Regulatory Body	Typical EPH Discharge Limit	Key Requirements / Notes
United States	EPA / NPDES	29 mg/L daily max, 42 mg/L monthly avg (for EPH in produced water)	Additional limits on TSS, pH, temperature; stricter limits near sensitive zones
Canada	Fisheries Act, CEPA, Offshore Waste Treatment Guidelines	≤30 mg/L max 30-day average for water discharged to sea, ≤15 mg/L for deck, bilge, ballast water	Applies to offshore platforms and coastal facilities; zero visible sheen
Canada	B.C. Reg. 177/2023	≤15 mg/L (extractable hydrocarbon)	Total extractable hydrocarbon in the effluent at any time does not exceed 15 mg/L

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

Jurisdiction	Regulatory Body	Typical EPH Discharge Limit	Key Requirements / Notes
EU (e.g., UK, Norway)	OSPAR / BEIS / NPD	≤30 mg/L (produced water oil-in-water); North Sea: target ≤20 mg/L	Norway uses strict controls with reinjection targets
International Waters (Offshore O&G)	MARPOL Annex I (IMO)	≤15 ppm (15 mg/L) (oil content)	Applies to offshore platforms; must use OWS & OCM; no visible sheen allowed

For Total Suspended Solids (TSS), the Canadian Wastewater Systems Effluent Regulations set a limit of a monthly average TSS of less than or equal to 25 mg/L in the final discharge point.

A summary of the Minimum Discharge Objective (MDO) framework is provided below in Table 4.

Table 4: Minimum Discharge Objectives for COCs

COC	MDO	Rationale for Application
Extractable Petroleum Hydrocarbons (EPH)	≤15 mg/L	Suggested water quality guideline based on B.C. Reg. 177/2023, and most conservative discharge specification identified in Table 3 above.
Total Suspended Solids (TSS)	Monthly average of ≤25 mg/L	Suggested water quality guideline for the protection of marine aquatic life based on the *Fisheries Act* (Wastewater Systems Effluent Regulations).

3.2 Step 2: Identify All Potential Technologies or Options

The section identifies technologies or options that may be applied for the management of contaminants associated with oil-water sources. The best management practices (BMPs) for managing contaminated runoff from concrete pads and foundations areas are outlined below.

3.2.1. Hydrovac Removal and Offsite Disposal

Since contaminated water is directed to drains and collected in sumps, the water can be captured and tested. If found to be contaminated, it can be vacuumed out of the sumps and transported to the mainland and transferred to a licensed waste facility, such as GFL in Squamish, Secure Energy in Richmond, Sumas Environmental in Burnaby, or Clean Harbours in Delta, BC.

3.2.2. Filtration/Adsorption

Contaminants can also be removed through conventional filtration (solids) and adsorption (oils) by media such as activated carbon.

Treatment system components would include mechanical filtration using fine screens, cartridge filters, sand filters or bag filters; potential agglomeration (de-emulsification) of oil using a polymer additive; and adsorption using activated carbon or specialty media.

Media would periodically be replaced due to loss of adsorption capacities. Treated water would be tested, either manually or inline by using specialty oil water instruments. Water exceeding

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

MDOs would be returned for subsequent retreatment.

3.2.3. Biological Treatment

Biological Treatment involves the use of microorganisms for contaminant removal. Potentially oil contaminated water is directed to a contained system which maintains a sustainable colony of microorganisms. The system uses aeration to keep the organism viable.

The microorganisms utilize the oils (hydrocarbons) as a food source, multiply, and ultimately die. The dead organisms settle and are collected and removed (hydrovac) for offsite disposal.

This settling produces an effluent low in solids and oils. Such a system most likely requires enhancements such as bioaugmentation (adding organisms) or bio stimulation (adding organism nutrients). Treated water would be tested, either manually or inline using specialty oil water instruments. Water exceeding MDOs would be returned for subsequent retreatment.

3.2.4. Oil-Water Solids Separation System

An oil-water separation system is designed to utilize gravity and buoyance to remove contaminants.

A treatment system designed to remediate co-mingled oils and solids would require a coalescing tank, which would allow free phase oil to separate and solids to settle. Separated oil would then be skimmed off the water interface, collected for disposal offsite in a licensed disposal facility. Likewise, settleable solids would be collected, vacuumed out, and properly disposed.

Treated water would be tested, either manually or inline using specialty oil water instruments. Water exceeding Canadian Water Quality Guidelines would be return for subsequent retreatment. There are several types of oil/water separators including gravity separators and coalescing separators and floatation units.

3.3 Step 3: Screening for Feasible Options

The screening of all treatment options for oil water runoff as identified in Section 3.2 is provided in the following section. Screening is based on the following criteria:

- Ability of the process to achieve MDOs;
- Technologies are proven and accepted by regulators and stakeholders;
- Deleterious by-products and/or waste are not generated because of the treatment option;
- Technologies are directly compatible with treatment requirements; and
- Consideration as to the remote location of the Site.

The purpose of this BATA is to identify effective treatment options, and screen for evaluation the most effective treatment option. All the options identified have been used successfully in removing solids and oil from a broad range of facilities. Table 5 summarizes the Management Option Feasibility Screening.

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

Table 5: Management Option Feasibility Screening

Source	Management Option	Feasibility	Comments
Oily Water Runoff	Capture and Removal for Offsite Disposal	Yes	Effective treatment option, carry forward
	Filtration and/or Adsorption	Yes	Effective treatment option, carry forward
	Biological Treatment	Yes	Effective treatment option, carry forward
	Oil/Water Separators	Yes	Effective treatment option, carry forward

3.4 Step 4: Describe and Compare the Reliability of Each Option

The following section provides a comparison of the reliability of all treatment options carried forward from Section 3.3. A summary of the comparison results is provided in Section 3.7.

Four options to treat potentially contaminated runoff from facility pad and foundations were identified: the capture, testing and removal by hydrovac/water trucks with offsite disposal, an onsite filtration and/or adsorption system, biological treatment, and oil water separation.

3.4.1. Hydrovac Removal and Offsite Disposal

The capture testing and removal option would rely on third party transport from the Site and across Howe Sound to licensed treatment facilities in the Lower Mainland. This option is reliable for the capture of solids and oil and subsequent testing.

If contaminated, it requires close coordination with third parties and results in large volumes being transported for offsite disposal (i.e., boat across Howe Sound). The coordination and weather introduce operational complexity and uncertainty, making this option less reliable than the onsite water treatment options.

3.4.2. Filtration/Adsorption

The filtration/adsorption option has been used extensively for the removal of hydrocarbons from liquid streams. This option utilizes conventional cartridge filtration (or similar technology) for removal of suspended solids to acceptable limits. Filtration is followed by the stream passing through a vessel containing granulated activated carbon (GAC). The GAC adsorbs the hydrocarbons to levels suitable for discharge to Howe Sound. The cartridge filters and GAC adsorbent must be periodically switched-out to maintain effectiveness. This option is considered reliable if maintained properly. The overall operational complexity is considered low, since filter change outs and GAC replacement are considered routine tasks.

3.4.3. Biological Treatment

Biological processes for oil removal are well studied and can be very effective under the right conditions. However, biological treatment typically is not used when there is a wide variability of hydrocarbons in the supply stream (i.e., high concentration of free oil to low/zero concentration of free oil). During low levels, additional food and nutrients are required to maintain a suitable microorganism population.

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

Additionally, biological treatment requires close monitoring by qualified personnel and a long detention time to achieve the required discharge parameters. The operational complexity for this option is therefore considered high.

The variability of flow and oil content combined with the high operational complexity result in a lower reliability of biological processes when compared with simpler processes for oil water separation/removal.

3.4.4. Oil-Water Solids Separation System

Physical removal by oil-water separation is commonly used to treat contaminated streams. This option uses physical forces - gravity and buoyance - to separate suspended solids and oil in the contaminated stream. The stream enters a vessel which allows the suspended solids to settle (gravity) and the oil droplets to rise (buoyancy). The contaminants, solids and free-oil, are collected for transport to an offsite disposal facility. Low-shear type feed pumps prevent oil droplets from being divided into smaller droplets sizing and forming an immiscible solution.

Properly designed oil-water separators are sufficient for removing oil and solids to meet discharge requirements. The operational complexity is low for oil-water separators that rely on physical forces. The simple design and operation combined with low maintenance requirements due to relatively few moving parts make this treatment option very reliable.

3.5 Step 5: Describe and Compare the Control-Effectiveness of Each Option

The following section provides a comparison of the control-effectiveness of all treatment options carried forward from Section 3.3. A summary of the comparison results is provided in Section 3.7. Four options to treat potentially contaminated stormwater were identified: the capture, testing and removal by hydrovac/water trucks with offsite disposal, an onsite filtration and /or adsorption plant, biological treatment and oil water separation. Energy requirements are negligible for all options and not considered a differentiator.

3.5.1. Hydrovac Removal and Offsite Disposal

There is limited space on Site to capture stormwater runoff. During high/multiple rain events, there is the possibility of overflowing the basins, resulting in oil contamination outside the collection area.

Due to numerous potential collection areas, there is also an increased possibility of testing delays, resulting in less control of the contaminants. Finally, the transportation requirement for this option is high as it involves transportation over land and water, and the carrying capacity of hydrovac and water trucks is limited. This requires a high number of trucks (if available) or trips during high rain events, minimizing control. As such, the control-effectiveness this option is considered low.

3.5.2. Filtration/Adsorption

Filtration and/or adsorption system breakthroughs can occur with the depletion of treatment media. Sediment build-up on filters can cause filter failure and/or preferential pathways that allow larger particles to pass through. Adsorption surface area being used up on granular activated carbon (GAC) beds limit their effectiveness. This can result in a treatment system allowing higher concentrations of particles or oil to pass into the effluent and potentially exceed discharge limits. Treatment systems can be installed with specific instruments to monitor and control the treatment

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

systems so breakthrough potential and system performance can be actively monitored, with the combination of real-time monitoring and manual sampling checks to maintain compliance.

As such, the control-effectiveness of a filtration and adsorption water treatment system is considered high if properly monitored and maintained.

3.5.3. Biological Treatment

Biological treatment needs a consistent food source to operate reliably. Run-off frequency from pads will vary based on climate conditions and food source (oils) would be uncertain and variable.

This can be minimized with the installation of equalization basins or tanks which can concentrate food sources. However, these increase plot space and would be subject to overflow (loss of control) during high rain events. During low food periods (minimal runoff), food and nutrients need to be introduced to maintain biological treatment. This requires additional operator interaction. Unreliable flow and food source combined with the required evaluation and intervention by qualified personnel make biological treatment a complicated option.

Therefore, the control-effectiveness for the biological treatment option is considered low.

3.5.4. Oil-Water Solids Separation System

Oil-water separators are highly effective at removing free-phase hydrocarbons and settleable solids in wastewater applications. This technology is common in most industrial facilities.

These units rely on physical forces - gravity and buoyance - to remove solids and free phase oil rather than operator interaction. Treatment systems can be installed with specific instruments to monitor and control the units. Therefore, breakthrough potential and system performance can be actively monitored with the combination of real-time monitoring and compliance testing.

Since oil-water separators are permanent fixtures with low maintenance requirements, control effectiveness for this option is considered high.

3.6 Step 6: Describe and Compare the Cost-Effectiveness of Each Option

The following section provides a comparison of the estimated probable cost in USD of all treatment options carried forward from Section 3.3. The costs provided herein are conservative and do not account for efficiencies realized from combined treatment system trains that treat multiple sources. The costs shown are provided for relative comparison purposes and do not represent detailed proposal costs. A tabular summary of the results is provided in Section 3.7.

Four options to treat potential contaminated runoff from facility pad and foundations were identified: the capture, testing and removal by hydrovac/water trucks with offsite disposal, an onsite filtration and /or adsorption plant, biological treatment and oil water separation.

3.6.1. Hydrovac Removal and Offsite Disposal

Given the facility operating period will be twenty-five years, the cost-effectiveness of mitigation using third-party hydrovac with offsite disposal is low when compared to the cost of a permanent onsite treatment facility. The travel uncertainty across Howe Sound and the waste disposal fees will exceed the cost of building an onsite treatment system.

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

The capital cost for third-party hydrovac is negligible since no additional infrastructure is needed for this option, but operation costs are estimated to be $USD 400,000 to $USD 800,000 per year for service and disposal. Over the course of a twenty five-year operational period, the order of magnitude of probable cost for third-party hydrovac disposal is $USD 10-20,000,000 for offsite treatment.

3.6.2. Filtration/Adsorption

The cost-effectiveness of a filtration/adsorption treatment system is considered to be moderate due to the cost of filters and GAC replacement and disposal. The total installed cost (TIC) for this option is in the range of $USD 1,000,000 - $USD 1,500,000. The order of magnitude cost for annual operation and maintenance is $USD 200,000 to $USD 300,000, with a twenty-five operational lifetime cost of $USD 6,000,000 to $USD 9,000,000.

3.6.3. Biological Treatment

The cost-effectiveness of biological treatment is moderate as there are ongoing food and nutrient additions and the frequency of these are unknown. The order of magnitude of TIC is $USD 1,000,000 to $USD 2,000,000 plus $USD 100,000 to $USD 250,000 in annual operating and maintenance costs. Included in the cost of operating is periodic removal and offsite disposal of waste sludge from the biological treatment unit. Over the course twenty-five years, the order of magnitude of operating lifetime costs are $USD 3,500,000 to $USD 8,250,000.

3.6.4. Oil-Water Solids Separation System

The cost-effectiveness of oil/water separators is high as they require low costs to install and require minimal maintenance. The order of magnitude TIC is $USD 750,000 to $USD 1,500,000, plus $USD 75,000 to $USD 150,000 in annual operating costs for periodic offsite removal and disposal of oil and waste sludge from the separation system. Over the course of twenty-five years, the order of magnitude of operating lifetime costs are $USD 2,625,000 to $USD 5,250,000.

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

3.7 Step 7: Select the Best Achievable Technology

The project considered several options for the treatment of the identified COCs, based on the MDOs for TSS and EPH in the treated effluent. Table 6 summarizes the results of the previous steps of the assessment:

Table 6: Assessment Summary Table

Management Option	Hydrovac Removal and Offsite Disposal	Filtration and / or Adsorption	Biological Treatment	Oil-Water Separation
Feasibility	Feasible	Feasible	Feasible	Feasible
Reliability	Moderate to high, dependent on reliability of transportation across Howe Sound	High, dependent on ongoing monitoring of treatment system breakthrough potential	Moderate to High if sufficient food and nutrients are available.	High, simple systems with few moving parts
Operational Complexity	Moderate	Low; Requires filter monitoring and change out	High	Low
Control-Effectiveness	Low control-effectiveness	High control-effectiveness for achieving MDOs	Low control-effectiveness due to variability of incoming stream quantity and quality	High control-effectiveness for achieving MDOs
Cost-Effectiveness	Low cost-effectiveness due to high transportation and waste disposal costs	Moderate cost-effectiveness due to higher capital cost with higher operational costs	Moderate cost-effectiveness due to operation costs of ongoing monitoring and operator training/interaction	High cost-effectiveness due to low capital cost and minimal operating expenses
Order of Magnitude Total Installed Cost (TIC)	N/A	$USD 1 million to $USD 1.5 million	$USD 1 million to $USD 2 million	$USD 0.75 million to $USD 1.5 million
Order of Magnitude Lifetime Cost over 25-yr Operation	$USD 10 million to $USD 20 million	$USD 6 million to $USD 9 million	$USD 3.5 million to $USD 8.25 million	$USD 2.6 million to $USD 5.25 million

Four options to treat potential contaminated runoff from facility pad and foundations were identified and carried forward from Section 3.3: the capture, testing and removal by hydrovac/water trucks with offsite disposal; an onsite filtration and/or adsorption plant; biological treatment; and oil-water separation.

The selected treatment technology must be capable of achieving the following discharge criteria:

- Reduce Total Suspended Solids (TSS) to a monthly average of ≤25 mg/L

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

- Reduce extractable petroleum hydrocarbons (EPH) to ≤15 mg/L.

Among the four evaluated options, filtration/adsorption and oil-water separation were assessed to have the highest reliability and control-effectiveness. Oil-water separation further distinguished itself by offering the most favorable operational simplicity and cost-effectiveness.

Given that all assessment criteria were weighed equally, oil-water separation is identified as the best achievable technology (BAT).

4.0 CONCLUSION

The best achievable technology with respect to reliability, operational simplicity, control-effectiveness, and cost-effectiveness was determined to be oil-water separation. These systems utilize fundamental physical principles (gravity and buoyancy) to effectively separate solids and free-phase oil with minimal operator intervention. Therefore, oil-water separators offer superior reliability and control performance, while maintaining a straightforward and cost-effective design.

The following table summarizes the selected management option as well as specifications for the minimum discharge objectives:

Table 7: Selected BAT for TSS and EPH Summary Table

Selected Management Option	Minimum Discharge Objective for Extractable Petroleum Hydrocarbons (EPH)	Minimum Discharge Objective for Total Suspended Solids (TSS)
Oil-Water Separation	≤15 ppmv (15 mg/L) EPH in treated water	Monthly average ≤25 ppmv (25 mg/L) TSS in treated water

1.0 INTRODUCTION

Woodfibre LNG Limited (WLNG) intends to develop, construct, and operate a Liquified Natural Gas (LNG) production, storage, and marine carrier LNG transfer facility on a decommissioned former pulp mill site, in British Columbia (BC), Canda. The WLNG site is located on the west side of Howe Sound, approximately 7 km southwest from Squamish, BC. The Woodfibre LNG facility is designed to have an LNG production capacity of 2.1 million tons per annum (MTPA) via processing pipeline quality gas.

The purpose of this document is to list and define the required catalysts and chemicals for the Woodfibre LNG Facility.

2.0 OVERVIEW

The Woodfibre LNG facility shall take pipeline quality gas, remove impurities and other component (mainly CO_2, trace sulphur and water), and liquefy the natural gas to produce LNG. The LNG shall be stored on FSTs and loaded onto LNG carriers for distribution to overseas natural gas markets.

All the following catalysts and chemicals are located and stored at the Woodfibre LNG Facility. The quantities and consumption of the catalysts and chemicals are based on final equipment selection, facility layout, and selected suppliers.

3.0 CATALYSTS

The table below lists the catalysts required for Woodfibre LNG Facility operation. The initial charge and consumption are based on final equipment selection, facility layout, and selected suppliers.

Service	Use	Material	Initial Charge	Consumption / Use	Chemical Storage Building Volume
Acid Gas Removal 01-FL-1203-02	aMDEA Filtration	Activated Carbon	5900 kg	6 to 12 month operating life	--
Dehydration 01-R-1303 A/B/C	Water Adsorbent	5.95m layer Adsorbent Bed Molecular Sieves	74.8 m^3/ dehydrator (Excluding Inert Balls-Alumina Balls) HOLD 1	5 yr operating life	--
Instrument Air Dryer 01-A-5604 A/B/C	Air Dryer Adsorbent	Molecular Sieve	1.93 m^3 / bed, 6 beds total	5 yr operating life	12 m^3
Mercury Removal 01-R-0201	Mercury Adsorbent	3.2 m layer Metal Oxide or approved equivalent	29 m^3 (Excluding Inert Balls-Alumina Balls) HOLD 1	5 yr operating life	--

Revision Notes and Holds History

Revision	Description of Changes and Notes
D	• Added additional oily water collection sumps and pumps for Diesel Fuel Storage, Air Compressor Package, Loading Arm hydraulic system, Rail Car Loading system, Solvent Drain Drum and Heating Medium Drain Drum. • Revised Amine Sump Pump discharge from stormwater system to Oily Water Treatment Package. • Drain collection for Anti-foam Injection Package deleted. • Added sump pumps for FST 1 LNG Impoundment sump and FST 2 LNG Impoundment sump。 • Added LNG Impoundment Sumps and Pumps for FST 1 and FST 2 manifold area • Revised Jetty area LNG impoundment sump pumps to electrical type and revised from local discharge to Howe Sound to East Mill Creek Stormwater Sedimentation Pond 01-SU-6418.
E	• Incorporated Client Comments • Document updated to provide reference to Stormwater Drainage Philosophy, 350106-000-CS-PH-00001 Rev. 2 • Rail Car Condensate Loading area deleted. Stabilized Condensate Storage Tank Area sump & pump added in Oily water system. • Refrigerant Storage Area sump pump, Diesel Fuel Area sump & pump, Instrument Air compressor sump & sump pump deleted. • Details of Sanitary Wastewater Treatment Package, Oily Water treatment package updated. • Potentially contaminated Stormwater system details added.
0	• Updated per latest configuration for LNG Platform Sump, Condensate Barge Loading Sump, First Flush Sump • Section 3.0 Note 1 updated for AODD spare pumps details.

1.0 INTRODUCTION

1.1 PURPOSE

The purpose of this document is as follows:

- Record the basis of design for the Unit 64 Effluent and Wastewater System based on Basis of Design, Document Number 350106-0000-00-EM-GEN-PDB-0001. Unit 64 consists of the stormwater system, oily water treatment, and sanitary sewer treatment. Section 1.2 provides additional details on the scope of this document.
- State process specifications used in development of Utility Flow Diagrams (UFD's), Piping & Instrument Diagrams (P&ID's) and equipment datasheets.

1.2 SCOPE

This Effluent and Wastewater System Process Design basis will cover the waste streams generated in the WLNG facility as specified below:

- Oily Water System
- Secondary Containment Drains
- Sanitary Wastewater from buildings
- Potential LNG and Refrigerant Spills
- Stormwater

1.2.1 OILY WATER SYSTEM

The oily water system will collect, convey and treat oily water equipment and piping drains. The design basis for the various components of the oily water system is provided in the following sections.

Oily Water Collection System

The oily water collection system consists of curbed areas to collect oily water equipment and piping drains and potentially lube oil contaminated surface runoff, and open hub collection headers to drain to the Oily Water Sump.

The collection systems are provided per the module layout as specified below.

- Module 01 North Oily Water collection
- Module 01/09 South Oily Water collection
- Module 02 South Oily Water collection
- Module 04/13 Oily Water collection
- Stabilized Condensate Storage Tank and Barge Loading Area Oily Water collection
- LNG loading platform Oily Water collection
- Solvent Drain Drum Oily Water collection
- Heating medium Drain Drum Oily Water collection

Oily Water Sump and Pump

The Oily Water Sumps receive drains from the oily water collection systems. The Sumps will be covered and vented to a safe location and constructed in-ground of reinforced concrete.

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

The most sumps will be provided with self-priming air driven/motor driven pump for transfer of the sump contents to the Oily Water Treatment Package 01-A-6417 via Oily Water Storage Tank 01-T-6469. Pump will have manual start & manual/auto stop control as regulated by the liquid level in the sump and can be initiated/stopped by Operator from the control room. Stand by pump with common capacity will be provided as a warehouse spare. Ability shall be provided to hook up a temporary pump or truck out connection for each pump.

Collection areas not provided with a sump pump shall be emptied out using vacuum truck such as diesel fuel storage area curbing. Oily water from LNG loading platform sump shall transfer via temporary pump to a local container for appropriate treatment.

The oily water sumps and pumps are specified as below:

- Oily Water Sump for Module 01North (01-SU-6435)
- Oily Water Sump Pump for Module 01North (01-P-6436), Pneumatic pump.
- Oily Water Sump for Module 01/09 South (01-SU-6443)
- Oily Water Sump Pump for Module 01/09 South (01-P-6444), Pneumatic pump.
- Oily Water Sump for Module 02 South (01-SU-6437)
- Oily Water Sump Pump for Module 02 South (01-P-6438), Pneumatic pump.
- Oily Water Sump for Module 04/13 (01-SU-6415)
- Oily Water Sump Pump for Module 04/13 (01-P-6416), Pneumatic pump.
- Oily Water Sump for Stabilized Condensate Storage Tank Area (01-SU-6468)
- Oily Water Sump Pump for Stabilized Condensate Storage Tank Area (01-P-6483), Motor Driven Pump.
- Oily Water Sump for Stabilization Condensate Barge Loading Area (01-SU-6472)
- Sump for Solvent Drain Drum (01-SU-6447)
- Sump Pump for Solvent Drain Drum (01-P-6448), Pneumatic Pump.
- Sump for Heating Medium Drain Drum (01-SU-6467)
- Sump Pump for Heating Medium Drain Drum (01-P-6468), Pneumatic Pump.

Oily Water Storage Tank and Pump

The purpose of the Oily Water Storage Tank, 01-T-6469, is to hold the incoming flow allowing downstream Oily Water Treatment Package, 01-A-6417, to operate in a stable condition. Oily Water Storage Tank is provided with heating coils to maintain temperature and skimming facility to skim-off oil, if any, from the tank. Skimmed oil sent offsite to appropriate waste management. Oily water from Oily Water Storage Tank 01-T-6469 is pumped via Oily Water Storage Tank Pump 01-P-6417-21A/B to downstream treatment package.

Oily Water Treatment Package 01-A-6417

The Oily Water Treatment Package 01-A-6417 is provided for the removal of free oil, and settleable and suspended solids from the Oily Water Sumps contents. The package is to be vendor standard design, consisting of an Oil-Water Separator which will be of the enhanced gravity separation type

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

complete with coalesce pack as well as associated instrumentation and controls designed to remove oil droplets.

The Oily Water Treatment Package 01-A-6417 will be installed above ground with the treated water pumped to the outfall Howe Sound. The Oil-Water Separator will be provided with an integral compartment to store the separated oil and an oil transfer pump. The separated oil collected within the Treatment Package will be removed periodically by the oil transfer pump into suitable containers or vacuum trucks for off-site waste management. Sludge accumulated in the Treatment Package will also be periodically transferred into suitable containers or vacuum trucks for off-site waste management. The treated water discharge from the Oily Water Treatment Package 01-A-6417 shall meet discharge specifications of $\leq$ 15 ppmv free oil (no visible sheen) and a monthly average of $<$ 25 mg/l Total Suspended Solids (TSS). To provide operating margin for potential upsets, the package was specified to provide 10 ppmv of free oil. If the treated water does not meet discharge specifications, water will be recycled back to the Oily Water Storage Tank (01-T-6469) for additional treatment.

1.2.2 SECONDARY CONTAINMENT DRAINS

Acid Gas Recovery Unit

All amine containing equipment and piping drains shall be collected by a closed drain system that shall gravity drain to a Solvent Drain Drum 01-V-1212. Material collected in the drum shall be returned to the AGRU for reuse.

The areas under the module which comprise the Acid Gas Recovery Unit (AGRU) will be paved and curbed, with surface runoff drained to a dedicated Amine Sump 01-SU-6401. The Sump serves to collect and retain the area runoff for inspection and testing to ensure that no amine solvent is inadvertently released to the Oily Water Treatment Package 01-A-6417.

The Amine Sump 01-SU-6401 will be constructed in-ground of reinforced concrete with the inner walls provided with liner or coating compatible with the amine solvent. The Sump will be provided with a level transmitter connected to the plant DCS for indication at the Control Room.

The Amine Sump 01-SU-6401, will be provided with a pump 01-P-6425. The sump also has a truck out connection, if needed. The Sump contents will be inspected and/or tested for solvent, and if found to meet regulatory requirements, will be pumped out to the Oily Water Treatment Package 01-A-6417. In the event of an amine solvent spill or leak, the following will be applied:

- Minor Amine Spills and Leaks – Minor incidental or accidental amine solvent leaks and spills will be managed through routine inspection, cleanup and expeditious maintenance and/or repairs. Cleanup will be by means of an inert material such vermiculite, sand or earth to adsorb the spill/leak. The waste cleanup material will be transferred to a suitable container for ultimate off-site waste management.
- Major Amine Spills – In the event of major spill or leak, the contained spill or leak material as well as any wash down water will be collected in the amine containment sump and transferred to a transport vessel or other suitable container for off-site waste management.

Tempered Water Storage, Electrical Transformers

Tempered Water storage equipment, oil filled electrical transformers and related truck loading/ unloading areas will be bounded by curbing.

- The area under the Tempered Water Header Tank 01-V-5302, Tempered Water Filter 01-FL-5304 and Tempered Water Pump 01-P-5303-A/B in the Tempered Water System will be paved and curbed to contain any glycol spills or leaks.
- Electrical transformers will be located on curbed containment area sloping to a common trench to drain and collect runoff away from the equipment.

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

The secondary containment areas will be provided with low point corner sumps/area and drain lines with normally closed isolation valves connecting to the stormwater drainage system.
The contents will be inspected and/or tested for potential contaminants of concern, and if found to meet regulatory requirements, it will be released to the nearest clean stormwater drainage ditch or oily water system via the manual valve. In the event of detection of potential contaminants of concern, the contents of the low point corner sumps will be removed by means of a vacuum truck for off-site waste management.

Truck Unloading Area

The truck unloading areas for Amine, Heating Medium, Diesel Fuel, and Tempered Water will be paved and sloped to a catch basin or curbed area for secondary containment. The catch basin will be provided with grated cover, and a drain line with an isolation valve to the clean stormwater system for Heating Medium/Tempered Water catch basin and to Amine Sump for Amine/ Heating Medium catch basin. The Deisel Fuel loading area will be contained in a curbed area with an isolation valve.

The valve will be open during normal operations except for the Diesel Fuel loading area since diesel may be present in a double walled storage tank. During truck unloading operations, the valve will be closed to contain any spills. Spilled liquid will be collected and removed for appropriate off-site waste management or to Oily Water Treatment Package for treatment.

1.2.3 SANITARY WASTEWATER SYSTEM

The Sanitary wastewater system consists of Sanitary Lift Station (Control and Operation Building, Warehouse Maintenance Building) 01-A-6420, and Sanitary Lift Station (Administration Building) 01-A-6434 and Sanitary Wastewater Treatment Package 01-A-6433.

Sanitary Lift Stations

Individual Sanitary Lift Stations will be provided to collect sanitary wastewater from the Control Room, Administration, and Warehouse/ Maintenance buildings located west of Mill Creek.

Sanitary wastewater will drain to Sanitary Lift Stations for transfer to a Sanitary Wastewater Treatment Package, 01-A-6433. Each Sanitary Lift Station will be supplied as a package system of vendor's standard design complete with: wet well, two 100% submersible non-clog grinder type pumps, and discharge piping and valves. The lift stations will be installed below grade to permit gravity inflow and will be equipped with an odor control vent filter. The lift stations will be operated on automatic start-stop as regulated by the liquid level in the wet well with level indication in control room.

The discharge lines from the sanitary lift stations will be routed underground, below the frost line, to the Sanitary Wastewater Treatment Package.

Sanitary Wastewater Treatment Unit (01-A-6433)

The Sanitary Wastewater Treatment Package (01-A-6433) will be of the extended aeration type of vendor standard design. The packaged unit will include influent tank aeration tank, clarifier tank, effluent tank, waste sludge holding tank, aeration air blowers, treated product pumps, waste sludge pump and any other required internal transfer pumps, as well as all associated instrumentation and controls. The treated water from the treatment package will be discharged to a submerged outfall into Howe Sound with level monitoring in control room.

1.2.4 LNG AND REFRIGERANT SPILL CONTAINMENT AND ASSOCIATED STORMWATER

The LNG and Refrigerant Spill Containment system shall be provided to collect potential LNG and refrigerant releases from the Process Area, Refrigerant Storage Area, FST loading area and LNG

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

Loading Platform. These areas shall be paved and curbed and sloped through open concrete/steel trenches to local LNG impoundment sumps. Spilled LNG shall be retained in the sumps until fully vaporized.

For Process Area and Refrigerant Storage Area, the LNG impoundment sumps shall be an in-ground basin constructed of insulating perlite concrete and filled with a layer of Foamglas cubes to suppress vapor dispersion and pool fires in the event of a spill.

For LNG impoundment sump in FST loading area, the LNG impoundment sump shall be a constructed steel tank and filled with a layer of Foamglas cubes to suppress vapor dispersion and pool fires in the event of an LNG spill.

Surface runoff from the curbed and contained LNG Process Area will be sent to the Oily Water Treatment Package, 01-A-6417, for treatment. Refrigerant storage area surface run off will be collected in the Impoundment Sump and removed via vacuum truck for proper waste management.

Clean surface runoff from the FST Loading area will be discharged to Howe Sound as there is no source for hydrocarbon contamination.

For the LNG Loading Platform, the LNG will boil-off in the containment area. Due to the potential contamination from biodegradable hydraulic fluid used in the LNG Loading Arms, the first inch of potentially contaminated Stormwater that contacts the area with hydraulic fluid will be contained in a metallic sump 00-SU-6471 and removed for appropriate off-site waste management

Each LNG Impoundment Sump shall be provided with a low temperature indicator, which will alarm in the event of LNG or refrigerant spill. Soft interlock will be added to prohibit pump start if the temperature in the sump is below zero Deg C, to prevent inadvertent LNG transfer to the stormwater system.

The LNG and Refrigerant Spill Containment system consists of sumps and pumps as specified below:

- Process Area Impoundment Sump 01-SU-6403 & Process Area Impoundment Sump Water Pump 01-P-6404-A/B,
- Propane Storage Area Impoundment Sump 01-SU-6451
- FST Loading LNG Impoundment Sump East 01-SU-6406
- FST Loading LNG Impoundment Sump West 01-SU-6405
- LNG Loading Platform Sump 00-SU-6471

Detailed system design information related to hydrocarbon containment basis of the LNG and Refrigerant Spill Containment refer to Basis of Design for Impoundment Sumps (350106-000-SE-BD-00001).

1.2.5 STORMWATER SYSTEM

Refer Stormwater Drainage Philosophy, 350106-000-CS-PH-00001 for detailed system design information.

2.0 DESIGN DATA

The following general design criteria for wastewater systems shall be considered; as per Section 13 and 14 in Project Design Basis 350106-0000-00-EM-GEN-PDB-0001:

- All spill containment systems shall be sufficiently impervious to prevent spilled material from being released to the environment.

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

- All below-grade water lines shall be installed below the frost line.
- All above-grade water piping with intermittent flow shall be protected from freezing in accordance with the winterization philosophy.
- All wastewater treatment facilities shall be installed in a ventilated- and temperature-controlled enclosure to maintain a minimum operating temperature of 10°C.
- Drainage calculations shall be performed based on Stormwater Drainage Philosophy, 350106-000-CS-PH-00001.
- Site drainage design shall consider the risks of flooding from Woodfibre and Mill Creeks and mitigation provided, as necessary.

2.1 OILY WATER SYSTEM

Oily Water Collection system

The equipment and piping drains, such as feed gas and fuel gas knockout drums, pumps, compressors and hydrocarbon containing equipment, are from controlled operations and low in volume. Therefore, the oily water drain lines will be sized for the peak surface runoff flow rate from the paved and curbed area.

For Oily Water Sumps sizing basis, refer Section 3.0.

Water collected in the oily water sumps shall be pumped or transferred via vacuum truck to Oily Water Treatment Package (01-A-6417) through Oily Water Storage Tank (01-T-6469) for further treatment.

Oily Water Sump and Pump

Each Oily Water Sump shall be an in ground, closed concrete sump and shall be vented to a safe location.

Each Oily Water Sump Pump is on float level control and will manually start on high-level and automatically/manually stop on low level with operator intervention possible from control room. There are two types of Oily Water Pumps provided for the sumps: Air Operated Double Diaphragm (AODD) type & Self Priming pumps (centrifugal type) driven by electric motors. AODD pumps are designed for 5m^3/hr capacity and Motor driven pumps for 30 m3/hr capacity. Each pump type is supplied with common warehouse spares.

The Oily Water pump operating and design conditions are specified below:

Capacity, m3	5 m3/hr for AODD; 30m3/hr for Self Priming pumps; Refer Section 3.0 for specific pumps
Normal supply Temperature, °C	ambient
Design Temperature, °C	-29/70
Discharge Pressure, bar (G)	1.9 bar (G) for AODD; 2.44 bar (G) for Self Priming pumps; Refer Section 3.0 for specific pumps
Design Pressure, bar (G)	5.0

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

Oily Water Storage Tank and Pump

Oily Water Storage Tank (01-T-6469) shall be above ground tank and shall be atmospherically vented to a safe location. The total required working capacity of approximately 450 m3. Oily Water Storage Tank Pump (01-P-6417-21A/B) are 2x100% pumps, with one pump operating and one on standby.

The Oily Water Storage Tank Pump operating and design conditions are specified below:

Capacity, m3/h	30.0
Normal supply Temperature, °C	ambient
Design Temperature, °C	-29/70
Discharge Pressure, bar (G)	1.0
Design Pressure, bar (G)	5.0

Oily Water Treatment Package (01-A-6417)

The oily water treatment system shall be supplied as a skid mounted system, which includes an Oil-Water Separator of enhanced separation, recovered oil tank, oil and treated water transfer pumps and all on-skid piping, wiring and instrumentation and controls for unattended operation, subject to meeting regulatory discharge specifications.

All oily water treatment facilities shall maintain a minimum operating temperature of 10°C.

The oily water and potentially contaminated flow to the Oily Water Treatment Package is mainly wet weather flows. The Oily Water Treatment Package (01-A-6417) is sized for a capacity of 30 m3/h.

The Oily Water Treatment Package will be specified to meet the regulatory discharge requirement of ≤ 15 ppmv free oil (no visible sheen) and a monthly average Total Suspended Solids < 25 mg/l. The influent and effluent lines of the treatment package will be provided with connections for periodic grab sampling. The Oily Water Treatment Package is designed for a free oil and grease content of 10 ppm or less in the treated water.

The discharge piping of Oily Water Treatment Package will be provided with online analyzers. If the treated discharge is off specification, it will be recirculated back to Oily water Storage Tank (01-T-6469) for reprocessing and it will be discharged to Howe Sound only upon meeting specification.

2.2 SECONDARY CONTAINMENT DRAINS

Acid Gas Recovery Unit drains

For Amine Sump sizing basis, refer Section 3.0. The sump is designed for containment of 100-year 24-hour rain event of 257.8 mm with 10% margin. The sump required volume is about 350 m3.

The Amine Sump Pump (01-P-6425) will be sized to empty full sump stormwater volume in about 12 hours and will be manually controlled. The pump capacity is 30 m3/h with a common warehouse spare.

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

Tempered Water Storage, Electrical Transformers

A secondary containment will be provided for the below areas for accidental spills and leaks. These leaks and spills will be managed through routine inspection, cleanup and expeditious maintenance and/or repairs. Cleanup will be by means of a vacuum truck and transfer to Oily Water Treatment Package (01-A-6417) or for offsite waste management;

- For the Tempered Water Header Tank (01-V-5302), Tempered Water Filter (01-FL-5304) and Tempered Water Pump (01-P-5303A/B), the drip pans will hold any tempered water spillage & spillage shall be sent to offsite for waste management via vacuum truck.
- Electrical transformers: the secondary containment will be sized to contain 110% of the contents of the largest transformer.

2.3 SANITARY WASTEWATER SYSTEM

2.3.1 SANITARY LIFT STATIONS

The operating and design conditions for sanitary lift stations are specified as follows:

Normal supply Temperature, °C	Ambient (minimum of 10°C)*
Design Temperature, °C	-18/49
Lift stations Discharge Pressure, bar (G)	3.0
Design Pressure, bar (G)	5.0

*Note: Wet well shall be equipped with a heating coil or other suitable means of maintaining the temperature in the wet well at a minimum temperature of 10 °C.

Sanitary Lift Station for Control and Operation Building & Warehouse Maintenance Building (01-A-6420)

The daily flow of sanitary effluent is calculated on the number of persons occupying the building being considered. The capacity of the Sanitary Lift Station for Control and Operation Building & Warehouse Maintenance Building is specified as below:

Name of Building	Number of People per Building	Liters per Person per Day	Total Liters per Day
Control And Operations Room Building	20	130	2600
Warehouse Maintenance Building	20	130	2600
Total	40	130	5200

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

Sanitary Lift Station for Administration Building (01-A-6434)

The daily flow of sanitary effluent is calculated on the number of persons occupying the building being considered. The capacity of the Sanitary Lift Station for Administration Building is specified as below:

Name of Building	Number of People per Building	Liters per Person per Day	Total Liters per Day
Administration Building	40	130	5200
Total	40	130	5200

2.3.2 SANITARY WASTEWATER TREATMENT PACKAGE (01-A-6433)

The occupancy of the LNG facility during operations is 80 persons, with a daily potable water consumption of 130 L/person/day. Therefore, the daily sanitary wastewater generation is set at 130 L/person/day. On this basis, the total volume of sanitary wastewater generated during operations of the LNG facility will be 10.4 m^3/day. The sanitary wastewater treatment unit will be a packaged unit with capacity to treat 12.5 m^3/day of average daily wastewater flow.

The operating and design conditions for Sanitary Wastewater Treatment Package (01-A-6433) are specified as follows:

Peak flow, m3/h	5 (Note 1)
Average flow, m3/h	0.52
Normal supply Temperature, °C	Ambient (Minimum of 10 °C) Note 2
Design Temperature, °C	-29/70 above ground -18/49 underground
Package Inlet Pressure, bar (G)	1.0
Package Outlet Pressure, bar (G)	1.0
Design Pressure, bar (G)	5.0

Note:

1. Peak flow is estimated typical flow for all the lift stations in pump out operation simultaneously, to be confirmed by package supplier.
2. The feed from the lift stations is minimum 10°C. The package shall be equipped with suitable provisions to maintaining the operation ‘of the package during cold winter days when the outside temperature is -16°C.

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

The flow and composition of sanitary wastewater from lift stations going to the Sanitary Wastewater Treatment Package are specified below.

Sanitary Wastewater Flow/Characteristics

Parameter	Unit	Value
Normal/Average Flow	m3/h	0.52
Design Flow (Peak Load)	m3/h	5
Normal Temperature	°C	AMB (Minimum of 10°C) Refer Note 2 above
pH	STU	7.0 – 8.5
BOD_5	mg/l	300
COD	mg/l	600
TSS	mg/l	250
TDS	mg/l	500
Free Oil & Grease	mg/l	90

Waste biological sludge generated in the Sanitary Wastewater Treatment Unit shall be periodically removed for transport and offsite waste management. The discharge flow rate from the Sanitary Wastewater Treatment Unit shall be monitored and the discharge line shall be equipped with a sample connection for periodic off-line quality monitoring.

The treated sanitary wastewater shall meet the discharge limitation provided in the following table. The treated discharge limits are a combination of those provided in the Municipal Wastewater Regulation (BC Reg. 87/2012) of the British Columbia Environmental Management Act and the Canadian national Wastewater Systems Effluent Regulations (SOR/2012-139) of the Fisheries Act; as per Section 14.6, Table 34 in Project Design Basis 350106-0000-00-EM-GEN-PDB-0001:

Parameter	Source for Limits	Criteria
Carbonaceous Biological Oxygen Demand (CBOD) (average)	(a)	≦ 25 mg/L
Total Suspended Solids (TSS) (average)	(a)	≦ 25 mg/L
Un-ionized Ammonia, as N at 15°C ± 1°C (maximum)	(a)	≦ 1.25 mg/L
Residual Chlorine (average)	(a)	≦ 0.02 mg/L
Fecal Coliforms:		
- Shellfish bearing waters	(b)	< 14/100 mL
- Recreational use waters	(b)	≦ 200/100 mL

Notes:

(a) Per national *Wastewater Systems Effluent Regulations (SOR/2012-139)*

(b) Per BC *Municipal Wastewater Regulation (BC Reg. 87/2012).*

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

2.4 LNG AND REFRIGERANT SPILL CONTAINMENT

Each LNG and Refrigerant Impoundment Sump designed working volume shall be based on the process spill volume or the rainfall volume, whichever is larger, plus 10% margin.

For Impoundment Sumps sizing basis, refer Section 3.0 The sump sizing has been specified as below. The sump depth has considered 0.3 meter for accommodating foam blocks for slow vaporization of LNG in case of spill.

Equipment Number	Description	Spill volume, m3 (Note 1)	Rainwater, m3 (Note 2)	Designed working volume, m3
01-SU-6403	Process Area Impoundment Sump	187.3	326	359
01-SU-6451	Propane Storage Area Impoundment Sump	17.6	21.9	25
01-SU-6405 & 01-SU-6406	FST Loading LNG Impoundment Sump West & FST Loading LNG Impoundment Sump East	Note 3	Note 3	25 (each)

Note:
1. Basis and detailed information refer to Design Basis for Spill Control, 350106-000-SE-BD-00001
2. Basis and detailed information refer Stormwater Drainage Philosophy, 350106-000-CS-PH-00001
3. Refer Basis of Design for Impoundment Sumps, 350106-000-SE-BD-00001

The impoundment sump for Process area will be provided with motor driven pump to remove water from the sumps after a rain event. After each rain event, the sump contents will be manual inspected and tested for contaminants of concern before discharge to oily water system. Soft interlock will be added to prohibit pump start if temperature in the Sump is below zero °C, to avoid LNG from being pumped to the oily water system.

FST Loading Impoundment Sumps West (01-SU-6405) & FST Loading Impoundment Sumps East (01-SU-6406) shall drain to Howe Sound by gravity as no hydrocarbon contamination of Stormwater is possible as no hydrocarbon contaminants of concern are present. Propane Storage Area Impoundment sump (01-SU-6451) shall be emptied using vacuum truck for appropriate waste management.

The emptying of stormwater from the sumps should be done in a timely manner so that the sump capacity is reserved for any potential LNG or propane spill.

All the pump capacity has been designed with minimum rate of 25% of the 100-year hourly rainfall rate based on the requirement of 5.2.2.8 CSA-Z276.

2.5 STORMWATER SYSTEM

Refer Stormwater Drainage Philosophy, 350106-000-CS-PH-00001.

2.6 POTENTIALLY CONTAMINATED STORMWATER SYSTEM

The potentially contaminated contact water from Inside Battery Limit (ISBL - east of Mill Creek) that is not routed to oily water sumps, stormwater in excess of first flush water from oily water sumps, and stormwater from unpaved areas in the LNG facility shall be collected and conveyed to the First Flush Sump (01-SU-6469).

Potentially contaminated stormwater in the First Flush Sump (01-SU-6469) will be inspected for a visible oil sheen or manually sampled prior to discharge via Clean Stormwater Sump Pump (01-P-6485) through an outfall to Howe Sound. If found contaminated, the stormwater will be routed via First Flush OW Sump Pump (01-P-6484) to the Oily Water Storage Tank for treatment.

This document or drawing is the sole property and copyright of CB&I LLC and contains confidential and proprietary information. This document or drawing cannot be reproduced, copied, retained or used, in whole or in part, without written consent of CB&I LLC, a McDermott company.

2.7 FIRST FLUSH SUMP (01-SU-6469)

The stormwater management approach for the Process ISBL area is based on the first one-inch (25 mm) flush philosophy, which is widely applied in industrial and petrochemical facilities for stormwater quality control.

At the onset of a rainfall event, accumulated contaminants on paved, operational, and equipment surfaces are rapidly mobilized and washed off. As a result, the initial portion of stormwater runoff typically contains the highest concentration of pollutants. Once the initial runoff has been conveyed and removed, subsequent stormwater becomes progressively diluted and generally exhibits a lower pollution potential.

Based on this industry-recognized behavior, stormwater generated from the initial 25 mm rainfall depth is classified as potentially contaminated contact stormwater and is preferentially collected, isolated, and managed. Runoff volumes generated beyond the first-flush depth may be discharged under controlled conditions, provided no active contamination sources are present.

Diversion Structure

A first-flush weir diversion structure (diversion box) is provided to implement the first-flush philosophy for the Process ISBL area.

Stormwater runoff from the Process ISBL area is conveyed to the diversion box via the site drainage system. The diversion box incorporates an internal weir and baffle arrangement that directs the initial runoff to a sump for collection and temporary storage.

The sump is designed for the collection and temporary storage of stormwater corresponding to the initial one-inch (25 mm) rainfall depth over the entire Process ISBL area. This volume represents the first flush and is isolated from downstream discharge.

The diversion structure also includes an overflow weir with a defined crest elevation to allow controlled bypass of stormwater volumes exceeding the first-flush capacity.

Operation

Under normal rainfall conditions, stormwater entering the diversion box is initially directed to the sump and retained as first-flush runoff.

The retained stormwater is held for sampling and testing, followed by further treatment or controlled disposal, in accordance with site environmental management procedures.

When the inflow volume exceeds the first-flush design capacity, additional stormwater flows beneath the internal baffle and rises on the downstream side. Once the water level reaches the design crest elevation of the overflow weir, excess stormwater overtops the weir and is discharged through the outlet.

The outlet conveys the bypassed stormwater to the adjacent ditch, allowing safe and controlled discharge of runoff beyond the first-flush volume while preventing overloading of the sump and associated management systems.

Retention Time in Diversion Structure

For ISBL active drainage area of approximately 2000 m^2 and typical rainfall intensities of 5–10 mm/hr (2-5 year rainfall event), the post–first flush residence time in the diversion box is approximately 8–15 minutes. This represents the time required for inflow to replace the available hydraulic volume between the internal baffle and the overflow weir (~2.7 m^3). This allows for additional settling time for hydrocarbon beyond the first flush volume.

00-SU-6471	LNG Loading Platform Sump	110%	(Note 3)
01-SU-6472	Stabilized Condensate Barge Loading Area Sump	110%	Larger of process spill and rainfall per Note 4

Notes:

1. Pneumatic Pump spares 01-P-6458-S,01-P-6464-S,01-P-6460-S and 01-P-6461-S. Oily Water Sump Pump common warehouse spare of capacity 5m3/hr and discharge pressure of 1.9 barg.
2. Motor Driven Pump spare, 01-P-6472-S. Oily Water Pump common warehouse spare of capacity 30m3/hr and discharge pressure of 2.44 barg.
3. Oily Sumps will be sized to accommodate the greater of the first 15 minutes of a 10-year hourly design rainfall event of 18.5mm or 1 inch of surface runoff, within a potentially contaminated area. Since 1 inch is larger, 25mm has been considered.
4. The sump is designed for containment of 100-year 24-hour rain event of 257.8 mm with 110% margin.
5. Process Area LNG Impoundment Sump is able to handle 10-year 24-hour rain event of 187.1 mm prior to overflow to the potentially contaminated stormwater system.

ELECTRIC HEATER	
ITEM	01-HE-6417-31 & 01-HE-6417-32
Q.TY	2 Duty
RATING (Kw.)	26.25
DUTY	ON START/STOP BASIS TO MAINTAIN 10°C
MAX. TEMP. CUT OFF	70°C

CPI SEPARATOR	
ITEM	01-H-6417-41
Q.TY	1X100%
VOLUME (m³)	37
SIZE - L x W x H (mm)	6200 x 2000 x 3000
DESIGN CODE	SUPPLIER STANDARD DESIGN (NOTE 3)
DESIGN TEMP. (°C)	(-)29 / 70
DESIGN PRESS. (barg)	ATM+LIQUID HEAD
TANK MOC	CS+3mm CA+ PAINTING
CPI PACKS MOC	PVC (NOTE 4)
WINTERIZATION	INSULATION, HEAT TRACING,ELECTRICAL HEATERS

ELECTRIC HEAT TRACING	
ITEM	01-EHTP-A-6417

OIL SKIMMER	
ITEM	01-Z-6417-61
CONFIGURATION	1x100%
TYPE	BELT

OIL SKIMMER MOTOR	
ITEM	01-M-6417-61
CONFIGURATION	1x100%
RATED POWER	0.37 kW

GENERAL NOTES:

A. SYMBOLOGY ACCORDING TO 350106-0000-00-PR-DWG-PID-0001 / 0002 /0003. OTHERS AS PER ARTES STANDARD SYMBOLOGY.
B. INTERCONNECTING PIPING WITHIN BATTERY LIMITS (PACKAGE LAYOUT) INCLUDED IN ARTES SCOPE OF SUPPLY.
C. ARTES SCOPE OF SUPPLY FOR INSTRUMENT INTERCONNECTING CABLE TRAY AND CABLE IS LIMITED WITHIN VENDOR SUPPLIED EQUIPMENT/SKIDS
D. OILY WATER TREATMENT PACKAGE AS PER ARTES STANDARD DESIGN.
E. INSULATION AND HEAT TRACING PROVIDED TO MAINTAIN THE OPERATING TEMPERATURE 10°C (MIN.) DURING WINTER AND SNOW-FALL CONDITIONS.
F. ON-OFF VALVES PROVIDED TO RECIRCULATE OFF-SPEC EFFLUENT UPON ALARM OF HH VALUE ON THE OIL IN WATER ANALYZER. EFFLUENT SHALL BE RECIRCULATED BACK TO OILY. WATER STORAGE TANK (01-T-6469) VIA BYPASS LINE FOR FURTHER REPROCESSING, ONCE DISCHARGE SPEC IS MET.

NOTES:

3. DOES NOT APPLY ANY INTERNATIONAL STANDARD OR PROJECT SPECIFICATION.
4. CPI PACK DESIGN TEMPERATURE (-)5 / 60°C.
5. PUMP 01-P-6417-21 A/B TO STOP ON CPI SEPARATOR (01-H-6417-41) HIGH HIGH LEVEL AND LOW LEVEL OF OILYWATER STORAGE TANK (01-T-6469)
6. TO BE REFERED ON PAGE 04 OF 05 (P&ID350106-11417-02-SD-000033)
7. SAMPLE CONNECTION.
8. DRAIN FROM N5,N6,N7 IS REQUIRED ONLY FOR TANK EMPTYING DURING MAINTENANCE. EXPECTED ONCE FOR YEAR, DISCHARGE VOLUME IS TOTAL COMPARTMENTS VOLUME.
9. SKIMMED OIL COMPARTMENT IS EMPTIED FOR HIGH LEVEL ON LT-64232, APPROX AFTER 10 BATCH OPERATIONS OF 12 HOURS.
10. THE HOPPER IS EMPTIED FROM THE SLUDGE AFTER EVERY SINGLE BATCH OPERATION OF 12 HOURS. TIMER FOR SLUDGE REMOVAL IS PROVIDED IN UCP
11. PUMP 01-P-6417-22A/B STOP ON CPI SEPARATOR (01-H-6417-41) LOW LOW LEVEL.
12. THE ELECTRICAL HEATER 01-HE-6417-31 IS STARTED/STOPPED BY LOW/HIGH TEMPERATURE ON 01-TT-64235.
13. THE ELECTRICAL HEATER 01-HE-6417-32 IS STARTED/STOPPED BY LOW/HIGH TEMPERATURE ON 01-TT-64236.
14. HH ALARM FOR LT64232 STOP THE PACKAGE INLET FEED PUMP 01-P-6417-21 A/B
15. L ALARM FOR LT64232 ADVICES OPERATOR TO STOP EMPTYING THE SKIMMED OIL COMPARTMENT.
16. PROCESS INTERLOCK 01-XS-64226 A WILL CLOSE 01-XV-64098 (MDR SCOPE) WHEN BELT OIL SKIMMER (01-Z-6417-61) IS NOT OPERATING.

GENERAL NOTES:

1. FOR GENERAL NOTES AND SYMBOLS SEE DRAWINGS 350106-0000-00-PR-DWG-PID-0001, 0002, 0002A & 0003.
2. FOR LIST OF PIPING CLASS CODES, REFER TO 350106-0000-00-PR-DWG-PID-0002A OR "THE PIPING MATERIAL CLASS INDEX", 350106-000-PI-SP-00001.0001
3. SEE INSTRUMENT NOMENCLATURE TAG NUMBER ON 350106-0000-00-PR-DWG-PID-0003.
4. REFER TO SPECIFIC PIPE SPEC FOR COMPLETE LIST OF VALVE CODES AVAILABLE FOR USE.
5. "HP" ON BUTTERFLY VALVES INDICATE THE PREFERRED SEALING SIDE. IT DENOTES WHERE THE HIGHER PRESSURE SIDE IS WHEN VALVE IS IN CLOSED POSITION. VALVE TO BE INSTALLED FOLLOWING THE INDICATED "HP" (HIGH PRESSURE) ON THE P&ID.
6. INDIVIDUAL VESSEL COMPOSITE INSULATION SYSTEM SHALL BE APPLIED AS PER INSULATION, PAINT, AND FIREPROOFING (IPF) LIST (350106-000-ME-LS-00001) COMPOSITE INSULATION SYSTEM CAN BE A COMBINATION OF PROCESS INSULATION, CRYOGENIC SPILL PROTECTION, POOL FIRE PROTECTION, AND/ OR JET FIRE PROTECTION. THICKNESS SHOWN ON P&ID IS THE TOTAL COMPOSITE INSULATION SYSTEM THICKNESS.
7. CAVITY VENTED ISOLATION VALVES TO BE INSTALLED WITH THE VENT ORIENTED ON THE HIGH PRESSURE SIDE WHEN VALVE IS ON CLOSED POSITION.

- REV REVERSE ACTION

GENERAL NOTES:

1. FOR GENERAL NOTES AND SYMBOLS SEE DRAWINGS 350106-0000-00-PR-DWG-PID-0001, 0002, 0002A & 0003.
2. TEMPORARY PRESSURE TEST POINTS FOR START-UP REQUIREMENTS. HOOK UP MATERIAL TO BE PROVIDED BY COMMISSIONING AS REQUIRED. PERMANENT INSTALLATION TO BE BLINDED.
3. THERMOWELL SS FLANGE AND PIPING CS FLANGE CONNECTION RATINGS TO BE VERIFIED AGAINST ASME B31.3 TABLES BASED ON LINE DESIGN PRESSURE AND TEMPERATURE.
4. SELECTED TAGS ASSOCIATED WITH A SAFETY INSTRUMENTED SYSTEM (SIS) SHALL INCLUDE THE "Z" VARIABLE MODIFIER. IN GENERAL THIS INCLUDES:
   A. HZS - FOR FIELD/CCR PUSHBUTTONS ASSOCIATED WITH ESD AND BLOWDOWN INITIALIZATION.
   B. XZY - FOR MCC INTERPOSING RELAYS.
   C. SPECIAL APPLICATIONS AS AGREED DURING DETAIL ENGINEERING.
5. THERMOWELLS ARE TYPICALLY 2" - FLANGED EXCEPT AS NOTED. CONNECTIONS SIZE AND TYPE TO BE PROVIDED IN ACCORDANCE TO THE INSTRUMENT INSTALLATION SPECIFICATION, 350106-000-IC-SP-00008.
6. "HP" ON BUTTERFLY VALVES INDICATE THE PREFERRED SEALING SIDE. IT DENOTES WHERE THE HIGHER PRESSURE SIDE IS WHEN VALVE IS IN CLOSED POSITION. VALVE TO BE INSTALLED FOLLOWING THE INDICATED "HP" (HIGH PRESSURE) ON THE P&ID.
7. FOR PRV METALLURGY, REFER TO NOTE 54 ON 350106-0000-00-PR-DWG-PID-0001.
8. FOR AIR DISTRIBUTION MANIFOLD USER INFORMATION, REFER TO DOCUMENT 350106-0000-00-IC-GEN-IX0-0001 FOR TRAIN/ ISBL, 350106-0000-00-IC-GEN-IX0-0002 FOR OSBL/ UTILITIES, AND 350106-0000-00-IC-GEN-IX0-0003 FOR MARINE/ FST.

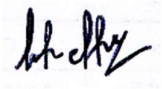
OBJECT: 350106 - Woodfibre LNG-PO-11417-02 Oily Water Treatment Package – Compliance with Discharge Requirements

In reference to the package in question, we hereby confirm that it has been designed in full compliance with the applicable discharge requirements.

Specifically, the system has been engineered to ensure the following minimum discharge standards:

- Total Suspended Solids (TSS): less than 25 mg/L
- Extractable Petroleum Hydrocarbons (EPH): less than 15 mg/L



considering the following influent water quality:

- EPH (influent): 0 to 200 mg/L
- TSS (influent): 10 to 200 mg/L

NOTE: EPH physical state is free oil.

Sincerely,

Mr. Antonio Catalano (PM)

NOTE

01. Reference document. Not included in IOM.
02. IOM for auxiliary items e.g. gear, mechanical seal, coupling is part of parent equipment (i.e. pump) IOM.
03. Included in 7.1
04. Included in 7.2.

1.1 PURPOSE

This document contains technical information useful for installation, commissioning, start-up, operating and maintenance of the Oily Water Treatment Package 01-A-6417 supplied for this project and prefabricated at Vendor workshop:

PROJECT NAME	:	350106 Woodfibre LNG Project
PLANT LOCATION	:	Howe Sound Woodfibre site, Squamish, BC, Canada
CONTRACTOR	:	MCDERMOTT
OWNER'S NAME	:	WOODFIBRE LNG
P.O. NO.	:	350106-PO-11417-02
P.O. DESCRIPTION	:	OILY WATER TREATMENT PACKAGE
ITEM NO.	:	01-A-6417
VENDOR JOB No.	:	23.D.287

1.2 DEFINITIONS

COMPANY/OWNER:	Principal end user – Woodfibre LNG Limited (WLNG)
CONTRACTOR:	Party appointed by COMPANY to carry out EPC services for the Project – McDermott (MDR)
PROJECT:	Woodfibre LNG Project
PURCHASER:	Entity placing the order i.e., McDermott / MDR
SUPPLIER:	Party responsible for furnishing the equipment, Cannon Artes S.p.A (also referred as Artes)
SPECIFICATIONS:	All applicable technical documents included in material requisition

1.3 LIST OF ABBREVIATIONS

DCS	Distributed Control System
PDB	Power Distribution Board
UCP	Unit Control Panel
PLC	Programmable logic controller
HMI	Human Machine Interface
CPI pack	Corrugated Plate Interceptor - Coalescer pack
TSS	Total Suspended Solids

1.4 INSTALLATION AND AMBIENT CONDITION

Location	Onshore, outdoor, uncovered
Climate	Saline Air, Freezing Temperatures and Snow
Maximum Air Temperature	+38 °C
Minimum Air Temperature	-16 °C
Design Temperature (mechanical)	-29 / +70 °C
Elevation	8.5 mt
Humidity Design Criteria (min/max)	70.6 % / 86.4 %
Average Annual total precipitation (rain + snow water equivalent)	2200 mm
Average annual snowfall	637 mm
Hazardous Area	Classified. All motors & instruments within the package shall be suitable for minimum Class 1, Zone 2, Group II A/B, T3.
Enclosure rating	CSA Type 4X (minimum)
Seismic	Per specification 350106-000-CS-BD-00003.0001 Site Class B, Seismic Category III
Basic Wind Speed (Vb) (10 min mean, 50 yrs return period)	27.8 m/s

1.5 OILY WATER INLET DATA

Flammable/ Explosive	No / No
Toxic	No
Average Free Oil and Grease	0 to 200 ppm
Total Suspended Solids Content	10 to 200 ppm
Temperature	10°C
Range of specific gravity of Oil	0.85 to 0.94

1.6 TREATED WATER CHARACTERISTICS

Total Suspended Solids (TSS)	25 ppm Max.
Free Oil and Grease	10 ppmv (No visible sheen)

1.7 PROCESS DESCRIPTION

The Oily Water Treatment Package 01-A-6417 is provided for the removal of free and dispersed oil and settleable & suspended solids from the oily water received from Oily Water Storage Tank 01-T-6469. The Oily Water Storage Tank 01-T-6469 (by others) collects the oily water from oily water sumps.

The PACKAGE INLET FEED PUMP 01-P-6417-21 A/B (provided loose by Artes and installed by MDR in upstream package) take suction from the Oily Water Storage Tank 01-T-6469 and feeds the Oily Water Treatment Package (at TP 201) with a fixed flowrate of 30 m^3/hr.

The Oily Water Treatment Package 01-A-6417 duty is a 12 hour batch operation.

The Oily Water Treatment Package is mainly composed by:

- Two PACKAGE INLET FEED PUMPS 01-P-6417-21 A/B (2x100% (1 DTY, 1 STB)) - Positive displacement type

- One CPI SEPARATOR 01-H-6417-41 (1X100%)

- Two TREATED WATER FORWARDING PUMPS 01-P-6417-22 A/B (2 x 100 % (1DTY-1STB)) – Centrifugal type

The CPI SEPARATOR 01-H-6417-41 is designed to separate oil with droplet size of 60 microns and bigger at a maximum flowrate of 30m3/hr. It is equipped with CPI pack and a motorized belt skimmer.

When the oil-water flows through the CPI pack, the oil rises to the liquid surface while the suspended solids settle to the bottom of the separator (hopper). The skimmer automatically starts when the package starts and is operating continuously collecting the oil on the surface and depositing it to the skimmed oil compartment (which is part of CPI separator).

The recovered oil (concentration 70%) is stored in the skimmed oil compartment, which will be emptied periodically (approximately after 10 batch operations of 12 hours) by a vacuum truck equipped with vacuum suction pump (by Client).

The sludge stored in the hopper is at 1% concentration. The hopper is emptied of the sludge periodically (after every single batch operation of 12 hours) by a vacuum truck equipped with vacuum suction pump for off-site disposal (by Client).

The treated water from the separator overflows the weir directly into the treated water compartment (which is part of CPI separator). The treated water compartment is emptied using the TREATED WATER FORWARDING PUMP 01-P-6417-22 A/B (one on line one in standby) and is disposed via outlet line to Howe Sound (by others).

5.4 Operator Training and Qualifications

SUPPLIER shall be responsible for the training of OWNER's technical personnel at SUPPLIER's premises or at OWNER's PROJECT SITE.
SUPPLIER has allowed for three (3) calendar days for such training and SUPPLIER has allowed for (10) of OWNER's personnel to attend such training & provision of manuals to trainees.

Operator training enables operators to acquire the skills needed to handle the package safely and efficiently. The primary goal is to prepare operators to handle real-world situations, including emergency situations, without putting the plant or personnel at risk.

The training consists of theoretical lessons (with the help of explanatory slides) and practical lessons (with simulation of operation in UCP) provided by a SUPPLIER qualified site supervisor.
At the end of each lesson there is a section for questions and answers.

The training procedure covers the following topics:

- Safety
- Common terminology
- Chemical/physical processes theory
- Unit description and overview
- Design criteria
- Equipment operation
- Operation, Control philosophy and start-up
- Troubleshooting and Problem Solving
- Maintenance

At the end of the course a personal attendance certificate is issued for each operator.

Declaration of Conformity

We declare that the subassembly described below complies with the requirements of the Machinery Directive 2006/42/EC.

The subassembly complies with the harmonised standard EN ISO 12100.

1. Introduction

1.1. General

The pump you have just acquired was manufactured and inspected with the utmost care.

This manual contains information for qualified and authorised personnel on how to install, commission, run and maintain the equipment mentioned on the front cover. It also contains important information regarding safety and potential hazards related to the equipment. Users should read these instructions carefully before carrying out any commissioning, repair or maintenance work on or near the equipment.

The information contained in this manual may not be copied or published in any form whatsoever, whether by printing, photography, recording on microfilm or any other means (electronic or mechanical) without the prior written consent of PCM.

The information given in this manual is subject to change without notice.

PCM or its representatives decline all responsibility in the event of damage resulting from the use of this manual. This exemption from responsibility applies to damage of all types, including (without any limit) compensatory damages, whether direct or indirect, loss of data, profits or return of capital, loss or damage caused to the property of others, and third-party claims.

PCM or its representatives accept no responsibility and do not guarantee the accuracy, completeness, or up-to-date nature of the information contained in this manual.

1.2. Limits of the guarantee

Before performing any maintenance operations on the pump, check that all necessary precautions have been taken: upstream and downstream valves closed, pipework cleaned and purged, electrical power supply disconnected and disabled. Check also that all the usual precautions have been taken in accordance with the regulations in force regarding the safety of personnel.

On receiving the pump, examine it immediately to check that no signs of damage are apparent. If it is visibly damaged, indicate clearly on the carrier's documents that the merchandise was received damaged, with a brief description of the type of damage observed. If you decide to accept the equipment, please send a registered letter with acknowledgement of receipt to the carrier within forty-eight hours, with a copy to your PCM service centre.

Comply with handling and storage conditions (see page 38).

To avoid all risk of damage or accidents (in particular when the products being conveyed are hazardous), it is essential that you do not use the equipment for an application other than the one provided for in our Technical description (see Appendices).

WARNING: To maintain the original qualities of the pump and to preserve the PCM guarantee on the equipment as well as compliance with the machines directive, it is essential to use genuine PCM parts only.

1.3. Information regarding residual risks

PCM have taken into account all internal risks for the equipment and draw the attention of the user to the residual risks if the following verifications are not carried out:

- Compliance with the pump conditions of use.
- Fixing of the pump.

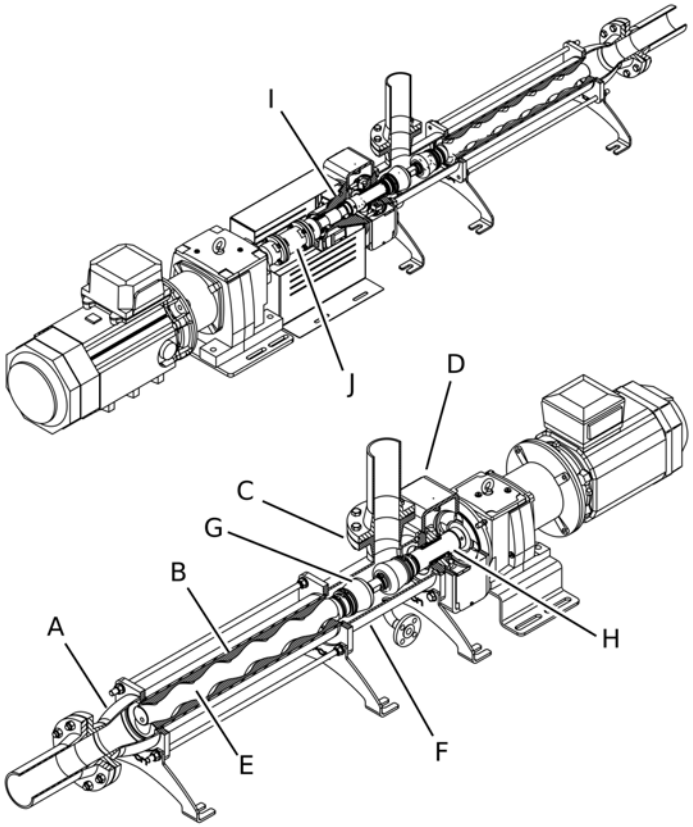
- Connections of the pipework to and from the pump.
- Installing security devices against overpressure, cavitation and frost.
- Installing accessories to prevent foreign bodies from entering the pumping circuit.
- Compliance with the electrical wiring instructions.
- Continuous feeding of the pump.
- Leak tightness of the assembly.
- For maintenance purposes, all necessary precautions against hazardous fluids.
- Compliance with the operating and maintenance instructions.
- Protection casing in place.
- Exclusive use of original PCM parts.

1.4. Environment

PCM is committed to an environmental protection initiative in accordance with the recommendations of the ISO 14001 standard.

PCM has set up a system through which its customers can ask PCM to handle the disposal of waste material (used pumps and spare parts). This system is especially useful for the disposal of parts containing elastomers, such as the stators of eccentric rotor pumps or hoses from peristaltic pumps.

All returns must be sent to the PCM factory, carriage paid. The equipment must be clean, with the pump and drive completely emptied of products, and must arrive with the sheet entitled: risk prevention (see Appendices)



All items returned for this purpose must be legibly marked with the words 'Equipment to be recycled'.

Send to: PCM – Rue René Moineau – 49123 Champtocé-sur-Loire – France

2. Characteristics and installation

2.1. Operating principle

2.1.1. Principle of the pump

A: Stator flange (discharge or suction port). B: Stator. C: Body flange (discharge or suction port). D: Spacer. E: Rotor. F: Body. G: Connecting rod. H: Drive shaft. I: Bearing. J: Coupling.

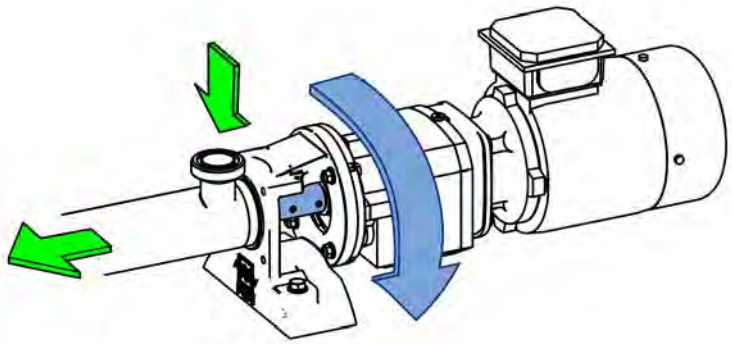
The PCM Moineau™ progressing cavity pump (or eccentric screw pump) essentially consists of two internal helical gears, which have the following features:

- The stator, which is the external element, has one more lobe than the rotor, which is the internal element.
- In any given cross-section, each section of the rotor is in contact with the stator, creating a helical seal line along the pump.
- The helical pitch of the stator is double that of the rotor.

The PCM Moineau™ A series pump is designed according to the principles of API Standard 676 (Positive Displacement Pumps – Rotary).

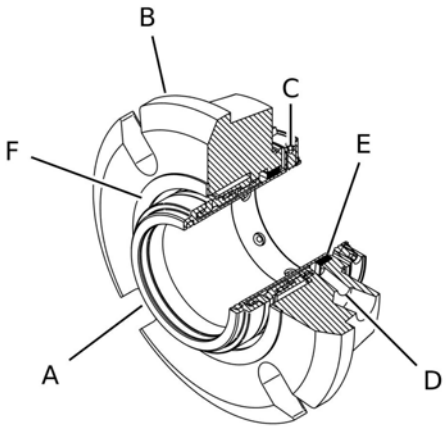
When the rotor is positioned in the stator, a series of watertight cavities is created. Consequently, when the rotor turns inside the stator, these cavities progress spirally around the outside of the rotor, conveying the fluid from the inlet to the outlet.

The PCM Moineau™ pump is a volumetric pump whose displacement is equal to the volume of one cavity. The drive system is directly attached to the pump by a flange, and drives the rotation of the rotor via a connecting rod.



The body design allows the port to be positioned in the most suitable orientation for the pumping conditions (vertical, horizontal, right or left).

The body has a boss enabling drainage. An optional flanged drainage port is available.



A baseplate, with or without a drip pan, is also available with the pump.

2.1.2. Pump rotation direction

For a discharge on the stator port side, the rotor rotates anticlockwise when viewed from the drive end. The suction connection (flange) is marked on the pump. The other connection (flange) is for the discharge (see "Equipment Installation" section, page 15).

2.1.3. Sealing by single mechanical seal

A: Sleeve. B: Body. C: Set screw. D: Orifice. E: Fix throttle bushing. F: Flat seal.

At the drive shaft, the seal between the pump body and the atmosphere is provided by a single cartridge-type mechanical seal system:

The cartridge-type mechanical seals enable rapid assembly with no need for adjustments. They must be installed in one piece.

The stationary ring is immobilised in the body (B). A rotating ring is installed on the sleeve (A), mounted on the drive shaft and fixed using set screws (C). The rotating ring comes into contact with the stationary ring via a spring. The thrusting force of the spring is preset in the factory.

The mechanical seal is equipped with lubrication orifices:

- FO ("Flush Out") orifice for lubricating the friction surfaces on the process fluid side.
- Q ("Quench") and D ("Drain") orifices for quenching the atmosphere side or collecting leaks.

Under normal operating conditions, there may be a slight leak. The mechanical seal is equipped with a fix throttle bushing (E) to contain this leak.

An optional single mechanical seal complying with API 682 is available.

NOTE: a mechanical seal must not run dry.
The auxiliary lubrication system must be clean and filtered.
The parts that receive the mechanical seal must be clean and free of defects.
Never separate the sleeve from the body.
Ensure that installation is performed under conditions of strict cleanliness.
During assembly, never force a part into position.

2.1.4. Sealing by double mechanical seal

The double mechanical seal is of cartridge type and must be installed in one piece. It consists of two single lubricated mechanical seals mounted front to back. The product to be sealed is insulated from the atmosphere by a barrier fluid confined between the two mechanical seals. With this type of seal, the pressure of the barrier fluid must be higher than the pressure of the product to be sealed.

The use of a double mechanical seal is mainly recommended with products with little lubrication, products that are very heavily solids laden or products that are dangerous in contact with the atmosphere.

The lubrication orifices are the following:

- LBI and LBO for the entry and exit of the barrier fluid
- V (if present) for venting
- D (if present) for drainage

An optional double mechanical seal complying with API 682 is available.

2.2. Markings

Information shown on the pump motor unit or on an identification plate attached to the pump:

- Manufacturer name and address.
- Serial Number
- The displacement (depending on the case) and the rotation speed of the pump unit.
- Maximum allowable pump pressure, according to its motor.
- Customer reference (optional).
- Year of manufacture.

This information is essential when ordering spare parts (contact the PCM service centre).

Pump characteristics (e.g. flow rate, pressure, speed of rotation, construction, direction of pump rotation, etc.) must not be modified without written permission from our customer services department.

2.3. Build Specifications

2.3.1. Pump

The materials used are as follows:

Element	Models	Material(s) used
Stator	All	NBR, FPM (FKM)
Sheath	All	NBR, FPM (FKM)
Static seal	All	NBR, FPM (FKM)
Dynamic seal	All	See section below
Rotor	003A24, 05A12, 1A12	X2CrNiMo17-12-2 (1.4404 /AISI 316L - Optional chromium plating)
	1A36, 3A12, 6A6, 6A12, 6A24, 13A6, 13A12, 13A24, 25A6, 25A12, 25A24, 40A6, 40A12, 60A6	X30Cr13 (1.4028 / AISI 420 – Optional chromium plating) - X2CrNiMoN22-5-3 (1.4462 / AISI 329 LN)
Drive shaft	All	X2CrNiMoN22-5-3 (1.4462 / AISI 329 LN)
Sleeve	25A6, 25A12, 25A24, 40A6, 40A12, 60A6	X30Cr13 (1.4028 / AISI 420)
Body / Pipe	All	S235JR (1.0037) - X2CrNiMo17-12-2 (1.4404 / AISI 316L) - X2CrNiMoN22-5-3 (1.4462 / AISI 329 LN) – Others on request
Brace	All	S355JR(1.0045)
Baseplate	All	S235JR (1.0037)
Drip pan	All	S235JR (1.0037)
Rod	003A24, 05A12, 1A12	X2CrNiMoN22-5-3 (1.4462 / AISI 329 LN)
	1A36, 3A12, 6A6, 6A12, 6A24, 13A6, 13A12, 13A24, 25A6, 25A12, 25A24, 40A6, 40A12, 60A6	Nitrided 30CrNiMo8 (1.6580 with or without E-CTFE coating)

The material designation comply with the AFNOR standard.

NOTE: The PCM Moineau™ A series pumps are designed to resist corrosive environments. This includes the systematic use of painting systems dedicated to C3 and C5M environments (following ISO 12944) for parts that may oxidise and the use of stainless steel.

The process and details of how these painting systems are applied are defined in the technical description.

PCM Moineau™ A series pumps are equipped with ANSI B16.5 Class 150 or 300 flanged connections.

2.3.2. Dynamic seal

The materials used for the dynamic seals are as follows:

Element	Material(s) used
Mechanical seal body	X2CrNiMo17-12-2 (1.4404 / AISI 316L)
Friction surfaces of mechanical seal	Silicon carbide / silicon carbide
O-rings	FPM (FKM)
Flat seal	Glass-filled PTFE

Other materials are available on request.

2.3.3. Allowable force and torque

The admissible forces and moments are defined by the API 676 standard.

Examples of maximum admissible forces and moments on the suction and discharge flanges:

Models	Flange	Max. forces Fx, Fy and Fz	Max. moments Mtx, Mty and Mtz
003A24, 05A12, 1A12	Class 150 / Class 300 DN25 (NPS 1")	650 N (150 lbf)	350 Nm (250 lbf.ft)
1A36, 3A12, 6A6, 6A12A, 6A24, 13A6, 13A12	Class 150 / Class 300 DN50 (NPS 2")	650 N (150 lbf)	350 Nm (250 lbf.ft)
25A6, 25A12, 13A24	Class 150 / Class 300 DN80 (NPS 3")	1040 N (225 lbf)	560 Nm (375 lbf.ft)
25A24, 40A6, 40A12, 60A6	Class 150 / Class 300 DN100 (NPS 4")	1300 N (300 lbf)	700 Nm (500 lbf.ft)

2.4. General Dimensions

The general dimensions and weights are available in the appendix as per the following drawing(s):

Model	Drawing number
003A24, 05A12, 1A12	TPE00569
1A36, 3A12, 6A6, 6A12, 6A24, 13A6, 13A12	TPE00567
25A6, 25A12, 13A24	TPE00568
40A6, 40A12, 25A24, 60A6	TPE00570
Motors	TPE00571, TPE00572

2.5. Operating Specifications

WARNING: Pumps do not tolerate dry running.

WARNING: Pump specifications (capacity, pressure, speed of rotation, construction, etc.) must not be changed without written authorisation from our Customer Service Department.

The specifications are indicated on the technical description of the equipment supplied.

The A-weighted sound pressure level (SPL) of pumps manufactured by PCM is below 80 dB(A), in compliance with the European directive in force concerning noise from motor-driven equipment.

PCM Moineau™ A Series pumps are used in the oil industry.

Their design enables them to pump any type of fluid, including aqueous solutions, oils and hydrocarbons, flashing or not. The body drain enables these fluids to be evacuated for cleaning or maintenance. These fluids are collected in the drip pan (available as an option) and can be evacuated by connecting an outlet flange.

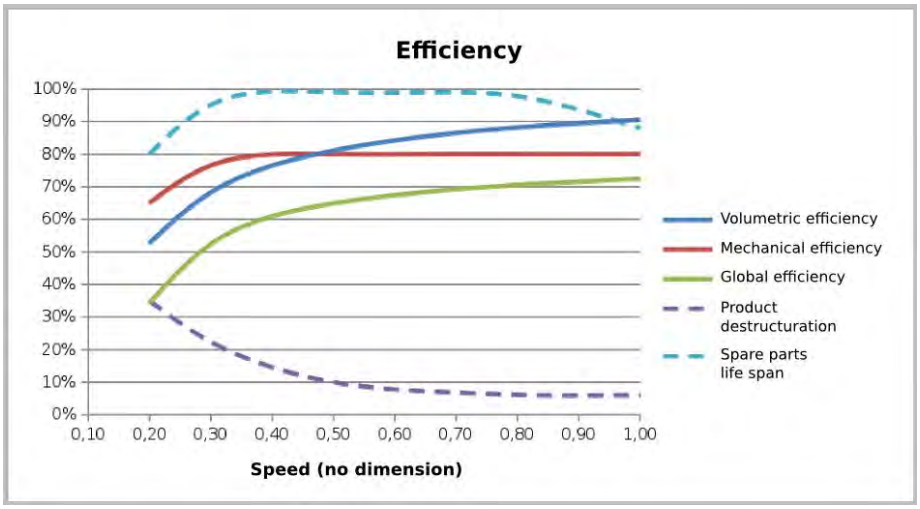
IMPORTANT: The operating temperature limit is determined by the stator material and the specifications given in the technical description provided in Appendix.

2.5.1. Pump performance

The pumps in the PCM Moineau™ range are volumetric pumps. This means that fluid is moved by imprisoning a certain quantity of fluid in a cavity created between the rotor and the stator. The flow is then generated by rotating the rotor relative to the stator.

The cavities must be sufficiently sealed to enable pumping by generating pressure and thus to produce good hydraulic efficiency. But they must also allow a slight degree of internal leakage to lubricate the contact between the rotor and the stator in order to improve mechanical efficiency and extend the life of the components. The internal leakage rate thus plays an important role in the performance of a Moineau™ pump.

As the overall efficiency of a volumetric pump is the product of the hydraulic efficiency and the mechanical efficiency, the efficiency of a PCM Moineau™ pump will depend on the compromise made with regard to the internal leakage rate, as shown by the table below:



Parameter	Action	Hydraulic efficiency	Mechanical efficiency
Internal leakage rate	↗	↘	↗
	↘	↗	↘

2.5.2. Influence of rotation speed

As the internal leakage rate is independent of the rotation speed, we can increase the volumetric efficiency by increasing the rotation speed, as shown by the graph below.

In addition, the integrity of the product being pumped depends mainly on the leakage ratio. The leakage ratio is the ratio between the internal leakage rate and the total pump flow rate. Increasing the rotation speed thus reduces the leakage ratio and better respects the product being pumped.

With regard to the components' lifetimes, too low a rotation speed does not allow the hydrodynamic lubrication film to form, thus limiting the components' lifetimes. Too high a rotation speed, however, places too much mechanical stress on the components, as shown by the graph below.

Manufacturing tolerances, chemical attack on the elastomers and wear of the rotor and stator components can cause the internal leakage rate to vary from the flow rate initially predicted.

The following points should be noted:

- The flow rate will be better controlled if the leakage ratio is reduced, and thus the rotation speed slightly increased (>150 rpm). **The rotation speed must be maintained above 80 rpm during all the phases of the**

pump's use.

- Respect for the integrity of the product increases with the pump's rotation speed.
- Due to the component manufacturing tolerances, two different stators may produce slightly different flow rates. The flow rate of the pump should thus be checked when new parts are installed.
- If the stator is not subject to chemical degradation or mechanical wear, the flow rate of the pump will remain constant.

2.5.3. Performance curves

The rotational speeds and pressures shown on the curves represent typical performance characteristics obtained with water at 20°C. When operating conditions differ from this standard, the performance characteristics must be adjusted according to:

- product characteristics (viscosity, fragility, abrasion),
- the characteristics of the application (operating speed, discharge pressure, available NPSH).

Inevitably with the tolerances of mechanical parts, and especially elastomer parts, after a stator is replaced the flow rate may fluctuate slightly.

The performance curves are available in the appendix.

2.5.4. Pump motors

Unless the customer issues specific requirements, the motor assemblies of PCM Moineau™ pumps are selected in order to optimise the overall efficiency of the pump motor unit and thus reduce installation costs.

Two operating phases are to be taken into account when selecting the motor assemblies: the start-up phase and the operating phase.

2.5.4.1. Start-up phase

After the stoppage phase, the coefficient of friction between the rotor and the stator is at its highest. The start-up torque can therefore be much higher than the torque in operation.

The start-up torque depends on:

- the stoppage time before start-up,
- the temperature of the stator during start-up,
- the nature of the fluid present in the stator during the stoppage (lubricity).

PCM progressive cavity pumps (Moineau™) are selected to start at a high temperature after time-limited stoppage phases.

The gearmotors selected by PCM supply enough torque to start under normal conditions of electric power and pump operation.

2.5.4.2. Operating phase

During the operating phase, when the PCM Moineau™ pump is in its steady state, the pump operates with constant torque.

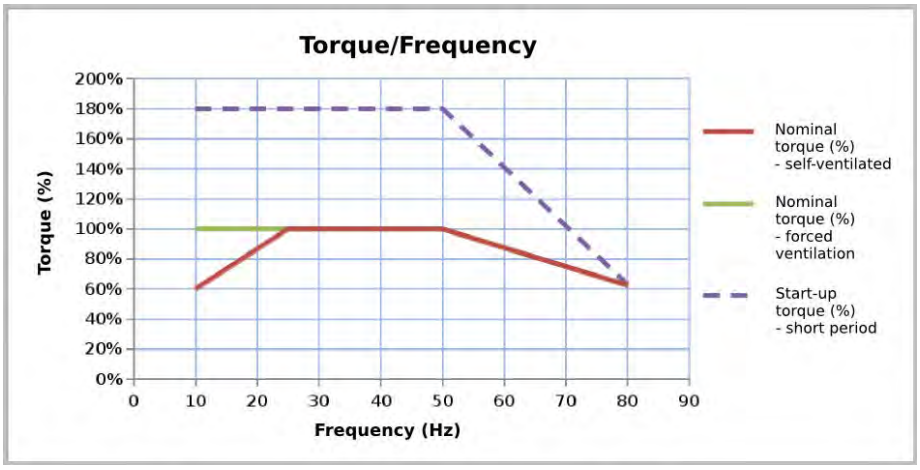
The operating torque depends on:

- mechanical efficiency,
- operating pressure.

The gearmotors selected by PCM are selected to supply enough torque to operate under the contractual conditions of pressure, viscosity and temperature.

2.5.4.3. Variable frequency operation

The use of a Variable Speed Drive (VSD) considerably extends the possibilities for using PCM Moineau™ pumps compared with fixed speed operation.



The frequency converter makes it possible to:

- extend continuous speed adjustment,
- save energy by adapting and optimising the process,
- adjust the speed for better control of the flow rate,
- configure programmable acceleration ramps for a gradual start or stop. Beneficial for the drive system and the pumped fluid, this prevents water hammer in the pipework and the pump.

2.5.4.4. Technical characteristics of variable frequency operation

Three-phase asynchronous motors supply a torque that is at its maximum at the nominal frequencies and voltages of the network to which it is connected.

Motors powered via a Variable Speed Drive (VSD) generally operate over a range of 10 to 80 Hz as shown by the graph below:

They supply a constant torque up to 50 Hz (or the nominal frequency), and then operate at constant power. The torque available thus decreases in proportion to the increase in speed.

2.5.4.5. Torque of an asynchronous motor in relation to drive frequency

For continuous operation at a **frequency of less than 25 Hz**, it is preferable to fit the motor with forced ventilation to avoid the risk of overheating and significant power loss.

For continuous operation at a **frequency of up to 80 Hz**, the motor power is chosen according to the torque available at 80 Hz.

The gearmotors powered by a Variable Speed Drive (VSD) and selected by PCM are selected to supply enough torque to start up and operate under the predefined conditions of pressure, viscosity and temperature.

2.5.4.6. Choice of the Variable Speed Drive (VSD)

The Variable Speed Drive chosen to power a PCM Moineau™ pump must:

- enable operation at a constant torque,
- be designed according to a characteristic at 50 Hz (or the nominal frequency),
- be sufficiently powerful to supply the start-up torque as a peak level and supply the pump in operation,
- supply a voltage compatible with the motor supplied by PCM,
- supply enough current to achieve the required torque,
- have electrical protection compatible with the characteristics of the installed motor.

Refer to the variator supplier's installation instructions and contact PCM customer services to validate your installation.

2.6. Equipment Installation

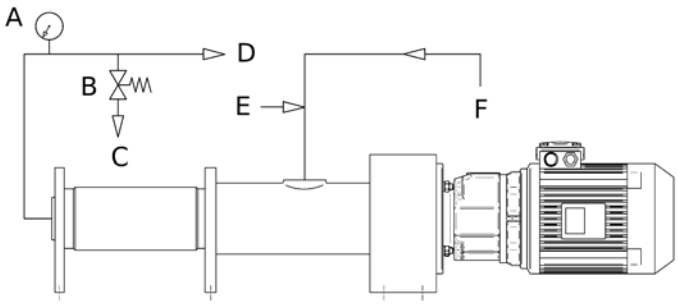
All PCM Moineau™ A series pumps are inspected in our workshop before dispatch.

2.6.1. Installation precautions

Always wear personal protective equipment (at least shoes, gloves, goggles/mask and ear defenders) when working on or near the pump.

It is important to leave enough space around the pump to allow access for maintenance and adjustments. Avoid installing the pump in a location where the ambient temperature might not be within the operating temperature limits of the pump (refer to the technical description in Appendix). For an outdoor installation, it is advisable to provide shelter above the equipment, and protection against freezing.

WARNING: the pump must be installed horizontally (unless a specific assembly request was made when ordering).



It is also recommended that you install a removable fitting for ease of servicing the entire pump motor unit. The pump must not support the weight of the pipework.

A safety valve or pressure switch and a pressure gauge located at the discharge will give protection and allow the pump's operating characteristics to be monitored. A dry running protection probe will protect the pump when there is a shortage of the product to be pumped. Please ask PCM about our wide selection of accessories to suit your requirements.

2.6.1.1. Tips for Optimum Pump Operation:

- Preferably the pump should have have a flooded suction.
- Place the pump as close as possible to the suction point.
- If a valve is present in the circuit, it is ESSENTIAL to provide a safety valve or pressure switch.

Without protection on the circuit, a valve at the discharge is often the cause of operating errors leading to damage to the pump or pipework, and presents a danger to personnel and equipment nearby.

A: Press. gauge &/or press. switch. B: Pressure Relief Valve (PRV). C: Return to tank or drain. D: To process. E: Dry running protection probe. F: From storage tank.

2.6.2. Pipework connections

An easily removable component should be installed on the stator end side. This allows the stator and then the rotor to be removed easily for maintenance, without removing the whole pump from its mounting location.

The weights of the pipes must not be supported by the pump. The allowable torques and forces on the fittings are given in "Build Specifications" section.

2.6.3. Pump position

The pump and its drive mechanism must be securely fixed to an adequately sized concrete plinth using screws and rawl plugs or anchor bolts. The unit shall be placed on a flat surface so that the body and the stator ports are maintained on the installation plane. If necessary, use shims to ensure that the unit is stable.

When mounting on feet, the pump must be installed horizontally. Each foot must be in contact with the ground and fixed down to ensure proper stability of the unit.

The pump equipped with a bearing must be secured to a rigid baseplate and aligned with its drive by a coupling system. The pump, mounted by PCM on a baseplate with its motor assembly, is aligned in our workshop, but the alignment must also be checked after final installation (sealing, anchoring, etc.). To do this, remove the coupling guard, and check that the alignment characteristics comply with the manufacturer's instructions (refer to the specific instructions in the Appendix).

2.6.4. Connecting the dynamic sealing system (cartridge type)

PCM Moineau™ A series pumps are designed to operate solely with single or double mechanical seals.

It is important to ensure that the components of the equipment are kept as clean as possible and are protected from damage under all circumstances.

The performance characteristics of the equipment depend on its environment and the operating conditions to which it is subjected. You should therefore consider that the time spent checking the environment before installation can help to prevent premature failure and can therefore reduce equipment maintenance costs.

All handling must be done with the greatest care to protect the seal, which must not be subject to impact. An effective seal essentially depends on how carefully the mechanical seal is installed.

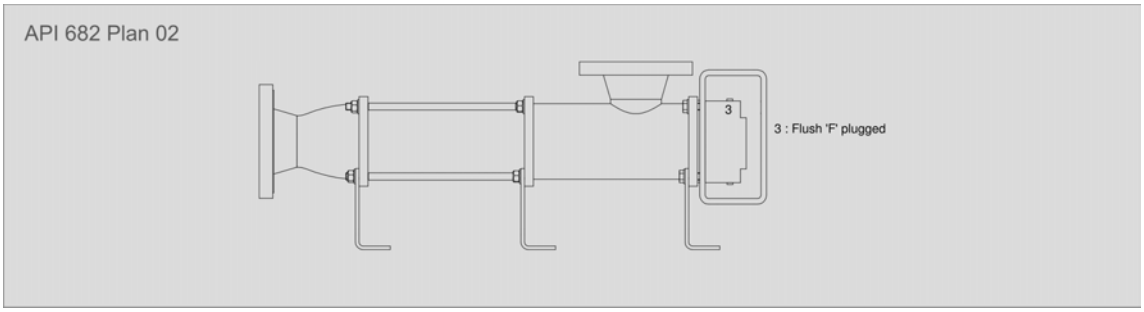
Before installation begins, ensure that all the parts to be installed are clean and that the products to be used are compatible with the seals.

You must also check that the O-rings have no trace of cuts, to avoid damaging the O-rings on assembly.

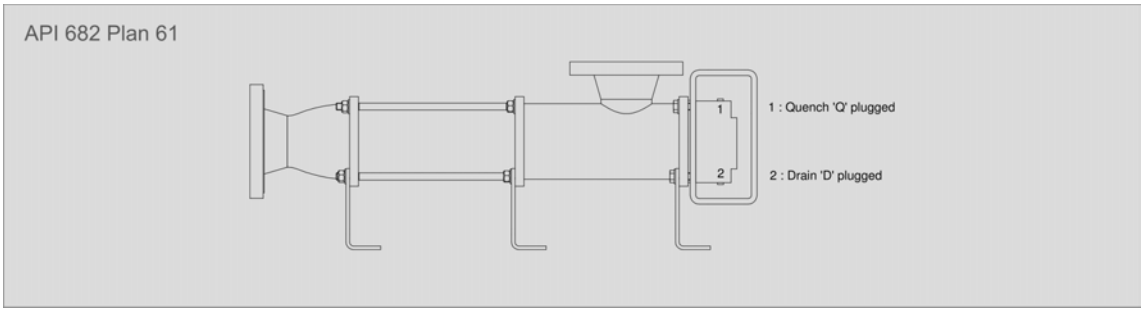
Ensure that there are no knocks or marks on the bearing surfaces of the O-rings, and eliminate any imperfections or scratches.

Carefully clean and examine the bearing surface and the bore of the cartridge.

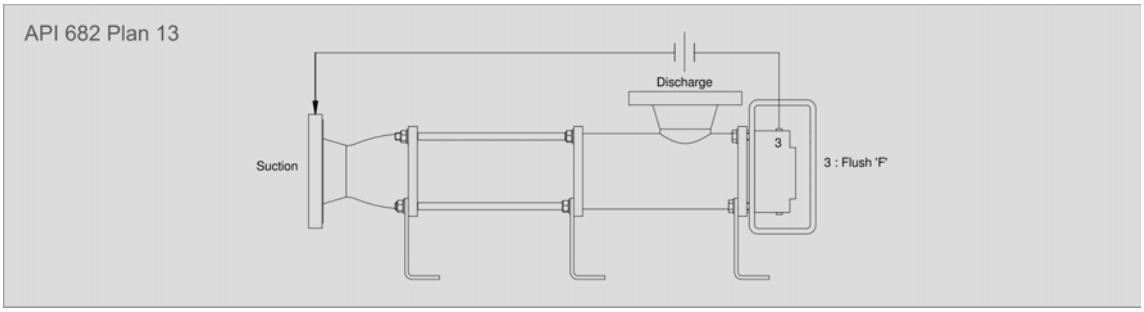
2.6.4.1. Single mechanical seal



The friction surfaces are lubricated by the pumped product.

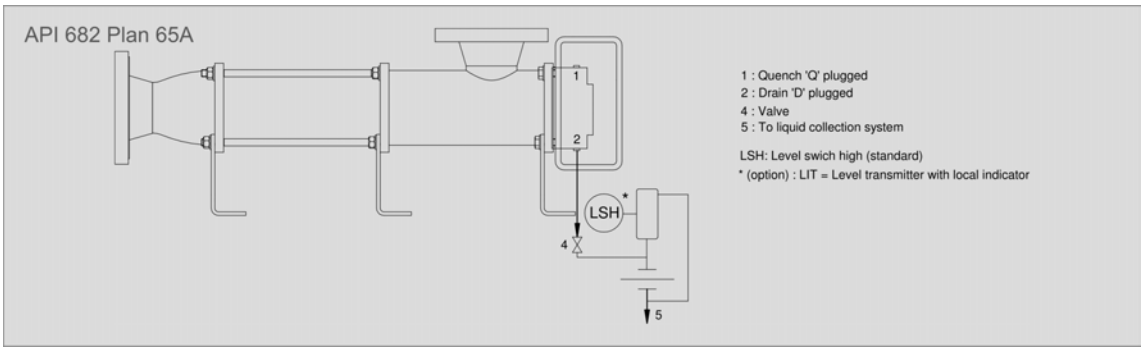


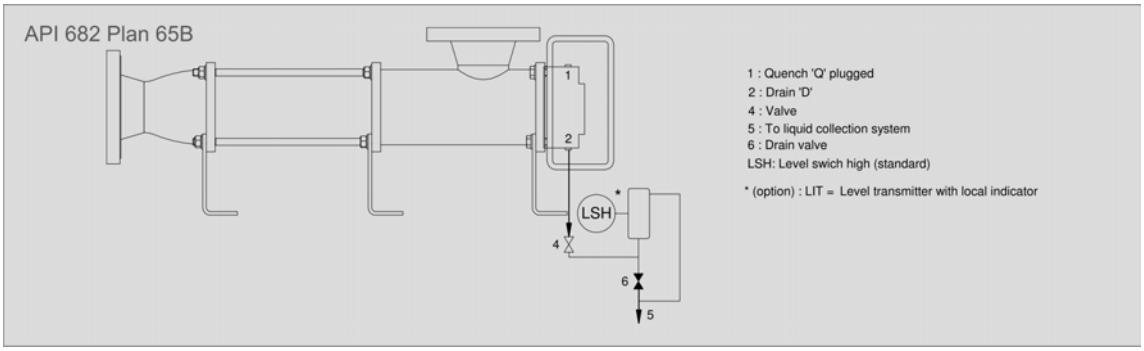
Mechanical seals can be used according to different sealing plans. These plans are described in the API 682 standard. The usual configurations are described below.



WARNING: the sealing plan connection must be carried out by qualified personnel.
The auxiliary lubrication system must be clean and filtered (if applicable).
Installation must be performed under the best conditions of cleanliness.

API 682 Plan 02/61 (as standard) Dead end seal chamber. Note: this type of arrangement is not suitable for vertical mounting of the pump.

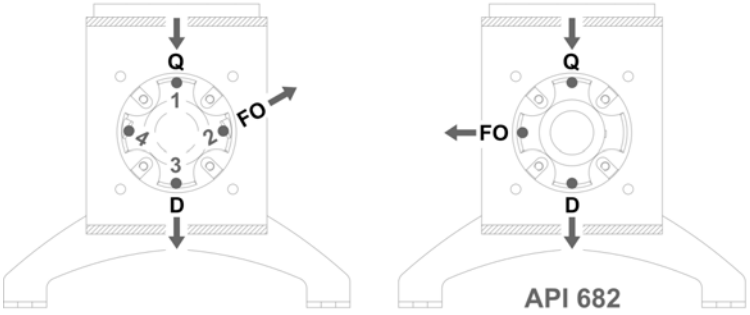




API 682 Plan 13 (optional) Recirculation from pump seal chamber through a flow control orifice and back to the pump suction. This type of arrangement is suitable for vertical mounting of the pump.

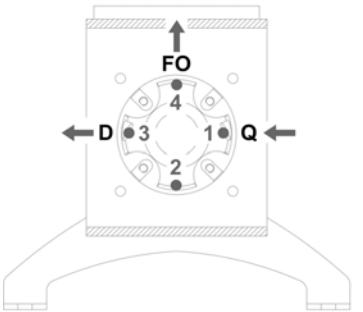
API 682 Plan 65A or B (optional) Detection of any leak in the mechanical seal via an alarm system. For the assembly and installation of the lubrication system, see the specific instructions supplied with the associated lubrication system.

Note: a plan 13 can be combined with a plan 65A or B.



Other configurations are possible on request. For any changes of sealing plan, contact PCM.

2.6.4.1.1. Seal orientation



The diagrams below show the position of the orifices depending on the chosen sealing plan.

The seals are shown seen from the motor in the direction of the pump.

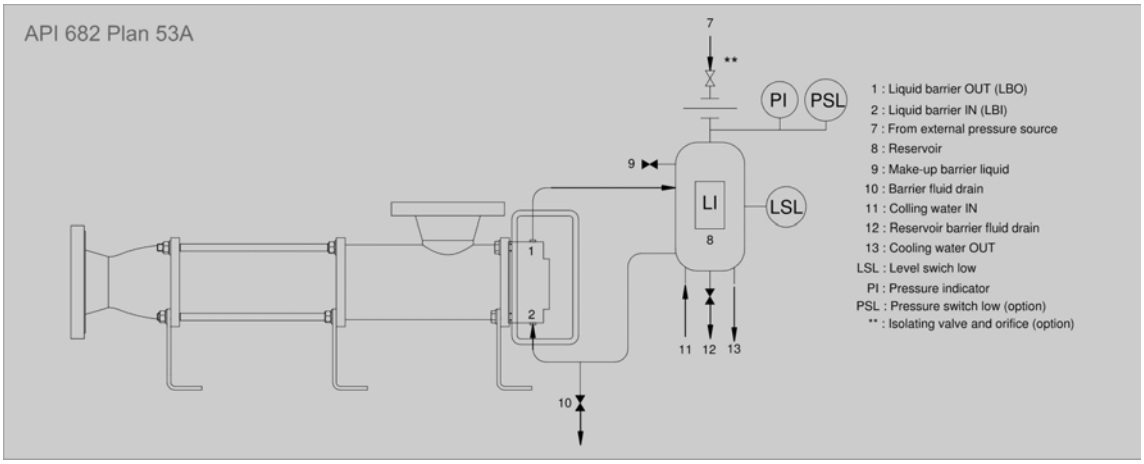
Plan 02/61/13:

Plan 65:

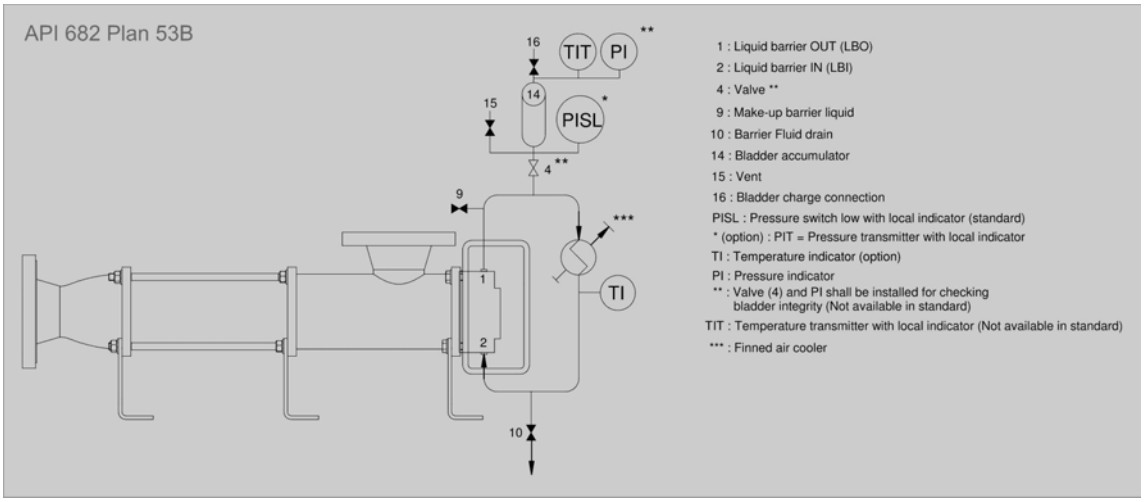
2.6.4.1.2. Fitting

The connections are of type 3/8" NPT on all the seal orifices.

The unused connections are closed off using metal plugs supplied with the pump.



2.6.4.2. Double mechanical seal

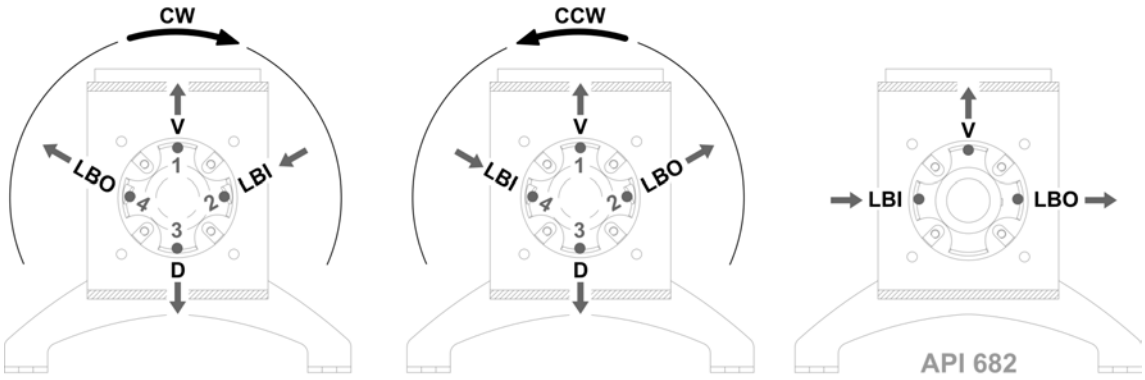


Double seals for PCM Moineau™ A series pumps are designed to operate solely with a barrier fluid such as oil or glycol and water.

The usual configurations are API plan 53A and API plan 53B. These systems are described in the API 682 standard.

WARNING: the sealing plan connection must be carried out by qualified personnel.
The auxiliary lubrication system must be clean and filtered (if applicable).
Installation must be performed under the best conditions of cleanliness.

API 682 Plan 53A or 53B Supplied with barrier fluid from a pressurised tank.



For the assembly and installation of the lubrication system, see the specific instructions supplied with the associated lubrication system.

2.6.4.2.1. Seal orientation

The diagrams below show the position of the orifices depending on the chosen sealing plan.

The seals are shown seen from the motor in the direction of the pump.

Plan 53A or 53B

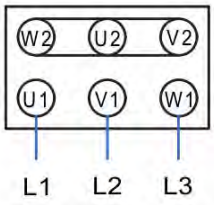
CW: seen from the motor, the rotor turns clockwise. CCW: seen from the motor, the rotor turns counter-clockwise.

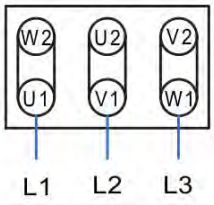
2.6.4.2.2. Fitting

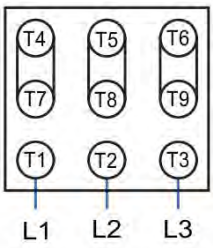
The connections are of type 3/8" NPT on all the seal orifices.

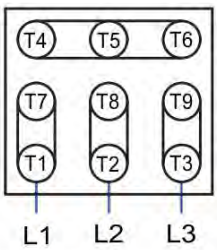
The unused connections are closed off using metal plugs supplied with the pump.

2.6.5. Motor connection

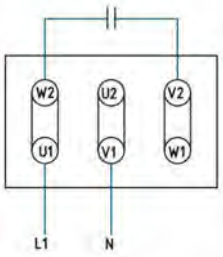


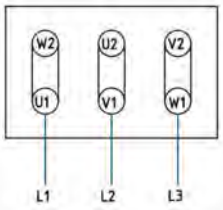


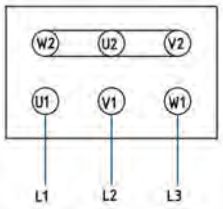




WARNING: All procedures must be performed by qualified personnel. PCM declines all responsibility if this requirement is not fulfilled. Before performing any connections, ensure that the electrical power supply has the characteristics listed on the motor plate. There is also a wiring diagram in the motor terminal box (see also the instructions in the Appendix).







For thermal protection, the setting value is the current indicated on the motor.

When all connections have been made, the motor should be run at low speed for a few seconds (if possible using a mechanical or frequency variator) in order to check the sense of rotation as indicated by the arrow marked on the pump.

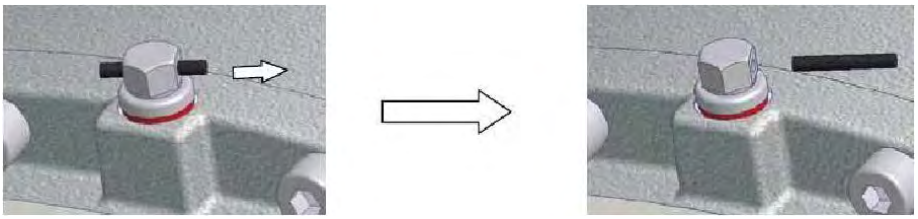
WARNING: Pumps do not tolerate dry running.

2.6.5.1. Examples of wiring diagrams

Device	Configuration	Diagram
Three-phase IEC motor	Y connection High voltage	
	Δ connection Low voltage	
Three-phase NEMA motor	Y connection High voltage	
	YY connection Low voltage	

Device	Configuration	Diagram
Forced ventilation	Single-phase operation Steinmetz connection 230V - 277V 50 + 60Hz	
	Three-phase operation Δ triangle connection 220V - 290V 50Hz 220V - 332V 60Hz	
	Three-phase operation Y star connection 380V - 500V 50Hz 380V - 575V 60Hz	

3. Operation



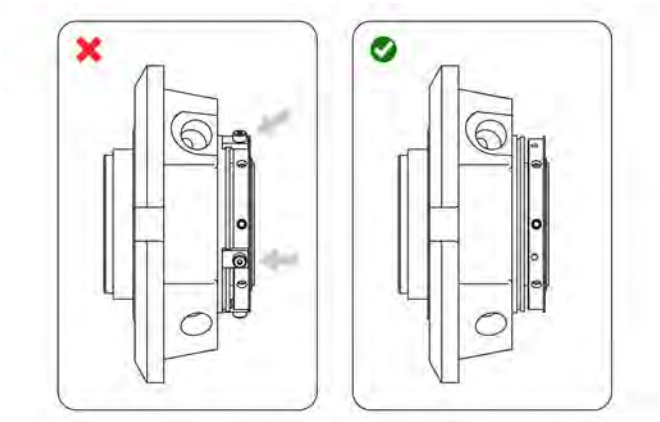
3.1. Commissioning

Always wear personal protective equipment (at least shoes, gloves, goggles/mask and ear defenders) when working on or near the pump.

3.1.1. Before start-up

Ensure that:

- The motor and baseplate are grounded (earthed).
- The electrical connections are correct and their arrangement does not lead to supplementary risks (falls).
- The gearbox has been filled with lubricant to the correct level.
- The motor has been filled with lubricant to the correct level.
- The gearbox screw (or vent valve where relevant) has been correctly installed and activated.



Activation of the vent screw

Installation of the vent valve

NOTE: for the positioning, see the drive instructions in the appendix.

- The product to be pumped is present in the tank and the pump body.
- The mechanical seal is connected to its sealing plan.
- The mechanical seal is vented (if used in a vertical installation or with a barrier fluid).
- The spacers (shown by the arrows on the diagram below) have been removed from the mechanical seal and conserved for maintenance operations.

- All valves installed upstream and downstream from the pump are open.
- The temperature and type of product to be pumped are correct.
- The alignment of the coupling has been checked.
- The screws are tightened to the right torque for their diameter.
- The direction of shaft rotation corresponds to the desired direction of pumped fluid flow.

Also follow the motor manufacturer's instructions (supplied in the appendix).

3.1.2. Start-up

WARNING: Never allow the pump to run dry!

To prevent dry running, PCM can supply a dry run protection system.

If the pump is not primed, you are advised to fill the pump body by hand. If the pump is temporarily not primed, the small amount of liquid remaining in the pump is enough to lubricate the stator until the next priming.

During the first few minutes of operation, check the following:

- The liquid being pumped reaches the end of the discharge pipe.
- The pump is not vibrating abnormally.
- No unusual noise.
- Sealing system functioning well.
- Check that the pressure stabilises, if a pressure gauge is installed.
- No abnormal heating of the stator or sealing system.

Check that the parameters (speed, flow rate, pressure, viscosity, and temperature) match the design parameters of the pump.

Note: it is normal for a fine black powder to form behind the mechanical seal. This is due to wear of the fix throttle bushing in the first moments of operation.

WARNING: If the values are not those indicated, consult your PCM service centre.

3.2. Normal operating procedure

The pump and its drive system can reach significant surface temperatures.

Always wear personal protective equipment (at least shoes, gloves, goggles/mask and ear defenders) when working on or near the pump.

3.2.1. Start-up procedure

Before each start-up, check the following:

- Fluid present at suction.
- Valves open on the suction and discharge pipes.
- Correct temperature of the product to be pumped.

Start the pump.

3.2.2. General Operating Precautions

During operation, ensure that:

- The pump is continuously supplied with product and power.
- The discharge pressure remains stable and below the maximum capacity of the pump.
- The temperature of the product being pumped remains within the operating limits.
- The operating instructions in force at the production site are observed.

3.2.3. Shutdown Procedure

This shutdown procedure depends on the type of product being pumped. Refer to the specific characteristics on the technical description (see Appendices).

The shutdown procedure is therefore defined by the process.

Nonetheless, the minimum procedure is to switch off the pump, then close the suction and discharge valves.

WARNING: for a product which settles, clean the pump using a suitable product in order to enable the pump to be restarted without damage. .

It is important to protect the pump against water hammer, which could destroy the equipment and cause a risk to staff and other equipment nearby.

3.2.4. Operating Procedure in the Event of an Incident

In the event of operating irregularities, such as:

- Pump does not start.
- Pump does not prime itself.
- Flow rate too low or irregular.
- Pump stops.
- Pump is not delivering.
- Pump is abnormally noisy.

Proceed as follows:

- Shut down the pump according to the shutdown procedure (see page 25).
- Hydraulically isolate the pump (suction, discharge).
- See "Troubleshooting" section (see page 43).

3.2.5. Automatic control

It is advisable to use devices that automatically control the operation of the pump.

Examples: pressure switch, valves with electrical position contact, dry running protection probe.

4. Maintenance

4.1. Spare parts list

For the list of spare parts for your pump, contact the PCM service centre, giving the serial number of your equipment. This number is shown on the manufacturer identification plate.

You can ask us to repair your pump. Within three days of receiving it, we will supply a quotation showing the cost of the overhaul and how long it will take to do.

PCM service centre address:

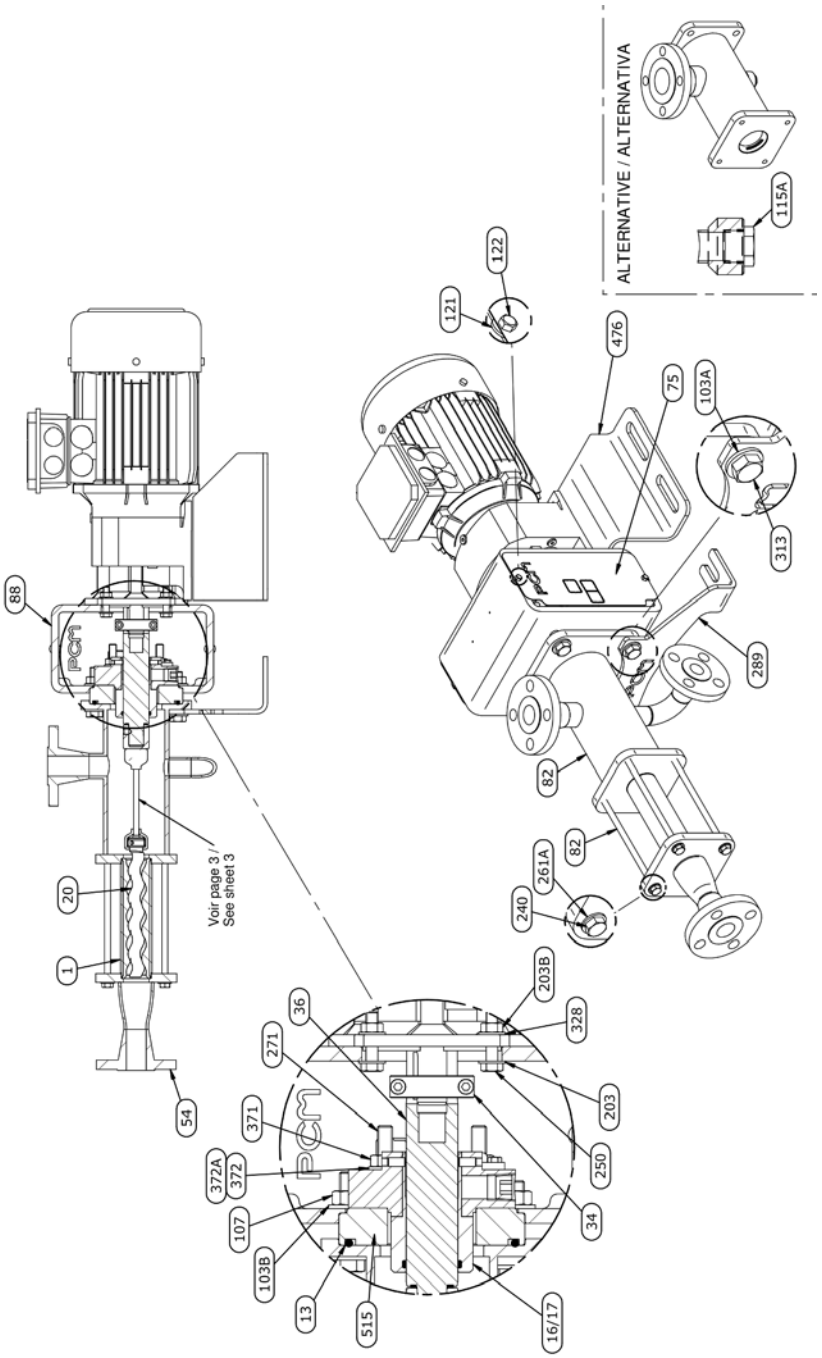
PCM – Rue René Moineau – 49123 Champtocé-sur-Loire – France

Phone: +33 (0) 1.77.68.31.00 – contact@pcm.eu

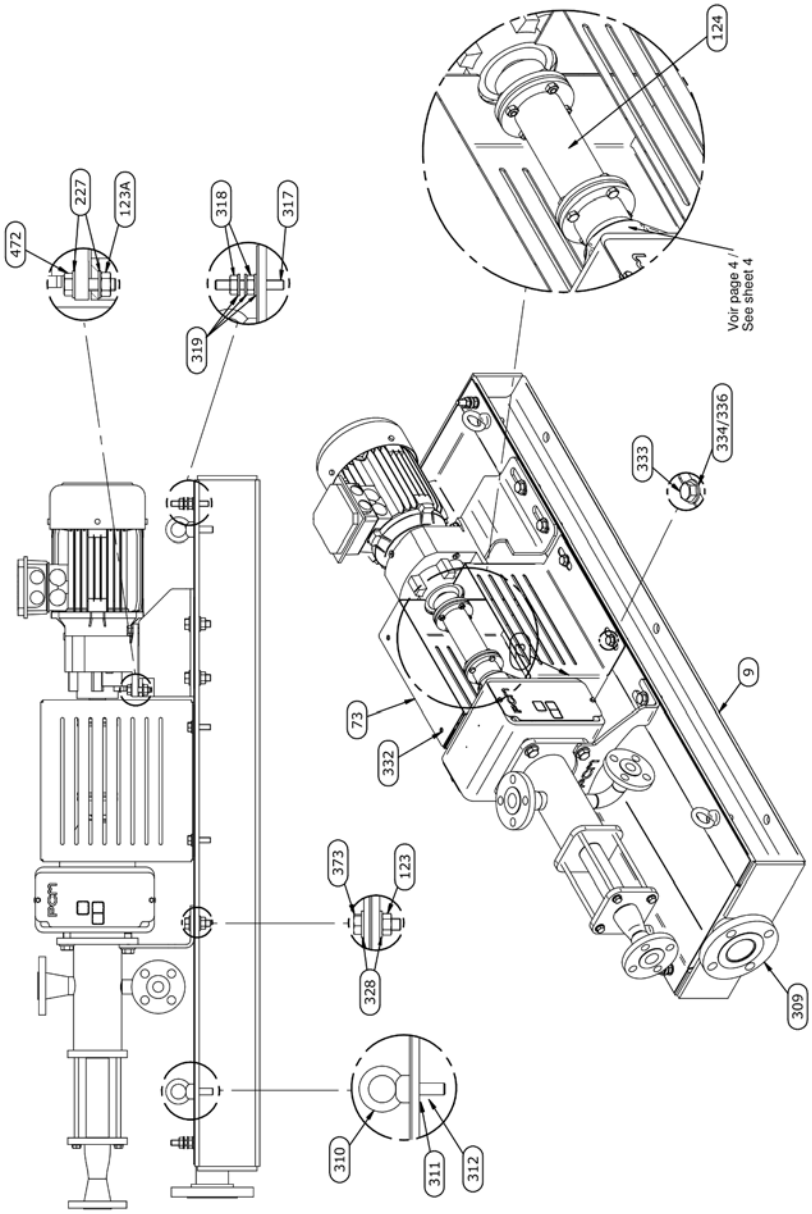
PCM USA Inc. – 11940 Brittmoore Park Drive – Houston, TX 77041 – USA

Phone: +1 713-896-4888 – contact@pcm.eu

PCM China – Unit 10A01, Shanghai Mart, No. 2299 – Ya Nan West Road, Shanghai, China 200336



Phone: +86 21 6236 2521 – contact@pcm.eu



PCM MIDDLE EAST FZE – Office N° 741 – Building 5, East Wing, Block B – Dubai Airport Free Zone – PO Box 293527, Dubai – United Arab Emirates

Phone: +971 42 04 58 48 – contact@pcm.eu

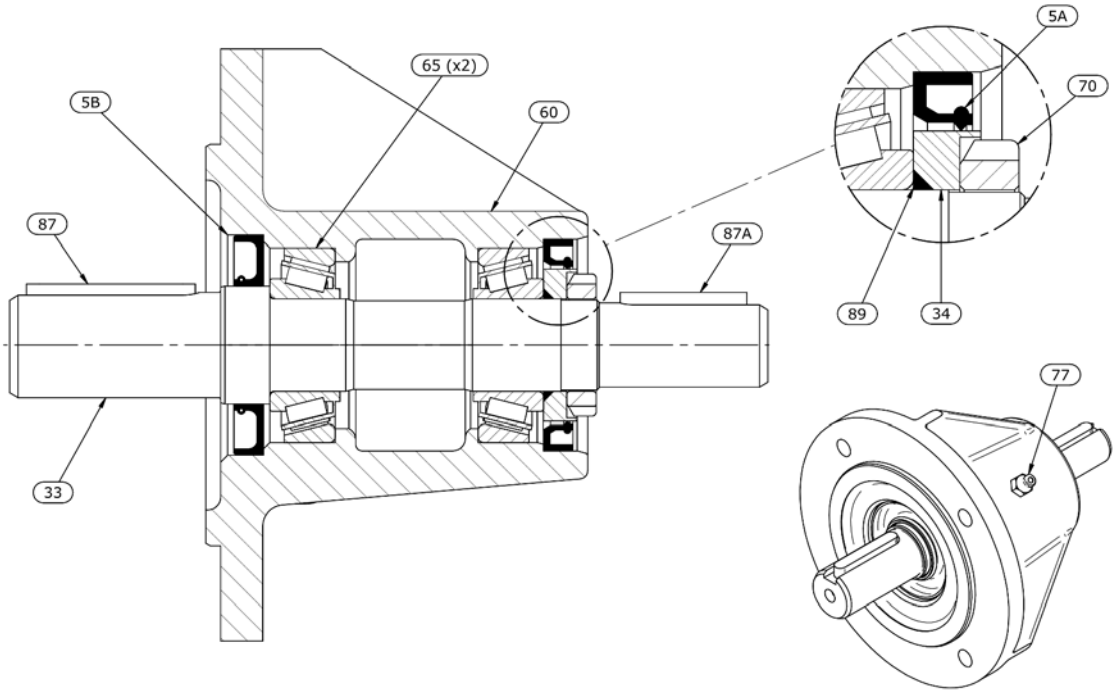
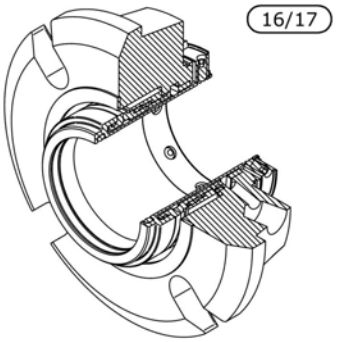
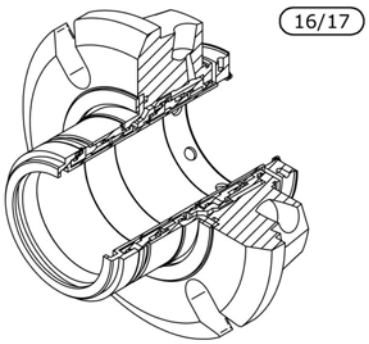
4.3. Rod assembly



4.3.1. Models 003A24, 05A12, 05A24, 1A12



4.3.2. Models 1A36, 3A12, 6A6, 6A12, 6A24, 13A6, 13A12, 25A6, 25A12, 13A24, 25A24, 40A6, 40A12, 60A6



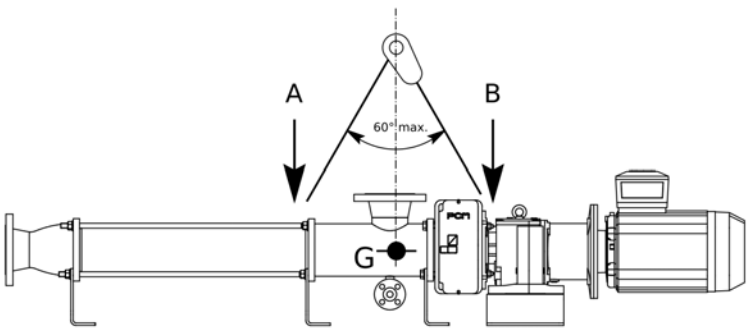
4.4. Bearing

4.5. Sealing by single mechanical seal

4.6. Sealing by double mechanical seal

4.7. Handling Equipment and Procedure

WARNING: To handle the complete pump, refer to the procedure in force and comply with legislation concerning the safety of personnel. Slinging must be performed by trained, qualified personnel in accordance with the instructions given in this manual. Any failure to observe this rule releases PCM from all responsibility.
Before lifting the pump, ensure that all its components are securely fastened to each other. Do not sling with a single sling or an endless sling that can slip on the lifting hook.



Always wear personal protective equipment (at least shoes, gloves, goggles/mask and ear defenders) when working on or near the pump.

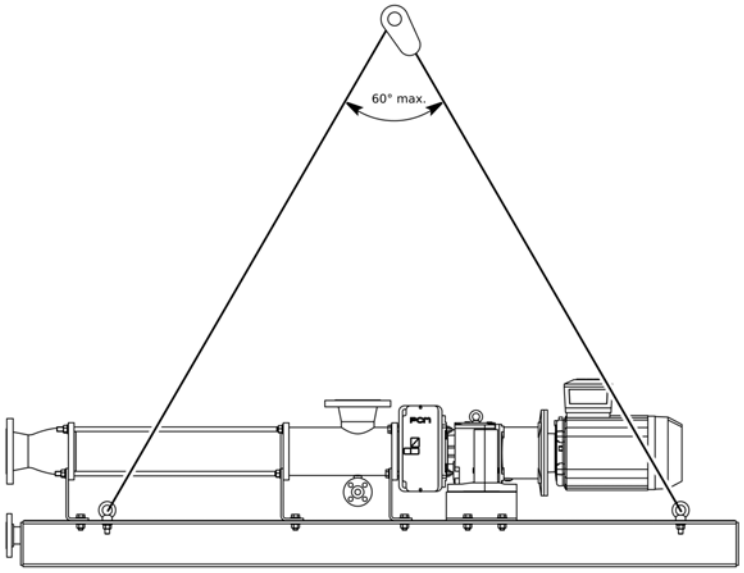
4.7.1. Monobloc pump with no baseplate

Use two single slings working in a loop on the stator (A) and the motor unit (B), while using a lining to protect the slings from sharp edges.

The hoisting rings that may be present on the motor unit (gearmotor, motor or gearbox) should not be used to lift the pump.

If the motor is equipped with an IEC or NEMA adaptor, do not attach the slings to the motor or the adaptor attach them to the gearbox.

Use a protective thimble or a sliding hook where the loop is situated. The max. loads on the pump units are available in the appendix.

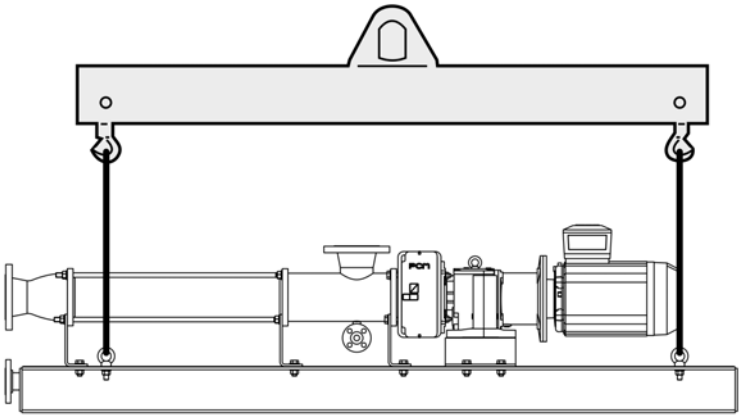


Use an adjustable sling with an adequate working load limit (WLL)[1]. Perform the adjustment with a series of tests to place the centre of gravity (G) of the load vertically below the hook (with latch), or position two slings of different lengths by attaching the shorter one on the heavier side so that the centre of gravity (G) of the load is positioned vertically below the hook (with latch).

The parts of the pump that cannot be handled may be lifted using a hoist and slings (or any similar lifting equipment). Metallic slings (chain, cable, etc.) are not recommended. Fragile parts must be handled with particular care to avoid impact. After removal, they must be laid in a stable position on wooden blocks, and protected from shocks.

4.7.2. Pump with baseplate

The motor must be wedged during all transport and handling (e.g. using a wooden wedge between the motor and the baseplate).



Always use the four dedicated hoisting rings on the pump baseplate.

1. WLL: Maximum allowable mass (kg) that can be hung vertically from the sling in normal use

The use of a lifting beam is recommended in the following cases:

- Long pumps
- Motor terminal box located laterally, on one side of the motor.

4.8. Storage conditions

4.8.1. General storage recommendations

Every two months, turn the pump through four or five revolutions using the fan or the bearing shaft. Check all visible machined surfaces, lubricating them with universal grease if necessary (flange bearings, bearing shafts, gearbox shaft etc.).

Protect the bearing, motor and coupling against sand, gravel and other foreign bodies (bearing pumps only).

Note: exposure to light and temperatures below 0°C or above 40°C are likely to damage elastomer parts (sheaths, seals, stator).

4.8.2. In PCM standard packaging

Pumps and pump parts must be stored in their original packaging, in a stable position, protected from impact and in a dry location.

The maximum storage temperature is +40°C.

4.8.3. In Packaging according to S.E.I. 4c

Pumps and pump parts must be stored in their original packaging, in a stable position, protected from impact and bad weather.

Every six months:

- Replace the desiccant pouches.
- Check machined surfaces, and lubricate if necessary,

Close the packaging carefully to avoid any water ingress.

4.8.4. After Unpacking

- Protect the equipment from impact, dust and humidity.

WARNING: In the event of prolonged storage, ensure that elastomer parts do not swell, crack or become sticky to the touch. If this occurs, change these parts before starting the pump.

4.9. Specialist Tools

No specialist tools.

Straight-jawed pliers would be useful for the installation and removal of the collars (127/127A).

4.10. Rules on preventive maintenance operations

WARNING: All servicing must be carried out by trained, qualified personnel in accordance with the instructions given in the present manual.
Any failure to observe this rule releases PCM from all responsibility.
Before performing any maintenance operations on the pump, check that all necessary precautions have been taken: upstream and downstream valves closed, pipework cleaned and purged, electrical power supply disconnected and disabled. Check also that all the usual precautions have been taken in accordance with the regulations in force regarding the safety of personnel.

4.11. Periodic Inspection

If the equipment is used daily, the following should be checked:

- Complete leak tightness of the pump (once a week).
- Tightness of the assembly mounting hardware (port, stator, body, spacer, drive) (once a month).
- Level of lubricant in the drive, if applicable (once a month).
- Anchoring (once a year).
- Motor current and cleanliness of drive ventilation grid (once a month).
- Condition of power supply electrical ducts (once a year).
- Alignment of the coupling for bearing pumps (once a year).

4.12. Cleaning

Always wear personal protective equipment (at least shoes, gloves, goggles/mask and ear defenders) when working on or near the pump.

4.12.1. External cleaning

Remove any dirt that could damage the paint and corrode the pump.

4.12.2. Internal cleaning

Cleaning procedures and frequency depend on the specific application of the pump, and the product being pumped. In any case, the minimum procedure is described below.

With the pump running, feed in the cleaning product that is compatible with the pumped product and pump materials at the suction end.

Cleaning time is defined according to the process using the pump. When this time has expired, shut down the pump according to "Shutdown Procedure" section of the chapter "Normal Operating Procedure" (see page 25).

4.13. Lubrication

The gearmotor, the bearing (if applicable) and the shaft line are supplied lubricated. Check the levels before putting the pump in service.

Consult the manufacturer documentation supplied in Appendix for the precautions to be taken when lubricating the gearmotor, where applicable.

The following table indicates the recommended lubricants to be used when servicing the pump:

Component to be lubricated	Recommended lubricant	Supplier
Gearbox shaft / drive shaft (36) or sleeve (36A) connection	GERALYN 2 grease	FUCHS LUBRITECH
Drive shaft (36) / gearbox shaft or sleeve (36A) connection	GERALYN 2 grease	FUCHS LUBRITECH
Gearbox shaft / sleeve (36A) connection	GERALYN 2 grease	FUCHS LUBRITECH
Sleeve (36A) / drive shaft (36) connection	GERALYN 2 grease	FUCHS LUBRITECH
Drive shaft (36) / drive (E) connection	GERALYN 2 grease	FUCHS LUBRITECH
Drive (E) / rotor (20) connection	GERALYN 2 grease	FUCHS LUBRITECH
Roller bearings (65)	AVIATION N°10	ELF
	UPTON 400	LABO
Stator (1) (for assembly)	GLYCERINE	

For the **sheathed connections**, the lubricant quantity required for each sheath depends on the pump model:

Model	Recommended lubricant	Supplier	Quantity per sheath
003A24, 05A12, 1A12	TOTAL AXA grease, grade 1	TOTAL	5 grams
1A36, 3A12, 6A6, 6A12, 6A24, 13A6, 13A12			30 grams
25A6, 25A12, 13A24			55 grams
25A24S, 40A6S, 40A12S, 60A6			170 grams

4.14. Thread locking

The following table indicates the recommended products to use when reassembling the pump:

Element to be locked	Recommended product	Supplier
Screws (105/105A)	LOCTITE® 243	HENKEL
Pin (271)	LOCTITE® 243	HENKEL
Nut (70)	LOCTITE® 243	HENKEL

4.15. Tightening torques

General tightening torque values for the fixing elements hardware are defined in the following table:

Screw diameter	Class 8.8 steel	Class 70 stainless steel
M4	4.1 N.m [2.95 lbf.ft]	4.1 N.m [2.95 lbf.ft]
M5	4.1 N.m [2.95 lbf.ft]	4.1 N.m [2.95 lbf.ft]

Screw diameter	Class 8.8 steel	Class 70 stainless steel
M6	10 N.m [7.38 lbf.ft]	7 N.m [5.16 lbf.ft]
M8	15 N.m [11.06 lbf.ft]	10 N.m [7.38 lbf.ft]
M10	30 N.m [22.13 lbf.ft]	20 N.m [14.75 lbf.ft]
M12	40 N.m [29.5 lbf.ft]	30 N.m [22.13 lbf.ft]
M14	65 N.m [47.94 lbf.ft]	50 N.m [36.88 lbf.ft]
M16	90 N.m [66.38 lbf.ft]	65 N.m [47.94 lbf.ft]

4.16. Troubleshooting the pump

4.16.1. Incidents and causes

Causes	Incident													Solutions (see section below)
	Pump does not start	Pump does not deliver	Pump does not prime itself	Pump stops running	Flow rate too low	Discharge pressure too low	Drive is overloaded	Pump is noisy or vibrates abnormally	Leak in shaft seal	Premature stator wear	Premature rotor wear	Flow rate is not constant	Joints deteriorate quickly	
The stator is swollen.	●			●			●			●			●	1
Rotor drive system is broken.	●	●	●	●										2
Product temperature is too high.	●		●	●			●	●		●	●		●	3
Sedimentation or precipitation of the fluid in the pump body	●	●	●	●			●	●		●	●		●	4
The solid bodies contained in the liquid are too voluminous	●	●		●			●			●	●		●	5
The electrical installation is not compliant, or is faulty.	●			●	●	●	●					●		6
The devices driving the pump are worn or broken.	●	●	●	●	●	●		●				●		7
Pump is blocked by a foreign body.	●	●		●			●			●	●		●	8

Causes	Incident													Solutions (see section below)
	Pump does not start	Pump does not deliver	Pump does not prime itself	Pump stops running	Flow rate too low	Discharge pressure too low	Drive is overloaded	Pump is noisy or vibrates abnormally	Leak in shaft seal	Premature stator wear	Premature rotor wear	Flow rate is not constant	Joints deteriorate quickly	
The stator has become hard and brittle.		●	●		●	●	●	●		●	●		●	9
The stator is sectioned at its rim.			●		●	●								10
The stator is worn.		●	●		●	●		●		●				11
The rotor is worn.		●	●		●	●		●		●				12
Leak in mechanical seal.			●						●					13
Incorrect direction of rotation.			●			●								14
Product temperature is lower than expected.		●	●		●	●								15
Net positive suction head is too low NPSHa<NPSHr		●			●	●		●		●	●	●	●	16
The pump suction is drawing in air.		●			●	●				●		●		17
Speed of rotation is too low.		●			●	●								18
Pump installation location, pipework and accessories should all be checked	●	●		●	●		●	●		●		●	●	19
The pump is running dry.		●	●					●		●				20
Viscosity of the pumped product is higher than expected.		●		●	●		●							21

Causes	Incident													Solutions (see section below)
	Pump does not start	Pump does not deliver	Pump does not prime itself	Pump stops running	Flow rate too low	Discharge pressure too low	Drive is overloaded	Pump is noisy or vibrates abnormally	Leak in shaft seal	Premature stator wear	Premature rotor wear	Flow rate is not constant	Joints deteriorate quickly	
Pressure at discharge is too high.	●	●		●	●		●	●		●	●		●	22
Speed of rotation is too high.							●	●		●	●		●	23
For a new pump or new stator: excessive static tightening.	●						●							24
Shaft is damaged (according to model).		●	●		●	●			●			●		25
The roller bearings are worn (according to model).								●	●					26
Stability of pump motor unit (according to model).								●						27
A valve upstream or downstream from the pump is closed.	●	●		●	●		●	●					●	28

4.16.2. Solutions

Solution no.	Description
1	The stator material swells when in contact with the product being pumped. Check that the material and the product are those specified in the order. Otherwise contact the PCM service centre.
2	Determine the cause of failure by checking points 1, 3, 4, 5, 8, 22, and 23, and then replace the damaged parts.
3	The operating temperature limit is defined according to the stator material.
4	Clean the pump body and rinse the pump after each use.
5	Remove these bodies using a strainer, or contact the PCM service centre to obtain another pump.
6	Check the network voltage, motor connections, circuit breaker calibration, and number of phases.

Solution no.	Description
7	Replace defective parts and check the load on the drive.
8	Disassemble the pump, clean it, and replace any defective components.
9	Check that the temperature is not higher than initially planned and that the product being pumped is the intended product. If any parameters change, contact the PCM service centre to determine a different pump construction.
10	This type of damage is typically caused by overpressure. Contact the PCM service centre.
11	Replace the stator and check the condition of the rotor.
12	Determine the cause of the wear: abrasion, corrosion, cavitation. Contact the PCM service centre to define a new rotor material if necessary, and install the new part.
13	Remove the mechanical seal and replace it with a new one.
14	Change the electrical connections.
15	Contact the PCM service centre, who will recommend a tighter stator.
16	Reduce head loss in the suction pipe, lower the temperature, and raise the suction level.
17	Check the installation for leaks.
18	Contact the PCM service centre to determine the best way to increase the speed.
19	Check all pipes for obstruction by a foreign body, for a defective or improperly sealed valve, for a leaky poppet, etc.
20	Re-arrange the overall layout of the installation, or provide a dry running protection system.
21	For any viscosity change, contact the PCM service centre, who will re-calculate the parameters.
22	Measure the pressure using a pressure gauge, and compare it to the pressure stated in the technical description.
23	Contact the PCM service centre to determine the best way to reduce the speed.
24	Fill the pump, and rotate the motor fan about ten revolutions by hand.
25	Replace the shaft and the mechanical seal.
26	Remove the bearing or gearbox and replace the roller bearings and seals.
27	Adjust the feet or check the mountings.
28	Open the abnormally closed valve.

4.17. Troubleshooting the seals

4.17.1. Incidents and causes

Causes	Incident				Solutions (see section below)
	Static leak in sealing system	Dynamic leak in sealing system from start-up	Abnormal heating in seal	The seal makes an abnormal noise	
The seal is damaged	●	●			1
Incorrect assembly	●	●			2
Geometric fault in the adapter fittings	●	●			3
Poor flatness of the mechanical seal surfaces	●	●			4
Operating conditions are too harsh		●			5
Poor choice of seal		●			6
Poor lubrication and/or cooling			●		7
Poor lubrication, dry running				●	8

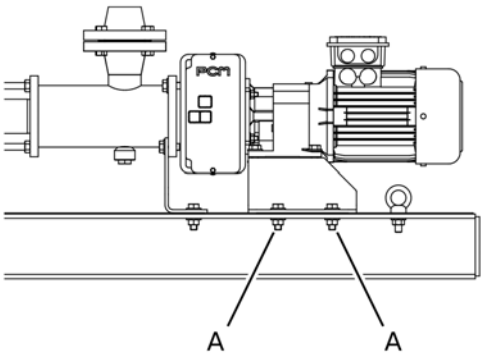
4.17.2. Solutions

Solution no.	Description
1	Check condition of seals, faces, etc.
2	(at the assembly procedure, taking care to follow the instructions.
3	Check the geometry.
4	Bed in the faces of the mechanical seal (contact your local PCM representative).
5	Check the operating conditions.
6	Review the choice of equipment to determine the most suitable seal.
7	Check the injections, sealing circuit, thermosyphon etc.
8	Restore the lubrication and pressurisation circuits. Eliminate gas pockets, etc.

4.18. Disassembling the pump (models 003A24, 05A12, 1A12)

WARNING: Before performing any maintenance operations on the pump, check that all necessary precautions have been taken: upstream and downstream valves closed, pipework cleaned and purged, electrical power supply disconnected and disabled. Check also that all the usual precautions have been taken in accordance with the regulations in force regarding the safety of personnel.
Systems connected to the mechanical seal must be disconnected before disassembling the pump.

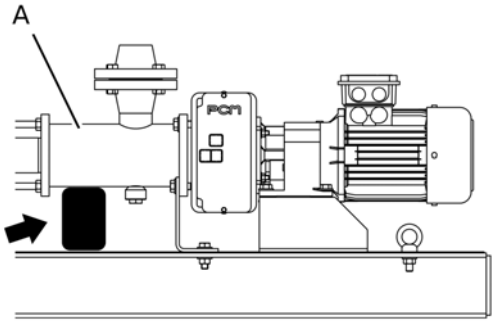
Always wear personal protective equipment (at least shoes, gloves, goggles/mask and ear defenders) when working on or near the pump.



4.18.1. Residual fluids

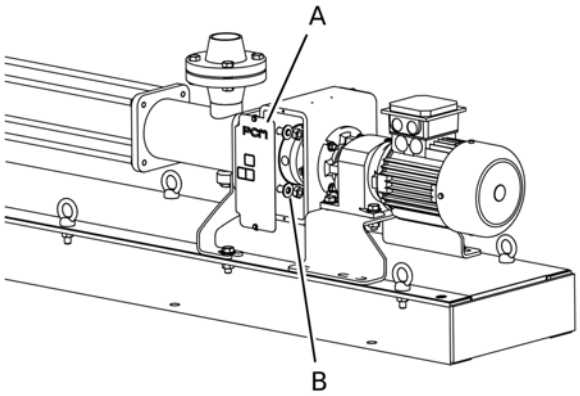
During maintenance operations, the fluid inside the pump is not fully evacuated. A certain volume of non-drainable fluid remains in the stator, with the quantity depending on the pump model:

Pump model	Fluid volume in the stator (in cm^3)
003A24	5
05A12	10
1A12	40



Take the necessary steps depending on the type of fluid present.

4.18.2. Disassembling the monobloc pump

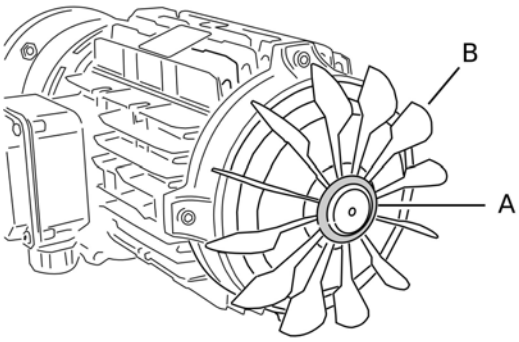


1.

Remove the motor support mounting screws (A).

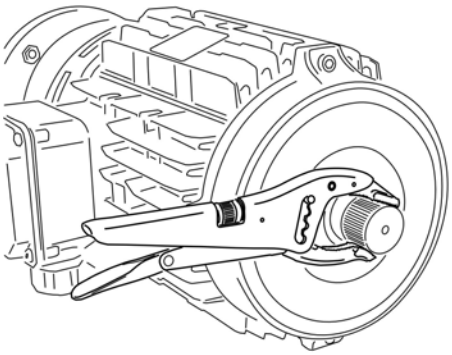
2.

Support the pump body (A) with a wedge or slings.



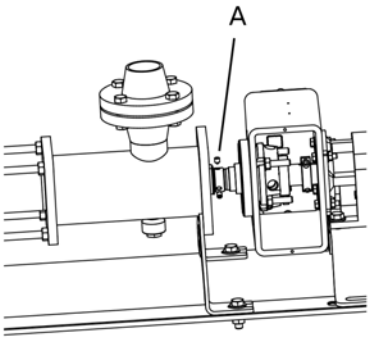
3.

Remove the two plates (A) and make sure to leave the washers on the screws.



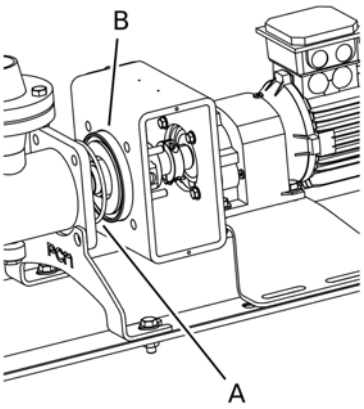
Remove any pipes connected to the mechanical seal.

Remove the four fixing screws (B) from the body.



4.

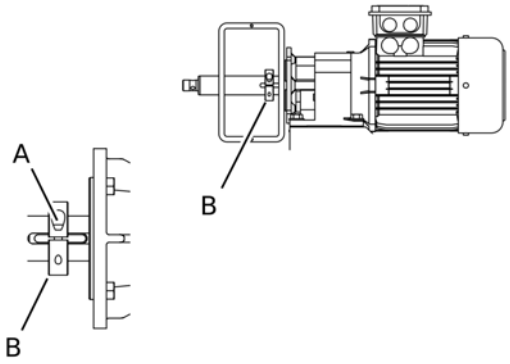
Remove the motor's protective casing, the ring (A) and the fins (B).



5.

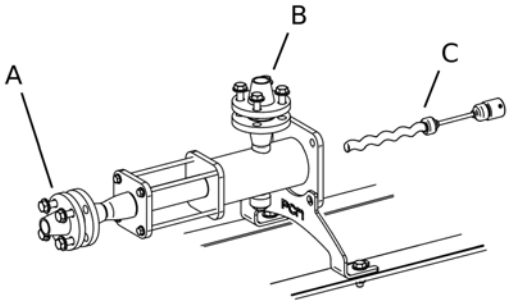
Using locking pliers, turn the shaft to pull the drive back by about 70 mm.

6.



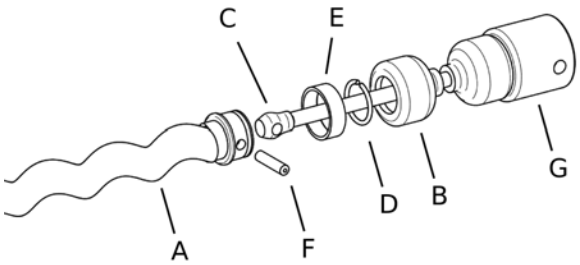
Unscrew the 3 screws (A).

7.



Remove and check the seal (A).

Remove the sealing system (B) only if it requires maintenance (removal instructions can be found in the "Removal of the sealing system" section).



8.

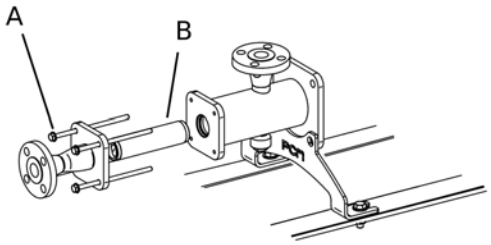
Remove the motor unit, unscrew the 2 screws (A) and remove the shaft collar (B) to remove the shaft.

9.

Disconnect the pipes (A) and (B) and remove the shaft line and the rotor (C).

10.

To release the rotor (A), slide the sheath (B) on the connecting rod (C).

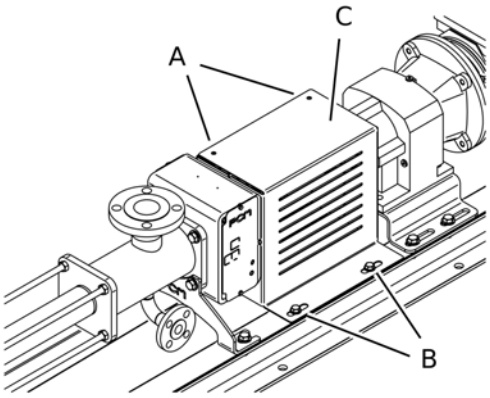


Remove any surplus grease.

Remove the circlip (D) with pliers.

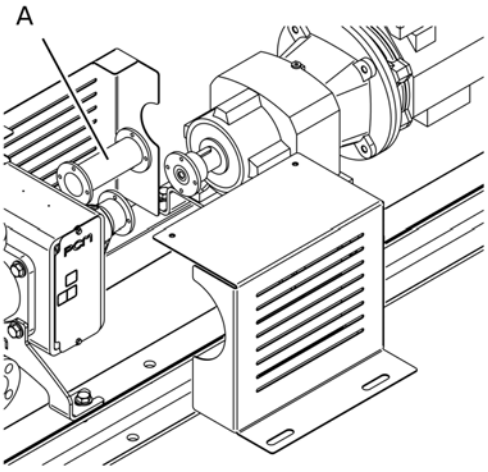
Slide the ring (E) on the connecting rod (C).

Remove the pin (F) and recover the rotor (A).



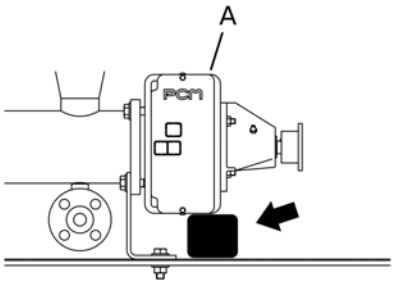
Do the same to release the drive system (G).

11.



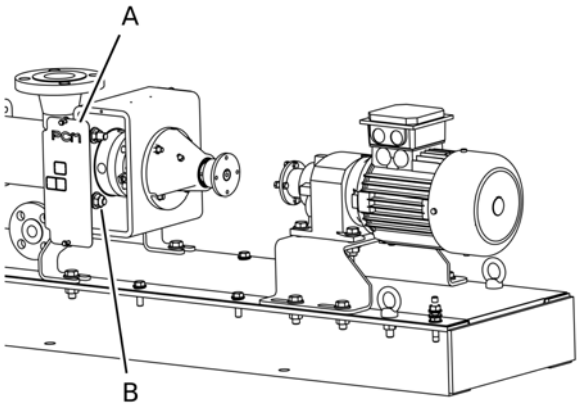
Unscrew the 4 screws (A) to remove the stator (B) and the last components.

4.18.3. Disassembling a bearing pump



1.

Remove the 2 screws (A). Remove the 4 screws (B) and the coupling cover (C).

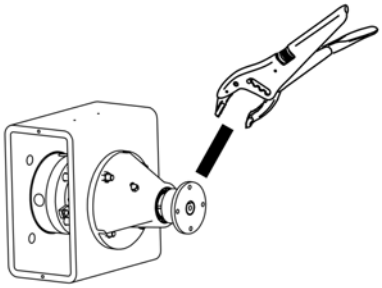


2.

Remove the coupling spacer (A) (the disassembly instructions are given in the coupling instructions).

3.

Wedge the bearing-spacer unit (A).

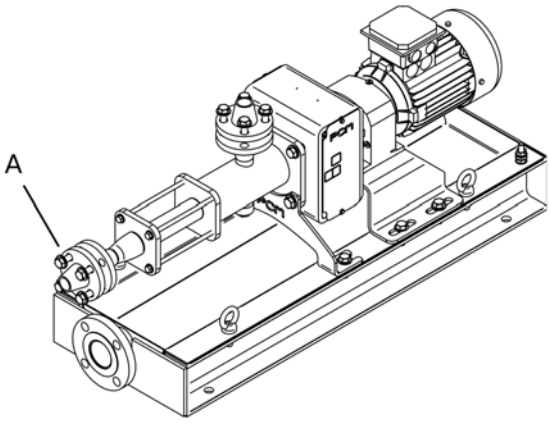


4.

Remove the two plates (A) and make sure to leave the washers on the screws.

Remove any pipes connected to the mechanical seal.

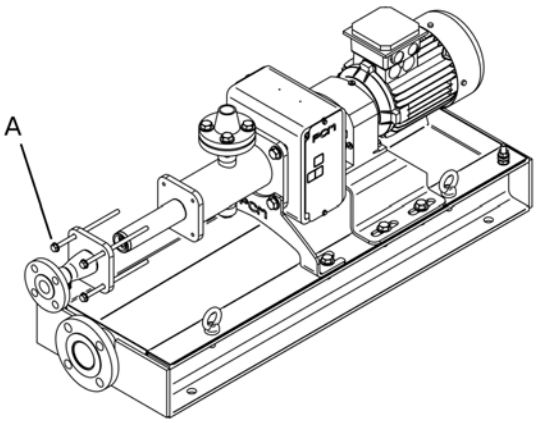
Remove the four fixing screws (B) from the body.



5.

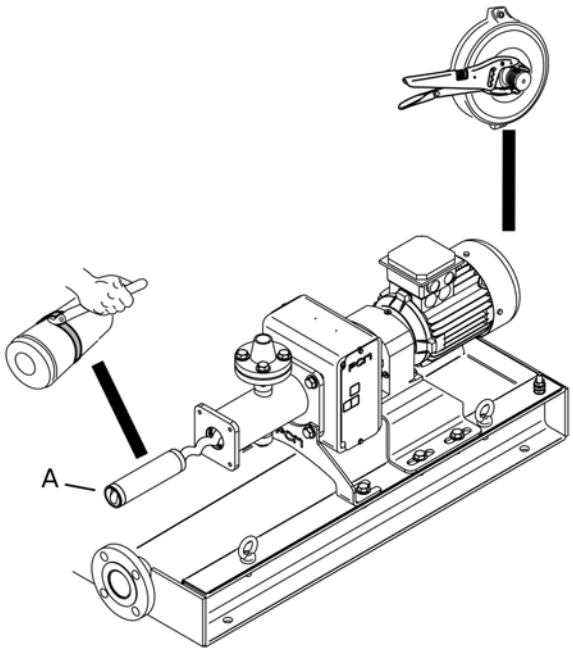
Using locking pliers, turn the hub to pull the bearing-spacer unit back by about 70 mm.

6.



Continue the disassembly from step 6 of the "Disassembling the monobloc pump" section.

4.18.4. Disassembly to change the stator



1.

Remove the pipes (A).

2.

Unscrew the 4 screws (A).

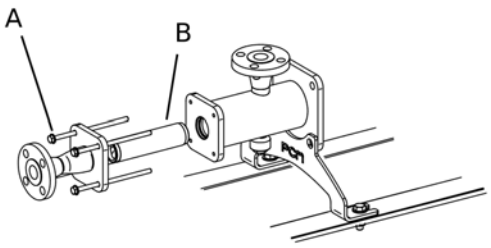
3.

Remove the stator (A).

If necessary, block the shaft line on the motor side using a plier wrench and use a strap wrench to unscrew the stator.

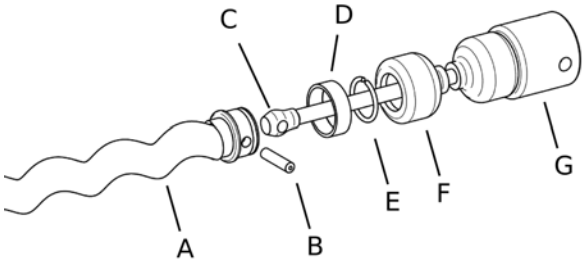
4.19. Reassembling the pump (models 003A24, 05A12, 1A12)

The pump is re-assembled in the reverse order.



Some screws are coated with LOCTITE® Freinfilet 243 (see steps mentioned below). All other screws or bearings must be covered with grease (GERALYN 2) to prevent sticking during disassembly and reassembly.

The threaded elements must be tightened as shown on page 42.

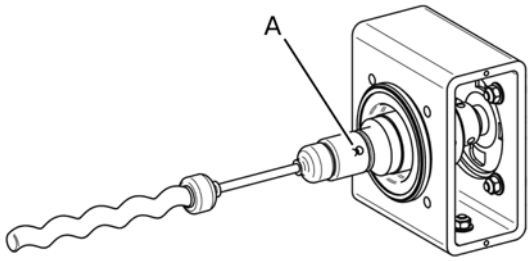


WARNING: To preserve optimum operating characteristics for the pump, it is essential to use original PCM parts only. Pump maintenance must be performed by qualified personnel only, in compliance with the recommendations in force.

Make sure to comply with the following points:

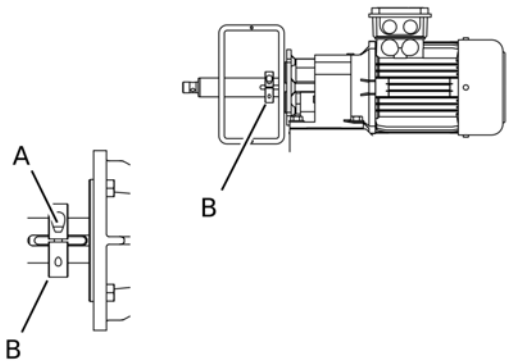
Coat the rotor and the inside of the stator with glycerine.

Fit the stator (B) and screw in the 4 screws (A).



To fit the rotor (A), insert the pin (B) through the rod (C) and the rotor (A).

Fit the ring (D) and then the circlip (E) using pliers.



Replace the sheath (F) after adding the grease.

Do the same to fit the drive system (G).

Coat the 3 conical screws (A) with Freinfilet® before screwing them in.

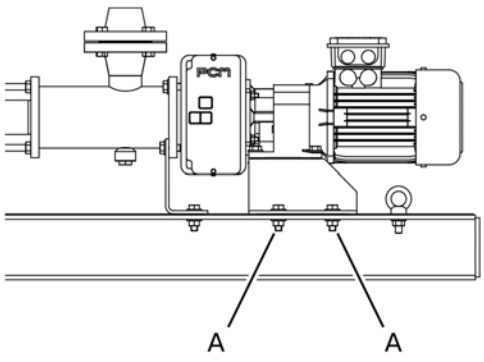
Check that the tightening torque (10 Nm) is the same for all 3 screws.

When fitting the drive shaft, ensure the shaft collar (B) is properly positioned relative to the key. Tighten the screws (A) (15 Nm) and check that they are uniformly tight.

4.20. Disassembling the pump (models 1A36, 3A12, 6A6, 6A12, 6A24, 13A6, 13A12)

WARNING: Before performing any maintenance operations on the pump, check that all necessary precautions have been taken: upstream and downstream valves closed, pipework cleaned and purged, electrical power supply disconnected and disabled. Check also that all the usual precautions have been taken in accordance with the regulations in force regarding the safety of personnel.
Systems connected to the mechanical seal must be disconnected before disassembling the pump.

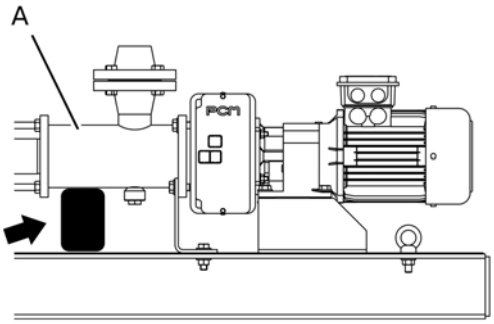
Always wear personal protective equipment (at least shoes, gloves, goggles/mask and ear defenders) when working on or near the pump.



4.20.1. Residual fluids

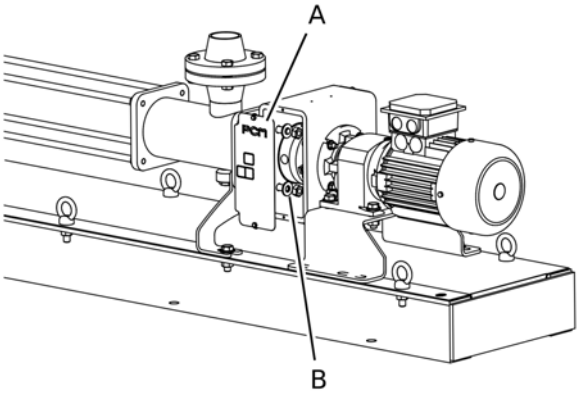
During maintenance operations, the fluid inside the pump is not fully evacuated. A certain volume of non-drainable fluid remains in the stator, with the quantity depending on the pump model:

Pump model	Fluid volume in the stator (in cm^3)
1A36	120
3A12	90
6A6	70
6A12	200
6A24	470
13A6	150
13A12	440



Take the necessary steps depending on the type of fluid present.

4.20.2. Disassembling the monobloc pump

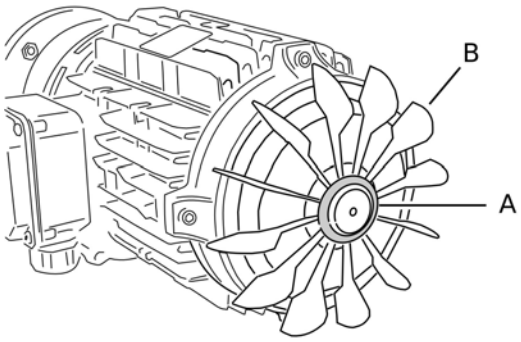


1.

Remove the motor support mounting screws (A).

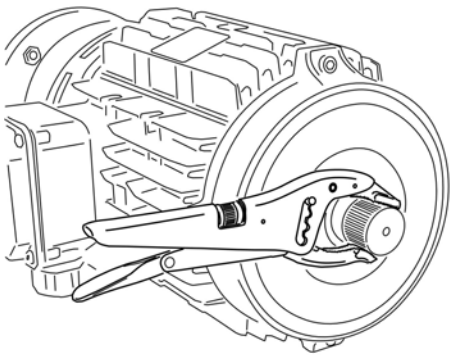
2.

Support the pump body (A) with a wedge or slings.



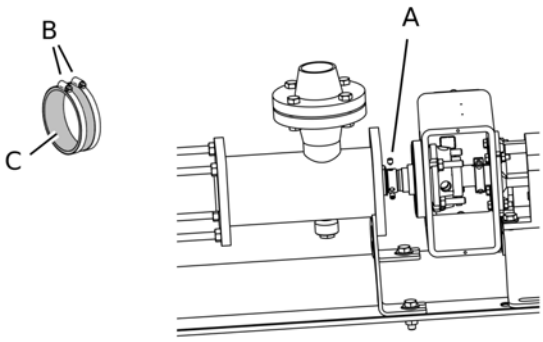
3.

Remove the two plates (A) and make sure to leave the washers on the screws.



Remove any pipes connected to the mechanical seal.

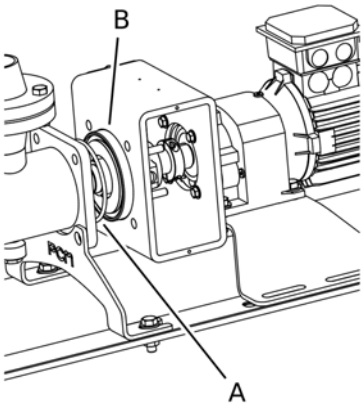
Remove the four fixing screws (B) from the body.



4.

Remove the motor's protective casing, the ring (A) and the fins (B).

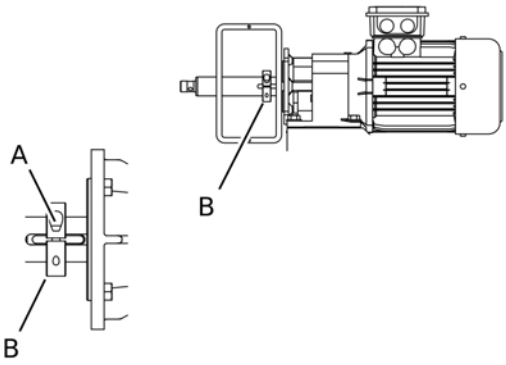
5.



Using locking pliers, turn the shaft to pull the drive back by about 70 mm.

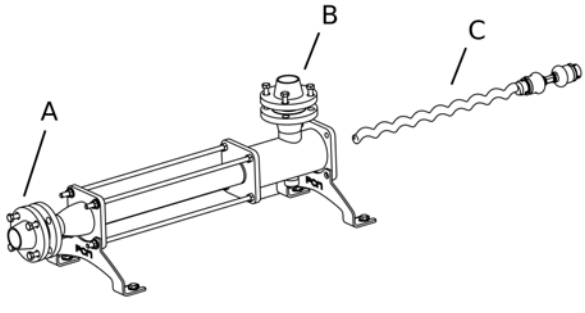
6.

Unscrew the 3 screws (A).



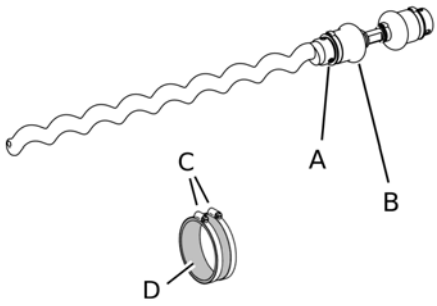
If the pump is equipped with protective sheaths, the screws cannot be accessed directly. In this case, remove the collars (B) and move the protective sheath (C) to reach the 3 screws (A).

7.



Remove and check the seal (A).

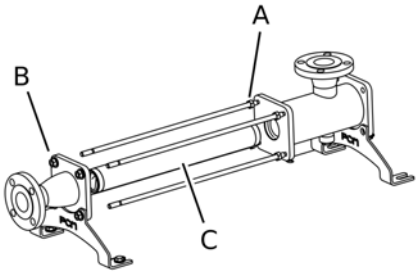
Remove the sealing system (B) only if it requires maintenance (removal instructions can be found in the "Removal of the sealing system" section).



8.

Remove the motor unit, unscrew the 2 screws (A) and remove the shaft collar (B) to remove the shaft.

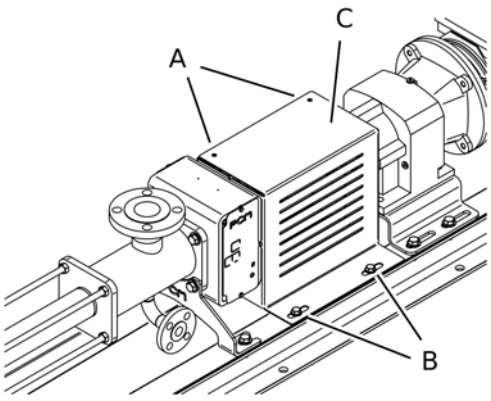
9.



Disconnect the pipes (A) and (B) and remove the shaft line and the rotor (C).

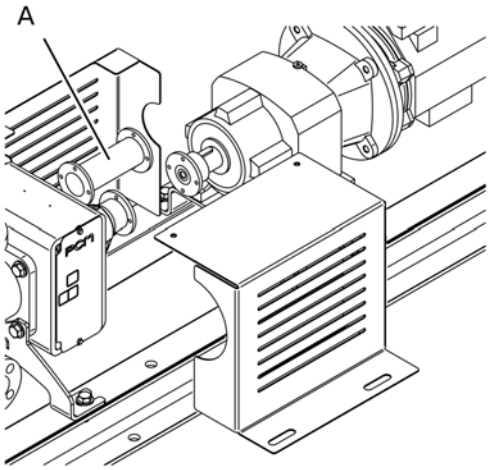
10.

Unscrew the 3 screws (A) and remove the connecting rod (B).



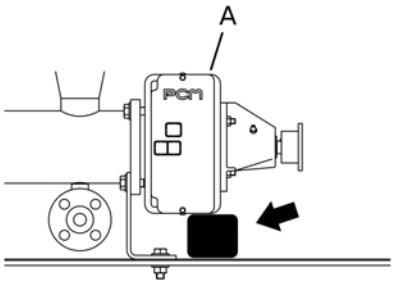
If the pump is equipped with protective sheaths, the screws cannot be accessed directly. In this case, remove the collars (C) and move the protective sheath (D) to reach the 3 screws (A).

11.



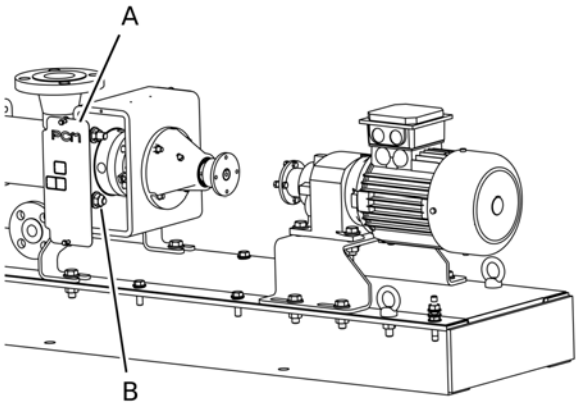
Unscrew the 4 nuts (A) and remove the 4 nuts (B) to remove the stator (C) and the last components.

4.20.3. Disassembling a bearing pump



1.

Remove the 2 screws (A). Remove the 4 screws (B) and the coupling cover (C).

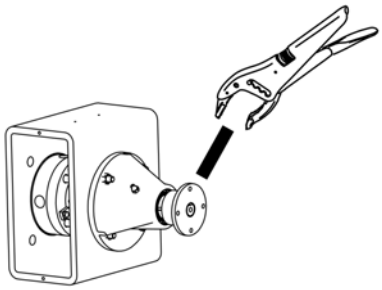


2.

Remove the coupling spacer (A) (the disassembly instructions are given in the coupling instructions).

3.

Wedge the bearing-spacer unit (A).

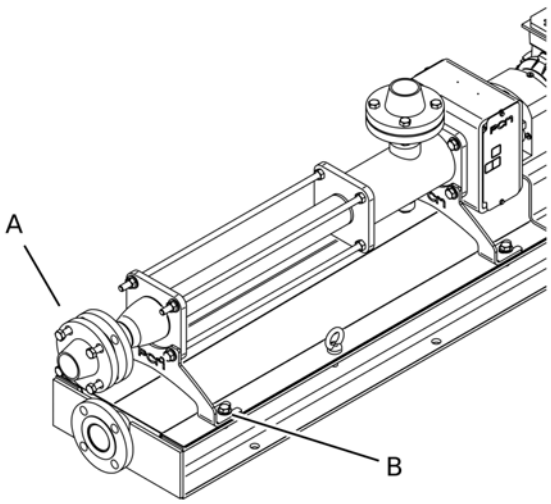


4.

Remove the two plates (A) and make sure to leave the washers on the screws.

Remove any pipes connected to the mechanical seal.

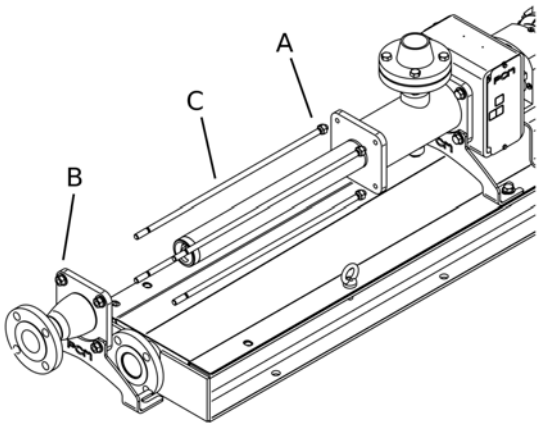
Remove the four fixing screws (B) from the body.



5.

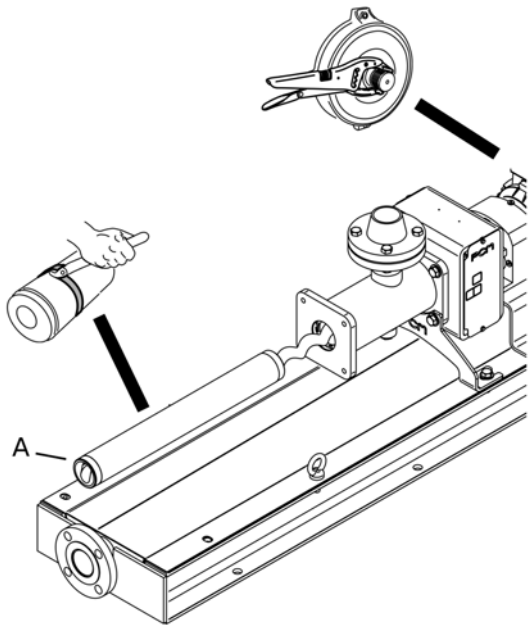
Using locking pliers, turn the hub to pull the bearing-spacer unit back by about 70 mm.

6.



Continue the disassembly from step 6 of the "Disassembling the monobloc pump" section.

4.20.4. Disassembly to change the stator



1.

Remove the pipes (A) and unbolt the foot (B).

2.

Unscrew the 4 nuts (A) and remove the 4 nuts (B) to remove the 4 pins (C).

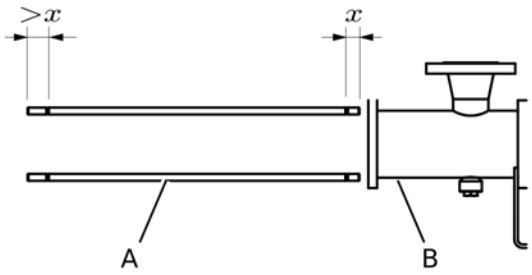
3.

Remove the stator (A).

Block the shaft line on the motor side using a plier wrench and use a strap wrench to unscrew the stator.

4.21. Reassembling the pump (models 1A36, 3A12, 6A6, 6A12, 6A24, 13A6, 13A12)

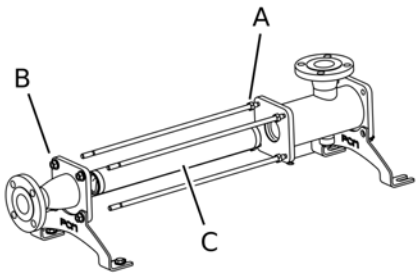
The pump is re-assembled in the reverse order.



Some screws are coated with LOCTITE® Freinfilet 243 (see steps mentioned below). All other screws or bearings must be covered with grease (GERALYN 2) to prevent sticking during disassembly and reassembly.

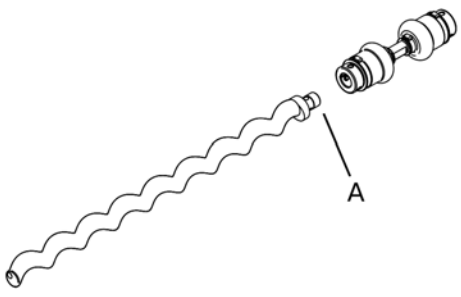
The threaded elements must be tightened as shown on page 42.

WARNING: To preserve optimum operating characteristics for the pump, it is essential to use original PCM parts only. Pump maintenance must be performed by qualified personnel only, in compliance with the recommendations in force.

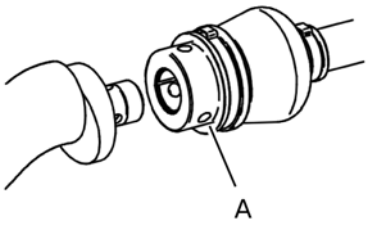


Make sure to comply with the following points:

Coat the rotor and the inside of the stator with glycerine.



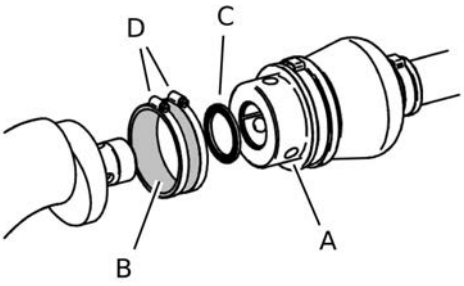
The threads at the ends of the pins (A) do not have the same length.



Position each pin so that the shortest thread, equipped with a nut, is screwed into the body (B).

Fit the stator (C), fix the pins and tighten the nuts (B).

Grease the end of the rotor (A) and fix the shaft line to the rotor.

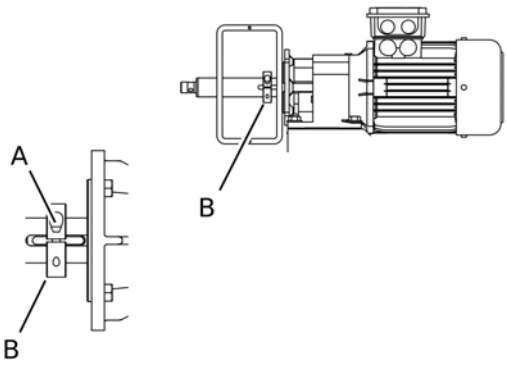


If the pump is not equipped with protective sheaths (option A):

Insert the rotor into the connecting rod.

Coat the 3 conical screws (A) with Freinfilet® before screwing them in.

Check that the tightening torque (10 Nm) is the same for all 3 screws.



If the pump is equipped with protective sheaths (option B):

First fit the sheath (B) and the seal (C) together, then insert the rotor into the connecting rod.

Coat the 3 conical screws (A) with Freinfilet® before screwing them in.

Check that the tightening torque (10 Nm) is the same for all 3 screws.

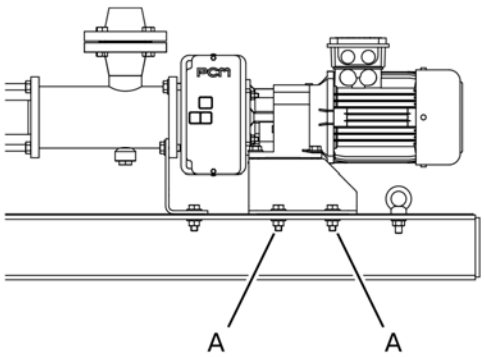
Cover the screws with the sheath and tighten the collars (D) at each end of the sheath.

When fitting the drive shaft, ensure the shaft collar (B) is properly positioned relative to the key. Tighten the screws (A) (15 Nm) and check that they are uniformly tight.

4.22. Disassembling the pump (models 13A24, 25A6, 25A12, 40A6, 40A12, 25A24, 60A6)

WARNING: Before performing any maintenance operations on the pump, check that all necessary precautions have been taken: upstream and downstream valves closed, pipework cleaned and purged, electrical power supply disconnected and disabled. Check also that all the usual precautions have been taken in accordance with the regulations in force regarding the safety of personnel.
Systems connected to the mechanical seal must be disconnected before disassembling the pump.

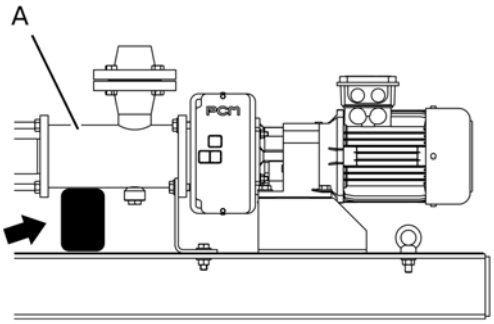
Always wear personal protective equipment (at least shoes, gloves, goggles/mask and ear defenders) when working on or near the pump.



4.22.1. Residual fluids

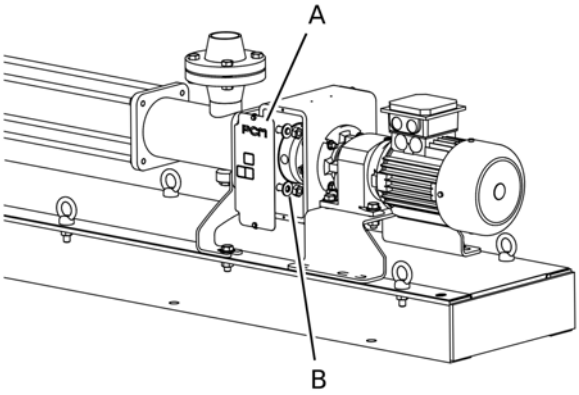
During maintenance operations, the fluid inside the pump is not fully evacuated. A certain volume of non-drainable fluid remains in the stator, with the quantity depending on the pump model:

Pump model	Fluid volume in the stator (in cm^3)
13A24	1030
25A6	470
25A12	1400
40A12	2400
40A6	980
25A24	3310
60A6	1960



Take the necessary steps depending on the type of fluid present.

4.22.2. Disassembling the monobloc pump

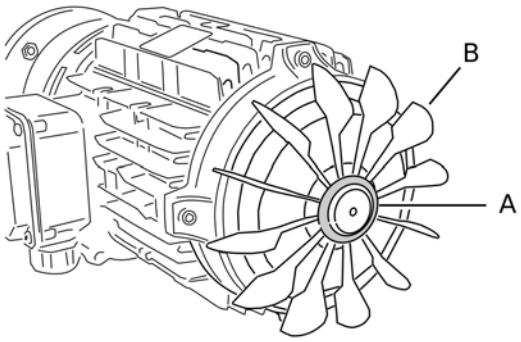


1.

Remove the motor support mounting screws (A).

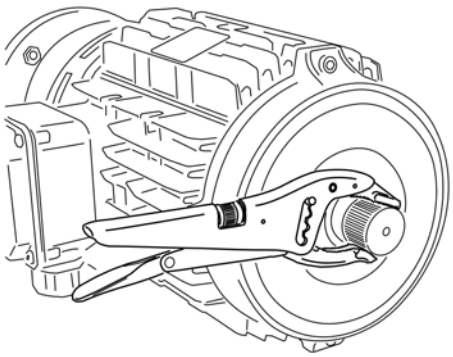
2.

Support the pump body (A) with a wedge or slings.



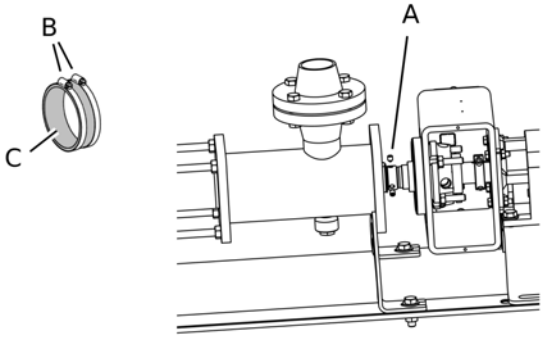
3.

Remove the two plates (A) and make sure to leave the washers on the screws.



Remove any pipes connected to the mechanical seal.

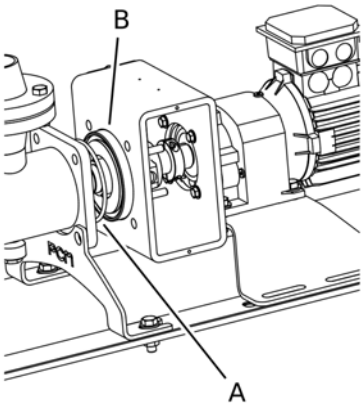
Remove the four fixing screws (B) from the body.



4.

Remove the motor's protective casing, the ring (A) and the fins (B).

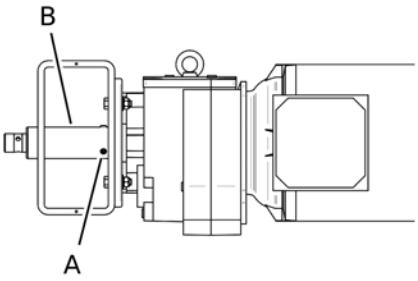
5.



Using locking pliers, turn the shaft to pull the drive back by about 70 mm.

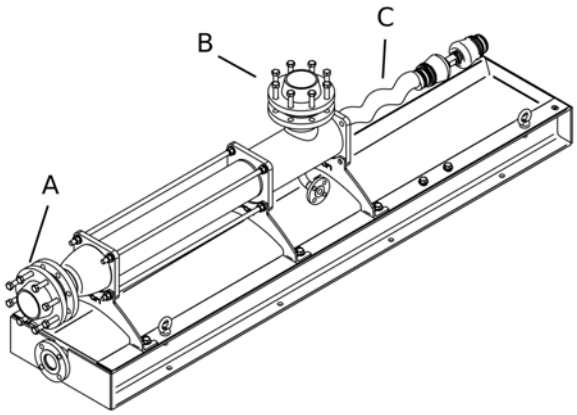
6.

Unscrew the 3 screws (A).



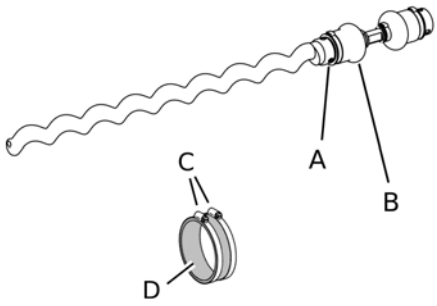
If the pump is equipped with protective sheaths, the screws cannot be accessed directly. In this case, remove the collars (B) and move the protective sheath (C) to reach the 3 screws (A).

7.



Remove and check the seal (A).

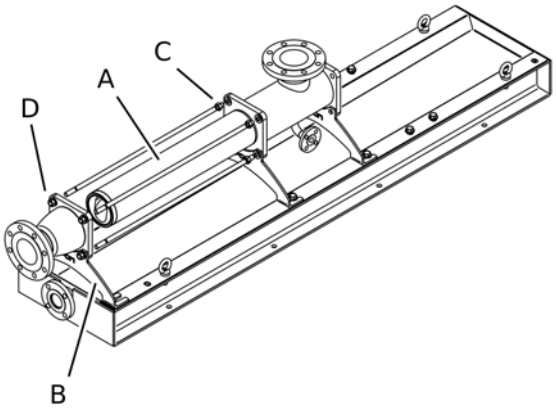
Remove the sealing system (B) only if it requires maintenance (removal instructions can be found in the "Removal of the sealing system" section).



8.

Remove the motor unit, unscrew the 3 screws (A) and remove the shaft (B).

9.

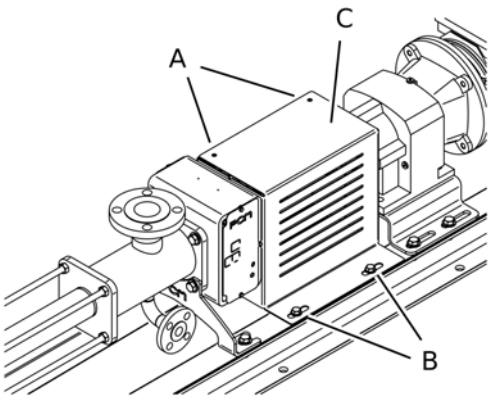


Disconnect the pipes (A) and (B) and remove the shaft line and the rotor (C).

10.

Unscrew the 3 screws (A) and remove the connecting rod (B).

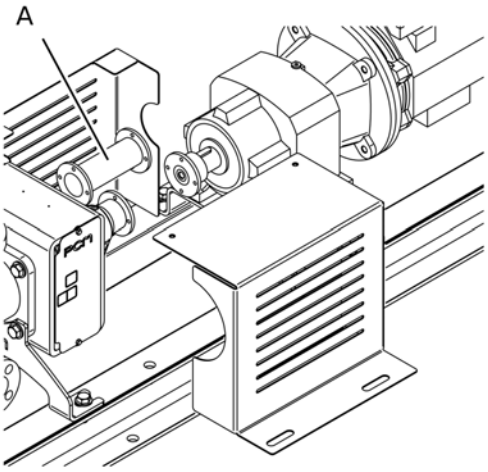
If the pump is equipped with protective sheaths, the screws cannot be accessed directly. In this case, remove the collars (C) and move the protective sheath (D) to reach the 3 screws (A).



11.

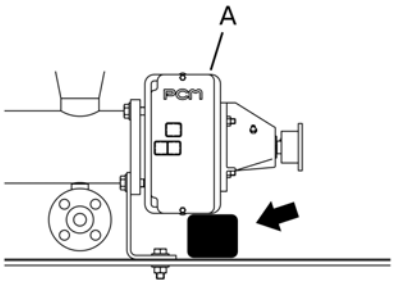
Wedge the stator (A).

Unbolt the front baseplate support (B), loosen the 4 nuts (C) and remove the nuts (D).



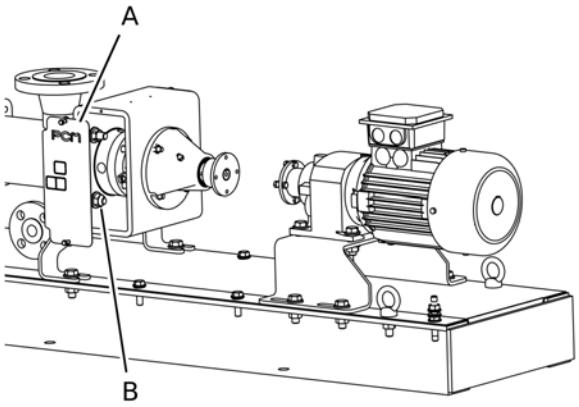
Recover the stator and the last components.

4.22.3. Disassembling a bearing pump



1.

Remove the 2 screws (A). Remove the 4 screws (B) and the coupling cover (C).

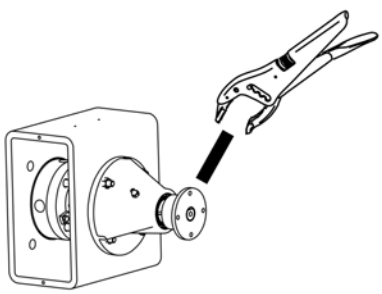


2.

Remove the coupling spacer (A) (the disassembly instructions are given in the coupling instructions).

3.

Wedge the bearing-spacer unit (A).

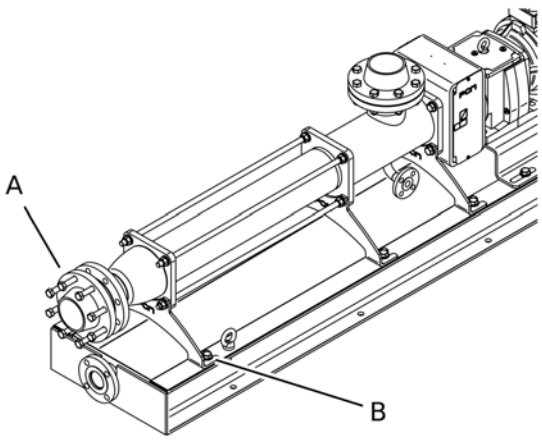


4.

Remove the two plates (A) and make sure to leave the washers on the screws.

Remove any pipes connected to the mechanical seal.

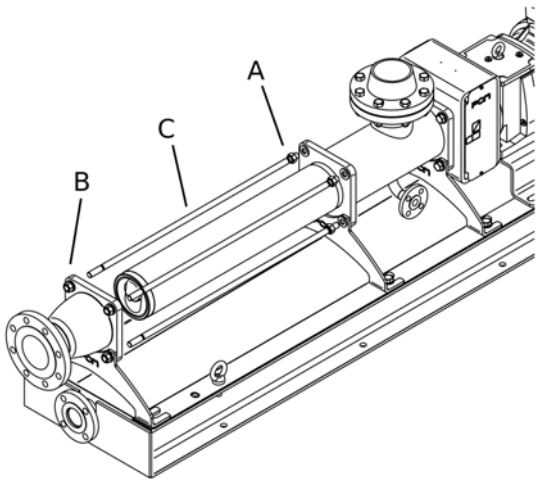
Remove the four fixing screws (B) from the body.



5.

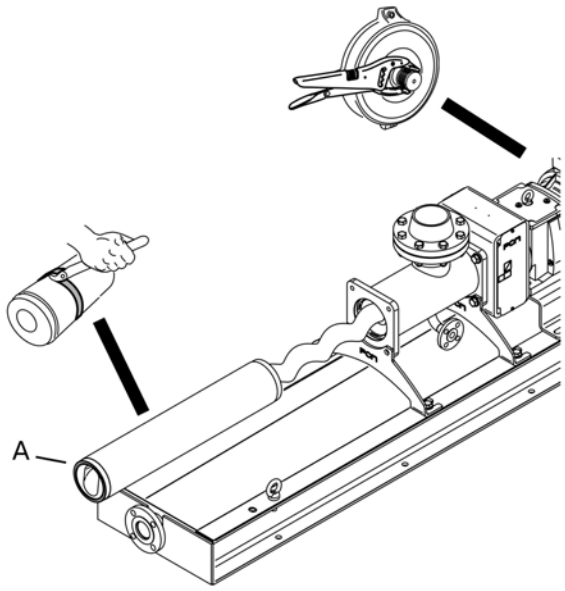
Using locking pliers, turn the hub to pull the bearing-spacer unit back by about 70 mm.

6.



Continue the disassembly from step 6 of the "Disassembling the monobloc pump" section.

4.22.4. Disassembly to change the stator



1.

Remove the pipes (A) and unbolt the front support (B).

2.

Unscrew the 4 nuts (A) and remove the 4 nuts (B) to remove the 4 pins (C).

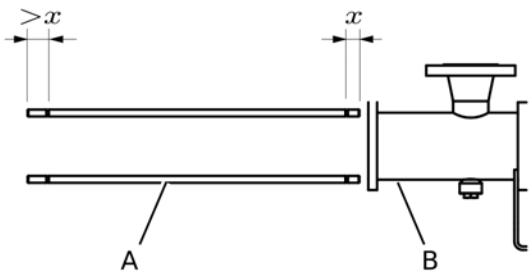
3.

Remove the stator (A).

Block the shaft line on the motor side using a plier wrench and use a strap wrench to unscrew the stator.

4.23. Reassembling the pump (models 13A24, 25A6, 25A12, 40A6, 40A12, 25A24, 60A6)

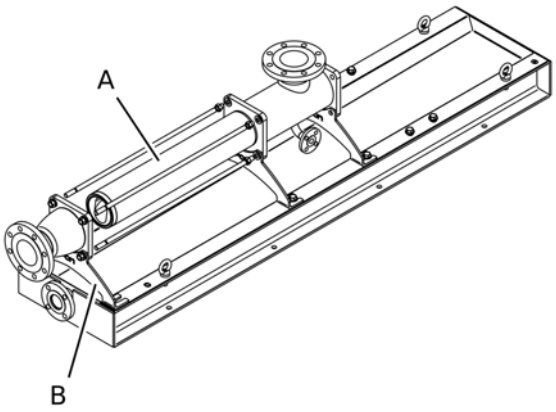
The pump is re-assembled in the reverse order.



Some screws are coated with LOCTITE® Freinfilet 243 (see steps mentioned below). All other screws or bearings must be covered with grease (GERALYN 2) to prevent sticking during disassembly and reassembly.

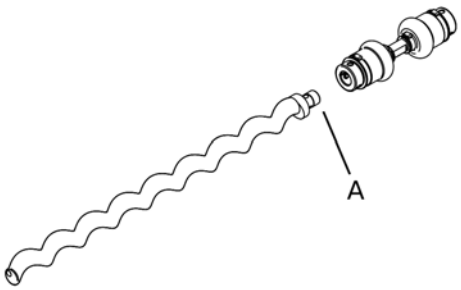
The threaded elements must be tightened as shown on page 42.

WARNING: To preserve optimum operating characteristics for the pump, it is essential to use original PCM parts only. Pump maintenance must be performed by qualified personnel only, in compliance with the recommendations in force.

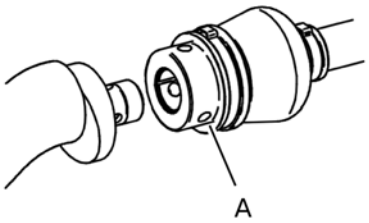


Make sure to comply with the following points:

Coat the rotor and the inside of the stator with glycerine.



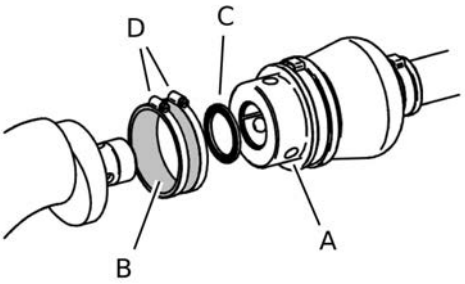
The threads at the ends of the pins (A) do not have the same length.



Position each pin so that the shortest thread, equipped with a nut, is screwed into the body (B).

Fit the stator (A), fix the pins and tighten the nuts (B).

Grease the end of the rotor (A) and fix the shaft line to the rotor.



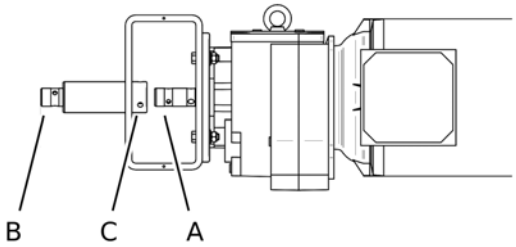
If the pump is not equipped with protective sheaths (option A):

Insert the rotor into the connecting rod.

Coat the 3 conical screws (A) with Freinfilet® before screwing them in.

Check that the tightening torque[2] is the same for all 3 screws.

If the pump is equipped with protective sheaths (option B):



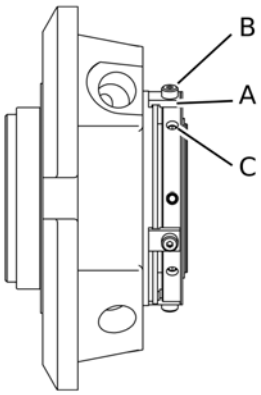
First fit the sheath (B) and the seal (C) together, then insert the rotor into the connecting rod.

Coat the 3 conical screws (A) with Freinfilet® before screwing them in.

Check that the tightening torque[3] is the same for all 3 screws.

Cover the screws with the sheath and tighten the collars (D) at each end of the sheath.

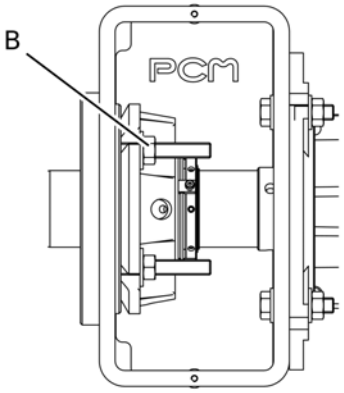
2. Models 13A24, 25A6, 25A12: 20 Nm; Models 40A6, 40A12, 25A24, 60A6: 40 Nm.
3. Models 13A24, 25A6, 25A12: 20 Nm; Models 40A6, 40A12, 25A24, 60A6: 40 Nm.



Grease the shaft ends (A) and (B).

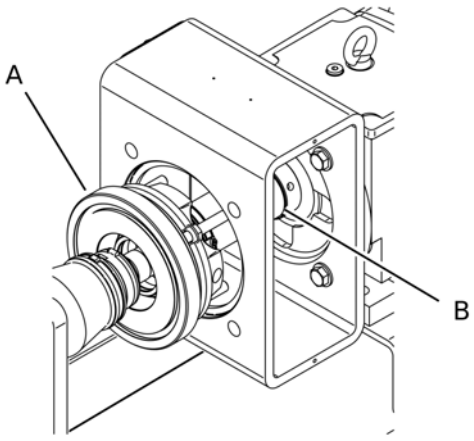
Coat the three screws (C) with Freinfilet® before screwing them in.

4.24. Disassembling the sealing system



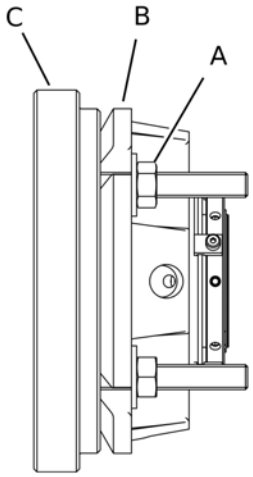
WARNING: Before any procedures are performed, the equipment must be at atmospheric pressure, ambient temperature, purged, and degassed. All control valves must be locked.
Before performing any servicing on the pump, please check that all necessary precautions have been taken: pump switched off, upstream and downstream valves closed, pipes cleaned and purged, electrical power supply disconnected and made inaccessible. All the usual precautions must be taken, in accordance with the texts in force regarding the safety of personnel.

1.



Fit the spacers (A) using screws (B).

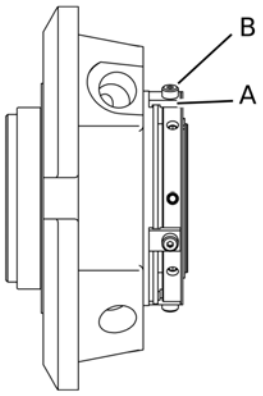
Release the set screws (C).



2.

Loosen the 4 screws (B) without removing them.

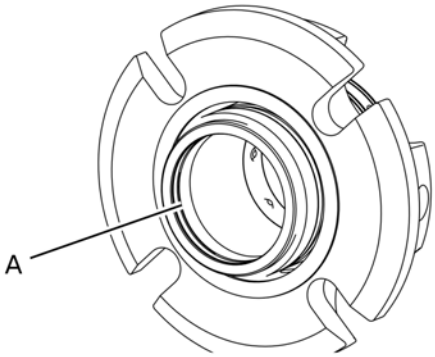
3.



Remove the mechanical seal and mechanical seal support assembly (A) from the drive shaft (B).

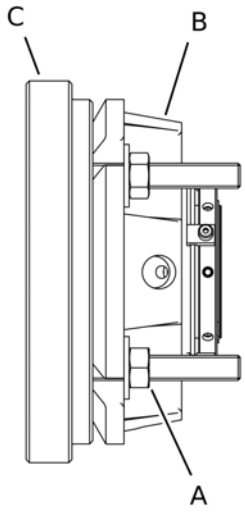
4.

Remove the 4 nuts (A) and disassemble the mechanical seal (B) from the mechanical seal support (C).



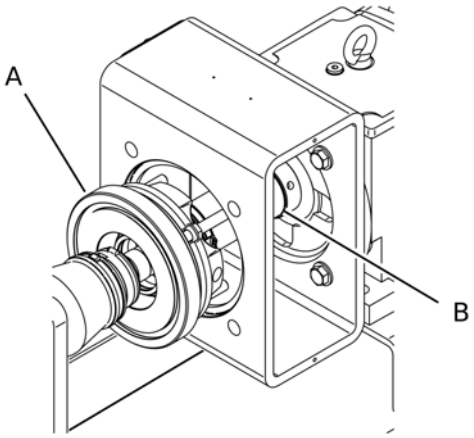
4.25. Reassembling the sealing system

1.



Ensure the seal gland is correctly positioned in its housing.

Check that the spacers (A) are in place and held by screws (B).



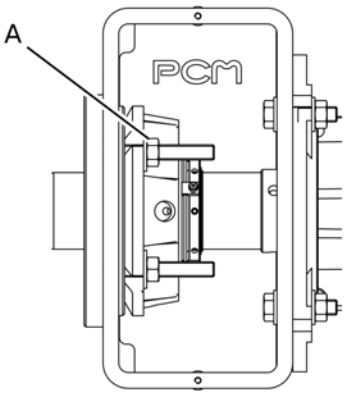
2.

Grease the sleeve O-ring (A).

3.

Position the mechanical seal (B) against the mechanical seal support (C) and position the nuts (A) without tightening them.

4.

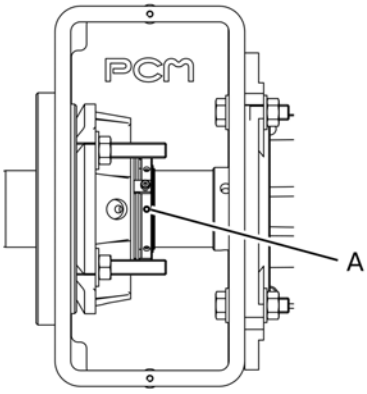


Fit the mechanical seal and mechanical seal support assembly (A) to the drive shaft (B).

5.

Orient the mechanical seal according to the lubrication system chosen (see the "Connecting the dynamic sealing system" section, page 16).

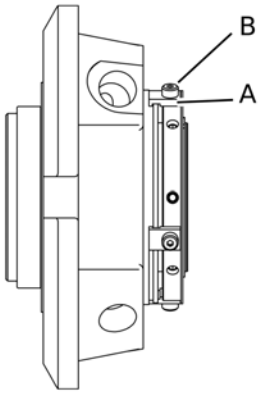
6.



Follow the procedure to reassemble the pump.

7.

Once the pump is fully assembled, tighten the nuts (A) to the recommended torque (see the "Tightening torques" section, page 42).



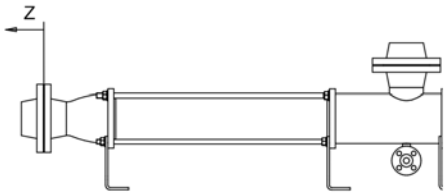
WARNING: If the mechanical seal is sealed by a flat seal, check the tightness again after an hour.

8.

Position the set screws (A) to centre the seal on the shaft, then tighten them to the following torques:

- M5 screw: 3.5 N.m [2.6 lbf.ft]
- M6 screw (models 25A24, 40A6, 40A12 and 60A6 only): 7.0 N.m [5.2 lbf.ft]

9.

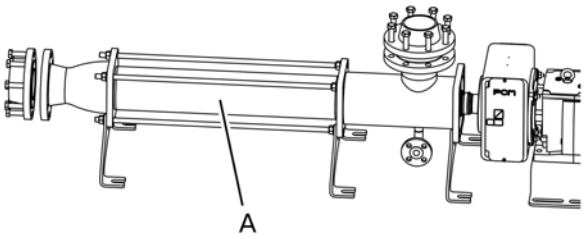


Remove the spacers (A) and screws (B).

10.

Connect the sealing system (see the "Connecting the dynamic sealing system (cartridge type)" section, page 16).

4.26. Disassembly in confined spaces



It is possible to reduce at least the Z dimension indicated in the footprint plans in order to disassemble the stator.

To do this, follow this procedure:

1.

Follow the pump disassembly procedure until you come to disconnect the shaft line.

2.

Disconnect the suction and discharge pipes and remove the complete subassembly (A).

3.

Disassemble the rotor from the stator (see the stator disassembly procedure, page 53, 60 or 69 depending on the pump type).

4.27. Equipment Storage when not in Use

Proceed as follows:

1. Release pressure at the suction and discharge.
2. Drain the pipework and the pump.
3. Clean the pipework and the pump using a cleaning product that is compatible with the pumped product and pump materials.
4. Run the pump for more effective cleaning.
5. Switch off the pump.
6. Isolate the pump from the rest of the circuit.

Prolonged stoppage of the pump can damage the hose fitted inside. Removing the hose is advisable if the pump needs to be stopped for more than three days.

4.27.1. Preserving the Rubber Components

We recommend that you store all rubber parts in a cool location, away from light to avoid damage by UV rays.

4.27.2. Preserving the sealing systems

When the seal is stored fitted to the machine, it is recommended that you rotate the shaft one quarter turn every two months to prevent the sealing faces from sticking.

5. Appendices

1 Safety information

1.1 Intended use

These gear units are used to transmit rotary movements. They convert velocity and torque. They are intended for use as part of a drive system in commercially used plant and machinery. The gear units must not be operated until it has been established that the plant or machinery can be safely operated with the gear unit. Suitable protective measures must be provided if failure of a gear unit or a geared motor could result in a risk to persons. The machine or system must comply with local legislation and directives. All applicable health and safety requirements must be met. In particular, the Machinery Directive 2006/42/EC, TR CU 010/2011 and the TR CU 020/2011 must be especially observed in the relevant areas of application.

The gear units are suitable for use in explosion hazard areas according to the category stated on the type plate. They satisfy the explosion protection requirements of Directive 2014/34/EU and TR CU 012/2011 for the category indicated on the type plate. The gear units may only be operated with components which are intended for use in explosion hazard areas. Atmospheres with gases, vapours and aerosols (CE: Zone 1 or 2, labelling G; EAC: Category IIG) and dusts (CE: Zone 21 or 22, labelling IID; EAC: Category IIID) must not be present during operation. The approval of the gear unit is void in case of a hybrid mixture.

Structural modifications to the gear units are not permitted and result in the approval for the gear unit becoming void.

The gear units may only be used according to the information in the technical documentation from Getriebebau NORD GmbH & Co. KG. Damage to the gear unit may result if the gear unit is not used as intended and according to the information in the operating and assembly manual. This may also result in personal injury.

The base or the gear unit mount must be appropriately designed for the weight and torque. All of the fastenings provided must be used.

Some gear units are equipped with a cooling coil. These gear units may only be operated if the cooling circuit is connected and in operation.

1.2 Safety information for explosion protection

The gear units are suitable for use in explosion hazard areas. The following information must be observed in order to ensure adequate explosion protection.

Note all technical data stated on the name plate and comply with them. Observe the special documentation stated in field "S" of the name plate as well as instructions for equipment and attachments.

1.2.1 Field of use

- Gear units must be properly designed. Overloads may result in breakage of components. This may cause sparks. Carefully fill in the enquiry form. Getriebebau NORD GmbH & Co KG designs gear units according to the details in the enquiry form. Please note the information for gear unit selection in the enquiry form and in the catalogue.
- Explosion protection only applies for areas which correspond to the device category and the type of explosive atmosphere according to the labelling on the type plate. The type of gear unit and all technical data must comply with the planning details for the plant or machinery. If there are several operating points, the maximum drive power, torque or speed must not be exceeded in any operating point. The gear unit may only be operated in the installation position which complies with the version. Carefully check all details on the type plate before installing the gear unit.

- All work, e.g. transportation, storage, installation, electrical connection, commissioning, servicing and maintenance must be performed in a non-explosive atmosphere.
- The atmospheric conditions, in which the drive is commissioned, must be within an ambient pressure range from 80 kPa to 110 kPa and an oxygen content of approx. 21 % according to DIN EN ISO 80079-36.

1.2.2 Attachments and equipment

- Gear units with a cooling coil for oil cooling must not be commissioned without lubricant cooling. The function of the lubricant cooling must be monitored. The drive must be shut down if the permissible temperature is exceeded. Check for leaks at regular intervals.
- Equipment attached to the gear unit such as couplings, pulleys, cooling systems, pumps, sensors etc., as well as drive motors must also be suitable for use in the zone with an explosive atmosphere. The ATEX labelling must conform to the details of the system and/or machine design.

1.2.3 Lubricants

- Unsuitable oils can cause an explosion risk. Therefore only use oils which correspond with the details on the name plate. Recommended lubricants can be found in the appendix to these operating and installation instructions.

1.2.4 Operating conditions

- If the gear unit is equipped with a back stop, note the minimum speed for releasing the back stop as well as the maximum speed. Gear units with a back stop on the drive shaft may only be operated with a minimum speed of the drive shaft of 900 min^{-1}. Speeds which are too low cause increased wear and temperature increases. Excess speeds will damage the back stop.
- If the gear unit is exposed to direct sunlight or comparable radiation, the ambient temperature or the temperature of the cooling air must always be at least 10 K below the maximum permissible ambient temperature range "Tu" as stated on the name plate.
- Even small changes to the installation conditions can have a significant effect on the temperature of the gear unit. Gear units with temperature class T4 or with a maximum surface temperature of 135 °C or less must be provided with a temperature sticker. The dot in the middle of the temperature sticker turns black if the surface temperature is too high. Take the gear unit out of service immediately if the dot has turned black.

1.2.5 Radial and axial forces

- Drive and driven elements may only be subjected to the maximum permitted radial forces F_{R1} and F_{R2} and axial forces F_{A2} indicated on the name plate (see Section 2.2 "Name plate").
- Observe the correct tension, particularly for belts and chains.
- Additional loads due to unbalanced hubs are not permitted.

1.2.6 Assembly, installation and commissioning

- Incorrect installation results in stresses and impermissibly high loads. This causes increased surface temperatures. Note the installation and assembly instructions in these operating and installation instructions.
- Before commissioning, carry out all of the checks which are prescribed in these operating and maintenance instructions in order to detect faults which could increase the risk of explosion in good time. Do not commission the gear unit if abnormalities are found during the checks. Contact Getriebebau NORD.

- For gear units with temperature class T4 or with a maximum surface temperature of less than 200 °C, carry out a measurement of the surface temperature of the gear unit before commissioning. Take the gear unit out of service if the measured surface temperature is too high.
- The gear unit housing must be earthed in order to prevent electrostatic charging.
- Defective lubrication causes temperature increases and sparks. Check the oil level before commissioning.

1.2.7 Service and maintenance

- Perform all of the inspection and maintenance work specified in these operating and installation instructions with great care, in order not to increase the risk of explosion due to functional faults and damage. The drive must be shut down if any abnormalities are detected. Contact Getriebebau NORD.
- Defective lubrication causes temperature increases and sparks. Check the oil level at regular intervals according to the details in these operating and installation instructions.
- Dust and dirt deposits cause temperature increases. Dust may also be deposited inside covers which are not dust-proof. Remove deposits at regular intervals according to the details in these operating and installation instructions.

1.2.8 Protection against electrostatic charging

- Non-conducting coatings, or low pressure hoses may become electrostatically charged. Sparks may be produced on discharge. Such components must not be used in areas in which processes that cause charging are to be expected. Oil level tanks may only be located in areas with the gas group IIB.
- Gear units with a coating thickness in excess of 0.2 mm may only be used in areas in which processes that cause charging are not to be expected.
- The painting of the gear unit is designed for Category 2G Group IIB (Zone 1 Group IIB). For use in Category 2G Group IIC (Zone 1 Group IIC) the gear unit must not be used or installed in areas in which processes which cause electrostatic charging are to be expected.
- In case of subsequent painting it must be ensured that the paint has the same characteristics as the original paint.
- To prevent electrostatic charging, surfaces may only be cleaned with a damp cloth.

1.3 Applied ignition protection classes according to DIN EN ISO 80079-37

The following ignition protection types are used:

- Measures to ensure constructional safety "c"
  - Strength and thermal calculations for all applications,
  - Selection of suitable materials and components,
  - Calculation of a recommended interval for general overhaul,
  - Inspection interval for lubricant level, therefore ensuring lubrication of bearings, seals and gears,
  - Requirement for thermal check during commissioning.
- Measures to ensure encapsulation with liquid "k"
  - The gears are lubricated with a suitable lubricant,
  - Statement of approved lubricants on the name plate,
  - Statement of lubricant fill levels.
- Measures to ensure monitoring of sources of ignition "b"
  - Use of temperature monitoring for oil cooling systems as ignition protection system b1.

1.4 Do not make any modifications.

Do not make any structural modifications to the gear unit. Do not remove any protective guards.

1.5 Performing inspection and maintenance work

Due to lack of maintenance and damage, malfunctions may occur which can result in personal injury.

- Carry out all servicing and maintenance work at the specified intervals.
- Also note that servicing is necessary after long storage periods prior to commissioning.
- Do not operate damaged gear units. The gear unit must not have any leaks.

1.6 Personnel qualification

All transport, storage, installation, commissioning and maintenance work must be carried out by qualified specialist personnel.

Qualified specialist personnel are persons who have the training and experience to recognise and avoid any possible risks.

Repairs may only be done by Getriebebau NORD GmbH & Co. KG or by a person authorised in accordance with the statutory regulations of explosion protection.

1.7 Safety for particular activities

1.7.1 Check for transport damage

Transport damage may cause malfunctions of the gear unit, which may cause personal injury. Oil which escapes due to leaks may cause a slipping hazard.

- Check the packaging and the gear unit for transport damage.
- Do not operate damaged gear units.

1.7.2 Safety information for installation and maintenance

Before starting work on the gear unit disconnect the drive from the power supply and secure it against accidental switch-on. Allow the gear unit to cool down. Depressurise the cooling circuit lines.

Damaged or defective components, attachment adapters, flanges and covers may have sharp edges. Wear work gloves and work clothing.

1.8 Hazards

1.8.1 Hazards when lifting

Persons may be injured by falling or swinging gear units. Therefore also observe the following information:

- Cordon off a wide area around the hazard area. Take care that there is adequate space to avoid swinging loads.
- Never stand under suspended loads.
- Use adequately dimensioned means of transport which are suitable for the purpose. The weight of the gear unit can be obtained from the type plate.
- Only lift the gear units by the eye bolts which are provided. The eye bolts must be fully screwed in. Only pull on the eye bolts vertically, never cross-wise or at an angle. Only use the eye bolts to lift the gear unit without other components. The eye bolts are not designed for lifting the gear unit with attachments. Use the eye bolts on both the gear unit and the motor to lift a geared motor.

1.8.2 Hazards due to rotating parts

Rotating parts cause a risk of entanglement. This may lead to severe injuries such as crushing or strangling.

- Provide contact protection. In addition to shafts, this also applies to fans as well as drives and driven elements such as belt drives, chain drives, shrink discs and couplings. Take possible run-on of the machine into consideration for the design of protective devices.
- Do not operate the drive without covers or hoods.
- Secure the drive to prevent activation during installation and maintenance work.
- For test operation do not switch on the drive without an installed driven element or secure the motor shaft key.
- Also observe the safety information in the operating and installation instructions provided by manufacturers of components supplied.

1.8.3 Hazards due to high or low temperatures

The gear unit may heat up to 90 °C during operation. Touching hot surfaces or contact with hot oil may result in burns. At very low ambient temperatures freezing may occur on contact.

- Only touch the gear unit when wearing gloves after operation or at very low ambient temperatures.
- Before starting maintenance work, allow the gear unit to cool down sufficiently after operation.
- Provide a contact guard if there is a risk that persons may touch the gear unit when it is in operation.
- Bursts of hot oil mist may be emitted from the pressure vent screw during operation. Provide a suitable guard so that persons cannot be injured by this.
- Do not place any flammable materials on the gear unit.

1.8.4 Hazards due to lubricants and other substances

Chemical substances which are used with the gear unit may be toxic. Eye injuries may result if these substances enter the eyes. Lubricants and adhesives may cause skin irritation.

Oil mist may escape when vent screws are opened.

Due to lubricants and conservation materials, gear units may be slippery and slip out of the hands. There is a slipping hazard from spilled lubricants.

- When working with chemical substances wear chemical-resistant gloves and work clothing. Wash your hands after working.
- Wear protective goggles if there is a possibility of splashed chemicals, for example when filling oil or during cleaning work.
- If chemicals enter the eyes, rinse with large amounts of cold water immediately. Consult a physician in case of symptoms.
- Observe the safety data sheets for the chemicals. Keep the safety data sheets in the vicinity of the gear unit.
- Collect spilled lubricants immediately with a binding agent.

1.8.5 Hazards due to noise

Some gear units or attached components may cause hazardous noise levels during operation. Wear hearing protection if work has to be carried out close to such gear units.

1.8.6 Hazards due to pressurised coolants

The cooling system is under high pressure. Damage or opening a cooling line which is under pressure may result in injury. Depressurise the cooling circuit before working on the gear unit.

2 Description of gear units

2.1 Gear unit types and type designations

Gear unit types/ Type designations
UNICASE helical gear units **2-stage:** SK 02, SK 12, SK 22 SK 32, SK 42, SK 52, SK 62N, SK 62, SK 72, SK 82, SK 92, SK 102 **3-stage:** SK 03, SK 13, SK 23, SK 33N, SK 43, SK 53, SK 63, SK 73, SK 83, SK 93, SK 103
NORDBLOC.1® helical gear unit **1-stage:** SK 071.1, SK 171.1, SK 371.1, SK 571.1, SK 771.1, SK 871.1, SK 971.1, SK 1071.1 **2-stage:** SK 072.1, SK 172.1, SK 372.1, SK 572.1, SK 672.1, SK 772.1, SK 872.1, SK 972.1 **3-stage:** SK 373.1, SK 573.1, SK 673.1, SK 773.1, SK 873.1, SK 973.1
STANDARD helical gear units **2-stage:** SK 0, SK 01, SK 20, SK 25, SK 30, SK 33 **3-stage:** SK 010, SK 200, SK 250, SK 300, SK 330
UNICASE parallel gear units **2-stage:** SK 0182NB, SK 0182.1, SK 0282NB, SK 0282.1, SK 1282, SK 1282.1, SK 2282, SK 3282, SK 4282, SK 5282, SK 6282, SK 7282, SK 8282, SK 9282 **3-stage:** SK 2382, SK 3382, SK 4382, SK 5382, SK 6382, SK 7382, SK 8382, SK 9382, SK 10382, SK 10382.1, SK 11382
UNICASE bevel gear units **3-stage:** SK 9012.1, SK 9016.1, SK 9022.1, SK 9032.1, SK 9042.1, SK 9052.1, SK 9062.1, SK 9072.1, SK 9082.1, SK 9086.1, SK 9092.1, SK 9096.1 **4-stage:** SK 9013.1, SK 9017.1, SK 9023.1, SK 9033.1, SK 9043.1, SK 9053.1
NORDBLOC.1® bevel gear unit **2-stage:** SK 920072.1, SK 92072.1, SK 92172.1, SK 92372.1, SK 92672.1, SK 92772.1, SK 930072.1, SK 93072.1, SK 93172.1, SK 93372.1, SK 93672.1, SK 93772.1
UNICASE worm gear units **2-stage:** SK 02040, SK 02040.1, SK 02050, SK 12063, SK 12080, SK 32100, SK 42125 **3-stage:** SK 13050, SK 13063, SK 13080, SK 33100, SK 43125
UNIVERSAL SI worm gear units **1-stage:** SK 1SI31, SK 1SID31, SK 1SI40, SK 1SID40, SK 1SI50, SK 1SID50, SK 1SI63, SK 1SID63, SK 1SI75 **2-stage (Helical worm gear unit):** SK 2SID40, SK 2SID50, SK 2SID63
UNIVERSAL SMI worm gear units **1-stage:** SK 1SMI31, SK 1SMID31, SK 1SMI40, SK 1SMID40, SK 1SMI50, SK 1SMID50, SK 1SMI63, SK 1SMID63, SK 1SMI75 **2-stage (Helical worm gear unit):** SK 2SMID40, SK 2SMID50, SK 2SMID63

Table 2: Gear unit types and type designations

Double gear units consist of two single gear units. The type designation of the SK 73/22 double gear unit, for example, means that the double gear unit consists of the single gear units SK 73 and SK 22.

Abbreviation	Description
(without)	Foot mounting with solid shaft
/31	Worm gear first stage
/40	Worm gear first stage
5	Reinforced output shaft
A	Hollow shaft
AI	Standard IEC motor attachment
AI…BRG1	Standard IEC motor attachment with manual re-lubrication
AI…RLS	Standard IEC motor attachment with integrated back stop
AL	Reinforced axial bearing
AN	Standard NEMA motor attachment
AN…BRG1	Standard NEMA motor attachment with manual re-lubrication
AN…RLS	Standard NEMA motor attachment with integrated back stop
B	Fastening element
CC	Cooling coil
D	Torque arm
EA	Splined hollow shaft
F	B5 flange
G	Rubber buffer for torque arm
H	Cover cap
/H10	Modular helical pre-stage for universal worm gear units
H66	IP66 cover
IEC	Standard IEC motor attachment
K	Torque bracket
L	Solid shaft both sides
NEMA	Standard NEMA motor attachment
OA	Oil expansion chamber
OT	Oil level tank
R	Back stop
S	Shrink disc
SCX	Screw conveyor flange ATEX
SO1	Synthetic oil ISO VG 220
V	Solid shaft (for standard helical gear units: reinforced drive)
VG	Reinforced rubber buffer
VI	Viton radial shaft seals
VL	Reinforced output bearings
VL2	Agitator version - Reinforced bearings
VL3	Agitator version - Reinforced bearings - Drywell
VS	Reinforced shrink disc
W	Free drive shaft
X	Housing foot mounting
Z	B14 flange

Table 3: Versions and options

2.2 Name plate

The name plate must be permanently attached to the gear unit and must not be exposed to permanent dirtying. Please contact the NORD service department if the name plate is illegible or damaged.

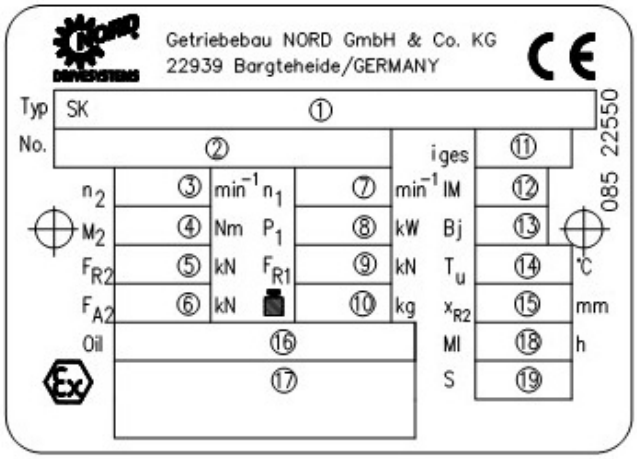

Figure 1: Name plate

Explanation

1	NORD gear unit type
2	Serial number
3	Rated speed of gear unit output shaft [1)]
4	Rated torque of gear unit output shaft
5	Max. permissible transverse force on the gear unit output shaft
6	Max. permissible axial force on the gear unit output shaft
7	Rated speed of the gear unit drive shaft or drive motor [1)]
8	Max. permissible drive power
9	Max. permissible transverse force on the gear unit drive shaft for option W
10	Weight
11	Overall gear unit ratio
12	Installation position
13	Year of manufacture
14	Permissible ambient temperature range
15	Max. dimension for the point of application of the transverse force F_{R2}
16	Lubricant type, viscosity and quantity
17	Labelling according to DIN EN ISO 80079-36: 1. Group (always II, not for mines) 2. Category (2G, 3G for gas or 2D, 3D for dust) 3. Labelling of non-electrical devices (Ex h) or ignition protection type if fitted (c) 4. Explosion group if present (Gas: IIC, IIB; Dust: IIIC, IIIB) 5. Temperature class (T1-T3 or T4 for gas) or max. surface temperature (e.g. 125°C for dust) or special max. surface temperature see special documentation 6. EPL (equipment protection level) Gb, Db, Gc, Dc 7. Note the special documentation and/or temperature measurement during commissioning (X)
18	Interval for general overhaul in operating hours or according to the specification of the dimensionless maintenance class CM
19	Number of the special documentation

1) The maximum permissible speeds are 10% above the rated speed if the maximum permissible drive power P1 is not exceeded.
If the fields FR1, FR2, and FA2 are empty, the forces are zero. If the field xR2 is empty, the point of application of force FR2 is central on the driven shaft journal.

For geared motors (gear units with attached electric motor), the electric motor has its own name plate with separate labelling according to Directive 2014/34/EU (ATEX). The motor labelling must also comply with data for the planning of the plant and the machine.

The lowest explosion protection level on the gear unit and the motor labelling applies for the geared motor unit.

If the electric motor is driven with a frequency inverter, the motor requires approval for inverter operation according to Directive 2014/34/ EU If the motor is operated with an inverter, significant differences between the nominal speeds on the name plates of the motor and the gearbox are normal and permissible. For operation of the motor with the mains supply, differences of the nominal speeds on the name plates of motor and gear unit of up to ± 60 rpm are permissible.

2.3 Additional labelling for EAWU

	EAC Ex	CE Ex
Directive	TR CU 012/2011	2014/34/EU – DIN EN ISO 80079-36
Labelling	II Gb c T4 X	II2G Ex h IIC T4 Gb
	II Gb c T3 X	II2G Ex h IIC T3 Gb
	II Gb c IIB T4 X	II2G Ex h IIB T4 Gb
	II Gb c IIB T3 X	II2G Ex h IIB T3 Gb
	III Db c T125°C X	II2D Ex h IIIC T125°C Db
	III Db c T140°C X	II2D Ex h IIIC T140°C Db
	II Gc T4 X	II3G Ex h IIC T4 Gc
	II Gc T3 X	II3G Ex h IIC T3 Gc
	III Dc T125°C X	II3D Ex h IIIC T125°C Dc
	III Dc T140°C X	II3D Ex h IIIC T140°C Dc

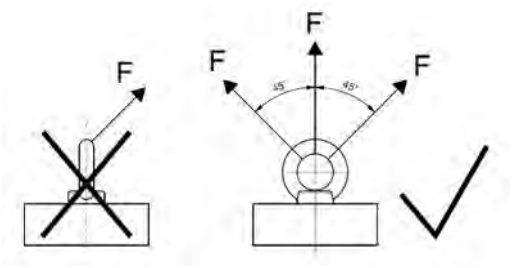
Table 4: EAC Ex / CE Ex labelling

In addition to the name plate according to Directive 2014/34/EU, explosion-protected gear units which are intended for use in the territory of the Eurasian Economic Union have an additional name plate which includes additional information according to Directive TP TC 012/2011.

In these operating and installation instructions, the EAC Ex logo will not be indicated together with the CE Ex logo. The EAC Ex logo is equivalent to the CE Ex logo. If "ATEX" is stated in these operating and installation instructions, this also applies accordingly for EAC Ex gear units.

With servicing as specified, gear units may have a service life of 30 years. The gear unit should be taken out of service at the latest 30 years after delivery by Getriebebau NORD. The year of delivery corresponds to the year of manufacture which is stated on the name plate.

Figure 2: Additional name plates for EAC Ex



3 Transport, storage, assembly

3.1 Transporting the gear unit

⚠ WARNING

Hazard due to falling loads

- The thread of the eyebolt must be fully screwed in.
- As shown in the illustration to the right, only lift on the eyebolts vertically to the female thread and not more oblique than 45° to the vertical.
- Note the centre of gravity of the gear unit.

Only use the eyebolts attached to the gear unit for transport. If geared motors have an additional eyebolt attached to the motor, this must also be used.

Transport the gear unit with care. Impacts to the free ends of shafts may cause internal damage to the gear unit.

No additional loads must be attached to the gear unit.

Use suitable aids such as cross-beams or similar to facilitate transportation of the gear unit. Gear units may only be transported with shackles and lifting strapschains at an angle of 90° to 70° to the horizontal.

3.2 Storage and downtimes

3.2.1 General measures

- Store the gear unit in a dry space, relative humidity less than 60%.
- Store the gear unit at a temperature in the range of – 5 °C to + 50 °C without severe temperature fluctuations.
- Do not expose the gear unit to direct sunlight or UV light.
- There must be no aggressive or corrosive substances (contaminated air, ozone, gases, solvents, acids, alkalis, salts, radioactivity etc.) in the immediate vicinity.
- The gear unit must not be exposed to vibration or oscillation.
- Store the gear unit in the mounting position (see chapter 7.1 "Versions and mounting position"). Secure it against falling.

3.2.2 Storage and downtimes in excess of 3 months

Note the following measures in addition to Section 3.2.1 "General measures".

- Repair damages to the coating. Check if a corrosion protection agent has been applied to the flange bearing surfaces, the shaft ends and the unpainted surfaces. If required, apply a suitable corrosion protection agent to the surfaces.
- Seal all openings on the gear unit.
- The output shaft must be rotated by at least one revolution every 3 months so that the contact position of the gear teeth and the roller bearings are changed.

3.2.3 Storage and downtimes in excess of 9 months

Under certain conditions, storage of 2 to 3 years is possible. The specified storage duration is for guidance only. The actual storage duration depends on the local conditions. Note the following measures in addition to Sections 3.2.1 "General measures"and 3.2.2 "Storage and downtimes in excess of 3 months".

Gear units can be supplied prepared for long-term storage. The gear units are completely filled with lubricant, have VCI corrosion protection agent mixed with the gear oil or are filled with small quantities of VCI concentrate. The adhesive label on the housing shows the respective information.

Conditions of the gear unit and storage area for long-term storage prior to commissioning:

- Store the gear unit at a temperature in the range of -5 °C to +40 °C without severe temperature fluctuations.
- Check if the sealing cord in the vent screw is in place. It must not be removed during storage.
- Store the gear unit in a dry space. With a relative humidity less than 60%, the gear unit can be stored for up to two years; with a relative humidity less than 50%, storage of up to three years is possible.
- For gear units, which are filled with VCI concentrate for long-term storage, the VCI concentrate must be renewed after 2 years and distributed in the oil by rotating the shaft.
- In tropical regions, protect the gear unit against damage by insects.
- Gear unit components such as brakes, couplings, belt drive, and cooling units must be protected for a long-term storage in accordance to their operation instructions.

In addition to the preparations listed in 4 "Commissioning", the following measures are necessary before commissioning:

- Check the gear unit for external damage.
- After storage of more than 2 years, or with storage temperatures outside of the permissible range from -5 °C to +40 °C, replace the lubricant in the gear unit before commissioning.
- If the gear unit is completely filled, the oil level must be reduced according to the mounting position. For the lubricant quantity and lubricant type, refer to the information on the name plate.
- For gear units without oil filling, the oil level must be refilled and checked according to chapter 5.2.3 "Checking the oil level" before commissioning. The VCI concentrate may remain in the gear unit. The VCI concentrate is not mixable with polyglycol-based lubricants (PG oils). If PG oils are used, the VCI concentrate must be removed from the gear unit. When using VCI additive, only use the oil types which are specified on the name plate and are approved by Getriebebau NORD (see chapter 7.2.2 "Gear oils").
- For the option with manual re-lubrication, switch the bearing grease after a storage of more than 2 years. The service life of the grease is reduced after a storage time or gearbox shutdown of more than 9 months (see chapter 5.2.11 "Re-greasing (Option: VL2, VL3, W, AI, AN)").
- Gear units filled with VCI concentrate for long-term storage are fully closed. Take care that the vent is fitted and released as necessary prior to commissioning.

3.3 Checking the version

The gear unit may only be operated in the stated version. The permissible version is stated in the field IM on the name plate. Gear units with the abbreviation UN in field IM of the name plate are version-independent. Section 7.1 "Versions and mounting position" shows the versions of the individual gear unit types. If an X is present in the field IM, the special documentation, whose number is stated in field S, must be observed.

Ensure that the version as stated on the name plate complies with the installation position and that the installation position does not change during operation.

For geared motors, also pay attention to the operating instructions of the motor.

3.4 Preparing for installation

3.4.1 Check for damages

Please examine the delivery for transport and packaging damage immediately on receipt. Pay particular attention to radial shaft seals and sealing caps. Report any damage to the carrier immediately.

Do not put the drive into operation if damage such as leaks are visible.

3.4.2 Remove corrosion protection agents

All bare metal surfaces and shafts of the drive are protected with corrosion protection agents before shipping.

Thoroughly remove corrosion protection agents and any dirt (e.g. colour residues) from all shafts, flange surfaces and gear unit attachment surfaces before assembly.

3.4.3 Check rotational direction

If an incorrect rotational direction may result in damage or potential risk, check for the correct rotational direction of the output shaft during a test run before attaching it to the machine. Ensure the correct rotational direction during operation.

For gear units with an integrated back stop, switching the drive motor to the blocked direction of rotation, may result in damage to the gear unit. Gears with integrated back stops are marked with arrows on the drive/driven sides. The arrows point in the rotation direction of the gear unit. When connecting the motor and during motor control, ensure, e.g. by testing the field of rotation, that the gear unit can only operate in the direction of rotation.

For further explanations refer to Catalogue G1000 and document WN 0-000 40.

3.4.4 Check ambient conditions

Make sure that no aggressive or corrosive substances which attack metal, lubricants or elastomers are present at the installation site or are subsequently expected during operation. If such substances are to be expected, contact Getriebebau NORD.

The gear unit, especially its radial shaft seals should be protected from exposure to direct sunlight.

3.4.5 Installing the oil expansion chamber (Option: OA)

Mount the oil expansion chamber (Option OA) according to document WN 0-530 04. For gear units with an M10x1 pressure relief vent, document WN 0-521 35 must also be observed during installation.

3.4.6 Installing the oil reservoir tank (Option: OT)

Mount the oil reservoir tank (Option OT) according to document WN 0-521 30.

For explosion-protected gear units, pressure venting is mandatory. Screw the enclosed M12x1.5 pressure relief vent into the oil reservoir tank.

3.5 Installing the gear unit

DANGER

Explosion hazard

- No explosive atmosphere must be present when installing the gear unit
- For geared motors, check that the cooling air from the motor fan can circulate around the gear unit without obstruction.

NOTICE

Damage of bearing and gear wheel

- Do not carry out any welding work on the gear unit.
- Do not use the gear unit as earth connection for welding work.

The following conditions must be met at the installation site in order to prevent overheating during operation:

- There must be adequate space around the gear unit.
- Air must be able to flow freely past all sides of the gear unit.
- For geared motors, the cooling air from the motor fan must be able to circulate around the gear unit without obstruction.
- The gear unit must not be enclosed or encased.
- The gear unit must not be exposed to high energy radiation.
- Do not direct warm exhaust air from other units onto the gear unit.
- The base or flange to which the gear unit is attached must not input any heat into the gear unit during operation.
- Do not allow dust to accumulate in the area of the gear unit

Install the gear unit in the correct mounting position (see chapter 7.1 "Versions and mounting position")**. Oil checking and oil drain screws must be accessible.**

The base or flange to which the gear unit is fitted should be vibration-free, torsionally rigid and flat. The flatness of the bolting surface on the base or flange must comply with DIN ISO 2768-2 tolerance class K.

Precisely align the gear unit with the drive shaft of the machine in order to prevent additional forces from being imposed on the gear unit due to distortion.

Fasten the gear unit to all gear unit feet of one side or to all flange holes. Use bolts with a minimum quality of 8.8. Tighten the bolts with correct torques (see chapter 7.3 "Screw tightening torques").

For foot and flange-mounted gear units (Option XZ or XF), ensure tension-free bolting. The foot mounting is used to fasten the gear unit. It is designed to absorb the reaction forces from the torque, radial and axial forces as well as the weight. B5 or B14 flanges are basically not designed to absorb the reaction forces. In case of doubt, contact Getriebebau NORD for investigation of the particular case.

Earth the gear unit housing. For geared motors, ensure the earthing via the motor connection.

3.6 Installation of a hub on solid shaft (option: V, L)

DANGER

Explosion hazard due to increased temperature or sparks

The gear unit may heat up to an impermissible extent if transverse forces are applied unfavourably. Bearing, gearing and housing may be damaged and cause sparks.

- The transverse force must be applied as closely as possible to the gear unit.

NOTICE

The gear unit may be damaged by axial forces.

Bearings, gearwheels, shafts and housings may be damaged by incorrect fitting.

- Use a suitable pulling device.
- Do not hit the hub with a hammer.

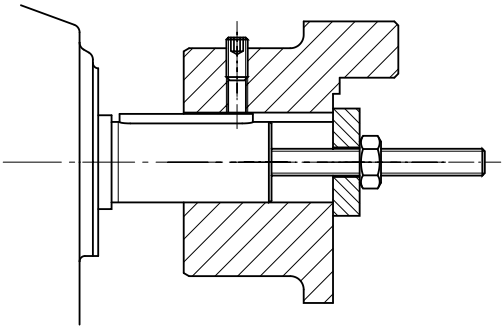


Figure 3: Example of a simple pulling device

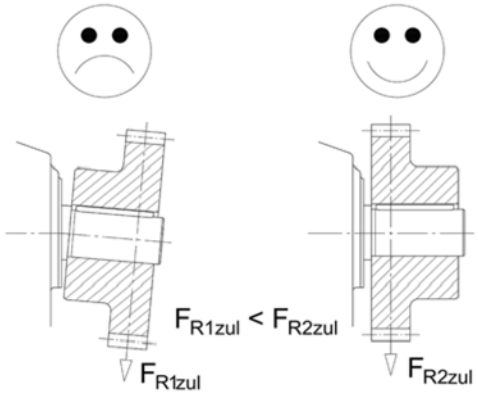

During fitting, ensure that the shaft axes are precisely aligned with each other. Comply with the permissible tolerance details provided by the manufacturer.

Information

Use the end thread of the shafts for pulling. Fitting can be facilitated by coating the hub with lubricant or heating it up to approx. 100 °C beforehand.

The maximum radial forces FR1 and FR2 and axial forces FA2 which are imposed on the driving and driven elements of the gear unit must not be exceeded (refer to the name plate). Pay particular attention to the correct tension of belts and chains.

Additional loads due to unbalanced hubs are not permitted.

The transverse force must be applied as closely as possible to the gear unit. For drive shafts with free shaft ends (Option W), the maximum permissible transverse force F_{R1} applies for the application of the transverse force to the centre of the free shaft journal. For output shafts, the application of the transverse force F_{R2} must not exceed the dimension x_{R2}. If the radial force F_{R2} is stated on the name plate, but no dimension x_{R2} is stated, application of force is assumed to be to the centre of the shaft journal.

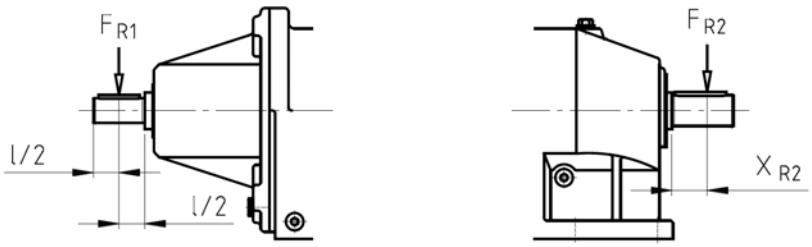

Figure 4: Permissible application of force to drive and driven shafts

3.7 Fitting push-on gear units with fastening element (option: B)

⚠ WARNING

Risk of severe injuries

If the screw fastenings of the torque arm are removed during operation, the gear unit will rotate around the output shaft.

- Secure the screw fastening against loosening, e.g. with Loctite 242 or a second nut.

NOTICE

The gear unit may be damaged by axial forces.

Bearings, gearwheels, shafts and housings may be damaged by incorrect fitting.

- Use a suitable pulling device.
- Do not strike the gear unit with a hammer.

Assembly and subsequent dismantling is facilitated by applying an anti-corrosive lubricant to the shaft before fitting (e.g. NORD Anti-Corrosion Part No. 089 00099). Excess lubricant may escape after fitting and may drip off. This escape of grease is not due to a leak in the gear unit. Thoroughly clean these points on the output shaft after a running-in time of approx. 24 hours.

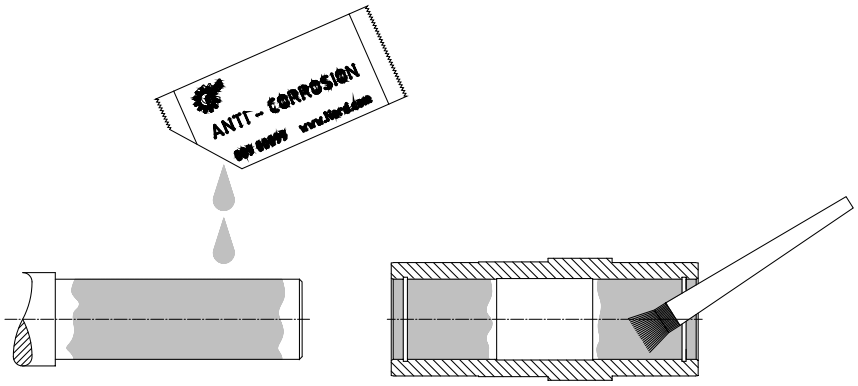

Figure 5: Applying lubricant to the shaft and the hub

For push-on gear units with cover cap IP66 (Option H66) and fastening element (Option B) the pressed-in closing cap must be pushed out before installing the gear unit. The pressed-in closing cap may be destroyed during dismantling. A 2nd closing cap is supplied as a spare part. Fit the closing cap after installation of the gear unit as described in Section 3.10 "Fitting the covers (option: H, H66)".

Figure 6: Removing the factory-fitted closing cap

The gear unit can be fitted to solid shafts with and without a shoulder using the fixing element (Option B). Tighten the fastening element bolt with correct torque (see chapter 7.3 "Screw tightening torques").

When fastening without a contact shoulder, a circlip is used in the hollow shaft for axial fastening.

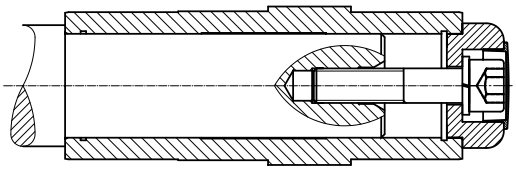

Figure 7: Gear unit mounted on shaft with a shoulder using the fastening element

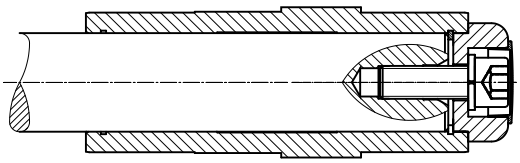

Figure 8: Gear unit mounted on shaft without a shoulder using the fastening element

A gear unit can be removed from a shaft with a shoulder e.g. using the following device.

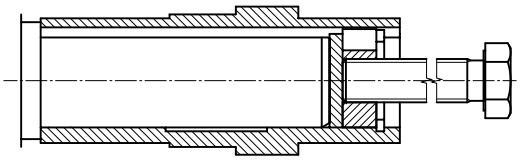

Figure 9: Removal using dismantling device

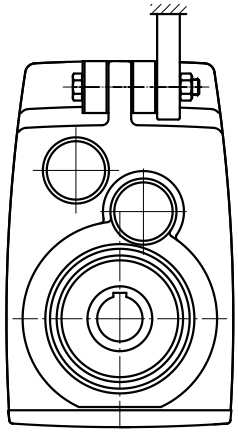
Do not distort the support when installing push-on gear units with a torque support. Tension-free mounting is aided by the rubber buffer (Option G or VG).



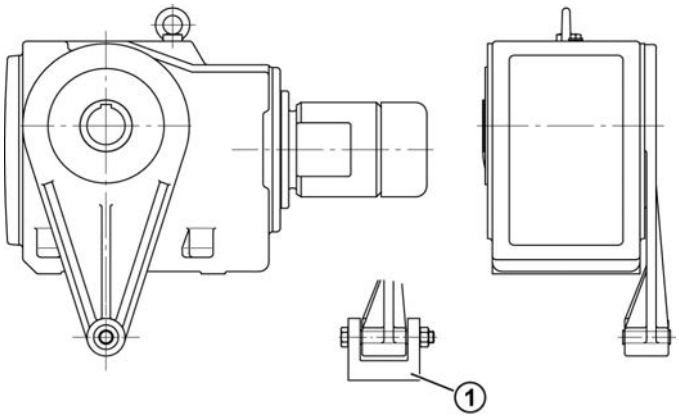


Figure 10: Mounting the rubber buffer (Option G and/or VG) on parallel shaft gear units

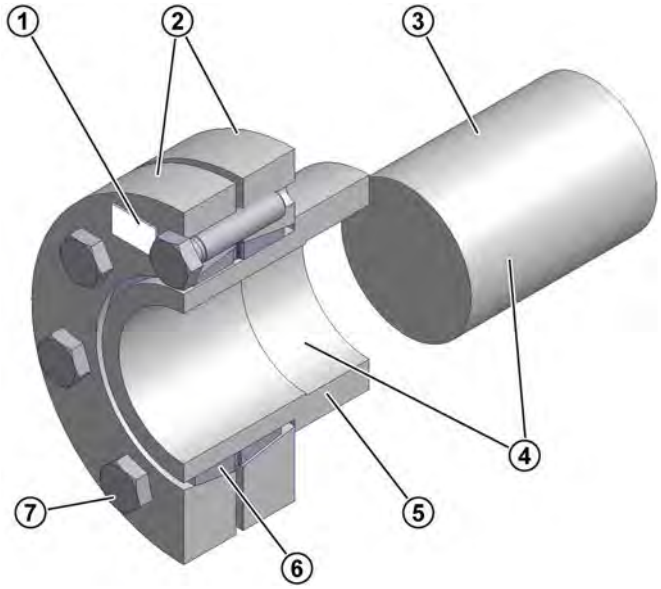
To fit the rubber buffer, tighten the screw fastening until there is no play between the contact surfaces when there is no load. For screw fastenings with standard thread, then rotate the fastening nut half a turn in order to pre-tension the rubber buffer. Greater pre-tension is not permissible.

Explanation	
1	Always support torque support on both sides

Figure 11: Attaching the torque support on bevel gear and worm gear units

Tighten the fastenings of the torque support with the correct torque (see chapter 7.3 "Screw tightening torques")and secure them against loosening, e.g. with Loctite 242 or Loxeal 54-03.



3.8 Fitting a hollow shaft with shrink disc (Option: S)

NOTICE

Risk of damage to the gear unit if the shrink disk is installed incorrectly

- Do not tighten the tensioning bolts if the solid shaft is not installed. This would permanently deform the hollow shaft.

Hollow shafts with shrink discs must be protected from dust, dirt and moisture. NORD recommends option H/H66 (see chapter 3.10 "Fitting the covers (option: H, H66)").

Explanation

1 Shrink disc, type, part no. and torque details for tensioning bolts
2 Tensioning flanges
3 Solid shaft of machine
4 Shaft and hollow shaft bore **FREE OF GREASE**
5 Hollow shaft of gear unit
6 Double half-slotted inner ring
7 Tensioning bolts DIN 931 (933) -10.9

Figure 12: Hollow shaft with shrink disc

The shrink disc is supplied ready for fitting. It must not be dismantled prior to fitting.

The solid shaft material must have a minimum yield strength of 360 N/mm^2. This ensures that no permanent deformation occurs due to the clamping force.

If necessary, also observe the documentation from the manufacturer of the shrink disc.

Prerequisites

- The hollow shaft must be completely free of grease.
- The solid shaft of the machine must be completely free of grease.
- The external diameter of the solid shaft must be within the tolerance h6 or k6 for highly irregular operation, unless otherwise specified in the order-related dimension sheet. The fit must be according to DIN EN ISO 286-2.

Fitting procedure

1. Remove the cover, if any.

2. Loosen the tensioning bolts of the shrink disc, but do not unscrew them completely. Tighten the tensioning bolts gently by hand until there is no play between the flanges and the inner ring.

3. Lightly grease the bore of the inner ring. Push the shrink disc onto the hollow shaft until the outer clamping flange is flush with the hollow shaft.

4. Grease the solid shaft of the machine in the area which will later come into contact with the bushing in the hollow shaft. Do not grease the bronze bushing. It is essential that the tensioning seat of the hollow shaft is free of grease.

5. Insert the solid shaft of the machine into the hollow shaft so that the area around the shrink connection is completely filled.

6. Tighten the tensioning bolts of the shrink disc **in sequence** with approx. ¼ rotation of the bolt per turn in clockwise direction by several turns. Use a torque wrench to tighten tensioning bolts to the tightening torque specified on the shrink disc.

7. Check if there is an even gap between the clamping flanges. If this is not the case, the shrink disc connection must be dismantled and checked for correct fit.

8. Mark the hollow shaft of the gear unit and the solid shaft of the machine with a label in order to detect any slippage under load.

Standard disassembly procedure:

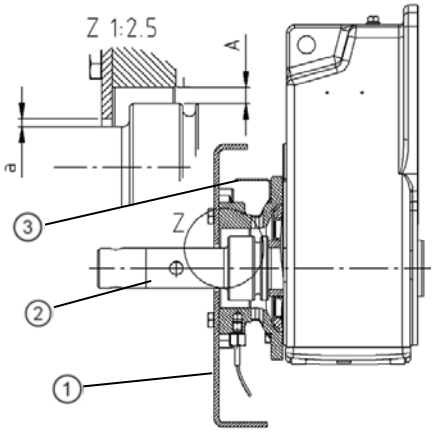
⚠ WARNING

Danger of injury due to sudden mechanical release

The elements of the shrink disc are under great mechanical tension. Sudden release of the outer rings produces high separating forces and can result in uncontrolled detachment of shrink disc components.

- Do not remove any tensioning bolts if you have not ensured that the external outer rings of the shrink disc have been released from the inner ring.

1. Loosen the tensioning bolts of the shrink disc with approx. ¼ rotation of the bolt per turn **in sequence** in a clockwise direction by several turns. Do not remove the tensioning bolts from their thread.



2. Loosen the clamping flanges from the cone of the inner ring.

3. Remove the gear unit from the solid shaft of the machine.

If a shrink disc has been in use for a long period or is dirty, dismantle it and clean it before refitting. Check the shrink disc for damage or corrosion. Replace the damaged elements if they are not in perfect condition.

Coat the conical surfaces with MOLYKOTE® G-Rapid Plus or a similar lubricant. Place some multi-purpose grease on the screw thread and the contact surfaces of the screw heads.

3.9 Installation of an SCX flange (option: SCX)

Explanations

1 Rear wall of the conveyor
2 Push-in shaft
3 Protection bracket

Figure 13: Installation example of an SCX flange

The SCX flange may only be operated in the mounting positions M1, M2, M3 and M4.

A temperature sensor can be optionally installed. The sensor must trip at a temperature of 120 °C and stop the drive. Visual inspection may be omitted upon usage of a temperature sensor (see chapter 5.1 "Inspection and maintenance intervals").

The gap (dimension A) between the push-in shaft (2) and the rear wall of the conveyor (1) or the fastening plate must not be larger than 8 mm.

The protection bracket (3) must cover the open hole running vertically upwards in the SCX flange.

3.10 Fitting the covers (option: H, H66)

DANGER

Explosion hazard due to damaged and rubbing covers

- Inspect covers for transportation damage, e.g. dents and warping before fitting.
- Do not use damaged covers.

Use all fastening screws. Secure the fastening screws by coating them with securing lubricant, e.g. Loctite 242, Loxeal 54-03. Tighten the fastening screws with the correct torque (see chapter 7.3 "Screw tightening torques").

For covers with Option H66, press in the new condition closing cap by tapping it lightly with a hammer.

Figure 14: Fitting the covers, Option SH, Option H, and Option H66

3.11 Fitting the covers

Some versions of universal worm gear units are delivered as standard with a plastic cover cap. The cover cap protects the radial shaft seals against the entry of dust and other contamination. The cover cap can attached on the A side or the B side. It can be removed by hand without tools.

NOTICE

Damage to the expansion elements of the cover cap

- Do not jam the cover cap when pulling it off or attaching it.

Pull the cover cap off vertically prior to the installation of the universal worm gear unit. After completing the fitting, attach the cover cap onto the right side by attaching the expanding elements into the threaded holes on the output flange.

Figure 15: Disassembly and assembly of the cover cap

3.12 Fitting a standard motor (Option: IEC, NEMA, AI, AN)

The maximum permitted motor weights indicated in the tables below must not be exceeded:

DANGER

Explosion hazard

- Only standard motors with an adequate ATEX Zone category according to the type plate may be used.
- For ATEX category 2D gear units (see the ATEX labelling on the last line of the gear unit type plate), the motor must have at least protection class IP6x.

Maximum permitted motor weights														
Motor size	63	71	80	90	100	112	132	160	180	200	225	250	280	315
Max. motor weight [kg]	**25**	**30**	**50**	**50**	**80**	**80**	**100**	**250**	**250**	**350**	**500**	**1000**	**1000**	**1500**

Table 6: Motor weights NEMA motors

Gear units with IEC or NEMA adapter must be operated with self-ventilated motors (IC411, TEFC) or externally ventilated motors (IC416, TEBC) according to EN 60034-6. The gear unit must be exposed to a continuous airflow. Please contact Getriebebau NORD if the use of motors without fans (IC410, TENV) is intended.

Fitting a standard motor to the IEC adapter (Option IEC) or NEMA adapter (Option NEMA)

1. Clean the motor shaft and the flange surfaces of the motor and motor adapter, and check them for damage. Check the motor dimensions. The dimensions must be within the tolerances according to DIN EN 50347 or NEMA MG1 Part 4.
2. For motor sizes 90, 160, 180 and 225, position the spacer bushes that may be provided onto the motor shaft.
3. Position the half-coupling onto the motor shaft so that the motor parallel key engages into the groove of the half-coupling. Tighten the half-coupling in accordance with the motor manufacturer's instructions. With standard helical gear units, observe dimension B between the half-coupling and the collar (see "Figure 16"). Adjust the coupling in accordance with the specifications indicated on the adhesive plate for certain **NEMA adapters** .
4. If the half-coupling contains a setscrew, secure the coupling axially on the shaft. Coat the setscrew with securing adhesive before screwing it in, e.g. Loctite 242 or Loxeal 54-03, and tighten it with the correct torque (see chapter 7.3 "Screw tightening torques").
5. For category 2D gear units (see ATEX labelling in the last line of the gear unit name plate), the flange surfaces of the motor and motor adapter must be sealed. For other gear units, sealing of the flange surfaces is recommended if the motor is installed outside or in a humid environment. Completely coat the flange surfaces with surface sealant, e.g. Loctite 574 or Loxeal 58-14.
6. Attach the motor to the adapter. Also attach the enclosed ring gear or the enclosed gear sleeve (see figure below).
7. Tighten the adapter bolts with the correct torque (see chapter 7.3 "Screw tightening torques").

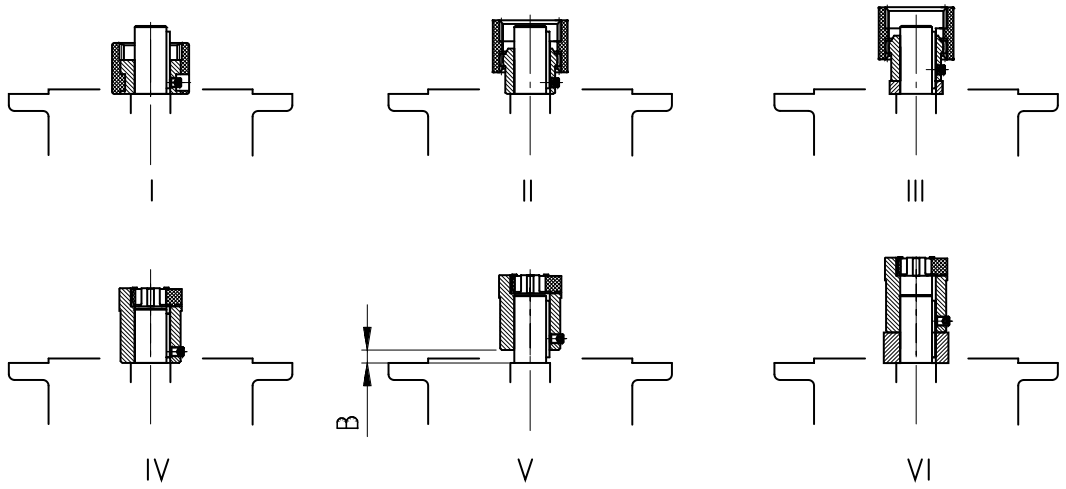

Figure 16: Fitting the coupling onto the motor shaft - various types of coupling

I Curved tooth coupling (BoWex®), one-piece

II Curved tooth coupling (BoWex®), two-piece

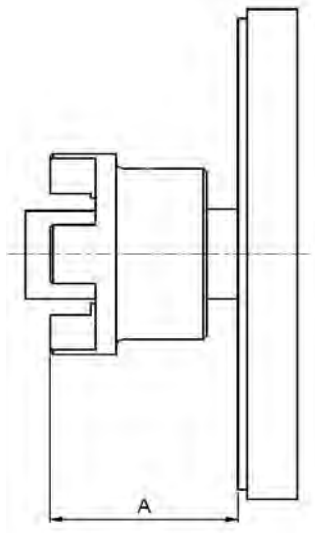
III Curved tooth coupling (BoWex®), two-part with spacer bush

IV Claw coupling (ROTEX®), two-piece

V Claw coupling (ROTEX®), two-piece, observe dimension B:

Standard helical gear units: SK 0, SK 01, SK 20, SK 25, SK 30, SK 33 (2-stage) SK 010, SK 200, SK 250, SK 300, SK 330 (3-stage)		
	IEC size 63	IEC size 71
Dimension B (Fig. V)	B = 4.5 mm	B = 11.5 mm

VI Claw coupling (ROTEX®), two-piece with spacer bush



Fitting a standard motor to the IEC adapters AI160–AI315 (Option AI) or NEMA adapter AN250TC–AN400TC (Option AN)

1. Clean the motor shaft and the flange surfaces of the motor and motor adapter, and check them for damage. Check the motor dimensions. The dimensions must be within the tolerances according to DIN EN 50347 or NEMA MG1 Part 4.
2. Remove the motor shaft's key.
3. With the adapters AI160, AI180 and AI225, attach the spacer bush supplied with the product.
4. Attach the key supplied with the product (see "Table7: Motor parallel keys").
5. For the attachment of the half-coupling, heat up the half-coupling to approx. 100 °C. Position the half-coupling as follows:
   - Push AI160, AI180 and AI225 on to the spacer bush.
   - Push AI200, AI250, AI280 and AI315 on to the motor shaft collar.
   - AN250TC–AN400TC until dimension A has been reached (see "Table 8: Position of the half-coupling on the NEMA motor shaft").
6. If the half-coupling contains a setscrew, secure the coupling axially on the shaft. Coat the setscrew with securing adhesive before screwing it in, e.g. Loctite 242 or Loxeal 54-03, and tighten it with the correct torque (see chapter 7.3 "Screw tightening torques").

7. For category 2D gear units (see ATEX labelling in the last line of the gear unit name plate), the flange surfaces of the motor and motor adapter must be sealed. For other gear units, sealing of the flange surfaces is recommended if the motor is installed outside or in a humid environment. Completely coat the flange surfaces with surface sealant, e.g. Loctite 574 or Loxeal 58-14.
8. Attach the motor to the adapter. Also attach the enclosed ring gear or the enclosed gear sleeve (see Figure 16: Fitting the coupling onto the motor shaft - various types of coupling). For the AN360TC and AN400TC adapters, attach the adapter flange to the motor first, and screw the motor onto the adapter.
9. Tighten the adapter bolts with the correct torque (see chapter 7.3 "Screw tightening torques").

IEC/NEMA type	Coupling	Shaft ø	Motor shaft's key
AI 160	R42	42	AB12x8x45
AI 180	R48	48	AB14x9x45
AN 250	R42	41.275	B3/8x3/8x1 1/2
AN 280	R48	47.625	B1/2x1/2x1 1/2
AI 200	R55	55	B16x10x50x
AN 320	R55	53.976	B1/2x1/2x1 1/2
AI 225	R65	60	B18x11x70

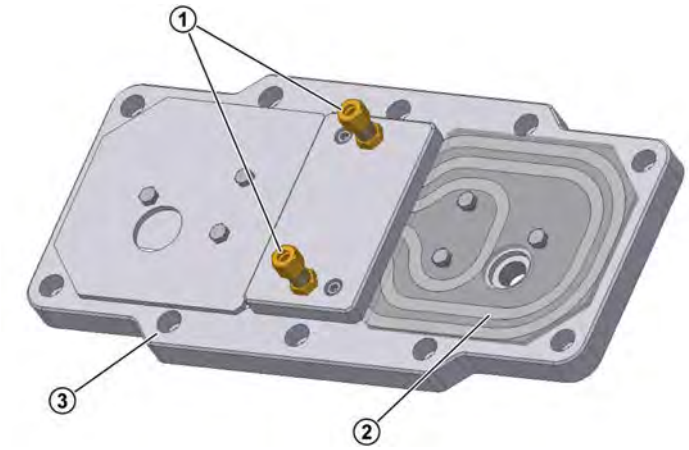
N360TC/450	R75	150.5
N400TC	R75	164.5

Table 8: Position of the half-coupling on the NEMA motor shaft

3.13 Mounting of the cooling coil onto the cooling system

⚠ WARNING



Risk of injury due to pressure discharge

- Ensure that the pressure is released from the cooling circuit before carrying out any work on the gear unit.

NOTICE

Damage to the cooling coil

- Do not twist the connection pieces during installation.
- Even after the installation, no external forces must be able to act on the cooling coil via the connection pieces.
- Prevent vibrations from reaching the cooling coil during operation.

Explanation

1 Connection pieces with cutting ring screw connections
2 Cooling coil
3 Housing cover

Figure 17: Cooling cover

The cooling coil is installed in the housing cover. For the inlet and outlet of cooling fluid, connection pieces with cutting ring screw connections according to DIN 2553 are provided on the housing cover for a connection of a pipe with an external diameter of 10 mm.

Remove the sealing plug from the screw necks prior to assembly and flush the cooling coil to prevent any contamination of the cooling system. Then, connect the connection pieces with the coolant circuit. The flow direction of the coolant is irrelevant.

3.14 Installation of an oil expansion chamber (Option: OA)

3.14.1 Installation of the sizes I, II and III

The oil expansion chamber is available in 3 sizes with different capacities:

- 0.7 l (Size I)
- 2.7 l (Size II)
- 5.4 l (Size III)

The oil expansion chamber must be mounted vertically with the hose connection facing downwards and the vent screw facing upwards. Taking the hose length into account, the container should be fitted as high as possible. Suggestions for the position of the oil expansion chamber see the following illustration.

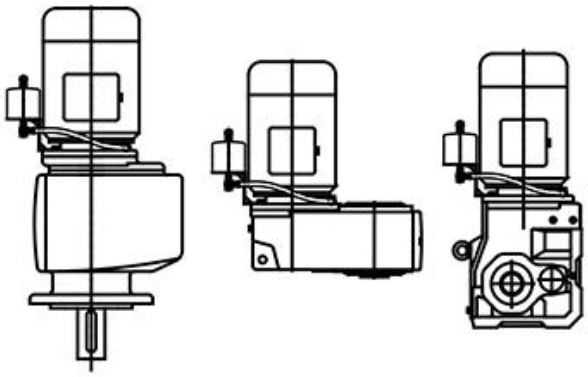


Figure 18: Position of the oil expansion chamber

1. After installing the gear unit, remove the vent screw.
2. Screw in the reduction or extension with the existing sealing ring.
3. If the fastening screw is screwed into a through hole, seal the thread with a medium strength screw securing material such as LOXEAL 54-03 or Loctite 242.
4. Screw on the expansion tank. If the necessary screw insertion depth of 1.5 × d can no longer be achieved, use a 5 mm longer screw. If a longer screw cannot be fitted, use a stud and a nut with appropriate dimensions.
5. Attach the vent hose with the enclosed hollow screws and seals.
6. Screw the enclosed M12 x 1.5 pressure vent into the oil expansion chamber.

3.14.2 Installation of sizes 0A and 0B

The oil expansion chamber must be mounted vertically with the hose connection facing downwards and the vent screw facing upwards. Taking the hose length into account, the container should be fitted as high as possible. Suggestions for the position of the oil expansion chamber see Figure 18. Note that with the M4 configuration with terminal box position in position 2, it is not possible to install the oil expansion chamber.

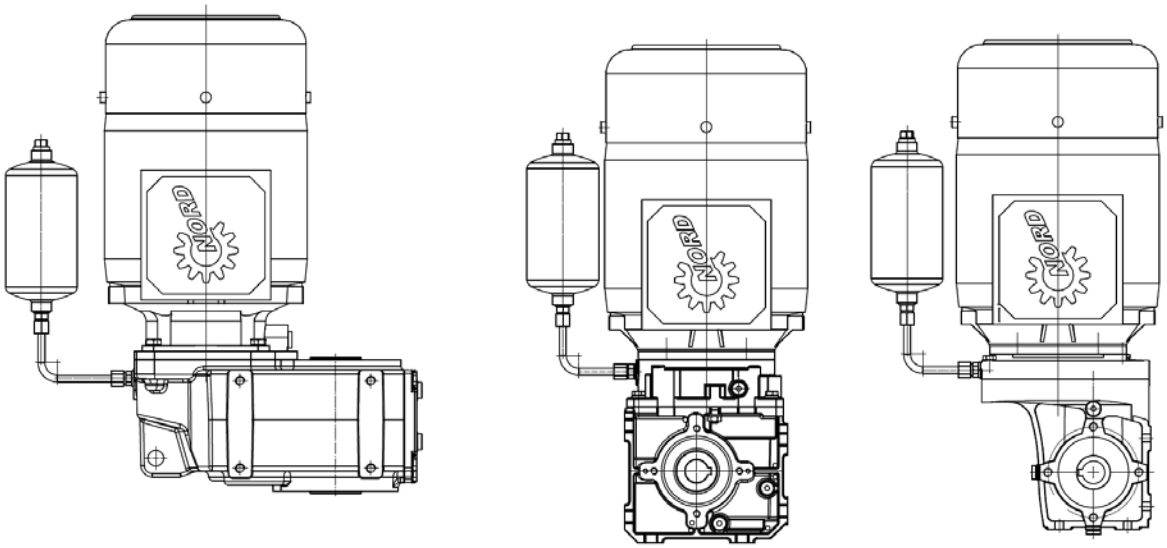

Figure 19: Position of the oil expansion chamber

1. After installing the gear unit, remove the oil level or vent screw.
2. Install the oil expansion chamber according to Figure 18. Align it parallel to the motor shaft.
3. Maintain the maximum tightening torque of 12 Nm for screwing the oil expansion chamber onto the gear unit housing.
4. Screw the enclosed M10 x 1.0 pressure vent into the oil expansion chamber.

3.15 Attaching the temperature sticker

For temperature class T4 gear units or gear units with a maximum surface temperature of less than 135 °C the supplied temperature sticker (printed with value 121 °C) must be affixed to the gear unit housing.

Part No.: 2839050.

The temperature class or the maximum surface temperature can be obtained from the ATEX labelling in the last line of the gear unit name plate.

Examples:

II 2G Ex h IIC **T4** Gb or. II 3D Ex h IIIC **T125°C** Dc

Affix the temperature sticker next to the oil level screw (see chapter 7.1 "Versions and mounting position")towards the motor. For gear units with an oil reservoir tank, affix the temperature sticker in the same position as for gear units without oil reservoir tanks. For gear units which are lubricated for life, affix the temperature sticker next to the name plate.

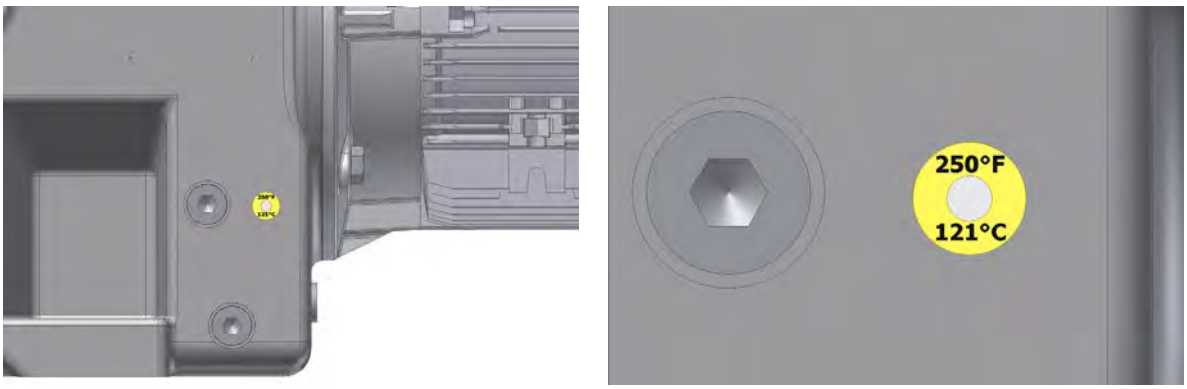

Figure 20: Position of the temperature sticker

3.16 Subsequent painting

DANGER

Explosion hazard due to electrostatic charge

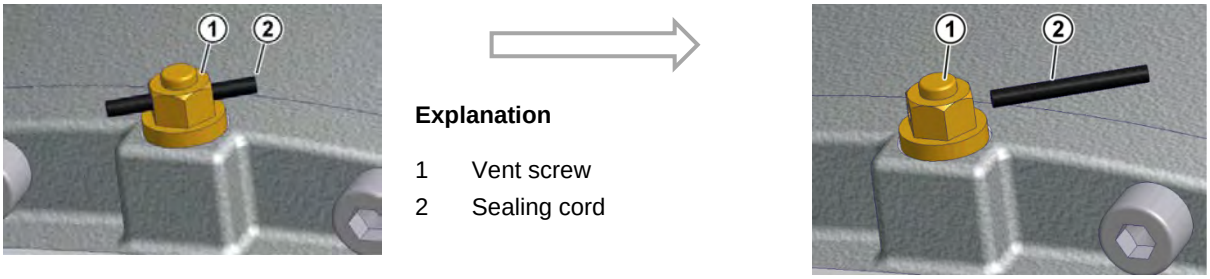
- Subsequent painting must have the same characteristics and layer thickness as the original painting.

For retrospective painting of the gear unit, the shaft sealing rings, rubber elements, pressure vent screws, hoses, type plates, adhesive labels and motor coupling components must not come into contact with paints, lacquers or solvents, as otherwise the components may be damaged or made illegible.

4 Commissioning

4.1 Checking the oil level

DANGER



Explosion hazard in case of inadequate lubrication

- Check the oil level before commissioning (see chapter 5.2.3 "Checking the oil level").

4.2 Activating the vent

If venting of the gear unit is provided, the pressure vent must be activated before commissioning. Double gear units consist of two single units, are equipped with 2 oil chambers and possibly 2 vents.

To activate, remove the sealing cord in the pressure relief vent. For the position of the pressure relief vent, see Section 7.1 "Versions and mounting position".

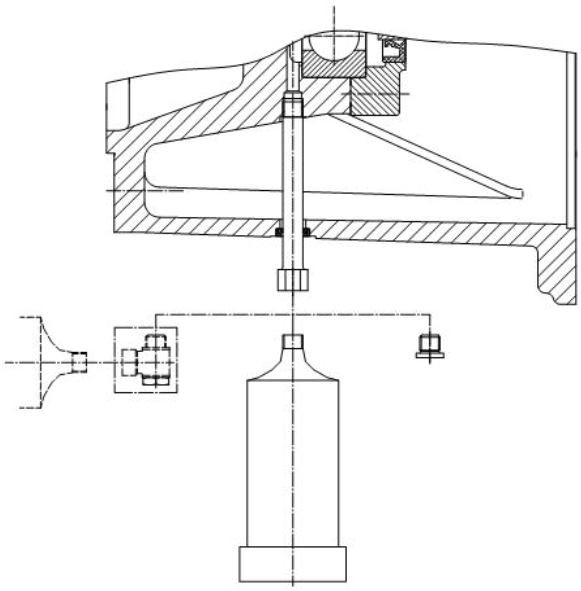
Explanation

1 Vent screw
2 Sealing cord

Figure 21: Activating the pressure vent screw

4.3 Activating the automatic lubricant dispenser

Some gear unit types with standard motor (Option IEC/NEMA, not AI/AN) have an automatic lubricant dispenser for the roller bearings. The lubricant sensor must be activated prior to commissioning the gear unit The cartridge case cover of the adapter for attaching an IEC/NEMA standard motor has a red information sign for activation of the lubricant dispenser. Opposite to the lubricant dispenser there is a grease escape hole which is closed with a G1/4 cap screw. After activation of the lubricant dispenser, the cap screw can be removed and replaced with the grease collection container (Part No. 28301210) which is supplied separately with the delivery.



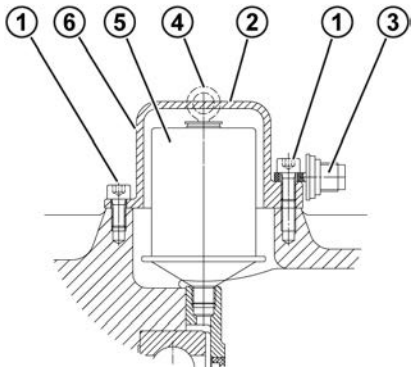


Figure 22: Fitting the grease collection container

Procedure:

1. Loosen and remove the cap screws.
2. Remove the cartridge cover.
3. Screw the activation screw into the lubricant dispenser until the lug breaks off at the defined fracture point.
4. For category 2D gear units (see ATEX labelling, last line of the gear unit name plate): Completely coat **the flange surfaces** of the cartridge cover with **surface sealant**, e.g. Loctite 574 or Loxeal 58-14.
5. Re-fit the cartridge cover. Attach the cartridge cover with the cap screws (see chapter 7.3 "Screw tightening torques").
6. Mark month and year of activation on the adhesive label.

	Explanation
1	Cap screws M8 x 16
2	Cartridge cover
3	Activation screw
4	Lug
5	Lubricant sensor
6	Position of adhesive label

Figure 23: Activating the automatic lubricant sensor with standard motor mounting

Adhesive label

Figure 24: Adhesive label

4.4 Cooling coil (Option: CC)

DANGER

Explosion hazard

- The drive may only be commissioned after the cooling spiral has been connected to the cooling circuit, and the cooling circuit has been put into operation.
- The temperature and the flow rate of the cooling fluid must be monitored and ensured.
- If there is a danger of frost, a suitable anti-freeze solution must be added to the cooling water in due time.
- Observe the special ATEX documentation provided by NORD.

The coolant must have a thermal capacity similar to water.

- Specific thermal capacity of water at 20 °C: c = 4.18 kJ/kgK

Clean, industrial water without any air bubbles or sediments is recommended as a coolant. The hardness of the water must be between 1 dH and 15 dH; the pH value must be between pH 7.4 and pH 9.5. No aggressive liquids may be added to the coolant!

The **coolant pressure** must not exceed **8 bar**. We also recommend fitting a pressure reducer at the coolant inlet to avoid damage due to excessive pressure.

The **coolant inlet temperature** must not exceed 40 °C. **10 °C** are recommended.

The required **coolant flow rate** is **10 l/min**.

4.5 Temperature measurement

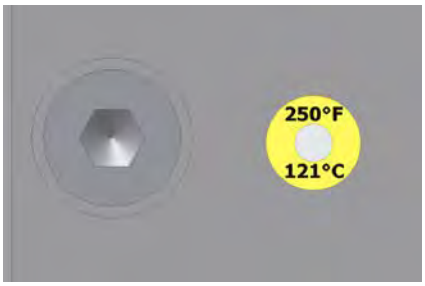
The details of the ATEX temperature class or the maximum surface temperature are based on normal installation conditions. Even small changes to the installation conditions can have a significant effect on the temperature of the gear unit.

During commissioning, a surface temperature measurement of the gear unit must be made under maximum load. This does not apply to gear units which are labelled as temperature class T1 – T3 or a maximum surface temperature of 200 °C in the last line of the rating plate.

For the temperature measurement, a normal temperature measuring device is required, which covers a measurement range from 0 °C to 130 °C and a precision of at least ± 4 °C and which enables the measurement of the surface temperature and the temperature of the air.

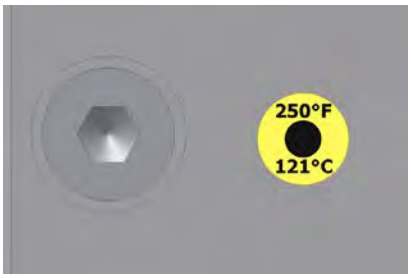
Temperature measurement procedure:

1. Allow the gear unit to run at maximum speed under maximum load for approx. 4 hours.



2. Following warm-up, the temperature of the gear unit housing surface T_{gm} is to be measured close to the temperature sticker (see chapter 3.15 "Attaching the temperature sticker").
3. Measure the temperature of the air T_{um} in the immediate vicinity of the gear unit.

Shut down the drive and contact Getriebebau NORD if one of the following criteria is not fulfilled:



- The measured air temperature T_{um} is within the permissible range stated on the type plate.
- The measured air temperature on the surface of the gear unit housing T_{gm} is less than 121 °C.
- The temperature sticker has not turned black (see Figure 26).
- The measured temperature of the surface of the gear unit housing plus the difference between the highest permissible air temperature T_u stated on the type plate and the measured air temperature must be at least 15 °C lower than the maximum permissible surface temperature, i.e.:

ATEX labelling:	II 2G Ex h IIC T4 Gb/ II 3G Ex h IICT4 Gc: $T_{gm} + T_u - T_{um} < 135\ °C - 15\ °C$
ATEX labelling:	II 2D Ex h IIIC T_{max} Db / II 3D Ex h IIIC T_{max}:Dc: $T_{gm} + T_u - T_{um} < T_{max} - 15\ °C$
T_{gm}:	Measured temperature of the surface of the gear unit housing in °C
T_{um}::	Measured air temperature in °C
T_{max}:	Maximum surface temperature according to gear unit type plate (ATEX labelling) in °C
T_u:	Upper value of the permissible ambient temperature range in °C according to the type plate

Figure 25: ATEX labelling

Centre dot is **white:** OK

Centre dot is **black:** Temperature was too high.

Figure 26: Temperature sticker

4.6 Test run

During commissioning of the gear unit a test run should be carried out in order to detect any problems prior to continuous operation.

During a test run under full load, the gear unit should be checked for:

- Unusual noises, such as grinding, knocking or rubbing noises
- Unusual vibrations, oscillations or other movements
- Production of steam or smoke

After the test run, the gear unit should be checked for:

- Leaks
- Slippage of the shrink discs. To do this, remove the cover and check whether the marking specified in Section 3.8 "Fitting a hollow shaft with shrink disc (Option: S)"indicates a movement of the gear unit hollow shaft relative to the machine shaft. Then remount the cover as described in Section 3.10 "Fitting the covers (option: H, H66)".

Information

Radial shaft seals are rubbing seals and have sealing lips made from an elastomer material. These sealing lips are lubricated with a special grease at the factory. This reduces the wear due to their function and ensures a long service life. An oil film in the region of the rubbing sealing lip is therefore normal and is not due to leakage.

4.7 Running-in time for the worm gear unit

In order to achieve maximum efficiency of the worm gear unit, the gear unit must be subjected to a running-in period of approx. 25 h – 48 h under maximum load.

There may be a reduction in efficiency before the running-in period is complete.

4.8 Checklist

Checklist		
Item to be checked	**Date of check:**	**Information see Section**
Are there any transport damages or other damages visible?		3.4.1
Does the labelling on the name plate comply with the specifications?		2.2
Does the version on the name plate conform to the actual installation?		3.3
Is the pressure vent activated?		4.2
Do all drive and driven elements have ATEX approval?		1.2.2
Are the external gear shaft forces within permitted limits (chain tension)?		3.6
Are rotating parts covered with the contact guard?		3.10
Does the motor also have appropriate ATEX approval?		3.12
Has the temperature sticker been affixed?		3.15
Has the correct oil level for the version been checked?		5.2.3
Is the automatic lubricant sensor activated?		4.3
Has the temperature been measured?		4.5
Does the centre of the temperature sticker have a white colour?		4.5
Is the cooling system connected?		3.13 4.4
Was the gear unit checked in a test run?		4.6
Was the shrink disc connection tested for slippage?		4.6

Table 9: Checklist for commissioning

5 Service and maintenance

5.1 Inspection and maintenance intervals

Inspection and maintenance intervals	Inspection and maintenance work	Information see Section
Weekly or every 100 operating hours	• Visual inspection for leaks • Check the gear unit for unusual running noises and/or vibrations • Only for **gear units with cooling cover**: Visual inspection of the temperature sticker	5.2.1 5.2.2 5.2.8
Every 2,500 operating hours, at least every six months	• Check the oil level • Visual inspection of the rubber buffer • Visual inspection of hose • Visual inspection of radial shaft seal • Visual inspection of Option SCX • Visual inspection of the temperature sticker	5.2.3 5.2.4 5.2.5 5.2.6 5.2.7 5.2.8
	• Remove dust (only for category 2D) • Check coupling (only for category 2G and standard IEC/NEMA motor attachment) • Re-grease/remove excess grease (only applicable for free drive shaft/option W, for agitator bearings/option VL2/VL3 and for AI…/AN… adapter with option BRG1) • Clean or replace the pressure relief vent	5.2.9 5.2.10 5.2.11 5.2.15
Every 5000 operating hours, at least every year (only for standard IEC / NEMA motor attachment)	• Replace the automatic lubricant sensor, remove excess grease, empty or replace the grease collection container at each second replacement of the lubricant sensor	5.2.12
For operating temperatures up to 80 °C, every 10000 operating hours, at least every 2 years	• Change the oil (if filled with synthetic products, the interval is doubled, with the use of ***SmartOilChange*** the interval is specified by ***SmartOilChange***) • Check the cooling coil for deposits (fouling) • Replace the radial shaft seals at every oil change, at the latest after 10,000 operating hours • Clean or replace the vent screw as necessary	5.2.3 5.2.14 5.2.16 5.2.15
Every 20000 operating hours, at least every 4 years	• Re-lubricate the bearings in the gear unit • Replace the hoses • Check the function of the resistance thermometer (only II2GD)	5.2.17
Interval as stated in field MI of the name plate (only for Category 2G and 2D) or at least every 10 years	• General overhaul	5.2.18

Information

The oil change intervals apply for normal operating conditions and operating temperatures up to 80 °C. The oil change intervals are reduced in the case of extreme conditions (operating temperatures higher than 80 °C, high humidity, aggressive environment and frequent fluctuations in the operating temperature).

Information

SmartOilChange determines the optimum time for an oil change based on a continuous determination of the oil temperature. With ***SmartOilChange*** from Getriebebau NORD, this is done entirely on the basis of key data for the specific product, the specified ambient temperature and internal measurement values of the power electronics such as the current consumption. Additional hardware is therefore not required for the Getriebebau NORD solution.

The measurement results are processed and interpreted by the integrated software and result in the display of the residual time until the next oil change.

5.2 Service and maintenance work

DANGER

Explosion hazard

- No explosive atmosphere must be present during repair work.
- When cleaning the gear unit, do not use procedures or materials which may cause electrostatic charging of the gear unit or adjacent non-conducting components.

5.2.1 Visual inspection for leaks

The gear unit must be checked for leaks. Attention should be paid to escaping gear oil and traces of oil on the exterior or underneath the gear unit. In particular, the radial shaft seals, cover caps, screw fittings, hoses and housing joints should be checked.

Information

Radial shaft seals are components with a limited life and are subject to wear and ageing. The service life of radial shaft seals depends on various ambient conditions. Temperature, light (especially UV light), ozone and other gases and liquids affect the ageing process of radial shaft seals. Some of these influences may change the physical or chemical properties of the radial shaft seals and result in a significant reduction of their service life. Foreign matter (e.g. dust, sludge, sand, metallic particles) and excess temperature (excessive speed or external heating) accelerate the wear of the sealing lip. These sealing lips are made of an elastomer material and are lubricated with a special grease at the factory. This reduces the wear due to their function and ensures a long service life. An oil film in the region of the rubbing sealing lip is therefore normal and is not due to leakage (see chapter 7.5 "Leakage and leak-tightness").

NOTICE

Damage to the radial shaft seals through unsuitable cleaning agents

Unsuitable cleaning agents may damage the radial shaft seals, which may then cause an increased risk of leaks.

- Do not clean the gear unit with cleaning agents which contain acetone or benzol.
- Avoid contact with hydraulic oils.

If leaks are suspected, the gear unit should be cleaned, the oil level checked and checked again for leaks after approx. 24 hours. If a leak is confirmed (dripped oil), the gear unit must be repaired immediately. Please contact the NORD service department.

If the gear unit is equipped with a cooling coil in the housing cover, the connections and the cooling coil must be checked for leaks. If there are any leaks, these must be repaired immediately. Please contact the NORD service department.

5.2.2 Check for running noises

If the gear unit produces unusual running noises or vibrations, this could indicate damage to the gear unit. In this case the gear unit must be repaired immediately. Please contact the NORD Service department.

5.2.3 Checking the oil level

Section 7.1 "Versions and mounting position" describes the versions and the corresponding oil level screws. With double gear units, the oil level must be checked on both units. The pressure vent must be at the position marked in Section 7.1 "Versions and mounting position".

The oil level does not need to be checked on gear units without oil level screw (see chapter 7.1 "Versions and mounting position").

The oil level must only be carried out when the gear unit is at a standstill and has cooled down. Provide protection against accidental activation. Check the oil level with an oil temperature of between 10 °C to 40 °C.

Gear units with oil level screw

1. Standard version M4 (V1 and V5) helical gear units have an angled pipe for checking the oil level as shown in Figure 27 (right-hand illustration). This must point vertically upwards. Before checking the oil level, unscrew the pressure vent.
2. Unscrew the oil level screw corresponding to the mounting position (see chapter 7.1 "Versions and mounting position").
3. Check the oil level in the gear unit with the dipstick supplied (Part No.: 283 0050) as shown in Figure 27 (left and right illustration). To do this, hold the part of the dipstick which is submerged in the oil vertically.
4. The maximum oil level is the lower edge of the oil level hole.
5. The minimum oil level is approx. 4 mm below the lower edge of the oil level hole. The dipstick then just dips into the oil.
6. If the oil level is not correct, adjust the oil level by draining off oil or topping up with the type of oil stated on the name plate.
7. If the integrated seal of the oil level screw is damaged, use a new oil level screw or clean the thread and coat it with securing adhesive before screwing it in, e.g. Loctite 242 or Loxeal 54-03.
8. Attach the oil level screw together with the sealing ring and tighten with the correct torque (see chapter 7.3 "Screw tightening torques").
9. If the pressure vent has been unscrewed, screw it back in again together with the sealing ring and tighten with the correct torque (see chapter 7.3 "Screw tightening torques").
10. Mount all removed attachments again.

Gear units with an oil level tank

The oil level must be checked with the aid of the dipstick plug (thread G1¼) in the oil reservoir tank. The oil level must be between the upper and lower marking when the dipstick is fully screwed in; see Figure 27 (centre illustration). These gear units may only be operated in the mounting position stated in Section 7.1 "Versions and mounting position".

Gear units with oil inspection glass

1. The oil level can be seen directly in the window.
2. The correct oil level is:
   - Maximum: the middle of the oil inspection glass,
   - Minimum: Lower edge of the oil inspection glass.
3. If the oil level is not correct, adjust the oil level by draining off oil or topping up with the type of oil stated on the name plate.

Final check

All previously removed screws must be screwed back in correctly.

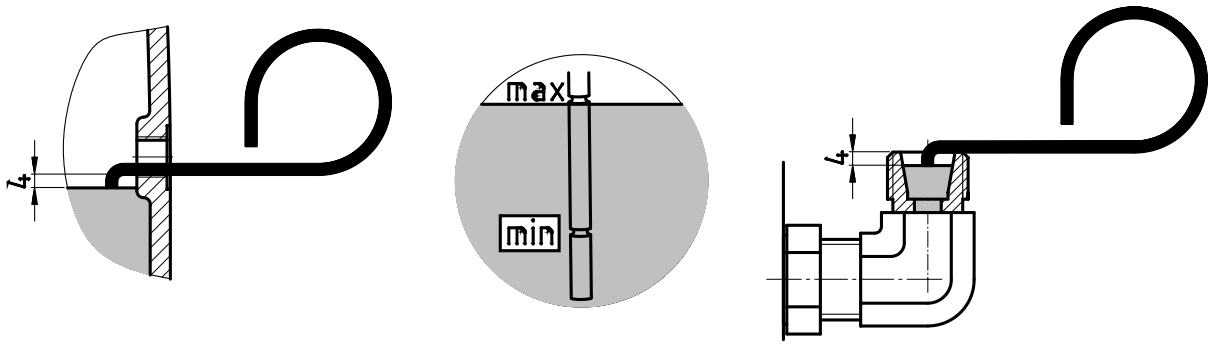


Figure 27: Checking the oil level with a dipstick

5.2.4 Visual inspection of the rubber buffers (Option: G, VG)

If these show damage such as tears to the surface, the rubber elements must be replaced. In this case, please contact NORD Service.

5.2.5 Visual inspection of the hoses (Option: OT)

Gear units with an oil reservoir tank have rubber hoses.

Check the hoses and screw connectors for leaks, cuts, tears, porous areas and chafing. In case of damage, the hoses must be replaced. Please contact the NORD service department.

5.2.6 Visual inspection of the radial shaft seals

Information

Radial shaft seals are rubbing seals and have sealing lips made from an elastomer material. These sealing lips are lubricated with a special grease at the factory. This reduces the wear due to their function and ensures a long service life. An oil film in the region of the rubbing sealing lip is therefore normal and is not due to leakage.

5.2.7 Visual inspection of the SCX flange (option: SCX)

Check the dirt outlet holes on the SCX flange for dirt.

The gap between the shaft and the fastening plate must be free from dirt. If severe soiling is apparent, pull the gear unit off the push-in shaft and clean the push-in shaft and the inside of the flange.

Check the radial shaft seals on the gear unit for damage. Damaged radial shaft seals must be replaced with new radial shaft seals.

Mount the gear unit on the cleaned SCX flange.

5.2.8 Visual inspection of the temperature sticker

(only necessary for temperature class T4 or maximum surface temperature < 135 °C)

Check the temperature sticker for black colouration. If the temperature sticker has turned black, the gear unit has become too hot. The cause of overheating must be determined. Please contact the NORD service department. Do not resume operation of the drive before the cause of overheating has been remedied and renewed overheating can be ruled out.

Before putting into operation again, affix a new temperature sticker on the gear unit.

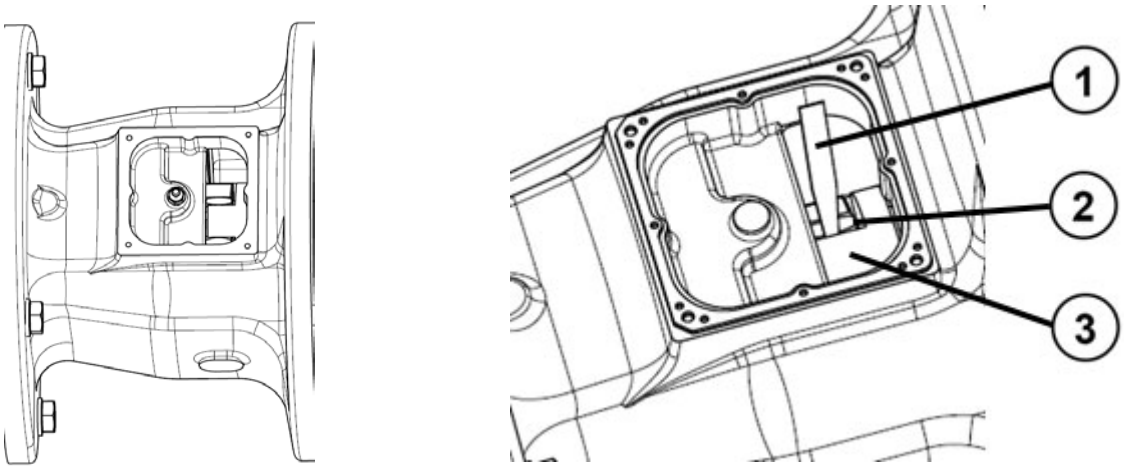
5.2.9 Remove dust

(only necessary for category 2D)

Remove dust deposits on the gear unit housing if they are more than 5 mm thick.

For gear units fitted with a cover (Option H), remove the cover. Remove dust deposits in the cover, on the output shaft and on the shrink disc. Remount the cover cap afterwards.

Information



If the cover cap is completely sealed with a liquid sealing agent such as Loctite 574 or Loxeal 58-14, there is no need for regular cleaning of the cover cap

5.2.10 Check coupling (option: IEC, NEMA, AI, AN)

(only necessary for category 2G)

For option AN or AI, it is possible to check the coupling through the inspection hole. Remove the inspection cover and check the claw coupling's play. If the wear limit X_{max} has been exceeded, the ring gear must be replaced.

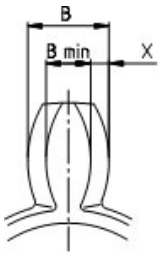
For the IEC or NEMA option, remove the motor.

1) Feeler gauge
2) Ring gear
3) Hub

Figure 28: For option AI, AN, check coupling through the inspection hole

Examine the plastic and elastomer coupling components for traces of wear. Permissible wear limits can be found in Table 10. If the limit values are undershot, the coupling components must be replaced. Only use replacement parts which have the same colour as the original parts. The colour corresponds to a permissible temperature range and the torque transmission. Otherwise there is an increased risk of material fatigue.

With claw couplings (ROTEX®), measure the tooth thickness of the elastomer ring gear as shown in Figure 29. B_{min} is the minimum permitted tooth thickness.



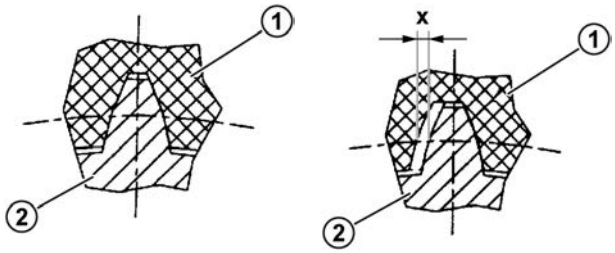


Figure 29: Measuring the tooth thickness on the ROTEX® claw coupling

Limiting wear values for coupling ring gears								
Type	R14	R24	R38	R42	R48	R55	R65	R90
B [mm]	9.7	8.6	13.3	15.7	17.7	19.6	22.2	32.3
B_{min} [mm]	7.7	5.6	10.3	11.7	13.7	14.6	17.2	24.3

Table 10: Limiting wear values of the coupling ring gears

For gear couplings, the limiting wear value is X = 0.8 mm, as shown in the following illustration.

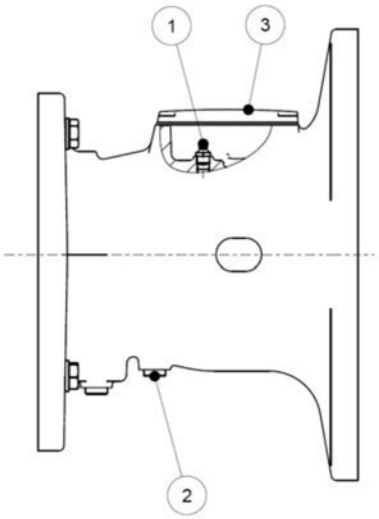
Explanation

1 Sleeve

2 Hub

Figure 30: Measurement of gear sleeve wear for curved tooth BoWex® couplings

Information



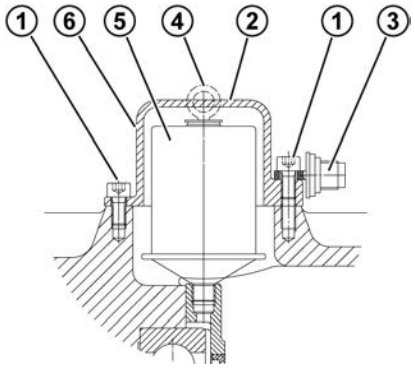
If the examination of the coupling only shows wear below 25% of the limiting value, it is permissible to duplicate the interval for examination of the coupling, i.e. to 5,000 operating hours, at least one year.

5.2.11 Re-greasing (Option: VL2, VL3, W, AI, AN)

Some gear unit designs are equipped with a re-greasing device.

For the agitator versions VL2 and VL3, unscrew the vent screw opposite the grease nipple prior to re-greasing. Inject grease until a quantity of 20 - 25g escapes from the vent hole. Screw the vent screw back in.

For option W and the IEC/NEMA adapters AI and AN with option BRG1, grease the outer roller bearing with approx. 20–25 g of grease at the grease nipple. The grease nipple is located under a bolt-on inspection cover. Before re-greasing, unscrew the grease drain screw so that the excess grease can drain off. Remove the excess grease on the motor adapter.



1 Conical grease nipple
2 Grease drain screw
3 Inspection cover

Figure 31: Re-grease IEC/NEMA adapters AI and AN with option BRG1

Recommended grease: Petamo GHY 133N (Klüber Lubrication) As an option, food-compatible grease may be used (see chapter 7.2.1 "Roller bearing greases")..

5.2.12 Replacing the automatic lubricant dispenser

Explanation

1 Cap screws M8 x 16
2 Cartridge cover
3 Activation screw
4 Lug
5 Lubricant dispenser
6 Position of adhesive label

Figure 32: Switching the automatic lubricant sensor with standard motor mounting

(Lubricant sensor: Part No.: 28301000 or for food-compatible grease Part No.: 28301010)

1. Unscrew the cartridge cover.
2. Unscrew the lubricant sensor.
3. Screw in the new lubricant sensor.
4. Remove excess grease from the adapter.
5. Activate the full lubricant sensor (see chapter 4.3 "Activating the automatic lubricant dispenser").

The grease collection container (Part No. 28301210) must be replaced or drained with every second replacement of the lubricant sensor. Due to the form of the container, a residual amount of grease remains in the container.

1. Unscrew the grease collection container from the screw connector.
2. Press grease out of the grease collection container. To do this, push the internal piston back with a rod. The rod may have a maximum diameter of 10 mm. Collect the extracted grease and dispose it properly.
3. Check the collecting vessel. If the collecting vessel is damaged, replace it with a new one.
4. Screw the collecting vessel back into the drain hole on the motor adapter.

5.2.13 Change the oil

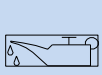
On the figures in Section 7.1 "Versions and mounting position"the positions of the oil drain screw, the oil level screw and the vent screw, if present, are shown depending on the mounting position.

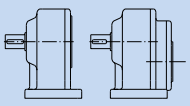
WARNING

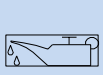
Danger of burns

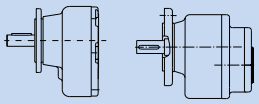
The oil may be very hot. Use protective equipment.

Procedure:









1. Place a collection vessel under the oil drain screw or the oil drain tap.
2. Screw out the oil level screw (if present) and the oil drain screw. When using an oil reservoir tank, screw out the screw plug with dipstick.
3. Completely drain the oil from the gear unit.
4. Check the sealing rings of the oil drain screw and the oil level screw. If a sealing ring is damaged, replace the corresponding screw. You can also clean the threads and coat them with securing adhesive e.g. Loctite 242 54-03 before screwing them in.
5. Screw the oil drain screw into the hole and tighten to the correct torque (see chapter 7.3 "Screw tightening torques").
6. Using a suitable filling device, refill with oil of the same type through the oil level hole until oil emerges from the oil level hole. The oil can also be filled through the hole of the pressure vent screw or of a screw plug located higher than the oil level. If an oil reservoir tank is used, fill the oil through the upper inlet (thread G1¼) until the oil level is set as described in Section 5.2.3 "Checking the oil level".
7. Check the oil level after at least 15 min, if using an oil level container after at least 30 min.

Information

The oil does not need to be replaced for gear units without oil drain screws (see chapter 7.1 "Versions and mounting position"). The gear unit are lifelong lubricated.

Standard helical gear units in ATEX categories 3G and 3D (see chapter 2.2 "Name plate")do not have an oil level screw. Here, new oil is injected through the threaded hole of the pressure vent, with the oil quantity according to the following table.

Oil quantities

Table 11: Oil quantities for standard helical gear units for ATEX categories 3G and 3D

5.2.14 Checking the cooling coil for deposits (Option: CC)

The cooling water flow rate must be controlled. For this, pay attention to the information in Section 4.4 "Cooling coil (Option: CC)".

If a chemical cleaner is used, it must be ensured that the cleaning agent does not attack the material of the cooling coil (copper pipe and brass fittings).

Check the cooling coil and the cover for leaks if strong corrosion is found on the connections.

Please contact the NORD Service department.

5.2.15 Clean and check vent screw

1. Unscrew the vent screw.
2. Thoroughly clean the vent screw, e.g. with compressed air.
3. Check the vent screw and the sealing ring. If the sealing ring is damaged, use a new vent screw.
4. Screw the vent screw back in.

5.2.16 Replacing the shaft sealing ring

Once the shaft sealing ring has reached the end of its service life, the oil film in the region of the sealing lip increases and a measurable leakage with dripping oil occurs. **The radial shaft seal must then be replaced.** The space between the sealing lip and the protective lip must be filled approximately 50 % with grease on fitting (recommended grease: PETAMO GHY 133N). Take care that after fitting, the new radial shaft seal does not run in the old wear track.

5.2.17 Re-lubrication of bearings in the gear unit

NOTICE

Damage to the gear unit due to insufficient lubricant

There is a risk of bearing failure in the event of inadequate lubrication.

- It is essential to comply with the recommended intervals.
- Only use greases which are approved by Getriebebau NORD.
- Never mix different greases. If different greases are mixed, the gear unit may be damaged due to inadequate lubrication caused by incompatibility between the different greases.
- Avoid contamination of the grease with foreign substances and washing out of the grease by lubricating oil.

Please contact the NORD Service department for replacement of the grease in the roller bearings.

Recommended grease: Petamo GHY 133N - Klüber Lubrication. (see chapter 7.2.1 "Roller bearing greases")

5.2.18 General overhaul

DANGER

Explosion hazard

- The general overhaul must be carried out by qualified personnel in a specialist workshop with appropriate equipment.
- We urgently recommend that the general overhaul is carried out by the NORD Service Department.

With Category 2G and 2D gear units, a general overhaul is necessary after a specified period of operation.

The approved period of operation is usually stated on the name plate in field MI.

Alternatively, the maintenance class CM may be stated in field MI (e.g.: MI CM = 5.).

In this case, the time for general overhaul in years after commissioning (N_A) is calculated according to the following formula: The maximum permissible duration of operation after commissioning is 10 years. This also applies to higher calculated values.

$N_A = CM \cdot f_L \cdot k_A$

CM Maintenance class according to field MI of the name plate

f_L: Running time factor

- $f_L = 10$ Maximum running time 2 hours per day
- $f_L = 6$ Running time 2 to 4 hours per day
- $f_L = 3$ Running time 4 to 8 hours per day
- $f_L = 1.5$ Running time 8 to 16 hours per day
- $f_L = 1$ Running time 16 to 24 hours per day

k_A: Utilisation factor (usually $k_A = 1$)

Longer maintenance intervals often result if the actual power required by the application is known. The utilisation factor may be calculated as follows.

$$k_A = \left(\frac{P_1}{P_{tat}} \right)^3$$

P1 Max. permissible drive power or motor power in kW according to the name plate

P_{tat}: Actual drive power or motor power in kW which is required by the application at the rated speed., determined e.g. by measurements

For variable loads with differing actual drive powers with nominal speeds P_{tat1}, P_{tat2}, P_{tat3}, … with known percentage times q_1, q_2, q_3, …, the following equivalent average drive power applies:

$$P_{tat} = \sqrt[3]{P_{tat1}^{\,3} \cdot \frac{q_1}{100} + P_{tat2}^{\,3} \cdot \frac{q_2}{100} + P_{tat3}^{\,3} \cdot \frac{q_3}{100} + \ldots}$$

During general overhaul, the gear unit is completely dismantled. The following work steps are carried out:

- All gear unit components are cleaned.
- All gear unit components are checked for damage.
- Damaged parts are replaced.
- All roller bearings are replaced.
- Replace all seals, radial shaft seals and Nilos rings.
- Optional: The back stop will be renewed.
- Optional: Replace the elastomers in the coupling.

6 Disposal

Observe the current local regulations. In particular, lubricants must be collected and disposed of correctly.

Gear unit components	Material
Gearwheels, shafts, roller bearings, keys, circlips, …	Steel
Gear unit housing, housing components, …	Grey cast iron
Light alloy gear unit housing, light alloy housing components, …	Aluminium
Worm gears, sockets, ...	Bronze
Radial shaft seals, sealing caps, rubber components, …	Elastomers with steel
Coupling components	Plastic and steel
Flat seals	Asbestos-free sealing material
Gear oil	Additive mineral oil
Synthetic gear oil (adhesive label: CLP PG)	Polyglycol-based lubricants
Synthetic gear oil (adhesive label CLP PG)	Poly-alpha-olefin based lubricants
Cooling coil, embedding material of the cooling coil, screw fittings	Copper, epoxy, yellow brass

Table 12: Materials

7 Appendix

7.1 Versions and mounting position

For versions which are not listed, please refer to the special documentation drawing (see chapter 2.2 "Name plate").

7.1.1 Explanation of symbols

Vent

Oil level

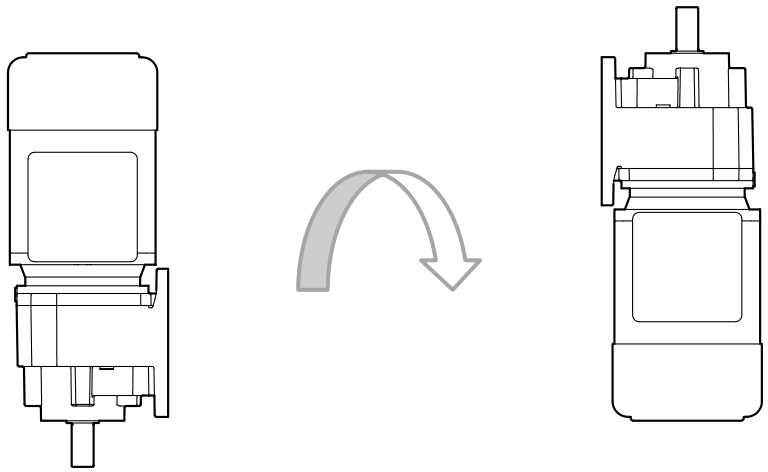
Oil drain

7.1.2 Standard helical gear units

Standard ATEX category 3G and 3D helical gear units do not have oil filling screws (see chapter 2.2 "Name plate").

7.1.3 NORDBLOC.1® helical in-line gear units SK 072.1 and SK 172.1

1. Bring the gear unit from the M4 installation position into the M2 installation position. Remove the oil level screw for the M2 installation position.



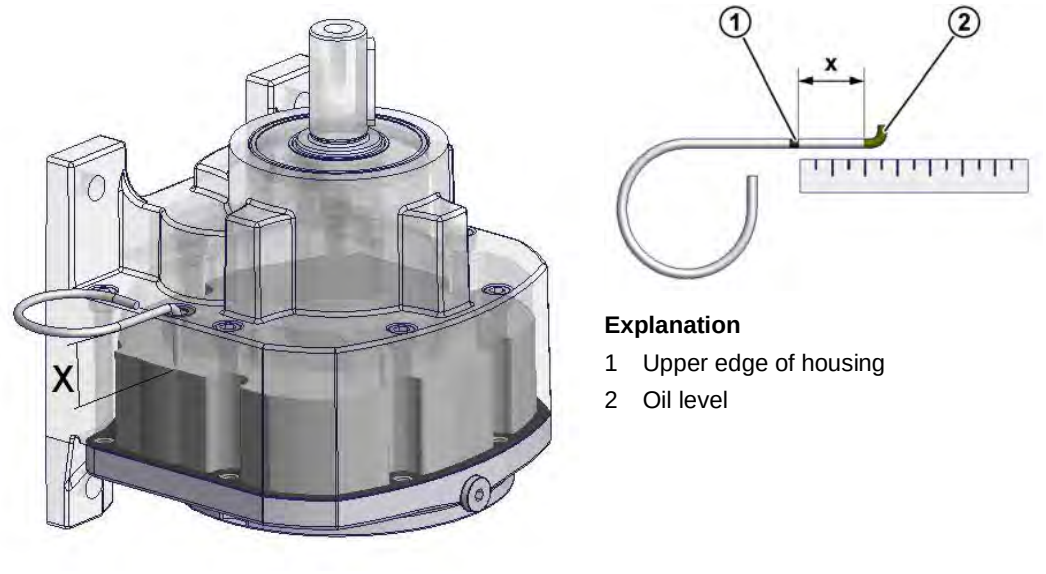


Figure 33: Oil level measurement SK 072.1 – SK 172.1

2. Determine the measurement X between the upper edge of the gear unit housing and the oil level. If necessary, adjust the dipstick accordingly (see Figure 34).

Explanation

1 Upper edge of housing
2 Oil level

Figure 34: Measuring the oil level

3. Compare the determined measurement X with the corresponding measurement in the following table. If necessary, adjust the oil level with the type of oil shown on the name plate.

Gear unit type	Thread size	Measurement X [mm]
SK 072.1	M8 x 1	22 ± 1
SK 172.1	M8 x 1	20 ± 1

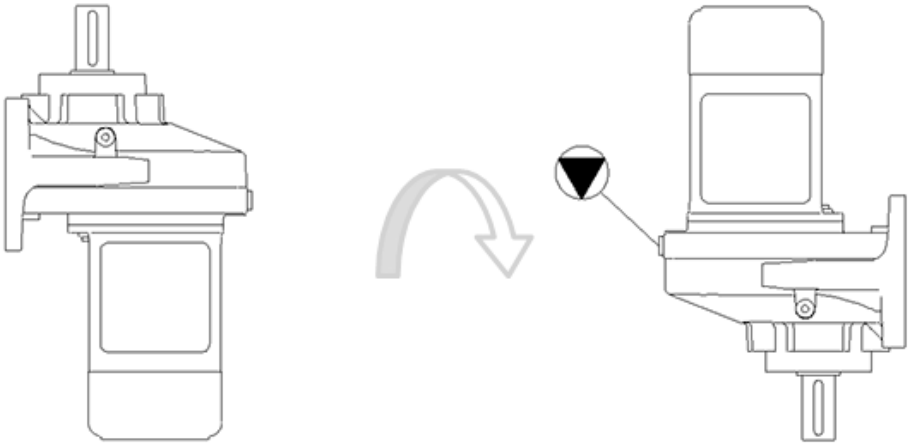
4. Screw the oil level screw of the M2 installation position back in and tighten it.
5. Bring the gear unit back into the M4 installation position.

7.1.4 NORDBLOC.1® helical in-line gear units SK 071.1, SK 171.1, SK 371.1, SK 571.1, SK 771.1 … SK 1071.1

The gear units do not have oil level screws in the installation position M2. The oil level must be measured in installation position M4. Proceed as follows.

SK 071.1, SK 171.1, SK 371.1, SK 571.1

1. Bring the gear unit into the M4 installation position.



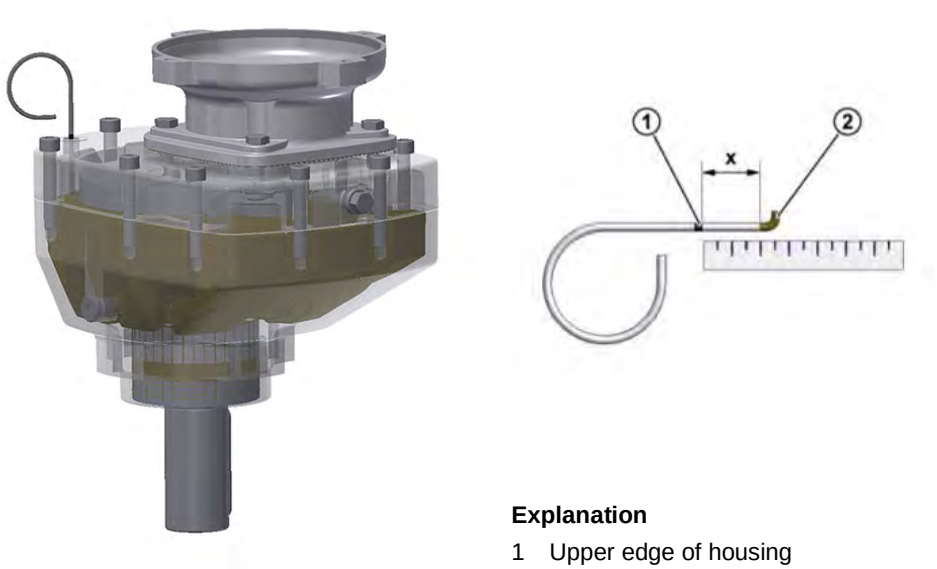


Figure 35: Oil level measurement SK 071.1 – SK 371.1

2. Remove the oil level screw for the M4 installation position. Check the oil level according to Section 5.2.3 "Checking the oil level". If necessary, adjust the oil level with the type of oil shown on the name plate.
3. Screw the oil level screw of the M4 installation position back in and tighten with the correct torque (see chapter 7.3 "Screw tightening torques").
4. Bring the gear unit back into the M2 installation position and remount it.

SK 771.1 … 1071.1

1. Bring the gear unit into the M4 installation position (see Figure 35)
2. Determine the measurement X between the upper edge of the gear unit cover and the oil level.

Explanation

1 Upper edge of housing
2 Oil level

Figure 36: Oil level SK 771.1 … 1071.1

3. Compare the determined measurement X with the measurement in the following table. If necessary, adjust the oil level with the type of oil shown on the name plate.

Gear unit type	Thread size	Measurement X [mm]
SK 771.1	M12 x 1.5	28 ± 1
SK 871.1	M12 x 1.5	14 ± 1
SK 971.1	M12 x 1.5	26 ± 1
SK 1071.1	M12 x 1.5	10 ± 1

4. Screw in the oil level screw of the M4 installation position and tighten with the correct torque (see chapter 7.3 "Screw tightening torques").
5. Bring the gear unit back into the M2 installation position and remount it.

7.1.5 NORDBLOC.1® helical in-line gear units

In category 2G and 2D, the gear unit types SK 320, SK 172, SK 272, SK 372 as well as SK 273 and SK 373 have only one oil level screw. These gear unit types have a checkable life-long lubrication. These gear unit types in ATEX categories 3G and 3D do not have oil level screws (see chapter 2.2 "Name plate").

7.1.6 Parallel shaft gear units

The following illustration applies to the M4 / H5 version of gear unit types SK 9282, SK 9382, SK 10282, SK 10382, SK 11282, SK 11382, SK 12382, SK10382.1, SK11382.1 with oil reservoir tank.

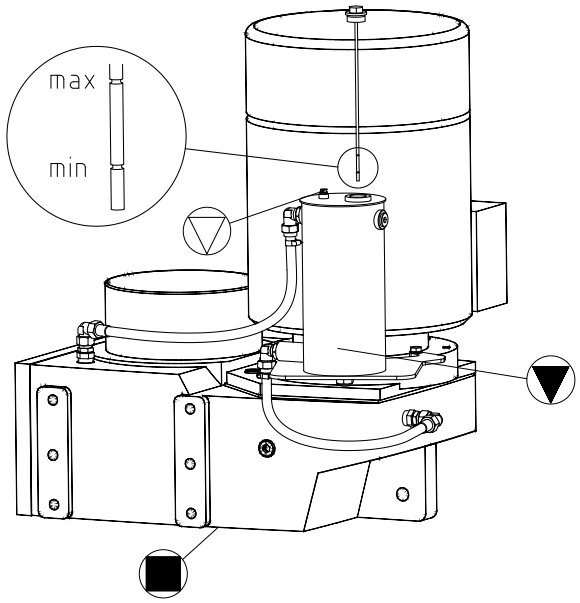

Figure 37: Parallel shaft gear units with oil level tank

In category 2G and 2D, types SK 0182 NB, SK 0282 NB and SK 1382 NB have a checkable life-long lubrication. In this category, the gear unit types have only one oil level screw. These gear unit types in ATEX categories 3G and 3D do not have oil level screws (see chapter 2.2 "Name plate").

7.1.7 UNIVERSAL worm gear units

SK 1SI 31 – SK 1SI 75

SK 1SIS 31 – SK 1SIS 75

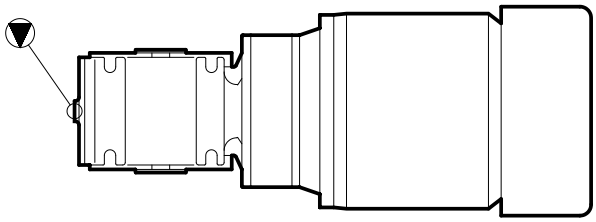

Figure 38: Orientation for oil level check

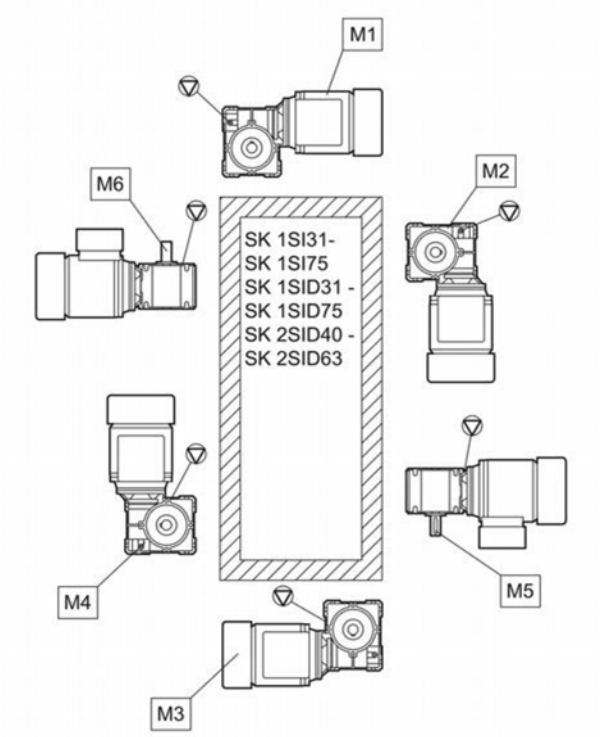
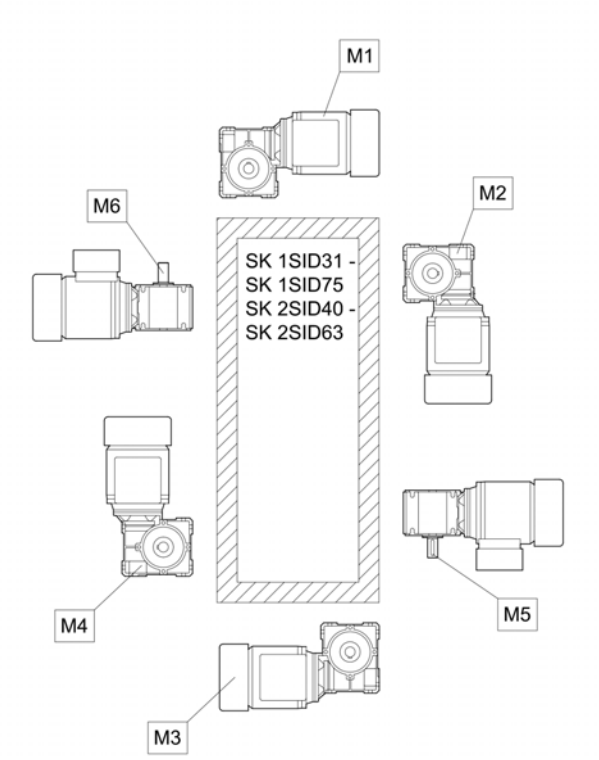
For the **oil level check**, bring the gear unit into the position shown above. To do this, it may be necessary to remove the gear unit or the geared motor.

Information

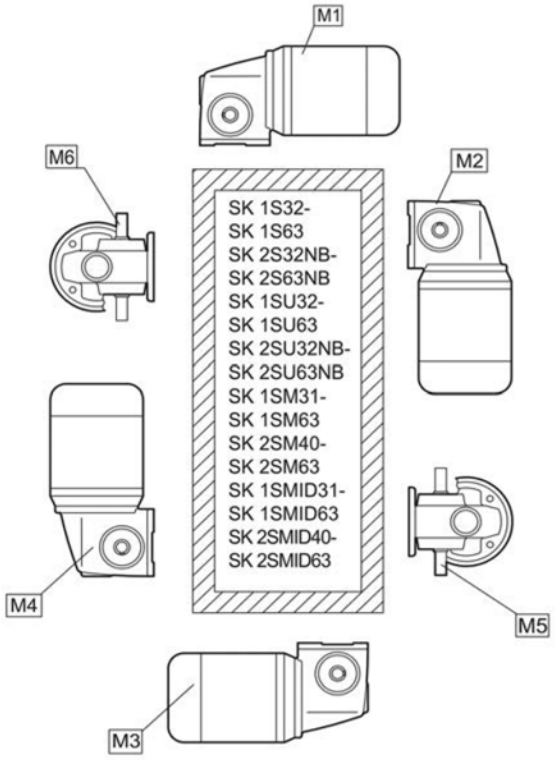
The warm gear unit must be adequately settled in the position shown in Figure 38, in order to allow the oil to settle evenly.



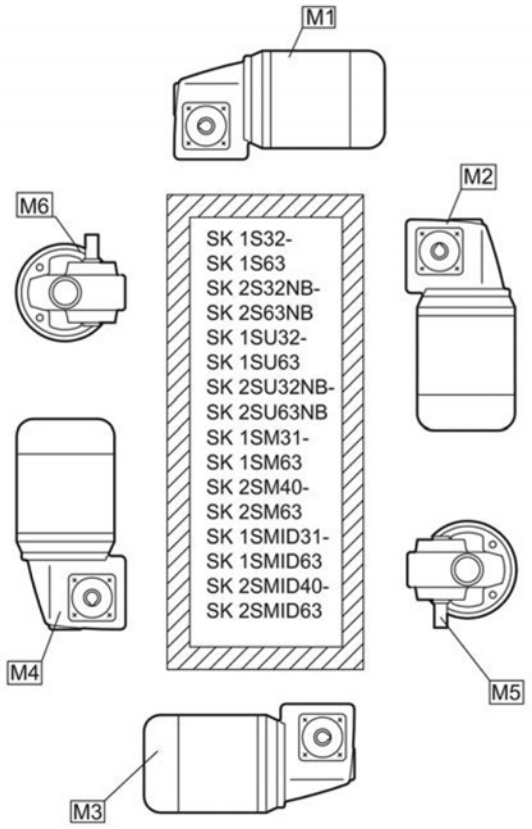
Afterwards, check the oil level as described in Section (see chapter 5.2.3 "Checking the oil level" on page 51).



In category 2G and 2D the gear units only have one oil level screw. These gear unit types have a checkable life-long lubrication.



The oil level screws are not used in ATEX categories 3G and 3D. These gear unit types are lubricated for life.



The gear unit types **SK 1S xx, SK 2S xx, SK 1SU xx, SK 2SU xx, SK 1SM xx, SK 2SM xx, SK 1SMI xx, SK 2SMI xx** may only be used in category 3G and 3D. These gear units are lubricated for life and do not have an oil level screw.

As an option, types SI and SMI can be equipped with a pressure relief vent.

7.2 Lubricants

With the exception of types SK 11382.1, SK 12382 and SK 9096.1, the gear units are filled with lubricant for the required mounting position and are ready for operation as delivered. The initial filling corresponds to a lubricant from the column for the ambient temperatures (standard version) in the lubricant table.

7.2.1 Roller bearing greases

This table contains comparable roller bearing greases from various manufacturers. The manufacturer can be changed within a grease type. When changing the grease type or the ambient temperature range, please consult Getriebebau NORD. Otherwise no guarantee can be accepted for the function of the gear units.

Lubricant type	**Ambient temperature**	Castrol	FUCHS	KLÜBER LUBRICATION	Mobil	Shell
Grease mineral oil-based	-30 … 60 °C	Tribol GR 100-2 PD	Renolit GP 2	-	Mobilux EP 2	Gadus S2 V100 2
			Renolit LZR 2 H			
	-50 … 40 °C	Optitemp LG 2	Renolit WTF 2	-	-	-
Synthetic grease	-25 … 80 °C	Tribol GR 4747/220-2 HAT	Renolit HLT 2	PETAMO GHY 133 N	Mobiltemp SHC 32	
			Renolit LST 2	Klüberplex BEM 41-132		
Bio-degradable grease	-25 … 40 °C	-	Plantogel 2 S	Klüberbio M 72-82	Mobil SHC Grease 102 EAL	Naturelle Grease EP2

Table 13: Roller bearing greases

7.2.2 Gear oils

DANGER

Explosion hazard due to unsuitable oil

Use of the gear oil type which is stated on the name plate is essential.

This table shows comparable lubricants from various manufacturers. The oil manufacturer can be changed within a viscosity and lubricant type. Only change the lubricant type or the viscosity after consultation with Getriebebau NORD.

Mixing different oil types is not permissible. When changing gear oil, different oils of one oil type with the same viscosity may be mixed in a maximum ratio of 1/20 (5 %).

Prior to the change of oils of different oil types, the gear unit must be thoroughly flushed with the new oil type. It is recommended to use the new product with a lower viscosity for flushing. This is especially valid when switching from a mineral oil (CLP) or synthetic oil CLP HC to to a synthetic oil CLP PG and vice versa.

Lubricant type	Details on name plate	Castrol	FUCHS	KLÜBER LUBRICATION	Mobil		TOTAL

Table 15: Screw tightening torques

Installing hose unions

Oil the thread of the union nut, the cutting ring and the thread of the connecting piece. Tighten the union nut with a spanner until the union nut becomes more difficult to turn. Turn the union nut further by approx. 30° to 60° but only to a maximum of 90° while holding the connecting piece with a spanner. Remove excess oil from the union.

7.4 Troubleshooting

DANGER

Explosion hazard

- Shut down the gear unit immediately in case of malfunction.

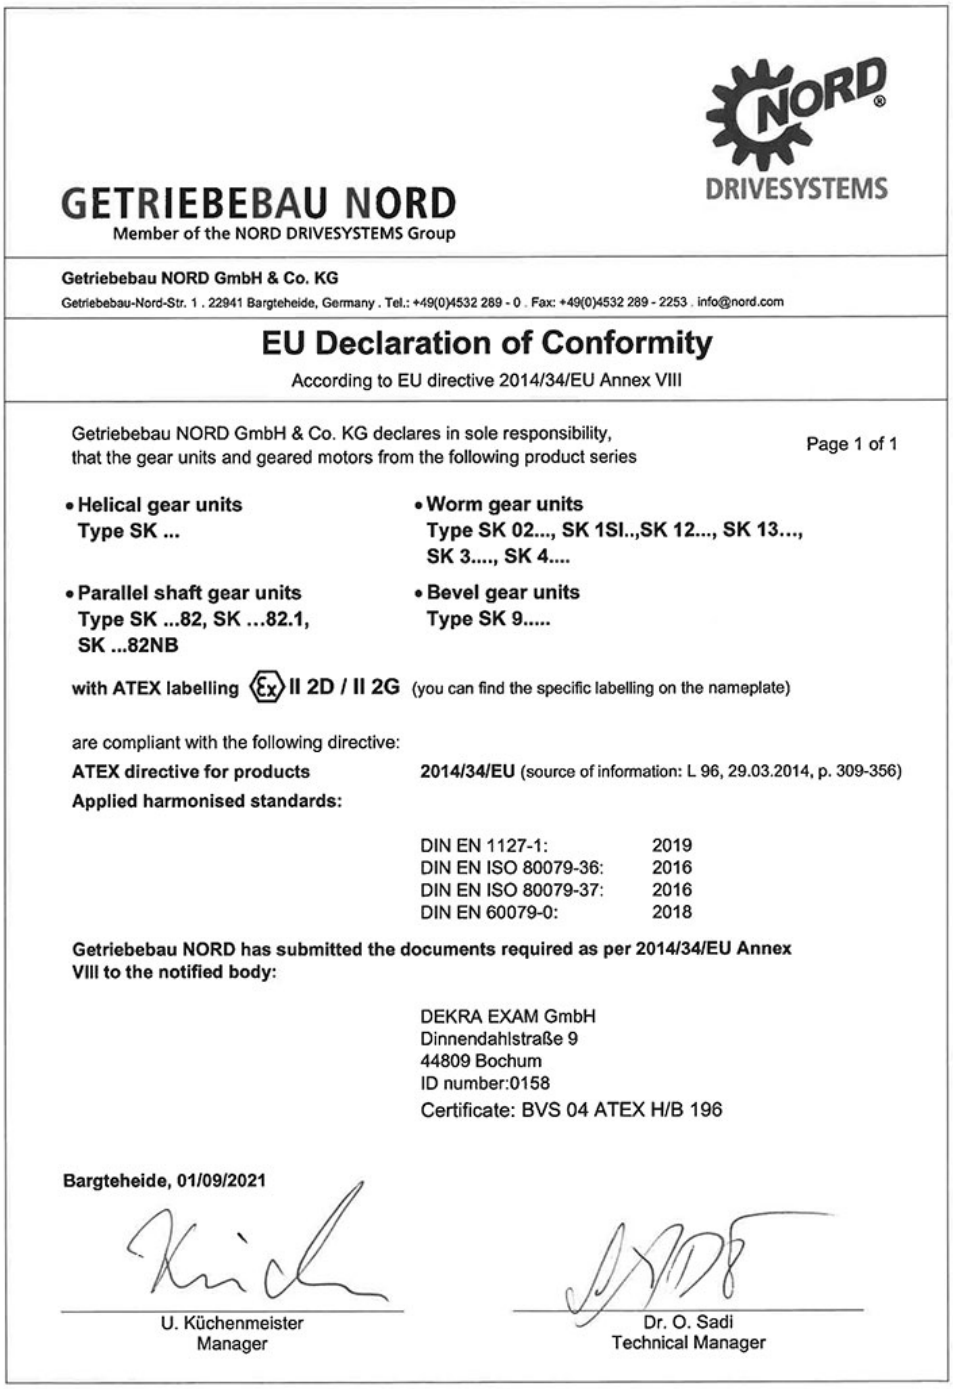
Gear unit malfunctions		
Error	**Possible cause**	**Remedy**
Unusual running noises, vibrations	Oil too low or bearing damage or gear wheel damage	Consult NORD Service department
Oil escaping from gear unit or motor	Defective seal	Consult NORD Service department
Oil escaping from pressure vent	Incorrect oil level	Use oil expansion chamber (Option OA)
	Incorrect, dirty oil	Oil change
	Unfavourable operating conditions	Consult NORD Service department
Gear unit becomes too hot	Unfavourable installation conditions or gear unit damage	Consult NORD Service department
Shock when switching on, vibrations	Motor coupling defective	Replace elastomer ring
	Gear unit fastening loose	Tighten motor and gear unit fastening screws
	Defective rubber element	Replace rubber element
Output shaft does not rotate although motor is running	Breakage in gear unit	Consult NORD Service department
	Motor coupling defective	
	Shrink disc slip	

Table 16: Overview of malfunctions

7.5 Leakage and leak-tightness

Gear units are filled with oil or grease to lubricate the moving parts. Seals prevent the escape of lubricants. A complete seal is technically not possible, as a certain film of moisture, for example on the radial shaft sealing rings is normal and advantageous for a long-term seal. In the region of vents, moisture due to oil may be visible due to the escape of oil mist because of the function. In the case of grease-lubricated labyrinth seals, e.g. Taconite sealing systems, used grease emerges from the sealing gap due to the principle of operation. This apparent leak is not a fault.

According to the test conditions as per DIN 3761, the leak is determined by the medium which is to be sealed, which in test bench tests exceeds the function-related moisture in a defined test period and which results in dripping of the medium which is to be sealed. The measured quantity which is then collected is designated as leakage.



Definition of leakage according to DIN 3761 and its appropriate use					
		Location of leak			
Term	**Explanation**	**Radial shaft seal**	**In IEC adapter**	**Housing joint**	**Venting**
Sealed	No moisture apparent	No reason for complaint	No reason for complaint	No reason for complaint	No reason for complaint
Damp	Moisture film locally restricted (not an area)	No reason for complaint	No reason for complaint	No reason for complaint	No reason for complaint
Wet	Moisture film beyond the extent of the component	No reason for complaint	No reason for complaint	Repair if necessary	No reason for complaint
Measurable leakage	Recognisable stream, dripping	Repair recommended	Repair recommended	Repair recommended	Repair recommended
Temporary leakage	Temporary malfunction of the sealing system or oil leak due to transport *)	No reason for complaint	No reason for complaint	Repair if necessary	No reason for complaint
Apparent leakage	Apparent leakage, e.g. due to soiling, sealing systems which can be re-lubricated	No reason for complaint	No reason for complaint	No reason for complaint	No reason for complaint

Table 17: Definition of leaks according to DIN 3761

*) Previous experience has shown that moist or wet radial shaft sealing rings stop leaking later. Therefore, under no circumstances can replacement be recommended at this stage. The reason for momentary moisture may be e.g. small particles under the sealing lip.

7.6 Declaration of Conformity

7.6.1 Explosion protected gear units and geared motors, Category 2G and 2D

EU Declaration of Conformity

According to EU directive 2014/34/EU Annex VIII

Getriebebau NORD GmbH & Co. KG hereby declares in sole responsibility, that the gear units and geared motors from the following product series

Page 1 of 1

- **Helical gear units**
  Type SK ...
- **Worm gear units**
  Type SK 02..., SK 1S...,SK 12..., SK 13..., SK 3...., SK 4....
- **Parallel shaft gear units**
  Type SK ...82, SK ...82.1, SK ..82NB
- **Bevel gear units**
  Type SK 9.....

with ATEX labelling Ex **II 3D / II 3G** (you can find the specific labelling on the nameplate)

are compliant with the following directive:

ATEX directive for products **2014/34/EU** (source of information: L 96, 29.03.2014, p. 309-356)

Applied harmonised standards:

7.7 Repair information

For enquiries to our technical and mechanical service department, please have the exact gear unit type and, if applicable, the order number to hand. You can find this information on the name plate.

7.7.1 Repairs

In case of repair, remove all non-original parts from the gear unit or geared motor. No guarantee can be given for any attached parts, such as rotary encoders or external fans.

Send the device to the following address:

Getriebebau NORD GmbH & Co. KG
Serviceabteilung
Getriebebau-Nord-Straße 1
22941 Bargteheide

Information

If possible, state the reason for returning the component/device. Specify a contact person for queries.

This is important in order to keep repair times as short as possible.

7.7.2 Internet information

In addition, you will find the manuals in the available languages on our website: www.nord.com.

7.8 Warranty

NORD GmbH & Co. KG accepts no liability for damage to persons, materials or assets as a result of failure to observe this operating manual, operating errors or incorrect use. General wearing parts, e.g. radial seals are excluded from the warranty.

INSTALLATION, OPERATION AND MAINTENANCE MANUAL OF ELECTRIC MOTORS

This manual provides information about WEG induction motors fitted with squirrel cage, permanent magnet or hybrid rotors, low, medium and high voltage, in frame sizes IEC 56 to 630 and NEMA 42 to 9606/10.
The motor lines indicated below have additional information that can be checked in their respective manuals:

- Smoke Extraction Motors;
- Electromagnetic Brake Motors;
- Hazardous Area Motors.

These motors meet the following standards, if applicable:

- NBR 17094-1: Máquinas Elétricas Girantes - Motores de Indução - Parte 1: trifásicos.
- NBR 17094-2: Máquinas Elétricas Girantes - Motores de Indução - Parte 2: monofásicos.
- IEC 60034-1: Rotating Electrical Machines - Part 1: Rating and Performance.
- NEMA MG 1: Motors and Generators.
- CSA C 22.2 N°100: Motors and Generators.
- UL 1004-1: Rotating Electrical Machines - General Requirements.

If you have any questions regarding this manual please contact your local WEG branch, contact details can be found at www.weg.net.

1. TERMINOLOGY

Balancing: the procedure by which the mass distribution of a rotor is checked and, if necessary, adjusted to ensure that the residual unbalance or the vibration of the journals and/or forces on the bearings at a frequency corresponding to service speed are within specified limits in International Standards.
[ISO 1925:2001, definition 4.1]
Balance quality grade: indicates the peak velocity amplitude of vibration, given in mm/s, of a rotor running free-in-space and it is the product of a specific unbalance and the angular velocity of the rotor at maximum operating speed.
Grounded Part: metallic part connected to the grounding system.
Live Part: conductor or conductive part intended to be energized in normal operation, including a neutral conductor.
Authorized personnel: employee who has formal approval of the company.
Qualified personnel: employee who meets the following conditions simultaneously:
- Receives training under the guidance and responsibility of a qualified and authorized professional;
- Works under the responsibility of a qualified and approved professional.

Qualified personnel: employee previously qualified and registered with the competent class council.
Qualified personnel: employee who proves completion of a specific course in the electrical area by the official education system.

Note*: The qualification is only valid for the company that trained the employee in the conditions set out by the authorized and qualified professional responsible for training.*

2. INITIAL RECOMMENDATIONS

Electric motors have energized circuits, exposed rotating parts and hot surfaces that may cause serious injury to people during normal operation. Therefore, it is recommended that transportation, storage, installation, operation and maintenance services are always performed by qualified personnel.
Also the applicable procedures and relevant standards of the country where the machine will be installed must be considered.
Noncompliance with the recommended procedures in this manual and other references on the WEG website may cause severe personal injuries and/or substantial property damage and may void the product warranty.

For practical reasons, it is not possible to include in this Manual detailed information that covers all construction variables nor covering all possible assembly, operation or maintenance alternatives.
This Manual contains only the required information that allows qualified and trained personnel to carry out their services. The product images are shown for illustrative purpose only.
For special applications and operating conditions(50026367 manual for Smoke Extraction Motors, 50021973 manual for Brake Motors, 50078700 manual for Electronically Conmutated Motors, 14629920 manual for Roller Table motors, 50106963 manual for WEG Lift Gearless motors) refer to the applicable manual on the website www.weg.net or contact WEG.
For motors supplied with WEG Motor Scan sensor, see installation guidelines Overview of Receipt to Operation Manual (10008475131) available on www.weg.net.

For information about permissible radial and axial shaft loads, please check the product technical catalogue.

The user is responsible for the correct definition of the installation environment and application characteristics.

During the warranty period, all repair, overhaul and reclamation services must be carried out by WEG authorized Service Centers to maintain validity of the warranty.

2.1 WARNING SYMBOL

Warning about safety and warranty.

2.2 RECEIVING INSPECTION

All motors are tested during the manufacturing process.
The motor must be checked when received for any damage that may have occurred during the transportation. All damages must be reported in writing to the transportation company, to the insurance company and to WEG. Failure to comply with such procedures will void the product warranty.
You must inspect the product:

- Check if nameplate data complies with the purchase order;
- Remove the shaft locking device (if any) and rotate the shaft by hand to ensure that it rotates freely. The shaft might not rotate freely in WMagnet and WQuattro motors, due to alignment torque from the magnets. It might be necessary to use a lever;

When rotating the shaft, it is necessary to certify that the terminals are insulated to eliminate the risc of electric shock from induced voltage.

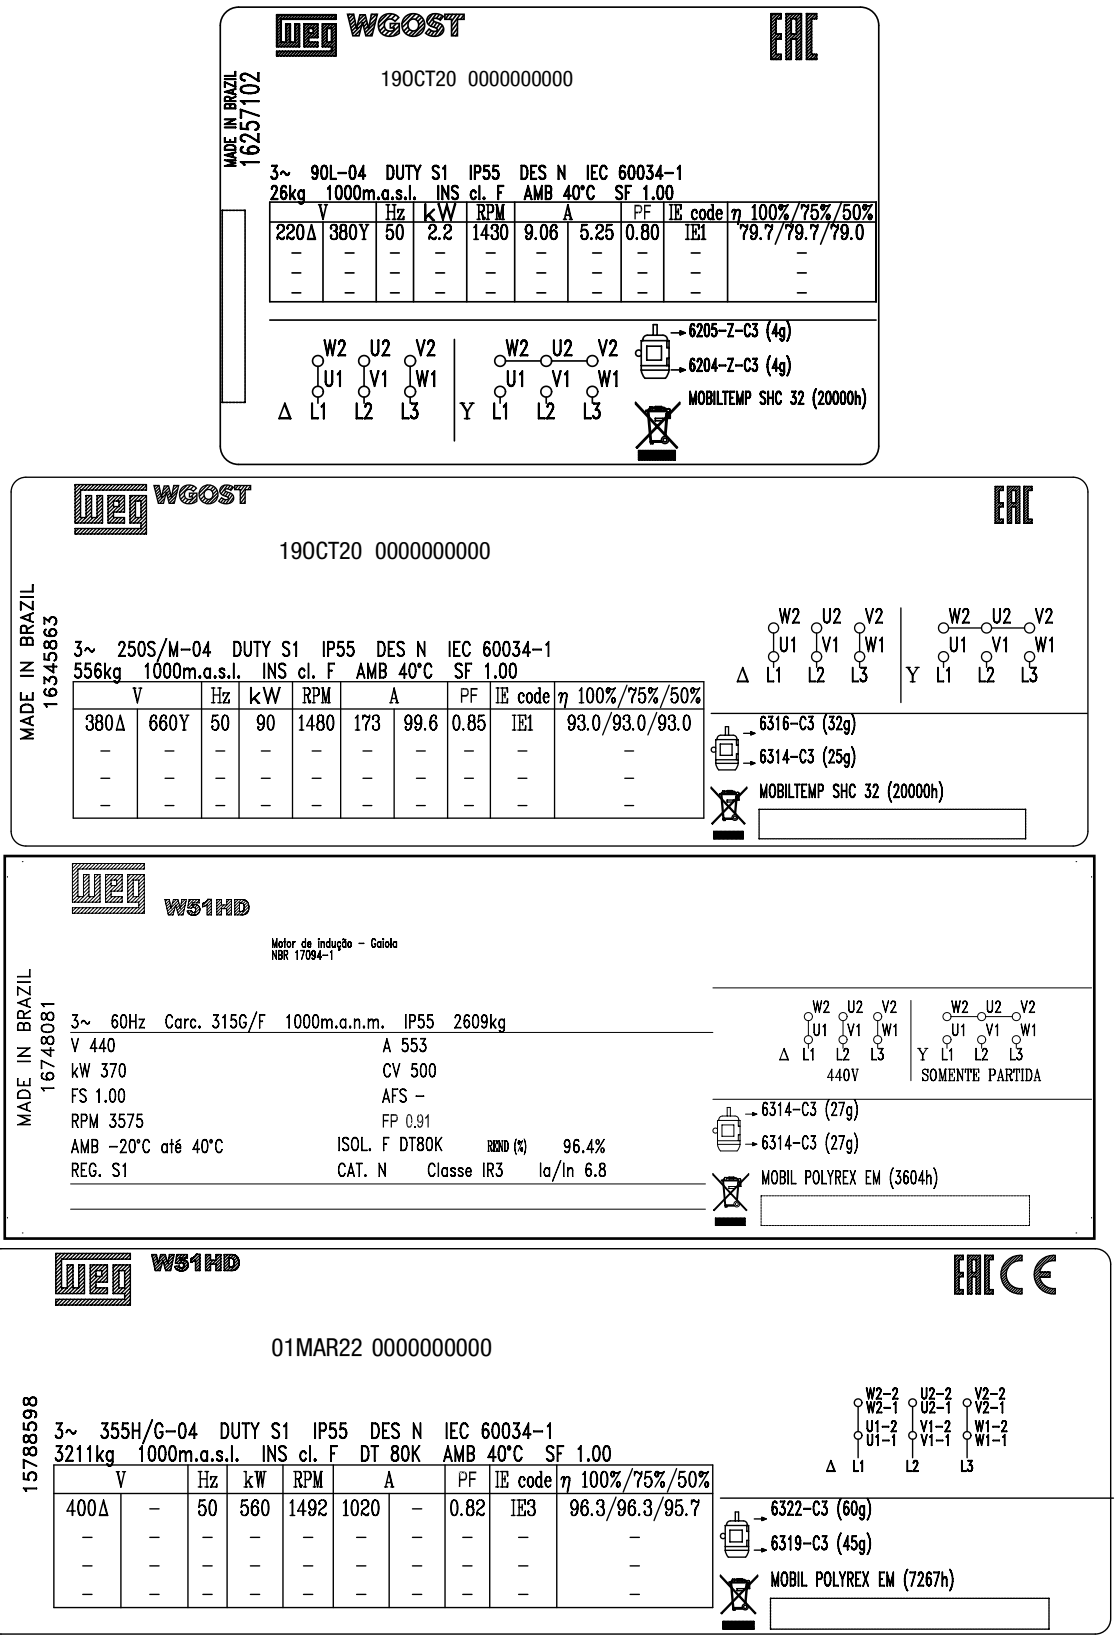
- Check that the motor has not been exposed to excessive dust and moisture during the transportation.

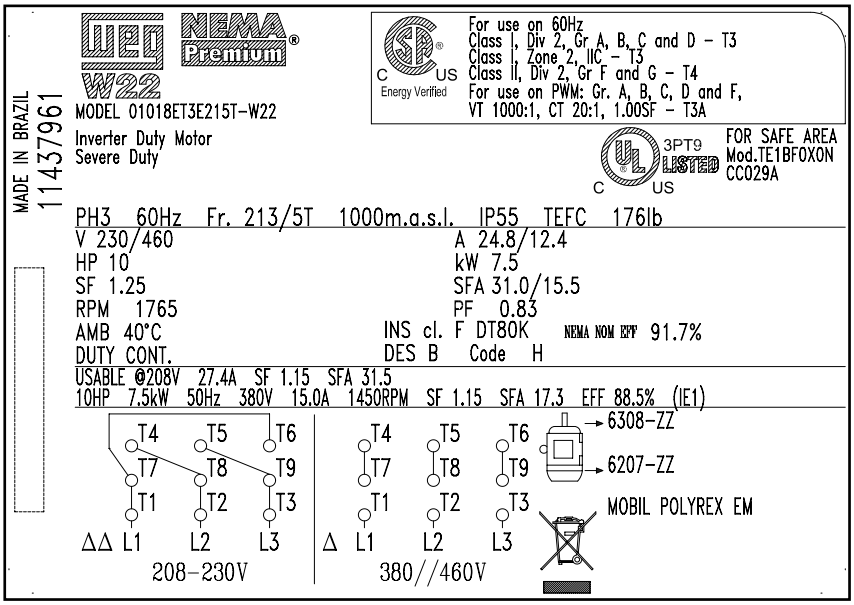
Do not remove the protective grease from the shaft, or the plugs from the cable entries. These protections must remain in place until the installation has been completed.

2.3 NAMEPLATES

The nameplate contains information that describes the construction characteristics and the performance of the motor. Figure 1, Figure 2 and Figure 3 show nameplate layout examples.

Figure 1 - IEC motor nameplate





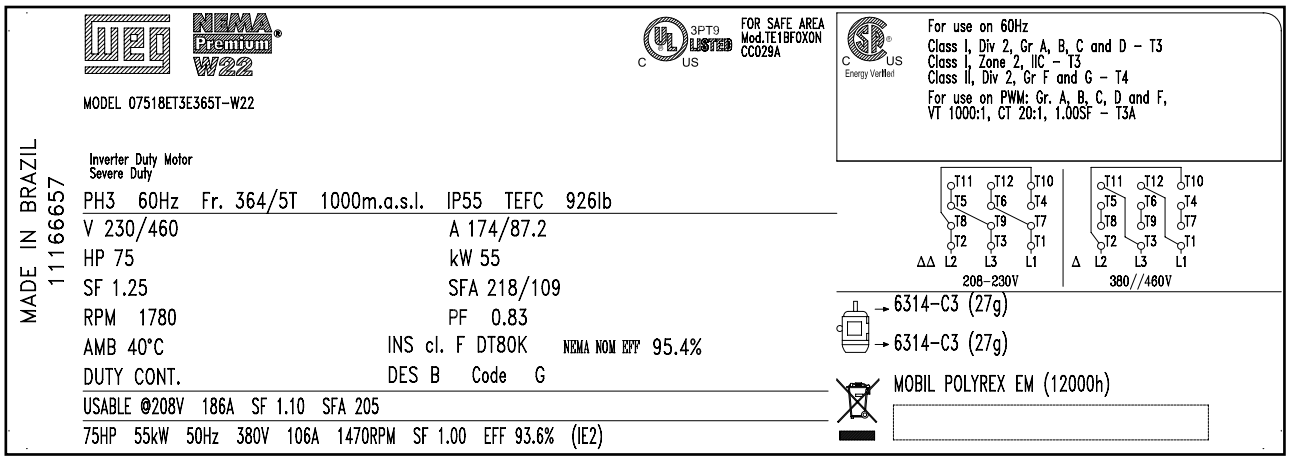


Figure 2 - IEC motor nameplate

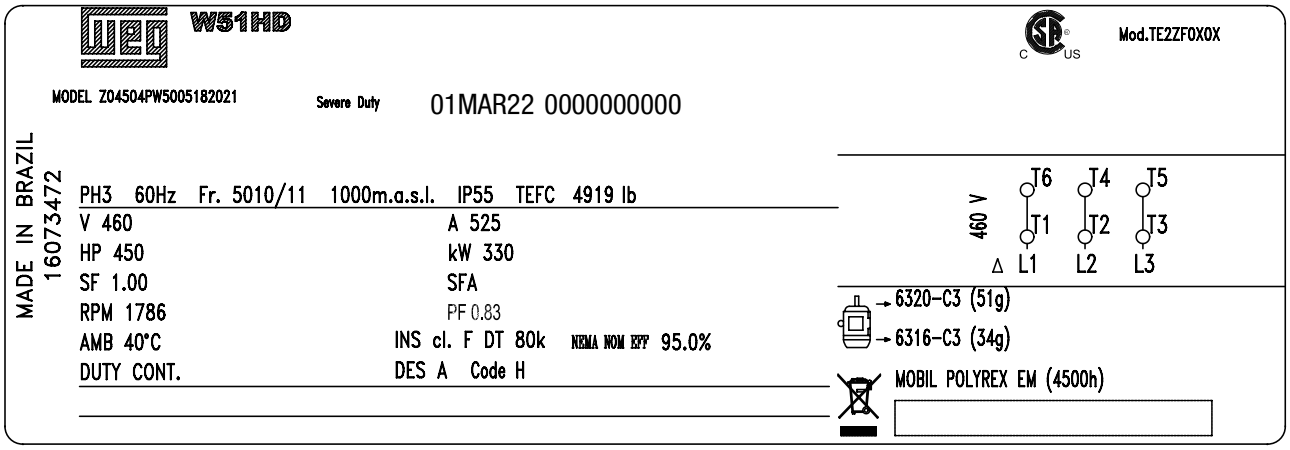

Figure 3 - NEMA motor nameplate

3. SAFETY INSTRUCTIONS

The motor must be disconnected from the power supply and be completely stopped before conducting any installation or maintenance procedures. Additional measures should be taken to avoid accidental motor starting.

Professionals working with electrical installations, either in the assembly, operation or maintenance, should use proper tools and be instructed on the application of standards and safety requirements, including the use of Personal Protective Equipment (PPE) that must be carefully observed in order to reduce risk of personal injury during these services.

Electric motors have energized circuits, exposed rotating parts and hot surfaces that may cause serious injury to people during normal operation. It is recommended that transportation, storage, installation, operation and maintenance services are always performed by qualified personnel.

Pacemaker users and unqualified personnel shall not open WMagnet and WQuattro motors, because high energy magnets are used.

Always follow the safety, installation, maintenance and inspection instructions in accordance with the applicable standards in each country.

4. HANDLING AND TRANSPORT

Individually packaged motors should never be lifted by the shaft or by the packaging. They must be lifted only by means of the eyebolts, when supplied. Use always suitable lifting devices to lift the motor. Eyebolts on the frame are designed for lifting the machine weight only as indicated on the motor nameplate. Motors supplied on pallets must be lifted by the pallet base with lifting devices fully supporting the motor weight. The package should never be dropped. Handle it carefully to avoid bearing damage.

Eyebolts provided on the frame are designed for lifting the machine only. Do not use these eyebolts for lifting the motor with coupled equipment such as bases, pulleys, pumps, reducers, etc..

Never use damaged, bent or cracked eyebolts. Always check the eyebolt condition before lifting the motor.

Eyebolts mounted on components, such as on end shields, forced ventilation kits, etc. must be used for lifting these components only. Do not use them for lifting the complete machine set.

Handle the motor carefully without sudden impacts to avoid bearing damage and prevent excessive mechanical stresses on the eyebolts resulting in its rupture.

Do not handle the motors by the polymeric components: fan cover, drip cover, terminal box and / or terminal box cover.

To move or transport motors with cylindrical roller bearings or angular contact ball bearings, use always the shaft locking device provided with the motor.
All HGF, W50, W51 HD and W60 motors, regardless of bearing type, must be transported with shaft locking device fitted.
Vertical mounted motors with oil-lubricated bearings must be transported in the vertical position. If necessary to move or transport the motor in the horizontal position, install the shaft locking device on both sides (drive end and non-drive end) of the motor.

4.1 LIFTING

Before lifting the motor ensure that all eyebolts are tightened properly and the eyebolt shoulders are in contact with the base to be lifted, as shown in Figure 4. Figure 5 shows an incorrect tightening of the eyebolt.
Ensure that lifting machine has the required lifting capacity for the weight indicated on the motor nameplate.

Figure 4 - Correct tightening of the eyebolt

Figure 5 - Incorrect tightening of the eyebolt

The center-of-gravity may change depending on motor design and accessories. During the lifting procedures the maximum allowed angle of inclination should never be exceeded as specified below.

4.1.1 Horizontal motors with one eyebolt

For horizontal motors fitted with only one eyebolt, the maximum allowed angle-of-inclination during the lifting process should not exceed 30° in relation to the vertical axis, as shown in Figure 6.

Figure 6 - Maximum allowed angle-of-inclination for motor with one eyebolt

4.1.2 Horizontal motor with two eyebolts

When motors are fitted with two or more eyebolts, all supplied eyebolts must be used simultaneously for the lifting procedure.
There are two possible eyebolt arrangements (vertical and inclined), as shown below:

- For motors with vertical lifting eyebolts, as shown in Figure 7, the maximum allowed lifting angle should not exceed 45° in relation to the vertical axis. We recommend to use a spreader beam for maintaining the lifting elements (chain or rope) in vertical position and thus preventing damage to the motor surface;

Figure 7 - Maximum resulting angle for motors with two or more lifting eyebolts

ENGLISH

- For HGF, W40, W50 and W51 HD motors, as shown in Figure 8, the maximum resulting angle should not exceed 30° in relation to the vertical axis;

Figure 8 - Maximum resulting angle for horizontal HGF, W40, W50 and W51 HD motors

For W60 motors, as shown in Figure 9, the use of a spreader beam is required for maintaining the lifting elements (chain or rope) in vertical position and thus preventing damage to the motor surface.

Figure 9 - Lifting for W60 motors with paralel chains

- For motors fitted with inclined eyebolts, as shown in Figure 10, the use of a spreader beam is required for maintaining the lifting elements (chain or rope) in vertical position and thus preventing damage to the motor surface.

Figure 10 - Use of a spreader beam for lifting

4.1.3 Vertical motors

For vertical mounted motors, as shown in Figure 11, the use of a spreader beam is required for maintaining the lifting element (chain or rope) in vertical position and thus preventing damage to the motor surface.

Figure 11 - Lifting of vertical mounted motors

Always use the eyebolts mounted on the top side of the motor, diametrically opposite, considering the mounting position. See Figure 12.

Figure 12 - Lifting of HGF, W50 and W51 HD motors.

4.1.3.1 Procedures to place W22/WEG General Purpose/WIN motors in the vertical position

For safety reasons during the transport, vertical mounted Motors are usually packed and supplied in horizontal position.
To place W22/WEG General Purpose/WIN motors fitted with eyebolts (see Figure 10), to the vertical position, proceed as follows:

1. Ensure that the eyebolts are tightened properly, as shown in Figure 4;
2. Remove the motor from the packaging, using the top mounted eyebolts, as shown in Figure 13;

Figure 13 - Removing the motor from the packaging

3. Install a second pair of eyebolts, as shown in Figure 14;

Figure 14 - Installation of the second pair of eyebolts

4. Reduce the load on the first pair of eyebolts to start the motor rotation, as shown in Figure 15. This procedure must be carried out slowly and carefully.

Figure 15 - End result: motor placed in vertical position

These procedures will help you to move motors designed for vertical mounting. These procedures are also used to place the motor from the horizontal position into the vertical position and vertical to horizontal.

For motors of IEC 112 to 200 frame (and equivalent NEMA), WEG has a kit of devices to facilitate the motor tipping to the vertical, with the point up or down (as shown in Figure 16 and Figure 17).

Figure 16 - Eyebolt to place the motor in vertical position, with the shaft end up (V6/V36)

Figure 17 - Eyebolts with extension fixed at NDE side to place the motor in vertical position, with the shaft end down (V5/V35)

4.1.3.2 Procedures to place HGF, W50 and W51 HD motors in the vertical position

HGF motors are fitted with eight lifting points: four at drive end and four at non-drive end. W50 and W51 HD motors are fitted with nine lifting points: four at drive end, one in the central part and four at non-drive end. The motors are usually transported in horizontal position, however for the installation they must be placed in the vertical position.

To place an these motors in the vertical position, proceed as follows:

1. Lift the motor by using the four lateral eyebolts and two hoists, see Figure 18;

Figure 18 - Lifting of HGF, W50 and W51 HD motors with two hoists

2. Lower the hoist fixed to motor drive end while lifting the hoist fixed to motor non-drive end until the motor reaches its equilibrium, see Figure 19;

Figure 19 - Placing HGF, W50 and W51 HD motors in vertical position

3. Remove the hoist hooks from the drive end eyebolts and rotate the motor 180° to fix the removed hooks into the two eyebolts at the motor non-drive end, see Figure 20;

Figure 20 - Lifting HGF, W50 and W51 HD motors by the eyebolts at the non-drive end

4. Fix the removed hoist hooks in the other two eyebolts at the non-drive end and lift the motor until the vertical position is reached, see Figure 21.

Figure 21 - HGF, W50 and W51 HD motors in the vertical position

These procedures will help you to move motors designed for vertical mounting. These procedures are also used to place the motor from the horizontal position into the vertical position and vertical to horizontal.

4.2 PROCEDURES TO PLACE W22/WEG GENERAL PURPOSE/WIN VERTICAL MOUNT MOTORS IN HORIZONTAL POSITION

To place W22/WEG General Purpose/WIN vertical mount motor in horizontal position, proceed as follows:
1. Ensure that all eyebolts are tightened properly, as shown in Figure 4;

2. Install the first pair of eyebolts and lift the motor as shown in Figure 22;

Figure 22 - Install the first pair of eyebolts

3. Install the second pair of eyebolts, as shown in Figure 23;

Figure 23 - Install the second pair of eyebolts

4. Reduce the load on the first pair of eyebolts for rotating the motor, as shown in Figure 24. This procedure must be carried out slowly and carefully;

Figure 24 - Motor is being rotated to horizontal position

5. Remove the first pair of eyebolts, as shown in Figure 25.

Figure 25 - Final result: motor placed in horizontal position

For IEC 112 to 200 (and NEMA equivalents), WEG has a device kit available to facilitate the procedure of tipping the motor for instalation in a vertical shaft up or shaft down position.

For Easy Maintenance, Wash, Brake motors, motors with forced ventilation, encoder or painting plan 212 or 213, please contact WEG.

5. STORAGE

If the motor is not installed immediately, it must be stored in a dry and clean environment, with relative humidity not exceeding 60%, with an ambient temperature between 5 °C and 40 °C, without sudden temperature changes, free of dust, vibrations, gases or corrosive agents. The motor must be stored in horizontal position, unless specifically designed for vertical operation, without placing objects on it. Do not remove the protection grease from shaft end to prevent rust.

If the motor are fitted with space heaters, they must always be turned on during the storage period or when the installed motor is out of operation. Space heaters will prevent water condensation inside the motor and keep the winding insulation resistance within acceptable levels. Store the motor in such position that the condensed water can be easily drained. If fitted, remove pulleys or couplings from the shaft end (more information are given on item 6).

The space heaters should never be energized when the motor is in operation.

5.1 EXPOSED MACHINED SURFACES

All exposed machined surfaces (like shaft end and flange) are factory-protected with temporary rust inhibitor. A protective film must be reapplied periodically (at least every six months), or when it has been removed and/or damaged.

5.2 STORAGE

The stacking height of the motor packaging during the storage period should not exceed 5 m, always considering the criteria indicated in Table 1:

Packaging type	Frame sizes	Maximum stacking quantity
Cardboard box	IEC 56 to 132 NEMA 143 to 215	Indicated on the top side of the cardboard box
Wood crate	IEC 56 to 315 NEMA 48 to 504/5	06
	IEC 355 NEMA 586/7 and 588/9	03
	W40 / W50 / W60 / W51 HD / HGF IEC 315 to 630 W40 / W50 / W51 HD / HGF NEMA 5000 to 9600	Indicated on the packaging

Table 1 - Maximum recommended stacking height

Notes:
1) Never stack larger packaging onto smaller packaging;
2) Align the packaging correctly (see Figure 26 and Figure 26);

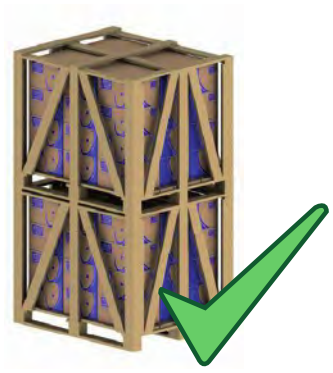

Figure 26 - Correct stacking

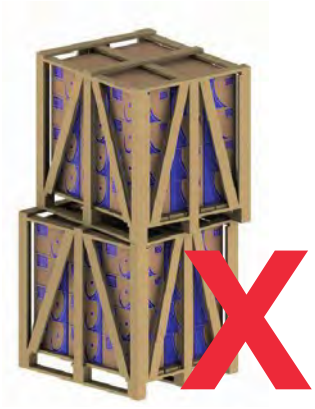

Figure 26 - Incorrect stacking

3) The feet of the crates above should always be supported by suitable wood battens (Figure 27) and never stand on the steel tape or without support (Figure 27);

ENGLISH

Figure 27 - Correct stacking

Figure 27 - Incorrect stacking

4) When stacking smaller crates onto longer crates, always ensure that suitable wooden supports are provided to withstand the weight (see Figure 28). This condition usually occurs with motor packaging above IEC 225S/M (NEMA 364/5T) frame sizes.

Figure 28 - Use of additional battens for stacking

5.3 BEARINGS

5.3.1 Grease lubricated bearings

We recommend rotating the motor shaft at least once a month (by hand, at least five revolutions, stopping the shaft at a different position from the original one). The shaft might not rotate freely in WMagnet and WQuattro motors, due to alignment torque from the magnets. It might be necessary to use a lever.

When rotating the shaft, it is necessary to certify that the terminals are insulated to eliminate the risc of electric shock from induced voltage.

If the motor is fitted with shaft locking device, remove it before rotating the shaft and install it again before performing any handling procedure.

Vertical motors may be stored in the vertical or in horizontal position. If motors with open bearings are stored longer than six months, the bearings must be relubricated according to item 8.2 before commissioning of the motor.

If the motor is stored for longer than 2 years, the bearings must be replaced or removed, washed, inspected and relubricated according to item 8.2.

5.3.2 Oil lubricated bearings

The motor must be stored in its original operating position and with oil in the bearings. Correct oil level must be ensured. It should be in the center of the sight glass.

During the storage period, remove the shaft locking device and rotate the shaft by hand every month, at least five revolutions, thus achieving an even oil distribution inside the bearing and maintaining the bearing in good operating conditions. Reinstall the shaft locking device every time the motor has to be moved.

If the motor is stored for a period equal or longer than the oil change interval, the oil must be replaced according to Item 8.2, before starting the operation. If the motor is stored for a period of over two years, the bearings must be replaced or removed, washed according to manufacturer instructions, checked and relubricated according to Item 8.2. The oil of vertical mounted motors is removed to prevent oils leaks during the transport. After receiving the motor the bearings must be lubricated.

5.3.3 Oil Mist lubricated bearings

The motor must be stored in horizontal position. Lubricate the bearings with ISO VG 68 mineral oil in the amount indicated in the Table 2 (this is also valid for bearings with equivalent dimensions). After filling with oil, rotate the shaft by hand, at least five revolutions)
During the storage period, remove the shaft locking device (if any) and rotate the shaft by hand every week, at least five revolutions, stopping it at a different position from the original one. Reinstall the shaft locking device every time the motor has to be moved. If the motor is stored for a period of over two years, the bearings must be replaced or removed, washed according to manufacturer instructions, checked and relubricated according to item 8.2.

Bearing size	Amount of oil (ml)	Bearing size	Amount of oil (ml)
6201	15	6309	65
6202	15	6311	90
6203	15	6312	105
6204	25	6314	150
6205	25	6315	200
6206	35	6316	250
6207	35	6317	300
6208	40	6319	350
6209	40	6320	400
6211	45	6322	550
6212	50	6324	600
6307	45	6326	650
6308	55	6328	700

Table 2 - Amount of oil per bearing

The oil must always be removed when the motor has to be handled. If the oil mist system is not operating after installation, fill the bearings with oil to prevent bearing rusting. During the storage period, rotate the shaft by hand, at least five revolutions, stopping it at a different position from the original one. Before starting the motor, all bearing protection oil must be drained from the bearing and the oil mist system must be switched ON.

5.3.4 Sleeve bearing

The motor must be stored in its original operating position and with oil in the bearings. Correct oil level must be ensured. It should be in the middle of the sight glass. During the storage period, remove the shaft locking device and rotate the shaft by hand every month, at least five revolutions, and at 30 rpm, thus achieving an even oil distribution inside the bearing and maintaining the bearing in good operating conditions. Reinstall the shaft locking device every time the motor has to be moved.
If the motor is stored for a period equal or longer than the oil change interval, the oil must be replaced, according to Item 8.2, before starting the operation.
If the motor is stored for a period longer than the oil change interval, or if it is not possible to rotate the motor shaft by hand, the oil must be drained and a corrosion protection and dehumidifiers must be applied.

5.4 INSULATION RESISTANCE

We recommend measuring the winding insulation resistance at regular intervals to follow-up and evaluate its electrical operating conditions. If any reduction in the insulation resistance values are recorded, the storage conditions should be evaluated and corrected, where necessary.

5.4.1 Insulation resistance measurement

The insulation resistance must be measured in a safe environment.

The insulation resistance must be measured with a megohmmeter. The machine must be in cold state and disconnected from the power supply.

To prevent the risk of an electrical shock, ground the terminals before and after each measurement. Ground the capacitor (if any) to ensure that it is fully discharged before the measurement is taken.

It is recommended to insulate and test each phase separately. This procedure allows the comparison of the insulation resistance between each phase. During the test of one phase, the other phases must be grounded.
The test of all phases simultaneously evaluates the insulation resistance to ground only but does not evaluate the insulation resistance between the phases.

The power supply cables, switches, capacitors and other external devices connected to the motor may considerably influence the insulation resistance measurement. Thus all external devices must be disconnected and grounded during the insulation resistance measurement.
Measure the insulation resistance one minute after the voltage has been applied to the winding. The applied voltage should be as shown in Table 3.

Winding rated voltage (V)	Testing voltage for measuring the insulation resistance (V)
< 1000	500
1000 - 2500	500 - 1000
2501 - 5000	1000 - 2500
5001 - 12000	2500 - 5000
> 12000	5000 - 10000

Table 3 - Voltage for the insulation resistance

The reading of the insulation resistance must be corrected to 40 °C as shown in the Table 4.

Measuring temperature of the insulation resistance (°C)	Correction factor of the insulation resistance corrected to 40 °C	Measuring temperature of the insulation resistance (°C)	Correction factor of the insulation resistance corrected to 40 °C
10	0.125	30	0.500
11	0.134	31	0.536
12	0.144	32	0.574
13	0.154	33	0.616
14	0.165	34	0.660
15	0.177	35	0.707
16	0.189	36	0.758
17	0.203	37	0.812
18	0.218	38	0.871
19	0.233	39	0.933
20	0.250	40	1.000
21	0.268	41	1.072
22	0.287	42	1.149
23	0.308	43	1.231
24	0.330	44	1.320
25	0.354	45	1.414
26	0.379	46	1.516
27	0.406	47	1.625
28	0.435	48	1.741
29	0.467	49	1.866
30	0.500	50	2.000

Table 4 - Correction factor for the insulation resistance corrected to 40 °C

The motor insulation condition must be evaluated by comparing the measured value with the values indicated in Table 5 (corrected to 40 °C):

Limit value for rated voltage up to 1.1 kV (MΩ)	Limit value for rated voltage above 1.1 kV (MΩ)	Situation
Up to 5	Up to 100	Dangerous. The motor can not be operated in this condition
5 to 100	100 to 500	Regular
100 to 500	Higher than 500	Good
Higher than 500	Higher than 1000	Excellent

Table 5 - Evaluation of the insulation system

The values indicated in the table should be considered only as reference values. It is advisable to log all measured values to provide a quick and easy overview on the machine insulation resistance.
If the insulation resistance is low, moisture may be present in the stator windings. In this case the motor should be removed and transported to a WEG authorized Service Center for proper evaluation and repair (This service is not covered by the warranty). To improve the insulation resistance through the drying process, see section 8.4.

6. INSTALLATION

The insulation resistance must be measured in a safe environment.

Check some aspects before proceeding with the installation:

1. Insulation resistance: must be within the acceptable limits. See item 5.4.
2. Bearings:
   If the motor is installed without running immediately, proceed as described in item 5.3.
3. Operating conditions of the start capacitors: If single-phase motors are stored for a period of over two years, it is recommended to change the start capacitors before motor starting since they lose their operating characteristics.
4. Terminal box:
   a. the inside of the terminal box must be clean and dry;
   b. the contacts must be correctly connected and corrosion free. See 6.9 and 6.10;
   c. the cable entries must be correctly sealed and the terminal box cover properly mounted in order to ensure the degree of protection indicated on the motor nameplate.
5. Cooling: the cooling fins, air inlet and outlet openings must be clean and unobstructed. The distance between the air inlet openings and the wall should not be shorter than ¼ (one quarter) of the diameter of the air inlet. Ensure sufficient space to perform the cleaning services. See item 7.
6. Coupling: remove the shaft locking device (where fitted) and the corrosion protection grease from the shaft end, including the grounding brush area, and flange immediately before installing the motor. See item 6.4.
7. Drain hole: the motor must always be positioned so the drain hole is at the lowest position (If there is any indication arrow on the drain, the drain must be so installed that the arrow points downwards).
   Motors supplied with rubber drain, threaded drain or any other open/close drain plugs must be opened periodically to allow the exit of condensed water. For environments with high water condensation levels and motor with degree of protection IP55, the drain plugs can be mounted in open position (see Figure 29).
   For motors with degree of protection IP56, IP65 or IP66, the drain plugs must remain at closed position (see Figure 29), being opened only during the motor maintenance procedures.
   The drain system of motors with Oil Mist lubrication system must be connected to a specific collection system (see Figure 29).

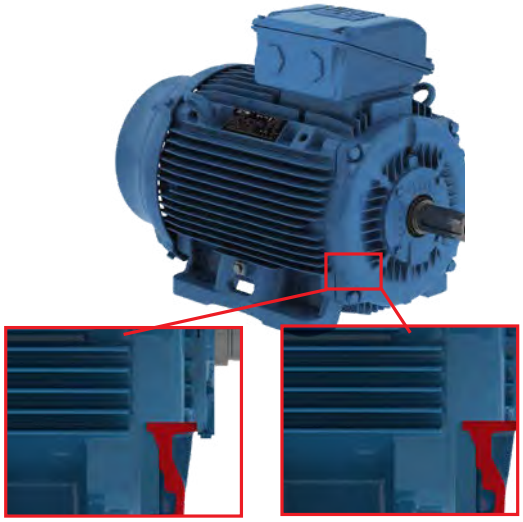

Figure 29 - Detail of the rubber drain plug mounted in closed and open position

8. Additional recommendations:
   a. Check the direction of motor rotation, starting the motor at no-load before coupling it to the load;
   b. Vertical mounted motors with shaft end down must be fitted with drip cover to protect them from liquids or solids that may drop onto the motors;
   c. Vertical mounted motors with shaft end up should be fitted with water slinger ring to prevent water ingress inside the motor.
   d. The fixing elements mounted in the threaded through holes in the motor enclosure (for example, the flange) must be properly sealed.

Remove or fix the shaft key before starting the motor.

Changes on the motor construction (features), such as installation of extended grease fittings or modification of the lubrication system, installation of accessories at alternative locations, etc., can be carried out only after prior written consent from WEG.

6.1 FOUNDATIONS

The foundation is the structure, structural element, natural or prepared base, designed to withstand the stresses produced by the installed equipment, ensuring safe and stable performance during operation. The foundation design should consider the adjacent structures to avoid the influences of other installed equipment and no vibration is transferred through the structure

The foundation must be flat and its selection and design must consider the following characteristics:

a) The features of the machine to be installed on the foundation, the driven loads, application, maximum allowed deformations and vibration levels (for instance, motors with reduced vibration levels, foot flatness, flange concentricity, axial and radial loads, etc. lower than the values specified for standard motors).

b) Adjacent buildings, conservation status, maximum applied load estimation, type of foundation and fixation and vibrations transmitted by theses constructions.

If the motor is supplied with leveling/alignment bolts, this must be considered in the base design.

Please consider for the foundation dimensioning all stresses that are generated during the operation of the driven load.
The user is responsible for the foundation designing and construction.

The foundation stresses can be calculated by using the following equations (see Figure 6.2):

$$F_1 = 0,5 * g * m - (4 * T_b / A)$$
$$F_2 = 0,5 * g * m + (4 * T_b / A)$$

Where:

F_1 and F_2 = lateral stresses (N);
g = gravitational acceleration (9,8 m/s^2);
m = motor weight (kg);
T_b = breakdown torque (Nm);
A = distance between centerlines of mounting holes in feet or base of the machine (end view) (m).

The motors may be mounted on:

- Concrete bases: are most used for large-size motors (Figure 30);
- Metallic bases: are generally used for small-size motors (Figure 31).

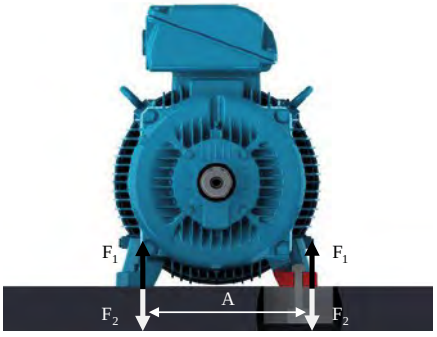

Figure 30 - Motor installed on concrete base

Figure 31 - Motor installed on metallic base

The metallic and concrete bases may be fitted with sliding system. These types of foundations are generally used where the power transmission is achieved by belts and pulleys. This power transmission system is easier to assemble/disassemble and allows the belt tension adjustment. Other important aspect of this foundation type is the location of the base locking screws that must be diagonally opposite. The rail nearest the drive pulley is placed in such a way that the positioning bolt is between the motor and the driven machine. The other rail must be placed with the bolt on the opposite side (diagonally opposite), as shown in Figure 32.

To facilitate assembly, the bases may have the following features:

- Shoulders and/or recesses;
- Anchor bolts with loose plates;
- Bolts cast in the concrete;
- Leveling screws;
- Positioning screws;
- Steel & cast iron blocks, plates with flat surfaces.

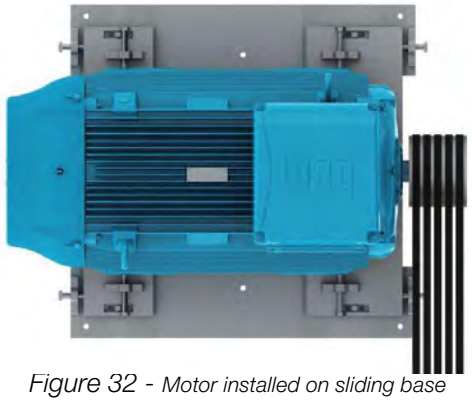

Figure 32 - Motor installed on sliding base

After completing the installation, it is recommended that all exposed machined surfaces are coated with suitable rust inhibitor.

6.2 MOTOR MOUNTING

Footless motors supplied with transportation devices, according to Figure 33, must have their devices removed before starting the motor installation.

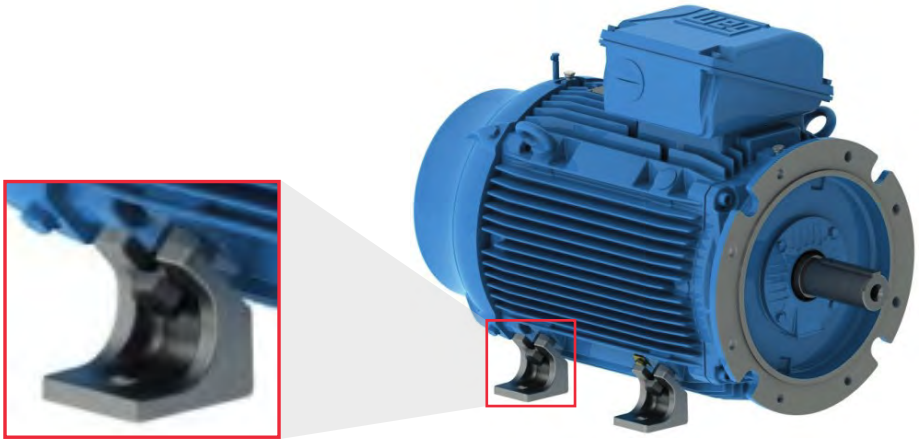

Figure 33 - Detail of the transportation devices for footless motors

6.2.1 Foot mounted motors

The drawings of the mounting hole dimensions for NEMA or IEC motors can be checked in the respective technical catalogue.
The motor must be correctly aligned and leveled with the driven machine. Incorrect alignment and leveling may result in bearing damage, generate excessive vibration and even shaft distortion/breakage.
For more details, see section 6.3 and 6.6. The thread engagement length of the mounting bolt should be at least 1.5 times the bolt diameter. This thread engagement length should be evaluated in more severe applications and increased accordingly.
Figure 6.6 shows the mounting system of a foot mounted motor indicating the minimum required thread engagement length.

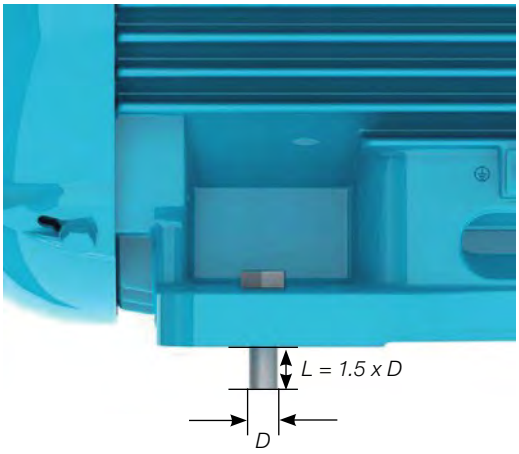

Figure 34 - Mounting system of a foot mounted motor

6.2.2 Flange mounted motors

The drawings of the flange mounting dimensions, IEC and NEMA flanges, can be checked in the technical catalogue. The coupling of the driven equipment to the motor flange must be properly dimensioned to ensure the required concentricity of the assembly.
Depending on the flange type, the mounting can be performed from the motor to the driven equipment flange (flange FF (IEC) or D (NEMA)) or from the driven equipment flange to the motor (flange C (DIN or NEMA)).
For the mounting process from the driven equipment flange to the motor, you must consider the bolt length, flange thickness and the thread depth of the motor flange.

In cases that use polymer flanges with a built-in nut or the aluminum flange with hexagonal hole, the length of the motor fixing screw must not exceed the length of the hole, thus avoiding misalignment and clearance of the coupling.

If the motor flange has tapped through-holes, the length of the mounting bolts must not exceed the tapped through-hole length of the motor flange, thus preventing damage to the winding head.

Motors with aluminum frame and/or flange can be supplied with hexagonal holes for flange mounting. These holes are suitable for receiving cylindrical screws compatible with standardized coupling dimensions, with attention to the minimum screw strength class according to the product catalog.
For flange mounting the thread engagement length of the mounting bolt should be at least 1.5 times the bolt diameter. In severe applications, longer thread engagement length may be required.

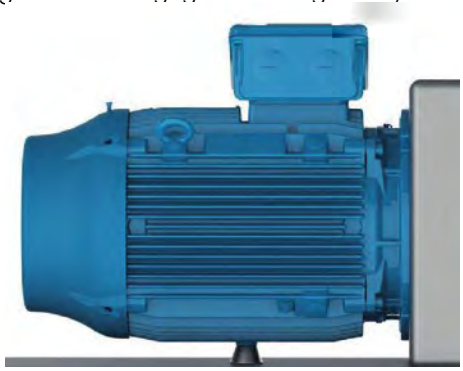

Figure 35 - Mounting method of flange mounted motors with frame base support

In severe applications or if large motors are flange mounted, a foot or pad mounting may be required in addition to the flange mounting (Figure 35). The motor must never be supported on its cooling fins.

The tightening torques indicated in Table 6 must be respected when:
- fixing a polymeric foot and/or flange to the customer equipment for W12/WEG General Purpose motors;
- installing polymeric fan covers for WEG General Purpose and WIN motors and/or changing/rotating the position of the terminal box for W12/WEG General Purpose motors.

For installation of W12/WEG General Purpose motors in frame sizes IEC56, W63 and W71 in the vertical position with the shaft upwards, the foot must be locked axially by the fixing of a flat head screw as indicated.
The hexagonal holes in the C-DIN flanges of W12/WEG General Purpose motors in frame sizes IEC56/W63/W71 are suitable for the screws indicated in Table 6.

Frame	Component	Bolt/Screw specification (Thread size x length)	Torque (Nm)
IEC56	Polymeric Foot	M5x12	8
W63/W71		M5x16	8
IEC56/W63/ W71	Polymeric Flange	-	8
	C-80	M5	5
	C-105	M6	6
160/180/200/W225/225/250/W280	Fan cover	M8 / M10	6 to 8
IEC 56/W63/W71	Terminal box/Grounding	M5	1,8 to 2,4
71/W80/90/W100/112/132	Terminal box/Grounding	M5	5

Table 6 - Tightening torque and screw specification for W12/WEG General Purpose motors.

Note:
When liquid (for example oil) is likely to come into contact with the shaft seal, please contact your local WEG representative.

For WFL motors, the flange has hexagonal holes suitable for M6 screws (maximum torque 8 Nm), and the screws must have at least a 5.6 resistance class. The length of the screws that will be used in the application to fix the motor to the equipment must not exceed the thickness of the endshield wall where they are mounted, at the risk of damaging the motor coil head and causing electric shock. The application screw must be embedded into the endshield with a minimum depth of 7 mm and a maximum of 9 mm.

6.2.3 Pad mounted motors

Typically, this method of mounting is used in axial fans. The motor is fixed by tapped holes in the frame. The dimensions of these tapped holes can be checked in the respective product catalogue. The selection of the motor mounting rods/bolts must consider the dimensions of the fan case, the installation base and the thread depth in the motor frame.
The mounting rods and the fan case wall must be sufficiently stiff to prevent the transmission of excessive vibration to the machine set (motor & fan). Figure 35 shows the pad mounting system.

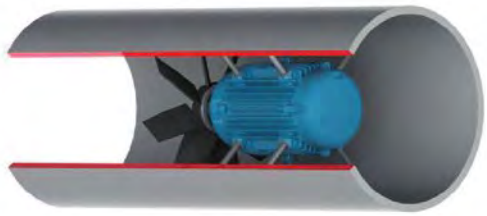

Figure 36 - Mounting of the motor inside the cooling duct

6.3 BALANCING

Unbalanced machines generate vibration which can result in damage to the motor. WEG motors are dynamically balanced with “half key” and without load (uncoupled). Special balancing quality level must be stated in the Purchase Order.

The transmission elements, such as pulleys, couplings, etc., must balanced with “half key” before they are mounted on the motor shaft.

The balance quality grade meets the applicable standards for each product line.
The maximum balancing deviation must be recorded in the installation report.

6.4 COUPLINGS

Couplings are used to transmit the torque from the motor shaft to the shaft of the driven machine. The following aspects must be considered when couplings are installed:

- Use proper tools for coupling assembly & disassembly to avoid damages to the motor and bearings;
- Whenever possible, use flexible couplings, since they can absorb eventual residual misalignments during the machine operation;
- The maximum loads and speed limits informed in the coupling and motor manufacturer catalogues cannot be exceeded;
- Level and align the motor as specified in sections 6.5 and 6.6, respectively.

Remove or fix the shaft key firmly when the motor is operated without coupling in order to prevent accidents.

6.4.1 Direct coupling

Direct coupling is characterized when the Motor shaft is directly coupled to the shaft of the driven machine without transmission elements. Whenever possible, use direct coupling due to lower cost, less space required for installation and more safety against accidents.

Do not use roller bearings for direct coupling, unless sufficient radial load is expected.

6.4.2 Gearbox coupling

Gearbox coupling is typically used where speed reduction is required.
Make sure that shafts are perfectly aligned and strictly parallel (in case of straight spur gears) and in the right meshing angle (in case of bevel and helical gears).

6.4.3 Pulley and belt coupling

Pulleys and belts are used when speed increase or reduction between motor shaft and driven load is required.

Excessive belt tension will damage the bearings and cause unexpected accidents such as breakage of the motor shaft.

6.4.4 Coupling of sleeve bearing motors

Motors designed with sleeve bearings must be operated with direct coupling to the driven machine or a gearbox. Pulley and belts can not be applied for sleeve bearing motors.

Motors designed with sleeve bearings have 3 (three) marks on the shaft end. The center mark is the indication of the magnetic center and the 2 (two) outside marks indicate the allowed limits of the rotor axial movement, as shown in Figure 36
The motor must be so coupled that during operation the arrow on the frame is placed over the central mark indicating the rotor magnetic center. During start-up, or even during operation, the rotor may freely move between the two outside marks when the driven machine exerts an axial load on the motor shaft. However, under no circumstance, the motor can operate continuously with axial forces on the bearing.

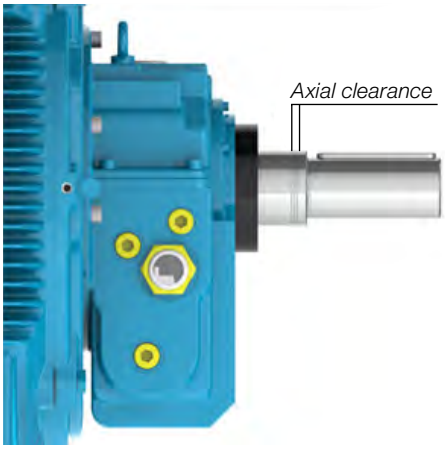

Figure 37 - Axial clearance of motor designed with sleeve bearing.

For coupling evaluation consider the maximum axial bearing clearance as shown in Table 7.
The axial clearance of the driven machine and coupling influence the maximum bearing clearance.

Bearing size	Total axial clearance (mm)
9*	3 + 3 = 6
11*	4 + 4 = 8
14*	5 + 5 =10
18	7,5 + 7,5 = 15

Table 7 - Clearance used for sleeve bearings

** For Motors in accordance with API 541, the total axial clearance is 12.7 mm*

The sleeve bearings used by WEG were not designed to support axial load continuously.
Under no circumstance must the motor be operated continuously at its axial clearance limits.

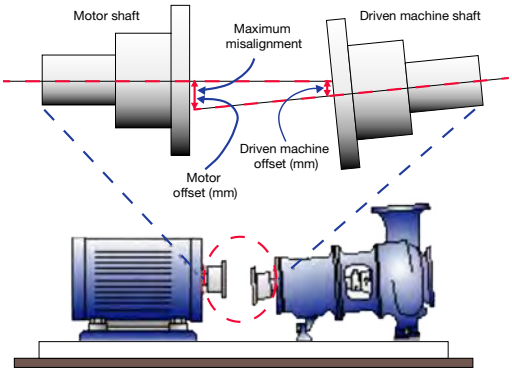
6.5 LEVELING

The motor must be leveled to correct any deviations in flatness arising from the manufacturing process and the material structure rearrangement. The leveling can be carried out by a leveling screw fixed on the motor foot or on the flange or by means of thin compensation shims. After the leveling process, the leveling height between the motor mounting base and the motor cannot exceed 0.1 mm.
If a metallic base is used to level the height of the motor shaft end and the shaft end of the driven machine, level only the metallic base relating to the concrete base.

Record the maximum leveling deviations in the installation report.

6.6 ALIGNMENT

The correct alignment between the motor and the driven machine is one of the most important variables that extends the useful service life of the motor. Incorrect coupling alignment generates high loads and vibrations reducing the useful life of the bearings and even resulting in shaft breakages. Figure38 illustrates the misalignment between the motor and the driven machine.



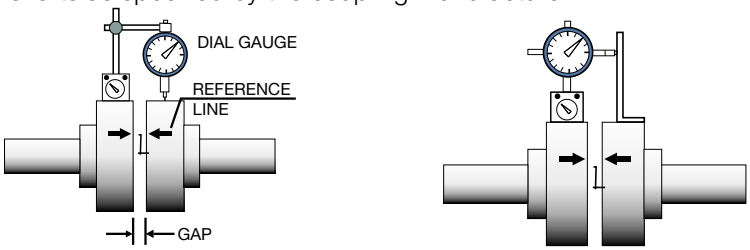


Figure 38 - Typical misalignment condition

Alignment procedures must be carried out using suitable tools and devices, such as dial gauge, laser alignment instruments, etc.. The motor shaft must be aligned axially and radially with the driven machine shaft.

The maximum allowed eccentricity for a complete shaft turn should not exceed 0.03 mm, when alignment is made with dial gauges, as shown in Figure 39. Ensure a gap between couplings to compensate the thermal expansion between the shafts as specified by the coupling manufacturer.

Parallel alignment *Angular alignment*

Figure 39 - Alignment with dial gauge

If alignment is made by a laser instrument, please consider the instructions and recommendations provided by the laser instrument manufacturer.
The alignment should be checked at ambient temperature with machine at operating temperature.

The coupling alignment must be checked periodically.

Pulley and belt couplings must be so aligned that the driver pulley center lies in the same plane of the driven pulley center and the motor shaft and the shaft of the driven machine are perfectly parallel.
After completing the alignment procedures, ensure that mounting devices do not change the motor and machine alignment and leveling resulting into machine damage during operation.

It is recommended to record the maximum alignment deviation in the Installation Report.

6.7 CONNECTION OF OIL LUBRICATED OR OIL MIST LUBRICATED MOTORS

When oil lubricated or oil mist lubricated motors are installed, connect the existing lubricant tubes (oil inlet and oil outlet tubes and motor drain tube), as shown in Figure 40. The lubrication system must ensure continuous oil flow through the bearings as specified by the manufacturer of the installed lubrication system.

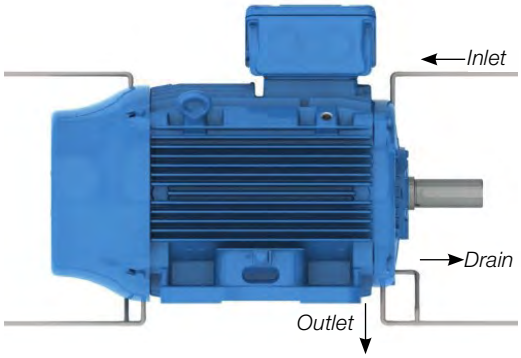

Figure 40 - Oil supply and drain system of oil lubricated or oil mist lubricated motors

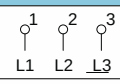
6.8 CONNECTION OF THE COOLING WATER SYSTEM

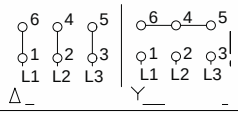
When water cooled motors are installed, connect the water inlet and outlet tubes to ensure proper motor cooling. According to item 7.2, ensure correct cooling water flow rate and water temperature in the motor cooling system.

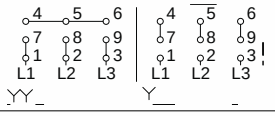
6.9 ELECTRICAL CONNECTION

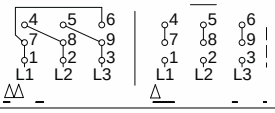
Consider the rated motor current, service factor, starting current, environmental and installation conditions, maximum voltage drop, etc. to select appropriate power supply cables and switching and protection devices.
All motors must be installed with overload protection systems. Three-phase motors should be fitted with phase fault protection systems.

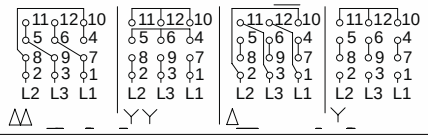
Before connecting the motor, check if the power supply voltage and the frequency comply with the motor nameplate data. All wiring must be made according to the connection diagram on the motor nameplate. Please consider the connection diagrams in the Tables 8 and 10 as reference value.
To prevent accidents, check if motor has been solidly grounded in accordance with the applicable standards.

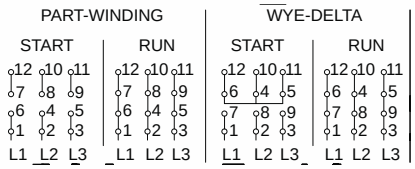


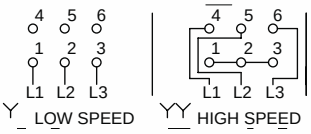


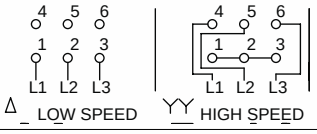


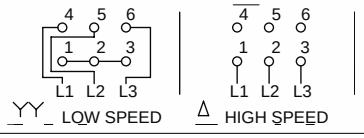


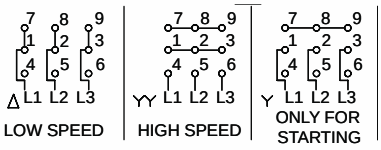












Configuration	Quantity of leads	Type of connection	Connection diagram
Single speed	3	-	
	6	Δ - Y	
	9	YY - Y	
		ΔΔ - Δ	
	12	ΔΔ - YY - Δ - Y	
		Δ - PWS Part-winding start	
Double speed Dahlander	6	YY - Y Variable Torque	
		Δ - YY Constant Torque	
		YY - Δ Constant Output	
	9	Δ - Y - YY	
Double speed Double winding	6	-

Table 10 - Typical connection diagram for single-phase motors.

W12/WEG General Purpose motors with polymeric terminal box cover have the connection diagram printed on its interior. To connect the cables, check on the nameplate the diagram code that must be used.

For motors with polymeric fan cover assembled by snap fit, to remove the polymeric fan cover use two crewdrivers or similar tool positioned near the snap fit region and remove one side by lifting carefully, repeat for the other sides until the complete removal of the fan cover.

Make sure that the motor is correctly connected to the power supply through safe and permanent contacts.

WARNING - Local Standards have priority on the definition of the connection standards.

The connections presented below are a reference for the connection of the customer's power cables on low voltage motors with terminal block. The terminal blocks presented below are the standard for each product line, however variations may occur.
It is recommended the use of terminals made of electrolytic copper or brass, similar to the terminals used on the motors cables.

K1M* terminal block

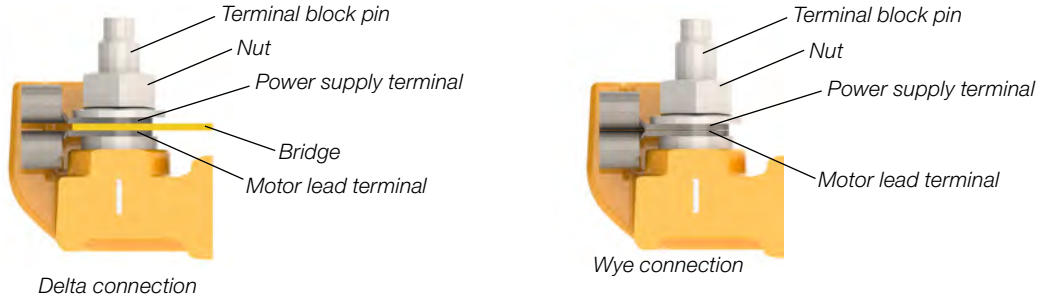

Figure 41 - Connetion for K1M terminal blocks*

KWLV* and KWMV* terminal blocks

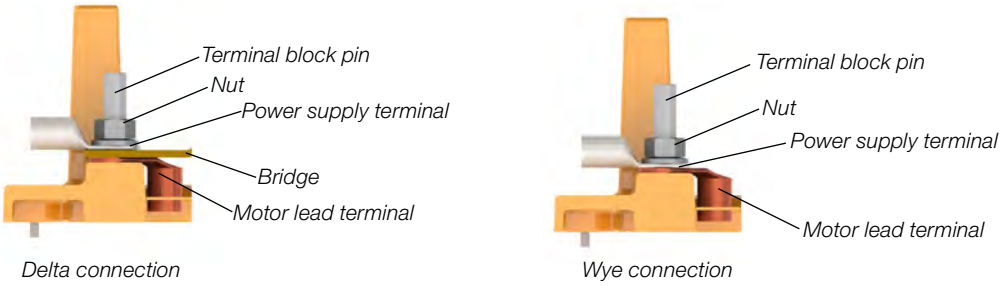

Figure 42 - Connetion for KWLV and KWMV* terminal blocks*

If motors are supplied without terminal blocks, insulate the cable terminals with suitable insulation material that meets the power supply voltage and the insulation class indicated on the motor nameplate.

Ensure correct tightening torque for the power cable and grounding connections as specified in Table 11.
The clearance distance (see Figure 6.15) between non-insulated live parts with each other and between grounded parts must be as indicated in Table 6.4.

Figure 43 - Minimum clearance distance (mm) x supply voltage

Voltage	Minimum clearance distance (mm)
U ≤ 440 V	4
440 < U ≤ 690 V	5.5
690 < U ≤ 1000 V	8
1000 < U ≤ 6900 V	45
6900 < U ≤ 11000 V	70
11000 < U ≤ 16500 V	105

Table 11 - Minimum clearance distance (mm) x supply voltage

Even when the motor is off, dangerous voltages may be present inside the terminal box used for the space heater supply or winding energization when the winding is used as heating element.
Motor capacitors will hold a charge even after the power has been cut off. Do not touch the capacitors and/or motor terminals, before discharging the capacitors completely. For WMagnet and WQuattro motors, even when the motor is disconnected from the power supply, there may be voltage in the motor's terminals if the rotor moves.

After the motor connection has been completed, ensure that no tool or foreign body has been left inside the terminal box.

Take the required measures in order to ensure the degree of protection indicated on the motor nameplate:
- unused cable inlet holes in the terminal boxes must be properly closed with threaded blanking plugs;
- components supplied loose (for example, terminal boxes mounted separately) must be properly closed and sealed.

The cable inlets used for power supply and control must be fitted with components (for example, cable-glands and conduits) that meet the applicable standards and regulations in each country.

If the motor is fitted with accessories, such as brakes and forced cooling systems, these devices must be connected to the power supply according to the information provided on their nameplates and with special care as indicated above.

In motors with polymeric terminal box and/or its cover, ensure that the fittings and locks of these components are correctly assembled after performing the cable connection.

For motors with terminal box knockouts, it is necessary to use a flathead screwdriver or similar tool and a hammer to detach the knockout, hammering the screwdriver several times until the knockout is removed. First, break the inside knockout, then if necessary, the external according to the cable gland size to be used. For the T-box polymeric knockouts, it can be necessary to use a blade or a driller to machine the hole and to not damage the auxiliary T-box. Caution, do not knock through to the inside of the terminal box and remove all material detached from the internal side of the t-box.
All protection devices, including overcurrent protection, must be set according to the rated machine conditions. These protection devices must protect the machine against short circuit, phase fault or locked rotor condition. The motor protection devices must be set according to the applicable standards.

Check the direction of rotation of the motor shaft. If there is no limitation for the use of unidirectional fans, the shaft rotation direction can be changed by reversing any two of the phase connections. For single-phase motor, check the connection diagram indicated on the motor nameplate.

6.10 CONNECTION OF THE THERMAL PROTECTION DEVICES

If the motor is supplied with temperature monitoring devices, such as, thermostat, thermistors, automatic thermal protectors, Pt-100 (RTD), etc., they must be connected to the corresponding control devices as specified on the accessory nameplates. The non-compliance with this procedure may void the product warranty and cause serious material damages.

Do not apply test voltage above 2.5 V on thermistors and current above 1 mA on RTDs (Pt-100) according to IEC 60751 standard.

Figure 43 and Figure 44 show the connection diagram of the bimetal thermal protector (thermostats) and thermistors, respectively.

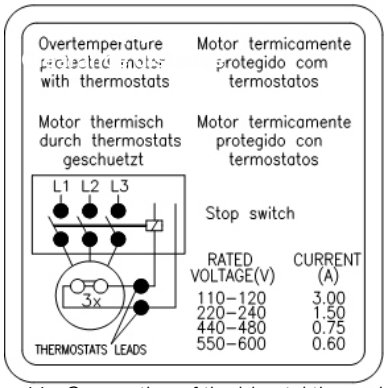

Figure 44 - Connection of the bimetal thermal protectors (thermostats)

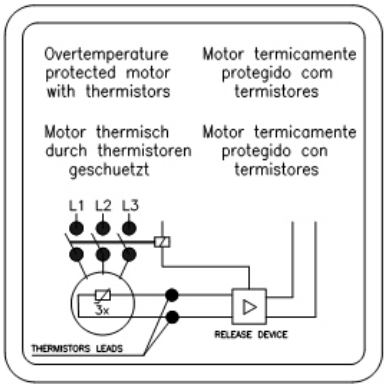

Figure 45 - Thermistor connection

The alarm temperature limits and thermal protection shutdowns can be defined according to the application; however these temperature limits can not exceed the values in Table 12

Component	Insulation class	Maximum temperature of the protection setting (°C)	
		Alarm	Tripping
Winding	B	-	130
	F	130	155
	H	155	180
Bearing	All	110	120

Table 12 - Maximum activation temperature of the thermal protections

Notes:
1) The number and type of the installed protection devices are stated on the accessory nameplate of the motor.
2) If the motor is supplied with calibrated resistance, (for example, Pt-100), the motor protection system must be set according to the operating temperatures indicated in Table 6.5.

6.11 RESISTANCE TEMPERATURE DETECTORS (PT-100)

The thermocouples Pt-100 are made of materials, whose resistance depends on the temperature variation, intrinsic property of some materials (usually platinum, nickel or copper), calibrated resistance. Its operation is based on the principle that the electric resistance of a metallic conductor varies linearly with the temperature, thus allowing a continuous monitoring of the motor warm-up through the controller display ensuring a high level of precision and answer stability. These devices are widely used for measuring temperatures in various industry sectors.
In general these devices are used in installations where precise temperature control is required, for example, in installation for irregular or intermittent duty. The same detector may be used for alarm and tripping purposes. Table 13 and Figure 45 show the equivalence between the Pt-100 resistance and the temperature. The Figure 46 shows the connection of a winding Pt-100.

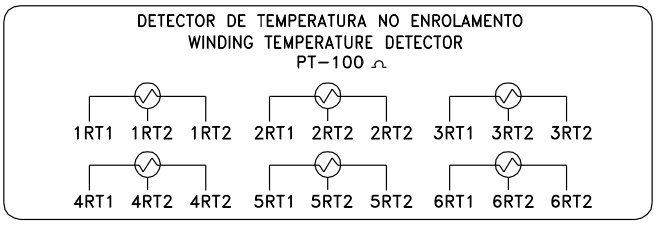

Figure 46 - Connection of winding Pt-100

Table 13 - Equivalence between the Pt-100 resistance and the temperature

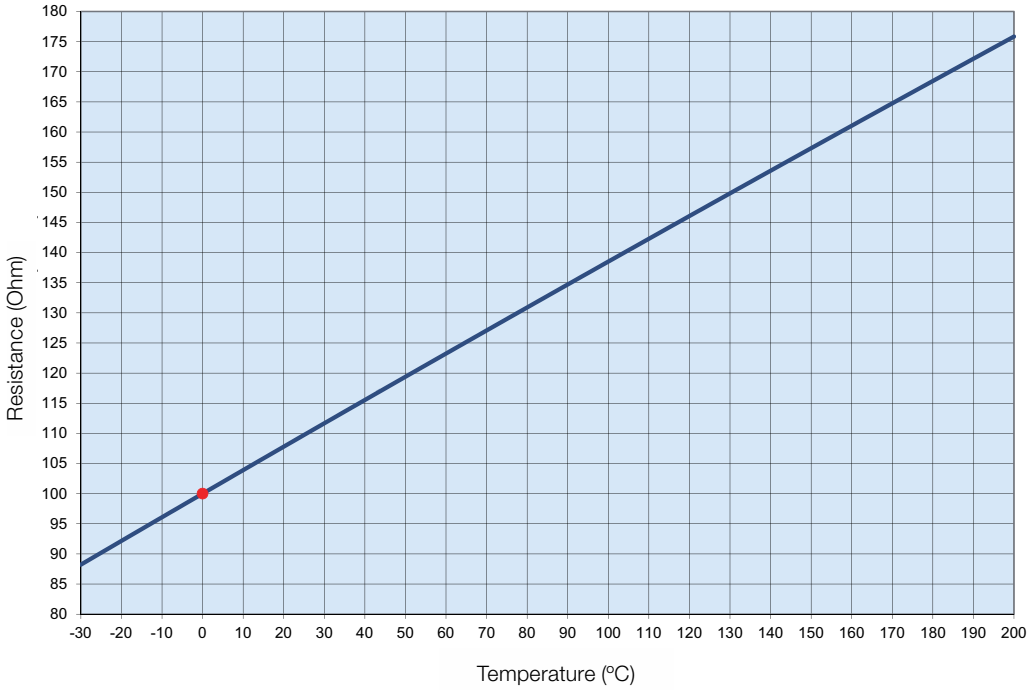

Figure 47 - Ohmic resistance of the Pt-100 x temperature

6.12 CONNECTION OF THE SPACE HEATERS

Before switching ON the space heaters, check if the space heaters connection have been made according to the connection diagram shown on the space heater nameplate. For motors supplied with dual voltage space heaters (110-127/220-240 V), see Figure 48.

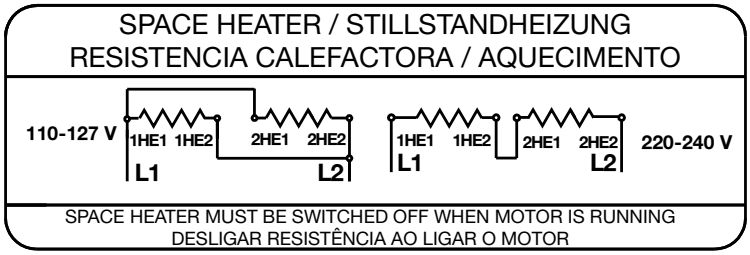

Figure 48 - Dual voltage space heater connection

The space heaters should never be energized when the motor is in operation.

6.13 STARTING METHODS

Whenever possible, the motor starting must be Direct On Line (DOL) at rated voltage. This is the most simple and feasible starting method. However, it must only be applied when the starting current does not affect the power supply. Please consider the local electric utility regulations when installing a motor.
High inrush current may result in:
a) high voltage drop in the power supply line creating unacceptable line disturbance on the distribution system; b) requiring oversized protection system (cables and contactor) increasing the installation costs.

If DOL starting is not allowed due to the reasons mentioned above, an indirect starting method compatible with the load and motor voltage to reduce the starting current may be used.
If reduced voltage starters are used for starting, the motor starting torque will also be reduced.

Table 14 shows the possible indirect starting methods that can be used depending on the number of the motor leads.

Number of leads	Possible starting methods
3 leads	Autotransformer Soft-starter
6 leads	Star-Delta Autotransformer Soft-starter
9 leads	Series/Parallel Part winding Autotransformer Soft-starter
12 leads	Star-Delta Series/Parallel Part winding Autotransformer Soft-starter

Table 14 - Starting method x number of motor leads

Table 15 shows examples of possible indirect starting methods to be used according to the voltage indicated on the motor nameplate and the power supply voltage.

Nameplate voltage	Operating voltage	Star-delta	Autotransformer starting	Starting by series/ parallel switch	Part-winding starting	Starting by Soft-starter
220/380 V	220 V 380 V	YES NO	YES YES	NO NO	NO NO	YES YES
220/440 V	220 V 440 V	NO NO	YES YES	YES NO	YES NO	YES YES
230/460 V	230 V 460 V	NO NO	YES YES	YES NO	YES NO	YES YES
380/660 V	380 V	YES	YES	NO	NO	YES
220/380/440 V	220 V 380 V 440 V	YES NO YES	YES YES YES	YES YES NO	YES YES NO	YES YES YES

Table 15 - Starting methods x voltage

Another possible starting method that does not overload the power supply network is the use of an inverter of frequency. For more information on motors powered by a frequency inverter, see item 6.14.

6.14 MOTORS DRIVEN BY FREQUENCY INVERTER

The operation with frequency inverter must be stated in the Purchase Order since this drive type may require some changes of the motor design.

The frequency inverter used to drive motors up to 690 V must be fitted with Pulse With Modulation (PWM) with vector control.
When a motor is driven by a frequency inverter at lower frequencies than the rated frequency, you must reduce the motor torque to prevent motor overheating. The torque reduction (derating torque) can be found in the item 6.4 of the “Technical Guidelines for Induction Motors driven by PWM Frequency inverters” available on the site www.weg.net.

If the motor is operated above the rated frequency, please note:
- That the motor must be operated at constant output;
- That the motor can supply max. 95% of its rated output;
- Do not exceed the maximum speed and please consider:
  - max. operating frequency stated on the additional nameplate;
  - mechanical speed limitation of the motor.

For WMagnet motors driven by non-WEG inverters, in addition to the speed limit stated in the motor data sheet, the maximum permitted speed limit must be checked to avoid burning the inverter in the event of a power failure. It should be considered according to the equation below:

$$RPM_{max} = \frac{0.9 * V_{rmsMax} * 1000}{ke}$$

Being,
RPM_{max} – Maximum speed allowed to avoid burning the inverter in the event of a power failure in [RPM].
V_{rmsMax} – Maximum input rms voltage of the inverter, as informed by the inverter manufacturer in [V].
ke – Parameter informed on the nameplate and in the motor data sheet in [V / kRPM].

Information on the selection of the power cables between the frequency inverter and the motor can be found in the item 6.4 of the "Technical Guidelines for Induction Motors driven by PWM Frequency inverters" available at www.weg.net.

6.14.1 Use of dV/dt filter

6.14.1.1 Motor with enameled round wire

Motors designed for rated voltages up to 690 V, when driven by frequency inverter, do not require the use of dV/dT filters, provided they comply with the criteria in Table 16.

Motor rated votage [1]	Peak voltage at the motor terminals (max)	dV/dt inverter output (max)	Inverter Rise Time [2] (min.)	MTBP [2] Time between pulses (min)
Vnom < 460 V	≤ 1600 V	≤ 5200 V/µs	≥ 0,1 µs	≥ 6 µs
460 ≤ Vnom < 575 V	≤ 2000 V	≤ 6500 V/µs		
575 ≤ Vnom ≤ 1000 V	≤ 2400 V	≤ 7800 V/µs		

Table 16 - Criteria for the selection of motors with round enameled wire when driven by frequency inverter

Notes:
1. For the application of dual voltage motors, example 380/660 V, consider the lower voltage (380 V).
2. Information supplied by the inverter manufacturer.

6.14.1.2 Motor with prewound coils

Motors with prewound coils (medium and high voltage motors regardless of frame sizes, and low voltage motors from IEC 500 / NEMA 800 frame on), designed for the use with frequency inverters, do not require the use of filters, provided they comply with the criteria in Table 17.

Motor rated voltage	Type of modulation	Turn to turn insulation (phase-phase)		Phase-ground insulation	
		Peak voltage at the motor terminals	dV/dt at the motor terminals	Peak voltage at the motor terminals	dV/dt at the motor terminals
690 < Vnom ≤ 4160 V	Sinusoidal	≤ 5900 V	≤ 500 V/µs	≤ 3400 V	≤ 500 V/µs
	PWM	≤ 9300 V	≤ 2700 V/µs	≤ 5400 V	≤ 2700 V/µs
4160 < Vnom ≤ 6600 V	Sinusoidal	≤ 9300 V	≤ 500 V/µs	≤ 5400 V	≤ 500 V/µs
	PWM	≤ 14000 V	≤ 1500 V/µs	≤ 8000 V	≤ 1500 V/µs

Table 17 - Criteria to be considered when using motor with prewound coils to be drive by frequency inverters

6.14.2 Bearing insulation

If motor must be driven by frequency inverter, insulate the bearing according to Table 18.

Frame size	Recommendation
IEC 315 and 355 NEMA 445/7 to L5810/11	■ Insulated bearing/end shield ■ Grounding between shaft and frame by grounding brush
IEC 400 and larger NEMA 680 and larger	■ Insulated NDE bearing ■ Grounding between shaft and frame by grounding brush

Table 18 - Recommendation on the bearing insulation for inverter driven motors

When motors are supplied with shaft grounding system, monitor the grounding brush constantly during its operation and, when it reaches the end of its useful life, it must be replaced by another brush with the same specification.
If a motor is supplied with an internal grounding brush, indicated by a tag in the product, it must be verified each time the bearings or any internal part of the motor is maintained.
Motors of frame sizes IEC 315, NEMA 445/7 and above, when inverter fed, must be equipped with shaft grounding kits.

For safe area motors and for verification testing purposes, contact pins can be installed on both sides of the bearing insulation, so that voltage measurements can be taken on the bearing, or, if the pins are connected by a cable or metallic strand (shorting-circuiting the bearing insulation), of the current through the bearing. It should be noted, however, that during the normal motor operation the bearing insulation must not be short-circuited.

Figure 49 - Metal flexible braid

6.14.3 Switching frequency

The minimum inverter switching frequency must not be lower than 2 kHz and should not exceed 5 kHz.

The non-compliance with the criteria and recommendations indicated in this manual may void the product warranty.

6.14.4 Mechanical speed limitation

Table below shows the maximum speeds allowed for motors driven by frequency inverter. For WMagnet motors, see the motor's data sheet or contact WEG.

Notes:
1. *When the motor has lip seals or Inproseals, contact WEG.*
2. *For speeds above the nominal one, measure the bearing vibration and temperature; if the temperature and vibration levels exceed the specified limits, contact WEG.*
3. *Check the DE bearing model on the motor plate.*
4. *For conditions other than those described in Tables 18 to 22, consult WEG.*

For more information on the application of frequency inverters, contact WEG or check the “Technical Guidelines for Induction Motors driven by PWM Frequency inverters” available at www.weg.net.

7. COMMISSIONING

7.1 INITIAL START-UP

After finishing the installation procedures and before starting the motor for the first time or after a long period without operation, the following items must be checked:

- If the nameplate data (voltage, current, connection diagram, degree of protection, cooling system, service factor, etc.) meet the application requirements;
- If the machine set (motor + driven machine) has been mounted and aligned correctly;
- If the motor driving system ensures that the motor speed does not exceed the max. allowed speed indicated in Table 6.12;
- Measure the winding insulation resistance, making sure it complies with the specified values in item 5.4;
- Check the motor rotation direction;
- Inspect the motor terminal box for damage and ensure that it is clean and dry and all contacts are rust-free, the seals are in perfect operating conditions and all unused threaded holes are properly closed thus ensuring the degree of protection indicated on the motor nameplate;
- Check if the motor wiring connections, including grounding and auxiliary equipment connection, have been carried out properly and are in accordance with the recommendations in item 6.9;
- Check the operating conditions of the installed auxiliary devices (brake, encoder, thermal protection device, forced cooling system, etc.);

- Check bearing operating conditions. If the motors are stored and/or installed for more than two years without running, it is recommended to change the bearings, or to remove, wash, inspect and relubricate them before the motor is started. If the motor is stored and/or installed according to the recommendations described in item 5.3, lubricate the bearings as described in item 8.2. For the bearing condition evaluation, it is recommended to use of the vibration analysis techniques: Envelope Analysis or Demodulation Analysis.
- For roller bearing motors with oil lubrication, ensure:
  - The oil level should be in the center of the sight glass (see Figure 51 and Figure 52);
  - That if the motor is stored for a period equal or longer than the oil change interval, the oil must be changed before starting the motor.
- When motors are fitted with sleeve bearings, ensure:
  - Correct oil level for the sleeve bearing. The oil level should be in the center of the sight glass (see Figure 8.3);
  - That the motor is not started or operated with axial or radial loads;
  - That if the motor is stored for a period equal or longer than the oil change interval, the oil must be changed before starting the motor.
- Inspect the capacitor operating condition, if any. If motors are installed for more than two years, but were never commissioned, it is recommended to change the start capacitors since they lose their operating characteristics;
- Ensure that the air inlet and outlet opening are not blocked. The minimum clearance to the nearest wall (L) should be at least ¼ of the fan cover diameter (D), see Figure 50. The intake air temperature must be at ambient temperature.

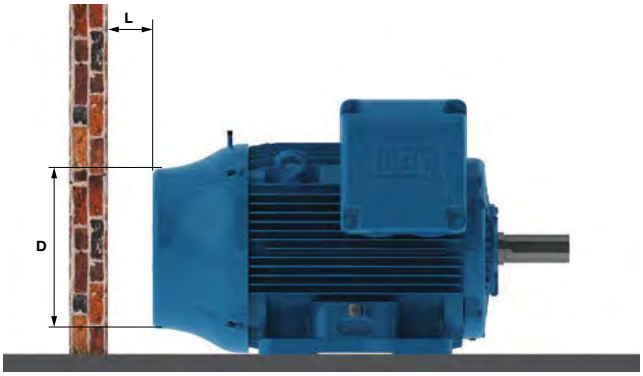

Figure 50 - Minimum clearance to the wall

Please consider the minimum distances shown in the Table 24 as reference value;

Frame size		Distance between the fan cover and the wall (L)

Table 24 - Minimum distance between the fan cover and wall

- Ensure correct water flow rate and water temperature when water cooled motors are used. See item 7.2;
- Ensure that all rotating parts, such as pulleys, couplings, external fans, shaft, etc. are protected against accidental contact.

Other tests and inspections not included in the manual may be required, depending on the specific installation, application and/or motor characteristics.

After all previous inspections have been carried out, proceed as follows to start the motor:

- Start the motor on no-load (if possible) and check the motor direction of rotation. Check for the presence of any abnormal noise, vibration or other abnormal operating conditions;
- Ensure the motor starts smoothly. If any abnormal operating condition is noticed, switch off the motor, check the assembly system and connections before the motor is started again;
- If excessive vibrations are noticed, check if the motor mounting bolts are well tightened or if the vibrations are not generated and transmitted from adjacent installed equipment. Check the motor vibration periodically and ensure that the vibration limits are as specified in item 7.2.1;
- Start the motor at rated load during a short time and compare the operating current with the rated current indicated on the nameplate;
- Continue to measure the following motor variables until thermal equilibrium is reached: current, voltage, bearing and motor frame temperature, vibration and noise levels;
- Record the measured current and voltage values on the Installation Report for future comparisons.

As induction motors have high inrush currents during start-up, the acceleration of high inertia load requires an extended starting time to reach full speed resulting in fast motor temperature rise. Successive starts within short intervals will result in winding temperature increases and can lead to physical insulation damage reducing the useful life of the insulation system. If the duty cycle S1 / CONT. is specified on the motor nameplate, this means that the motor has been designed for:

- Two successive starts: first start from cold condition, i. e., the motor windings are at room temperature and the second start immediately after the motor stops;
- One start from hot condition, i. e., the motor windings are at rated temperature.

The Troubleshooting Chart in section 10 provides a basic list of unusual cases that may occur during motor operation with the respective corrective actions.

7.2 OPERATING CONDITIONS

Unless otherwise stated in the Purchase Order, electric motors are designed and built to be operated at altitudes up to 1000 meters above sea level and in a temperature range from -20 °C to +40 °C. Any deviation from the normal condition of motor operation must be stated on the motor nameplate. Some components must be changed if the ambient temperature is different from the specified one. Please contact WEG to check the required special features.

For operating temperatures and altitudes differing from those above, the factors indicated in Table 25 must be applied to the nominal motor power rating in order to determine the derated available output (Pmax = Pnom x correction factor).

T (°C)	Altitude (m)								
	1000	1500	2000	2500	3000	3500	4000	4500	5000
10							0.97	0.92	0.88
15						0.98	0.94	0.90	0.86
20					1.00	0.95	0.91	0.87	0.83
25				1.00	0.95	0.93	0.89	0.85	0.81
30			1.00	0.96	0.92	0.90	0.86	0.82	0.78
35		1.00	0.95	0.93	0.90	0.88	0.84	0.80	0.75
40	1.00	0.97	0.94	0.90	0.86	0.82	0.80	0.76	0.71
45	0.95	0.92	0.90	0.88	0.85	0.81	0.78	0.74	0.69
50	0.92	0.90	0.87	0.85	0.82	0.80	0.77	0.72	0.67
55	0.88	0.85	0.83	0.81	0.78	0.76	0.73	0.70	0.65
60	0.83	0.82	0.80	0.77	0.75	0.73	0.70	0.67	0.62
65	0.79	0.76	0.74	0.72	0.70	0.68	0.66	0.62	0.58
70	0.74	0.71	0.69	0.67	0.66	0.64	0.62	0.58	0.53
75	0.70	0.68	0.66	0.64	0.62	0.60	0.58	0.53	0.49
80	0.65	0.64	0.62	0.60	0.58	0.56	0.55	0.48	0.44

Table 25 - Correction factors for altitude and ambient temperature

Motors installed inside enclosures (cubicles) must be ensured an air renewal rate in the order of one cubic meter per second for each 100 kW installed power or fraction of installed power. Totally Enclosed Air Over motors - TEAO (fan and exhaust / smoke extraction) are supplied without cooling fan and the manufacturer of the driven machine is responsible for sufficient motor cooling. If no minimum required air speed between motor fins is indicated on the motor nameplate, ensure the air speed indicated in the table 21 is provided. The values shown in Table 26 are valid for 60 Hz motors. To obtain the minimum air speed for 50 Hz motors, multiply the values in the table by 0.83.

Frame		Poles			
IEC	NEMA	2	4	6	8
56 to 90	143/5	13	7	5	4
100 to 132	182/4 to 213/5	18	12	8	6
160 to 200	254/6 to 324/6	20	15	10	7
225 to 280	364/5 to 444/5	22	20	15	12
315 to 450	445/7 to 7008/9	25	25	20	15

Table 26 - Minimum required air speed between motor fins (metres/second)

The voltage and frequency variations may affect the performance characteristics and the electromagnetic compatibility of the motor. The power supply variations should not exceed the values specified in the applicable standards. Examples:

- ABNT NBR 17094 - Parts 1 and 2. The motor has been designed to supply the rated torque for a combined variation in voltage and frequency:
  - Zone A: ±5% of the rated voltage and ±2% of the rated frequency;
  - Zone B: ±10% of the rated voltage and +3% -5% of the rated frequency.

When operated continuously in Zone A or B, the motor may show performance variations and the operating temperature may increase considerably. These performance variations will be higher in Zone B. Thus it is not recommended to operate the motor in Zone B during extended periods.

- IEC 60034-1. The motor has been designed to supply the rated torque for combined variation in voltage and frequency:
  - Zone A: ±5% of the rated voltage and ±2% of the rated frequency;
  - Zone B: ±10% of the rated voltage and +3% -5% of the rated frequency.

When operated continuously in Zone A or B, the motor may show performance variations and the operating temperature may increase considerably. These performance variations will be higher in Zone B. Thus it is not recommended to operate the motor in Zone B during extended periods. For multivoltage motors (example 380-415/660 V), a ±5% voltage variation from the rated voltage is allowed.

- NEMA MG 1 Part 12. The motor has been designed to be operated in one of the following variations:
  - ±10% of the rated voltage, with rated frequency;
  - ±5% of the rated frequency, with rated voltage;
  - A combined variation in voltage and frequency of ±10%, provided the frequency variation does not exceed ±5%.

If the motor is cooled by ambient air, clean the air inlet and outlet openings and cooling fins at regular intervals to ensure a free airflow over the frame surface. The hot air should never be returned to the motor. The cooling air must be at room temperature limited to the temperature range indicated on the motor nameplate (if no room temperature is specified, please consider a temperature range between -20 °C and +40 °C).

Table 22 shows the minimum required water flow for water cooled motors considering the different frame sizes and the maximum allowed temperature rise of the cooling water after circulating through the motor. The inlet water temperature should not exceed 40 °C.

Frame size		Flow rate (litres/minute)	Maximum allowed water temperature rise (°C)
IEC	NEMA		
180	284/6	12	5
200	324/6	12	5
225	364/5	12	5
250	404/5	12	5
280	444/5 445/7 447/9	15	6
315	504/5	16	6
355	586/7 588/9	25	6

Table 27 - Minimum required water flow and the maximum allowed temperature rise of the cooling water after circulating through the motor

For W60 motors, please see the nameplate at heat-exchanger.
Motors fitted with oil mist lubrication systems can be operated continuously for a maximum of one hour after the failure of the oil pumping system.

Considering the sun's heat increases the operating temperature, externally mounted motors must always be protected from direct sunlight exposure.

Each and every deviation from the normal operating condition (tripping of the thermal protection, noise and vibration level increase, temperature and current rise) should be investigated and corrected by WEG Authorized Service Centers.

Failure to observe the criteria and recommendations set out in this manual may result in the cancellation of the product warranty.

7.2.1 Limits of vibration

The vibration severity is the maximum vibration value measured at all positions and in all directions as recommended in the standard IEC 60034-14. Table 28 specifies the limits of the maximum vibrations magnitudes according to standard IEC 60034-14 for shaft heights IEC 56 to 400, for vibrations grades A and B. The vibration severity limits in Table 28 are given as RMS values (Root Mean Square values or effective values) of the vibration speed in mm/s measured in free suspension condition.

Shaft height [mm]	56 ≤ H ≤ 132	H ≥ 132
Vibration grade	Vibration severity on elastic base [mm/s RMS]	
A	2.8	2.8
B	1.1	1.8

Table 28 - Recommended limits for the vibration severity according to standard IEC 60034-14

Notes:
1 - The values in valid for measurements carried out with decoupled machines (without load) operated at rated voltage and frequency.
2 - The values in valid regardless of the direction of rotation of the machine.
3 - The values in not applicable to single-phase motors, three-phase motors powered by a single-phase system or to machines mounted in situ or coupled with inertia flywheels or to loads.

According to NEMA MG 1, the allowed vibration limit for standard motors is 0.15 in/s (peak vibration in in/s).

Note:
For the load operation condition, the use of the standard ISO 10816-3 is recommended for evaluating the motor vibration limits. In the load condition the motor vibration will be influenced by several factors, such as, type of the coupled load, condition of the motor fixation, alignment condition under load, structure or base vibration due to other equipments, etc..

ENGLISH

8. MAINTENANCE

The purpose of the maintenance is to extend the useful life of the equipment. The non-compliance with one of these previous items can cause unexpected machine failures.
If motors with cylindrical roller or angular contact bearings are to be transported during the maintenance procedures, the shaft locking device must always be fitted. All HGF, W50, W51 HD and W60 motors, regardless of the bearing type, must always be transported with the shaft locking device fitted.
All repairs, disassembly and assembly related services must be carried out only by qualified and well-trained personnel by using proper tools and techniques. Make sure that the machine has stopped and it is disconnected from the power supply, including the accessory devices (space heater, brake, etc.), before any servicing is undertaken.
The company does not assume any responsibility or liability for repair services or maintenance operations executed by non-authorized Service Centers or by non qualified service personnel. The company shall have no obligation or liability whatsoever to the buyer for any indirect, special, consequential or incidental loss or damage caused or arising from the company's proven negligence.

Pacemaker users and unqualified personnel shall not open WMagnet and WQuattro motors, because high energy magnets are used.

8.1 GENERAL INSPECTION

The inspection intervals depend on the motor type, application and installation conditions. Proceed as follows during inspection:

- Visually inspect the motor and coupling. Check if abnormal noises, vibrations, excessive heating, wear signs, misalignment or damaged parts are noticed. Replace the damaged parts as required;
- Measure the insulation resistance according to the item 5.4;
- Clean the motor enclosure. Remove oil spills and dust accumulation from the motor frame surface to ensure a better heat transfer to the surrounding ambient;
- Check cooling fan condition and clean the air inlet & outlet openings to ensure a free air flow over the motor;
- Investigate the actual condition of the seals and replace them, if required;
- Drain the condensed water from inside the motor. After draining, reinstall the drain plugs to ensure the degree of protection as indicated on the motor nameplate. The motor must always be positioned so the drain hole is at the lowest position (see item 6);
- Check the connections of the power supply cables, ensuring the correct clearance distance between live and grounded parts, as specified in Figure 31.

- Check if the tightening torque of the bolted connections and mounting bolts meets the tightening torque specified in Table 44;
- Check the status of the cable passages, the cable gland seals and the seals inside the terminal box and replace them, if required;
- Check the bearing operating conditions. Check for the presence of any abnormal noise, vibration or other abnormal operating conditions, like motor temperature rise. Check the oil level, the lube oil condition and compare the workings hours with the informed life time;
- Record and file all changes performed on the motor.

Do not reuse damaged or worn parts. Damaged or worn parts must be replaced by parts supplied by the manufacturer and must be installed as if they were the original parts.

8.2 LUBRICATION

Proper lubrication plays a vital role in the motor performance. Only use the grease or oil types, amounts and lubrication intervals recommended for the bearings. This information is available on the motor nameplate and the lubrication procedures must be carried out according to the type of lubricant (oil or grease).
When the motor is fitted with thermal protection devices for bearing temperature control, consider the operating temperature limits shown in Table 12.
The maximum operating temperature of motors used in special applications may differ from those shown in Table 31. The grease and oil disposal should be made in compliance with applicable laws in each country.

Please contact WEG when motors are to be installed in special environments or used for special applications.

8.2.1 Grease lubricated rolling bearings

Excess grease causes bearing overheating, resulting in bearing failure.

The lubrication intervals specified in Table 29, Table 30, Table 31, Table 32, Tabla 34, Table 34 Table 35, Table 36 and Table 37, Table 38, andTable 39 consider an absolute temperature on the bearing of 70 °C (up to frame size IEC 200 / NEMA 324/6) and 85 °C (for frame size IEC 225 / NEMA 364/5 and above), the motor running at rated speed, a motor mounted in horizontal position and greased with Mobil Polyrex EM grease. Any variation of the parameters listed above must be evaluated.

Table 39 - Lubrification interval for roller bearings - W51 HD line

ENGLISH

WGOST motors use Mobiltemp SHC 32 grease as standard, suitable for operation at low temperatures, with the ambient temperature ranging from -45°C to +40°C. Table 40 indicates the lubrication intervals for these motors.

Frame IEC	Poles	50 Hz (h)	Frame IEC	Poles	50 Hz (h)	Frame IEC	Poles	50 Hz (h)	Frame IEC	Poles	50 Hz (h)

Table 41 - Lubrication interval for ball bearings - WEG General Purpose and WIN lines

The WEG General Purpose and WIN motor lines with relubrication system (grease fitting and open bearings) in frame sizes 225S/M, 250S/M and W280S/M is provided with a grease storage chamber inside the motor and do not have an opening for its exit. The internal volume destined to store the old grease has the capacity to reach to 7 (seven) relubrications, limited to 5 years of operation, being necessary the grease removal after this period. For each increment of 15 ºC above the bearing temperature, the relubrication intervals given in the Table must be halved. The relubrication interval of motors designed by the manufacturer for mounting in horizontal position, but installed in vertical position (with WEG authorization), must be halved.
For special applications, such as: high and low temperatures, aggressive environments, driven by frequency inverter (VFD - frequency inverter), etc., please contact WEG about the required amount of grease and the relubrication intervals.

8.2.1.1 Motor without grease fitting

Motors without grease fittings must be lubricated in accordance with the existing Maintenance Plan. Motor disassembly must be carried out as specified in Item 8.3. If motors are fitted with shielded bearings (for example, ZZ, DDU, 2RS, VV), these bearings must be replaced at the end of the grease service life.

8.2.1.2 Motor with grease fitting

To lubricate the bearings with the motor stopped, proceed as follows:
- Before lubricating, clean the grease nipple and immediate vicinity thoroughly;
- Lift grease inlet protection;
- Remove the grease outlet plug (not required for motors with automatic grease relief fittings, such as IEEE Std 841);
- Pump in approximately half of the total grease indicated on the motor nameplate and run the motor for about 1 (one) minute at rated speed;
- Switch-off the motor and pump in the remaining grease;
- Lower again the grease inlet protection and reinstall the grease outlet plug.

To grease the motor while running, proceed as follows:
- Before lubricating, clean the grease nipple and immediate vicinity thoroughly;
- Lift grease inlet protection;
- If safe and possible, remove the grease outlet plug;
- Pump the total grease indicated on the motor nameplate;
- Lower again the grease inlet protection and reinstall the grease outlet plug (if removed).

For lubrication, use only manual grease gun.

Due to internal clearances in the motor, it is possible that, in the first re-lubrication of the bearings, the grease will not come out of the grease outlet. Therefore, do not apply excess grease expecting for it to come out.

If Motors are provided with a spring device for grease removal, the grease excess must be removed by pulling the rod and cleaning the spring until the spring does not remove more grease.

8.2.1.3 Compatibility of the Mobil Polyrex EM grease with other greases

The Mobil Polyrex EM grease has a polyurea thickener and a mineral oil and it is not compatible with other greases.
If you need another type of grease, contact WEG.
It is not recommended to mix different types of greases. In such a case, clean the bearings and lubrication channels before applying new grease.
The used grease must have in its formulation corrosion and oxidation inhibitors.

8.2.1.4 Oil lubricated bearings

To change the oil of oil lubricated motor proceed as follows:
- Switch-off the motor;
- Remove threaded oil drain plug;
- Open the valve and drain the oil;
- Close the drain valve again;
- Reinstall the threaded oil drain plug;
- Fill-up with the type and amount of oil as specified on the nameplate;
- Check oil level. The oil level is OK when the lubricant can be viewed approximately in the center of the sight glass;
- Reinstall oil inlet plug;
- Check for oil leaks and ensure that all not used threaded plugs are closed with plugs.

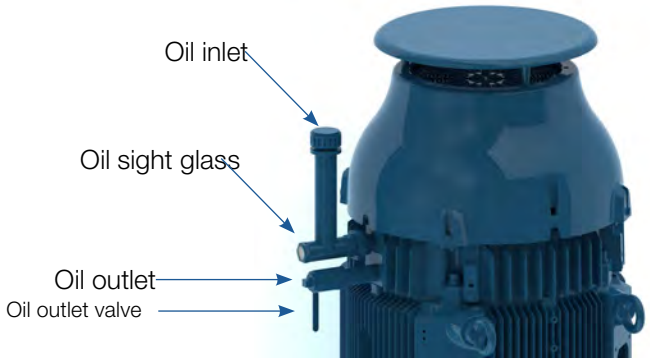

Figure 51 - Oil lubricated bearing - vertical mounting

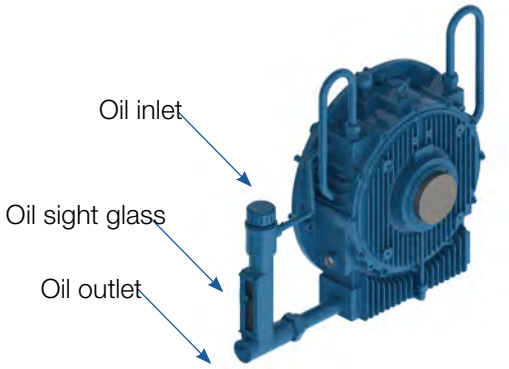

Figure 52 - Oil lubricated bearing - horizontal mounting

The bearing lubricating oil must be replaced as specified on the nameplate or whenever changes in the oil properties are noticed. The oil viscosity and pH must be checked periodically. The oil level must be checked every day and must be kept in the center of the sight glass.
Please contact WEG, when oils with different viscosities should be used.
Note:
The HGF vertical mounted motors with high axial thrust are supplied with grease lubricated DE-bearings and with oil lubricated NDE-bearings. The DE-bearings must be lubricated according to recommendations in item 8.2.1. Table 8.10 specifies the oil type and the amount of oil required for this motor lubrication.

Mounting - high axial thrust	Frame		Poles	Bearing designation	Oil (liters)	Interval (h)	Lubricant	Lubricant specification
	IEC	NEMA						
	315L/A/B and 315C/D/E	5006/7/8T and 5009/10/11T	4 - 8	29320	20	8000	FUCHS Renolin DTA 40 / Mobil SHC 629	ISO VG150 mineral oil with antifoam and antioxidant additives
	355L/A/B and 355C/D/E	5807/8/9T and 5810/11/12T			26			
	400L/A/B and 400C/D/E	6806/7/8T and 6809/10/11T			37			
	450	7006/10			45			

Table 42 - Oil properties for HGF vertical mounted motors with high axial thrust and Vertical High Thrust

8.2.1.5 Oil mist lubricated bearings

Check the service conditions of the seals and if replacement is required use only original components. Clean the seal components before assembly (bearing caps, end shields, etc.).
Apply joint sealant between the bearing caps and end shields. The joint sealant must be compatible with the used lubricating oil. Connect the oil lubricant tubes (oil inlet and oil outlet tubes and motor drain tube), as shown in Figure 40

8.2.1.6 Sleeve bearings

The lubricating oil of sleeve bearings must be changed at the intervals specified in Table 43 To replace the oil, proceed as follows:
- NDE-bearing: remove the protection plate from the fan cover;
- Drain the oil through the drain hole located at the bottom of the bearing (see Figure 53);
- Close the oil drain hole;
- Remove the oil inlet plug;
- Fill the sleeve bearing with the specified oil and with the amount of oil specified in the Table 43;
- Check the oil level and ensure it is kept close to the center of the sight glass;
- Install the oil inlet plug;
- Check for oil leaks.

500	8000						

Table 43 - Oil properties for sleeve bearings

The lubricating oil must be replaced as specified on the nameplate or whenever changes on the oil properties are noticed. The oil viscosity and pH must be checked periodically. The oil level must be checked every day and kept in the center of the sight glass.
Please contact WEG, when oils with different viscosities are to be used.

8.3 MOTOR ASSEMBLY AND DISASSEMBLY

All repair services on motors should be always performed by qualified personnel and in accordance with the applicable laws and regulations in each country. Always use proper tools and devices for motor disassembly and assembly.

Disassembly and assembly services can be carried out only after the motor has been disconnected from the power supply and is completely stopped.
Dangerous voltages may be present at the motor terminals inside the terminal box since capacitors can retain electrical charge for long periods of time even when they are not connected directly to a power source or when space heaters are connected to the motor or when the motor windings are used as space heaters.
Dangerous voltages may be present at the motor terminals when they are driven by frequency inverter even when they are completely stopped.

Record the installation conditions such as terminal connection diagram, alignment / leveling conditions before starting the disassembly procedures. These records should be considered for later assembly.
Disassemble the motor carefully without causing scratches on machined surfaces or damaging the threads.
Assemble the motor on a flat surface ensuring a good support base. Footless motors must be fixed/locked on the base to prevent accidents.
Handle the motor carefully to not damage the insulated components such as windings, insulated rolling bearings, power cables etc..
Seal elements, such as joint seals and bearing seals should always be replaced when wear or damage is noticed.
Motors with degree of protection higher than IP55 are supplied with joint and screw seal Loctite 5923 (Henkel)
Clean the components and apply a new coat of Loctite 5923 on the surfaces before assembly.

For motors with permanent magnet rotor (WQuattro and WMagnet motors), the motor assembly and disassembly require the use of proper devices due to the attracting or repelling forces that occur between metallic parts. This work must only be performed by a WEG Authorized service center specifically trained for such an operation. People with pacemakers cannot handle these motors.
The permanent magnets can also cause disturbances or damages to other electric equipment and components during maintenance.

For the W40, W50, W51 HD and HGF motor lines provided with axial fans, the motor and the axial fan have different markings for indicating the direction of rotation for prevent incorrect assembly.
The axial fan must be assembled so that the indicative arrow for direction of rotation is always visible, viewing the non-drive end side. The marking indicated on the axial fan blade, CW for clockwise direction of rotation or CCW for counterclockwise direction of rotation, indicates the direction of rotation of the motor viewing the drive end side.

For motors with encoder, it is necessary to check the radial run out of the encoder seat. The runout should not exceed the limit specified by the encoder manufacturer.

For motors with polymeric fan cover assembled by snap fit, to remove the polymeric fan cover use two screwdrivers or similar tool positioned near the snap fit region and remove one side by lifting carefully, repeat for the other sides until the complete removal of the fan cover.
When assembling polymeric components, the tightening torques specified in Table 28 must be respected.

Engines with fans fixed only by interference on the shaft, if disassembled, the component must be replaced with a new one. For engines that have aluminum injected covers without machining, it is necessary to heat the covers for assembly and disassembly.

8.3.1.1 Terminal box

Proceed as follows to remove the terminal box cover and to disconnect/connect the power supply cables and the cables of the accessory devices:

- Ensure that during the screw removal the terminal box cover does not damage the components installed inside the terminal box;
- If the terminal box cover is fitted with lifting eyebolt, lift the terminal box cover always by its lift eyebolt;
- If motors are supplied with terminal blocks, ensure the correct tightening torque on the motor terminals as specified in Table 44;

For flying leads motors, do not push the overlength of leads into the motor in order to prevent that they touch the rotor.

  - Ensure that the cables do not contact sharp edges;
- Ensure that the original IP degree of protection is not changed and is maintained as indicate on the motor nameplate. The power supply cables and the control cables must always be fitted with components (cable glands, conduits) that meet the applicable standards and regulations of each country;
- Ensure that the pressure relief device is in perfect operating condition, if provided. The seals in the terminal box must be in perfect condition for reuse and must be reinstalled correctly to ensure the specified degree of protection;
- Ensure the correct tightening torque for the securing bolts of the terminal box cover as specified in Table 44.

Screw type and seal	M4	M5	M6	M8	M10	M12	M14	M16	M20
Hex bolt/hex socket bolt (rigid joint)	-	3,5 to 5	6 to 9	14 to 20	28 to 40	45 to 70	75 to 110	115 to 170	230 to 330
Combined slotted screw (rigid joint)	1,5 to 3	3 to 5	5 to 10	10 to 18	-	-	-	-	-
Hex bolt/hex socket bolt (flexible joint)	-	3 to 5	4 to 8	8 to 15	18 to 30	25 to 40	30 to 45	35 to 50	-
Combined slotted screw (flexible joint)	-	3 to 5	4 to 8	8 to 15	-	-	-	-	-
Terminal blocks	1 to 1,5	2 to 4 1)	4 to 6,5	6,5 to 9	10 to 18	15,5 to 30	-	30 to 50	50 to 75
Grounding terminals	1,5 to 3	3 to 5	5 to 10	10 to 18	28 to 40	45 to 70	-	115 to 170	-

Table 44 - Tightening torque for the securing bolts [Nm]

Note: 1) For 12-pin terminal block, apply the minimum torque of 1.5 Nm and maximum torque of 2.5 Nm.

8.4 DRYING THE STATOR WINDING INSULATION

Dismantle the motor completely. Remove the end shields, the rotor with the shaft, the fan cover, the fan and the terminal box before the wound stator with the frame is transferred to the oven for the drying process. Place the wound stator in the oven heated to max. 120 °C for two hours. For larger motors a longer drying time may be required. After the drying process has been concluded, allow the stator to cool to room temperature. Measure the insulation resistance again as described in item 5.4. Repeat the stator drying process if the required insulation resistance does not meet the values specified in Table 3. If the insulation resistance does not improve despite several drying processes, evaluate the causes of the insulation resistance drop carefully and an eventual replacement of the motor winding may be required. If in doubt contact WEG.

To prevent electrical shock, discharge the motor terminals immediately before, and after each measurement. If the motor is equipped with capacitors, these must be discharged before beginning any repair.

Pacemaker users and unqualified personnel shall not open WMagnet and WQuattro motors, because high energy magnets are used.

8.5 SPARE PARTS

When ordering spare parts, always provide complete motor designation, indicating the motor type, the code number and the serial number, which are stated on the motor nameplate.
Spare parts must always be purchased from WEG authorized Service Centers. The use of non-original spare parts can cause motor failure, performance drop and void the product warranty.
The spare parts must be stored in a clean, dry and properly ventilated room, with relative air humidity not exceeding 60%, with ambient temperature between 5 °C and 40 °C, free of dust, vibrations, gases, corrosive smokes and at constant temperature. The spare parts must be stored in their normal mounting position without placing other components onto them.

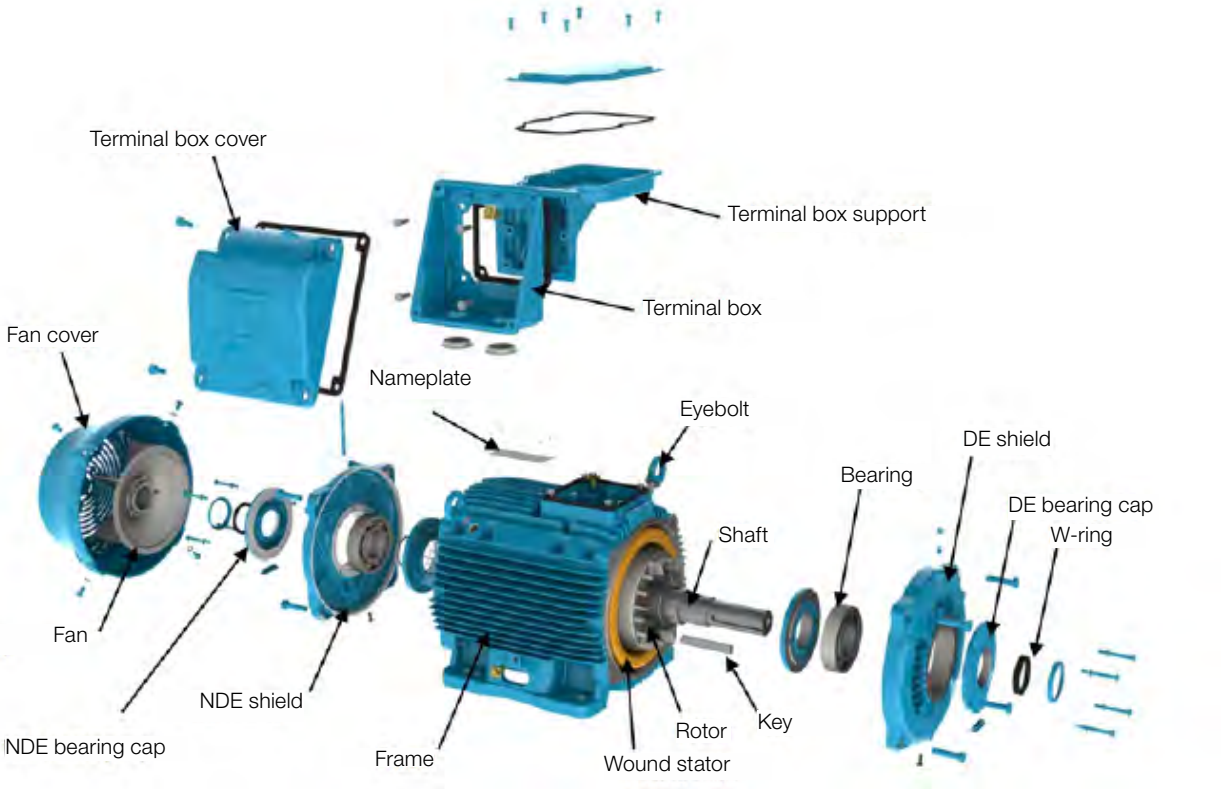

Figure 54 - Exploded view of the components of a W22 motor

9. ENVIRONMENTAL INFORMATION

9.1 PACKAGING

WEG electric motors are supplied in cardboard, plastic or wooden packaging. These materials can be recycled and must be disposed according to the applicable laws and regulations in each country. All wood used in the packaging of WEG motors come from the company reforestation program and is not submitted to any chemical conservation treatment.

9.2 PRODUCT

Electric motors consist mainly of ferrous metals (steel plates and cast iron), non ferrous metals (copper and aluminum) and plastic materials.
In general, electric motors have relatively long service live. However when they must be discarded, WEG recommends to dismantle the motor, sort the different materials and send them for recycling.
No-recyclable materials should be disposed of at industrial landfills according to the applicable environmental laws and regulations in each country, or co-processed in cement kilns or incinerated.
The recycling service providers, the disposal in industrial landfills, the waste co-processing or the incineration process must be properly authorized by the state environment agency to carry out these activities.

10. TROUBLESHOOTING CHART X SOLUTIONS

This troubleshooting chart provides a basic list of problems that may occur during motor operation, possible causes and recommended corrective actions. In case of doubts, please contact WEG Service Center.

Problem	Possible cause	Corrective action
Motor does not start, neither coupled nor decoupled	Power cables are interrupted	Check the control panel and the motor power supply cables
	Blown fuses	Replace blown fuses
	Wrong motor connection	Correct the motor connection according to connection diagram
	Locked rotor	Check motor shaft to ensure that it rotates freely
The motor starts at no-load, but fails when load is applied. It starts very slowly and does not reach the rated speed	Load toque is too high during start-up	Do not start the motor on load
	Too high voltage drop in the power cables	Check the installation dimensioning (transformer, cable cross section, relays, circuit breakers, etc.)
Abnormal/excessive noise	Defective transmission component or defective driven machine	Check the transmission force, the coupling and the alignment
	Misaligned / unleveled base	Align / level the motor with the driven machine
	Unbalanced components or unbalanced driven machine	Balance the machine set again
	Different balancing methods used for motor and coupling balancing (halve key, full key)	Balance the motor again
	Wrong motor direction of rotation	Reverse the direction of rotation
	Loose bolts	Retighten the bolts
	Foundation resonance	Check the foundation design
	Damaged bearings	Replace the bearings
Motor overheating	Insufficient cooling	Clean air inlet and outlet and cooling fins
		Check the minimum required distance between the fan cover and nearest walls. See item 7
		Check air temperature at inlet
	Overload	Measure motor current, evaluate motor application and if required, reduce the load
	Number of starts per hour is too high or the load inertia moment is too high	Reduce the number of starts per hour
	Power supply voltage too high	Check the motor power supply voltage. Power supply voltage must not exceed the tolerance specified in item 7.2
	Power supply voltage too low	Check the motor power supply voltage and the voltage drop. Power supply voltage must not exceed the tolerance specified in item 7.2
	Interrupted power supply	Check the connection of the power cables
	Voltage unbalance at the motor terminals	Check for blown fuses, wrong commands, voltage unbalance in the power line, phase fault or interrupted power cables
	Direction of rotation is not compatible with the unidirectional fan	Check if the direction of rotation matches the rotation arrow indicated on end shield
Bearing overheating	Excessive grease/oil	Clean the bearing and lubricate it according to the provided recommendations
	Grease/oil aging	
	The used grease/oil does not matches the specified one	
	Lack of grease/oil	Lubricate the bearing according to the provided recommendations
	Excessive axial or radial forces due to the belt tension	Reduce the belt tension
		Reduce the load applied to the motor

Introduction and Safety

Introduction

Purpose of this manual

The purpose of this manual is to provide necessary information for:

- Installation
- Operation
- Maintenance

CAUTION:
Failure to observe the instructions contained in this manual could result in personal injury and property damage, and may void the warranty. Read this manual carefully before installing and using the product.

NOTICE:
Save this manual for future reference and keep it readily available.

Requesting other information

Special versions can be supplied with supplementary instruction leaflets. See the sales contract for any modifications or special version characteristics. For instructions, situations, or events that are not considered in this manual or in the sales documents, please contact the nearest ITT representative.

Always specify the exact product type and identification code when requesting technical information or spare parts.

Safety

WARNING:

- The operator must be aware of the pumpage and take appropriate safety precautions to prevent physical injury.
- Risk of serious injury or death. If any pressure-containing device is over-pressurized, it can explode, rupture, or discharge its contents. It is critical to take all necessary measures to avoid over-pressurization.
- Risk of death, serious personal injury, and property damage. Installing, operating, or maintaining the unit using any method not prescribed in this manual is prohibited. Prohibited methods include any modification to the equipment or use of parts not provided by ITT. If there is any uncertainty regarding the appropriate use of the equipment, please contact an ITT representative before proceeding.
- Risk of serious personal injury. Applying heat to impellers, propellers, or their retaining devices can cause trapped liquid to rapidly expand and result in a violent explosion. This manual clearly identifies accepted methods for disassembling units. These methods must be adhered to. Never apply heat to aid in their removal unless explicitly stated in this manual.
- If the pump or motor is damaged or leaking, electric shock, fire, explosion, liberation of toxic fumes, physical harm, or environmental damage may result. Do not operate the unit until the problem has been corrected or repaired.
- Risk of serious personal injury or property damage. Dry running may cause rotating parts within the pump to seize to non-moving parts. Do not run dry.
- Risk of death, serious personal injury, and property damage. Heat and pressure buildup can cause explosion, rupture, and discharge of pumpage. Never operate the pump with suction and/or discharge valves closed.
- Running a pump without safety devices exposes operators to risk of serious personal injury or death. Never operate a unit unless appropriate safety devices (guards, etc.) are properly installed. See specific information about safety devices in other sections of this manual.

CAUTION:
Risk of injury and/or property damage. Operating a pump in an inappropriate application can cause over pressurization, overheating, and/or unstable operation. Do not change the service application without the approval of an authorized ITT representative.

Safety terminology and symbols

About safety messages

It is extremely important that you read, understand, and follow the safety messages and regulations carefully before handling the product. They are published to help prevent these hazards:

- Personal accidents and health problems
- Damage to the product
- Product malfunction

Hazard levels

Hazard level	Indication
 **DANGER:**	A hazardous situation which, if not avoided, will result in death or serious injury

Hazard level	Indication
WARNING:	A hazardous situation which, if not avoided, could result in death or serious injury
CAUTION:	A hazardous situation which, if not avoided, could result in minor or moderate injury
NOTICE:	· A potential situation which, if not avoided, could result in undesirable conditions · A practice not related to personal injury

Hazard categories

Hazard categories can either fall under hazard levels or let specific symbols replace the ordinary hazard level symbols.

Electrical hazards are indicated by the following specific symbol:

Electrical Hazard:

These are examples of other categories that can occur. They fall under the ordinary hazard levels and may use complementing symbols:

- Crush hazard
- Cutting hazard
- Arc flash hazard

The Ex symbol

The Ex symbol indicates safety regulations for Ex-approved products when used in atmospheres that are potentially explosive or flammable.

Environmental safety

The work area

Always keep the station clean to avoid and/or discover emissions.

Waste and emissions regulations

Observe these safety regulations regarding waste and emissions:

- Appropriately dispose of all waste.
- Handle and dispose of the processed liquid in compliance with applicable environmental regulations.
- Clean up all spills in accordance with safety and environmental procedures.
- Report all environmental emissions to the appropriate authorities.

WARNING:
If the product has been contaminated in any way, such as from toxic chemicals or nuclear radiation, do NOT send the product to ITT unless it has been properly decontaminated.

Electrical installation

For electrical installation recycling requirements, consult your local electric utility.

Recycling guidelines

Always follow local laws and regulations regarding recycling.

User safety

General safety rules

These safety rules apply:

- Always keep the work area clean.
- Pay attention to the risks presented by gas and vapors in the work area.
- Avoid all electrical dangers. Pay attention to the risks of electric shock or arc flash hazards.
- Always bear in mind the risk of drowning, electrical accidents, and burn injuries.

Safety equipment

Use safety equipment according to the company regulations. Use this safety equipment within the work area:

- Helmet
- Safety goggles, preferably with side shields
- Protective shoes
- Protective gloves
- Gas mask
- Hearing protection
- First-aid kit
- Safety devices

Electrical connections

Electrical connections must be made by certified electricians in compliance with all international, national, state, and local regulations. For more information about requirements, see sections dealing specifically with electrical connections.

Precautions before work

Observe these safety precautions before you work with the product or are in connection with the product:

- Provide a suitable barrier around the work area, for example, a guard rail.
- Make sure that all safety guards are in place and secure.
- Make sure that you have a clear path of retreat.
- Make sure that the product cannot roll or fall over and injure people or damage property.
- Make sure that the lifting equipment is in good condition.
- Use a lifting harness, a safety line, and a breathing device as required.
- Allow all system and pump components to cool before you handle them.
- Make sure that the product has been thoroughly cleaned.
- Disconnect and lock out power before you service the pump.
- Check the explosion risk before you weld or use electric hand tools.

Precautions during work

Observe these safety precautions when you work with the product or are in connection with the product:

CAUTION:
Failure to observe the instructions contained in this manual could result in personal injury and property damage, and may void the warranty. Read this manual carefully before installing and using the product.

- Never work alone.
- Always wear protective clothing and hand protection.
- Stay clear of suspended loads.
- Always lift the product by its lifting device.
- Beware of the risk of a sudden start if the product is used with an automatic level control.
- Beware of the starting jerk, which can be powerful.
- Rinse the components in water after you disassemble the pump.
- Do not exceed the maximum working pressure of the pump.
- Do not open any vent or drain valve or remove any plugs while the system is pressurized. Make sure that the pump is isolated from the system and that pressure is relieved before you disassemble the pump, remove plugs, or disconnect piping.
- Never operate a pump without a properly installed coupling guard.
- The coupling guard used in an ATEX classified environment must be constructed from a non-sparking material.

Hazardous liquids

The product is designed for use in liquids that can be hazardous to your health. Observe these rules when you work with the product:

- Make sure that all personnel who work with biologically hazardous liquids are vaccinated against diseases to which they may be exposed.
- Observe strict personal cleanliness.
- A small amount of liquid will be present in certain areas like the seal chamber.

Wash the skin and eyes

1. Follow these procedures for chemicals or hazardous fluids that have come into contact with your eyes or your skin:

Condition	Action
Chemicals or hazardous fluids in eyes	1. Hold your eyelids apart forcibly with your fingers. 2. Rinse the eyes with eyewash or running water for at least 15 minutes. 3. Seek medical attention.
Chemicals or hazardous fluids on skin	1. Remove contaminated clothing. 2. Wash the skin with soap and water for at least 1 minute. 3. Seek medical attention, if necessary.

Ex-approved products

Follow these special handling instructions if you have an Ex-approved unit.

Personnel requirements

These are the personnel requirements for Ex-approved products in potentially explosive atmospheres:

- All work on the product must be carried out by certified electricians and ITT-authorized mechanics. Special rules apply to installations in explosive atmospheres.
- All users must know about the risks of electric current and the chemical and physical characteristics of the gas, the vapor, or both present in hazardous areas.
- Any maintenance for Ex-approved products must conform to international and national standards (for example, IEC/EN 60079-17).

ITT disclaims all responsibility for work done by untrained and unauthorized personnel.

Product and product handling requirements

These are the product and product handling requirements for Ex-approved products in potentially explosive atmospheres:

- Only use the product in accordance with the approved motor data.

- The Ex-approved product must never run dry during normal operation. Dry running during service and inspection is only permitted outside the classified area.
- Before you start work on the product, make sure that the product and the control panel are isolated from the power supply and the control circuit, so they cannot be energized.
- Do not open the product while it is energized or in an explosive gas atmosphere.
- Make sure that thermal contacts are connected to a protection circuit according to the approval classification of the product, and that they are in use.
- Intrinsically safe circuits are normally required for the automatic level-control system by the level regulator if mounted in zone 0.
- The yield stress of fasteners must be in accordance with the approval drawing and the product specification.
- Do not modify the equipment without approval from an authorized ITT representative.
- Only use parts that are provided by an authorized ITT representative.

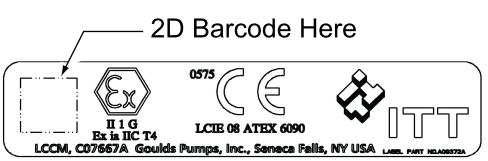
Product approval standards

Regular standards

WARNING:
Use of equipment unsuitable for the environment can pose risks of ignition and/or explosion. Ensure that the code classifications on the pump are compatible with the specific environment in which the equipment is to be installed. If they are not compatible, do not operate the equipment and contact an ITT representative before proceeding.

All standard products are approved according to CSA standards in Canada and UL standards in USA. The drive unit degree of protection follows IP68. See the nameplate for maximum submersion, according to standard IEC 60529.

All electrical ratings and performance of the motors comply with IEC 600341.



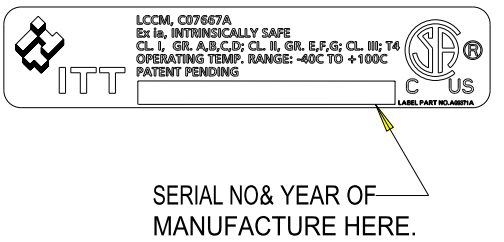
Explosion-proofing standards

All explosion-proof products for use in explosive atmospheres are designed in compliance with one or more of the following approvals:

- EN, ATEX Directive 94/9/EC
- FM According to NEC
  - Class 1 Div 1 Groups “C”, and “D”
  - Class 2 Div 1 Groups “E”, “F”, and “G”
  - Class 3 Div 1 Hazardous Locations

ATEX/IECEx:

- Group: IIC
- Category: Ex ia
- Temperature Class: T4 (for ambients up to 100ºC)
- ATEX Marking: Ex II 1 G



CSA certification

Intrinsically safe for:

- Class I, Div. 1, Groups A, B, C, D
- Class II, Div. 1, Groups E, F, G

- Class III
- Certified to Canadian and US requirements

Product warranty

Coverage

ITT undertakes to remedy faults in products from ITT under these conditions:

- The faults are due to defects in design, materials, or workmanship.
- The faults are reported to an ITT representative within the warranty period.
- The product is used only under the conditions described in this manual.
- The monitoring equipment incorporated in the product is correctly connected and in use.
- All service and repair work is done by ITT-authorized personnel.
- Genuine ITT parts are used.
- Only Ex-approved spare parts and accessories authorized by ITT are used in Ex-approved products.

Limitations

The warranty does not cover faults caused by these situations:

- Deficient maintenance
- Improper installation
- Modifications or changes to the product and installation made without consulting ITT
- Incorrectly executed repair work
- Normal wear and tear

ITT assumes no liability for these situations:

- Bodily injuries
- Material damages
- Economic losses

Warranty claim

ITT products are high-quality products with expected reliable operation and long life. However, should the need arise for a warranty claim, then contact your ITT representative.

Transportation and Storage

Inspect the delivery

Inspect the package

1. Inspect the package for damaged or missing items upon delivery.
2. Note any damaged or missing items on the receipt and freight bill.
3. File a claim with the shipping company if anything is out of order.
   If the product has been picked up at a distributor, make a claim directly to the distributor.

Inspect the unit

1. Remove packing materials from the product.
   Dispose of all packing materials in accordance with local regulations.
2. Inspect the product to determine if any parts have been damaged or are missing.
3. If applicable, unfasten the product by removing any screws, bolts, or straps.
   For your personal safety, be careful when you handle nails and straps.
4. Contact your sales representative if anything is out of order.

Transportation guidelines

Pump handling

WARNING:
Dropping, rolling or tipping units, or applying other shock loads, can cause property damage and personal injury. Ensure that the unit is properly supported and secure during lifting and handling.

CAUTION:
Risk of injury or equipment damage from use of inadequate lifting devices. Ensure lifting devices (such as chains, straps, forklifts, cranes, etc.) are rated to sufficient capacity.

Lifting methods

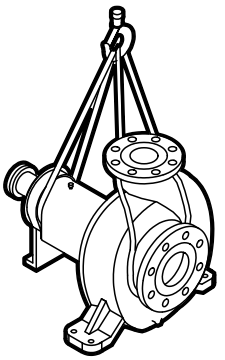
WARNING:

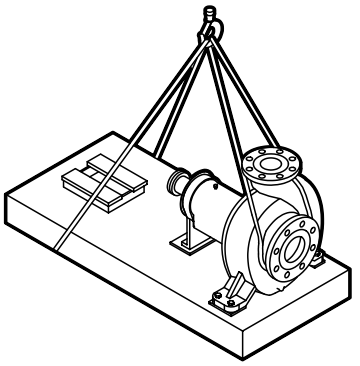
- Risk of serious personal injury or equipment damage. Proper lifting practices are critical to safe transport of heavy equipment. Ensure that practices used are in compliance with all applicable regulations and standards.
- Safe lifting points are specifically identified in this manual. It is critical to lift the equipment only at these points. Integral lifting eyes or eye bolts on pump and motor components are intended for use in lifting the individual components only.
- Lifting and handling heavy equipment poses a crush hazard. Use caution during lifting and handling and wear appropriate Personal Protective Equipment (PPE, such as steel-toed shoes, gloves, etc.) at all times. Seek assistance if necessary.

Table 1: Methods

Pump type	Lifting method
A bare pump without lifting handles	Use a suitable sling attached properly to solid points like the casing, the flanges, or the frames.
A bare pump with lifting handles	Lift the pump by the handles.
A base-mounted pump	Use slings under the pump casing and the drive unit, or under the base rails.

Examples





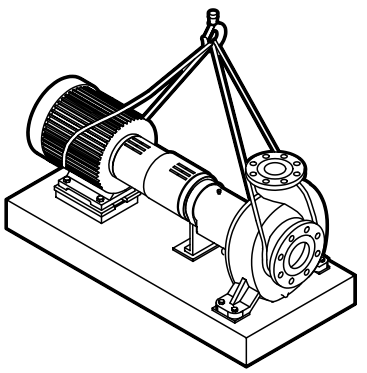


Figure 1: Example of a proper lifting method

NOTICE:
Do not use this method to lift a Polyshield ANSI Combo with the pump and motor mounted. These items are not designed to handle the heavy weight of the Polyshield system. Doing so may result in equipment damage.

Figure 2: Example of a proper lifting method

NOTICE:
Do not use this method to lift a Polyshield ANSI Combo with the pump and motor mounted. These items are not designed to handle the heavy weight of the Polyshield system. Doing so may result in equipment damage.

Figure 3: Example of a proper lifting method

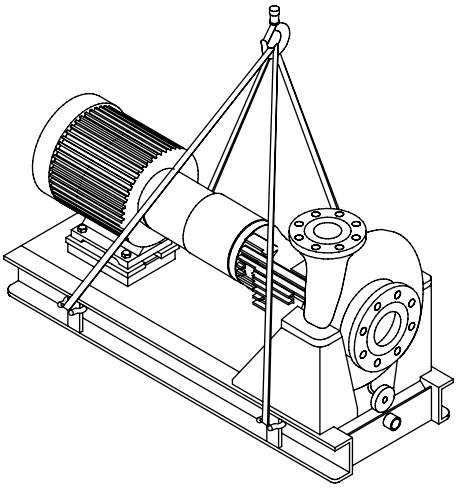

Figure 4: Example of a proper lifting method

NOTICE:

When lifting a unit for which a strap cannot be secured at the suction flange, secure the strap through the frame/frame adapter. Securing at the frame adapter will prevent slipping of the strap and possible equipment damage.

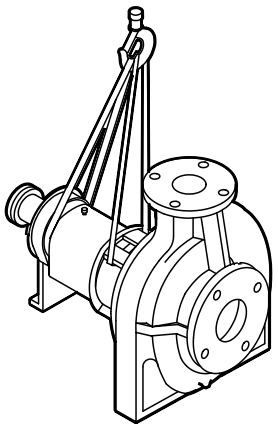

Figure 5: Example of a proper lifting method with a strap secured around the frame adapter

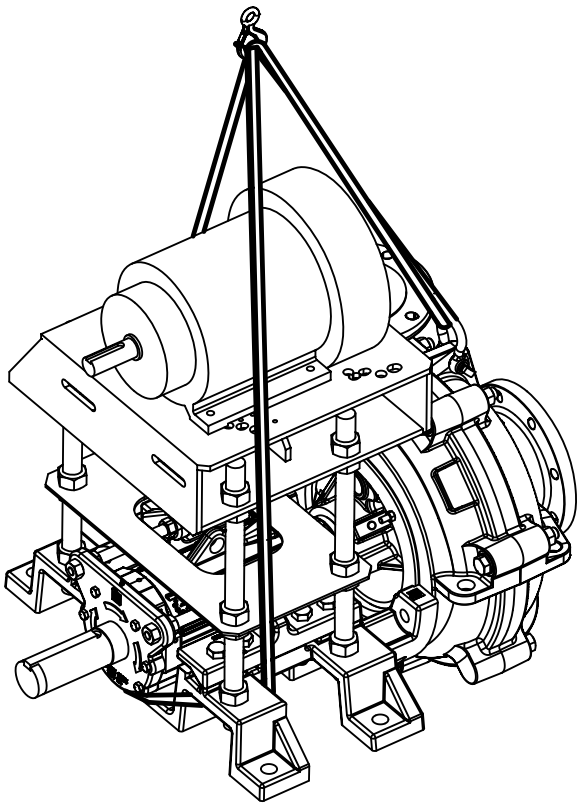

Figure 6: Example of offset overhead motor mount pump proper lifting method

Storage guidelines

Pump storage requirements

Storage requirements depend on the amount of time that you store the unit. The normal packaging is designed only to protect the unit during shipping.

Length of time in storage	Storage requirements
Upon receipt/short-term (less than six months)	· Store in a covered and dry location. · Store the unit free from dirt and vibrations.
Long-term (more than six months)	· Store in a covered and dry location. · Store the unit free from heat, dirt, and vibrations. · Rotate the shaft by hand several times at least every three months.

Treat bearing and machined surfaces so that they are well preserved. Refer to drive unit and coupling manufacturers for their long-term storage procedures.

You can purchase long-term storage treatment with the initial unit order or you can purchase it and apply it after the units are already in the field. Contact your local ITT sales representative.

Frostproofing

Table 2: Situations when the pump is or is not frostproof

Situation	Condition
Operating	The pump is frostproof.
Immersed in a liquid	The pump is frostproof.
Lifted out of a liquid into a temperature below freezing	The impeller might freeze.

Product Description

General description 3196 i-FRAME

The 3196 i-FRAME is a horizontal overhung, open impeller, centrifugal pump. This pump is ANSI B73.1 compliant.

The model is based on 5 power ends and 31 hydraulic sizes.

Figure 7: 3196 i-FRAME pump

This table shows the number of hydraulic sizes available for each drive-unit size group.

Drive-unit size group	Number of hydraulic sizes
STi	5
MTi	15
LTi	15
XLT-i	6
i-17	5

WARNING:
Use of equipment unsuitable for the environment can pose risks of ignition and/or explosion. Ensure that the code classifications on the pump are compatible with the specific environment in which the equipment is to be installed. If they are not compatible, do not operate the equipment and contact an ITT representative before proceeding.

Part description 3196

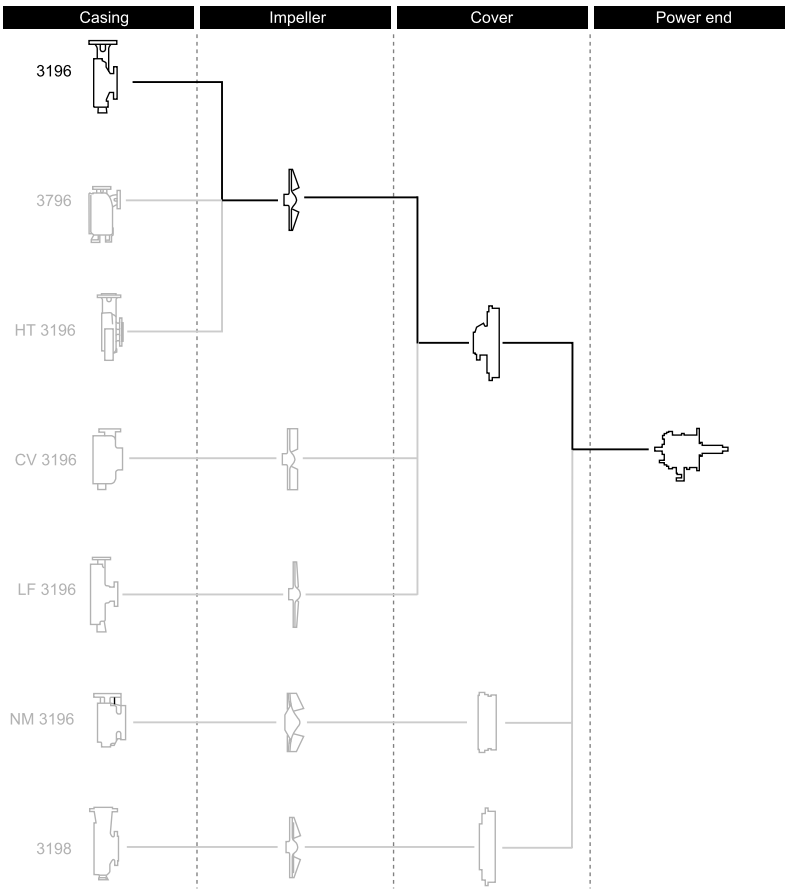

Figure 8: 3196 part description

Table 3: Casing

This table describes the pump casing parts.

Part	Description
Discharge	Top-centerline
Casing ventilation	Self venting
Gasket	Fully confined
Mounting method	Integral foot support for maximum resistance to misalignment due to piping loads.
Standard flange	ANSI flat-faced serrated flange
Optional flanges	One of the following flanges can be used: · ANSI class 150 raised-face serrated flange · ANSI class 300 flat-face serrated flange · ANSI class 300 raised-face serrated flange

Impeller

The impeller is

- fully open
- threaded onto the shaft

The threads are sealed from the pumped liquid by a PTFE O-ring for the 3196.

Cover

Standard

- Stuffing Box cover designed for packing or a mechanical seal
- BigBore or TaperBore® PLUS seal chambers designed for improved performance of mechanical seals

Optional sealing design

- a dynamic seal is available which uses a repeller to pump liquid out of the stuffing box while the pump operates. A static seal prevents leakage when the pump is shut down.

Table 4: Power end

This table describes the main parts of the power end.

Part	Description
Frame adapter	The ductile iron frame adapter has · a machined rabbet fit to the seal chamber/ stuffing box cover · a precision dowel pin fit to the bearing frame.
Power end	· Flood-oil lubrication is standard. · Oil-mist, regreasable and greased-for-life options are available. · The oil level is checked through a sight glass. · The power end is sealed with labyrinth seals. · The power end is made in the following sizes: · STi · MTi · LTi · XLT-i · i-17
Shaft	The shaft is available with or without a sleeve.
Bearings	The inboard bearing · carries only radial loads. · is free to float axially in the frame. · is a single-row deep-groove ball bearing The outboard bearing · is shouldered and locked to the shaft and housing to enable it to carry radial and thrust loads. · is a double-row angular-contact bearing, except for the LTi which uses a pair of single-row angular-contact ball bearings mounted back-to-back.

General description i-ALERT® Condition Monitor

Description

The i-ALERT®2 Condition Monitor is a compact, battery-operated monitoring device that continuously measures the vibration and temperature of the pump power end. The condition monitor uses blinking red LEDs to alert the pump operator when the pump exceeds pre-set vibration and temperature limits. This allows the pump operator to make changes to the process or the pump before a catastrophic failure occurs. The condition monitor is also equipped with a single green LED to indicate when it is operational and has sufficient battery life. (i-ALERT®2) Bluetooth Equipment Health Monitor option available. The i-ALERT®2 monitor allows customers to identify potential problems before they become costly failures. It tracks vibration, temperature and run-time hours and wirelessly syncs the data with a smart phone or tablet the i-ALERT®2 mobile app. More information available on *http://www.ittproservices.com/aftermarket-products/monitoring/i-alert2/*i-ALERT2.com).

Software License Agreement

BY USING THE i-ALERT®2 CONDITION MONITOR, YOU AGREE TO BE BOUND BY THE TERMS AND CONDITIONS OF THE FOLLOWING LICENSE AGREEMENT. PLEASE READ THIS AGREEMENT CAREFULLY.

ITT Corporation and its subsidiaries, affiliates, either directly, or through its authorized sublicensees ("ITT") grants you a limited, non-exclusive license to use the software embedded in this device ("Software") in binary executable form in the normal operation of the i-ALERT®2 condition monitor for monitoring the condition of an Goulds Pump Inc. model. Title, ownership rights, and intellectual property rights in and to the Software remain in ITT or its third-party

providers. You agree that this license agreement does not need to be signed for it to take effect.

You acknowledge that this Software is the property of ITT and is protected under United States of America copyright laws and international copyright treaties. You further acknowledge that the structure, organization, and code of the Software are valuable trade secrets of ITT and/or its third-party providers and that the Software in source code form remains a valuable trade secret of ITT. You agree not to decompile, disassemble, modify, reverse assemble, reverse engineer, or reduce to human readable form the Software or any part thereof or create any derivative works based on the Software. You agree not to export or re-export the Software to any country in violation of the export control laws of the United States of America.

Alarm mode

The condition monitor enters alarm mode when either vibration or temperature limits are exceeded over two consecutive readings within a ten minute period. Alarm mode is indicated with two red flashing LEDs within two second intervals.

Temperature and vibration limits

Variable	Limit
Temperature	91°C | 195°F
Vibration	100% increase over the baseline level

Battery life

The i-ALERT®2 Condition Monitor battery is not replaceable. You must replace the entire unit once the battery runs out of power.

The battery life is not covered as part of the standard pump warranty.

This table shows the average condition monitor battery life under normal and alarm-mode operating conditions.

Condition monitor operational state	Battery life
Normal operating and environmental conditions	Three to five years
Alarm mode	One year

Nameplate information

Important information for ordering

Every pump has nameplates that provide information about the pump. The nameplates are located on the casing and the bearing frame.

When you order spare parts, identify this pump information:

- Model
- Size
- Serial number
- Item numbers of the required parts

Refer to the nameplate on the pump casing for most of the information. See Parts List for item numbers.

Nameplate types

Nameplate	Description
Pump casing Pump	Provides information about the hydraulic characteristics of the pump. The formula for the pump size is: Discharge x Suction - Nominal Maximum Impeller Diameter in inches. (Example: 2x3-8)
Bearing frame	Provides information about the lubrication system used.
ATEX	If applicable, your pump unit might have an ATEX nameplate affixed to the pump, the baseplate, or the discharge head. The nameplate provides information about the ATEX specifications of this pump.
IECEx	If applicable, your pump unit might have the following IECEx nameplate affixed to the pump and/or baseplate. The nameplate provides information about the IECEx specifications of this pump.

Nameplate on the pump casing using English units

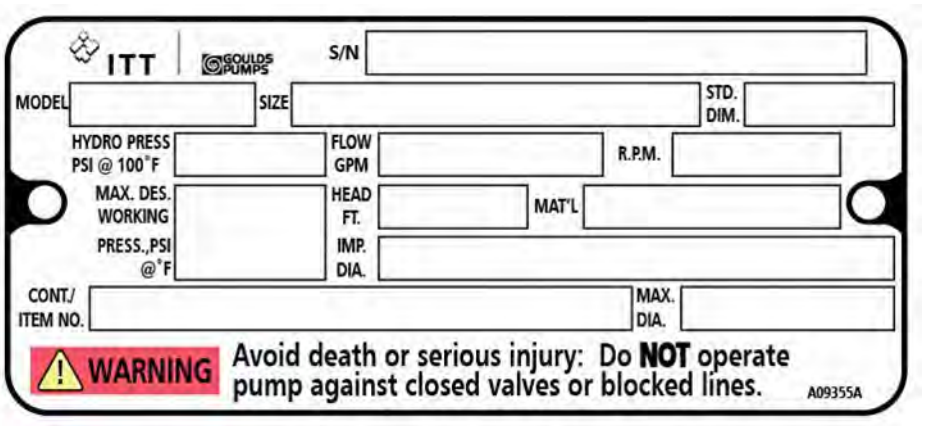

Figure 9: Nameplate on the pump casing using English units

Table 5: Explanation of nameplate on the pump casing

Nameplate field	Explanation
IMPLR. DIA.	Impeller diameter, in inches
MAX. DIA.	Maximum impeller diameter, in inches
GPM	Rated pump flow, in gallons per minute
FT HD	Rated pump head, in feet
RPM	Rated pump speed, revolutions per minute
MOD.	Pump model
SIZE	Size of the pump
STD. NO.	ANSI standard designation
MAT L. CONST.	Material of which the pump is constructed
SER. NO.	Serial number of the pump
MAX DSGN PSI @ 100ºF	Maximum pressure at 100ºF according to the pump design

Nameplate on the pump casing using metric units

WARNING:
Use of equipment unsuitable for the environment can pose risks of ignition and/or explosion. Ensure that the code classifications on the pump are compatible with the specific environment in which the equipment is to be installed. If they are not compatible, do not operate the equipment and contact an ITT representative before proceeding.

Installation

Preinstallation

Precautions

WARNING:

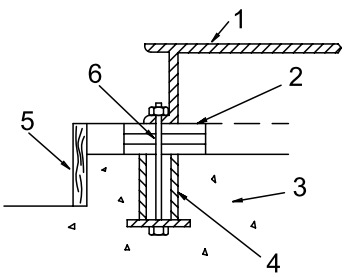
- (Ex) When installing in a potentially explosive environment, ensure that the motor is properly certified.
- (Ex) All equipment being installed must be properly grounded to prevent unexpected discharge. Discharge can cause equipment damage, electric shock, and result in serious injury. Test the ground lead to verify it is connected correctly.

NOTICE:

- Electrical connections must be made by certified electricians in compliance with all international, national, state and local regulations.
- Supervision by an authorized ITT representative is recommended to ensure proper installation. Improper installation may result in equipment damage or decreased performance.

Pump location guidelines

Guideline	Explanation/comment
Keep the pump as close to the liquid source as practically possible.	This minimizes the friction loss and keeps the suction piping as short as possible.
Make sure that the space around the pump is sufficient.	This facilitates ventilation, inspection, maintenance, and service.
If you require lifting equipment such as a hoist or tackle, make sure that there is enough space above the pump.	This makes it easier to properly use the lifting equipment and safely remove and relocate the components to a safe location.
Protect the unit from weather and water damage due to rain, flooding, and freezing temperatures.	This is applicable if nothing else is specified.
Do not install and operate the equipment in closed systems unless the system is constructed with properly-sized safety devices and control devices.	Acceptable devices: · Pressure relief valves · Compression tanks · Pressure controls · Temperature controls · Flow controls If the system does not include these devices, consult the engineer or architect in charge before you operate the pump.
Take into consideration the occurrence of unwanted noise and vibration.	The best pump location for noise and vibration absorption is on a concrete floor with subsoil underneath.
If the pump location is overhead, undertake special precautions to reduce possible noise transmission.	Consider a consultation with a noise specialist.

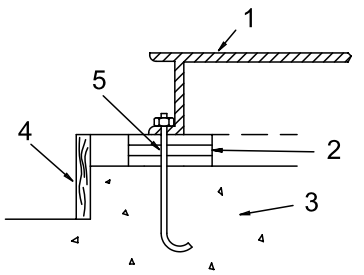


Foundation requirements

Requirements

- The foundation must be able to absorb any type of vibration and form a permanent, rigid support for the unit.
- The location and size of the foundation bolt holes must match those shown on the assembly drawing provided with the pump data package.

- The foundation must weigh between two and three times the weight of the pump.
- Provide a flat, substantial concrete foundation in order to prevent strain and distortion when you tighten the foundation bolts.



Sleeve-type bolts

1. Baseplate
2. Shims or wedges
3. Foundation
4. Sleeve
5. Dam
6. Bolt

Figure 17: Sleeve type bolts

J-type bolts

1. Baseplate
2. Shims or wedges
3. Foundation
4. Dam
5. Bolt

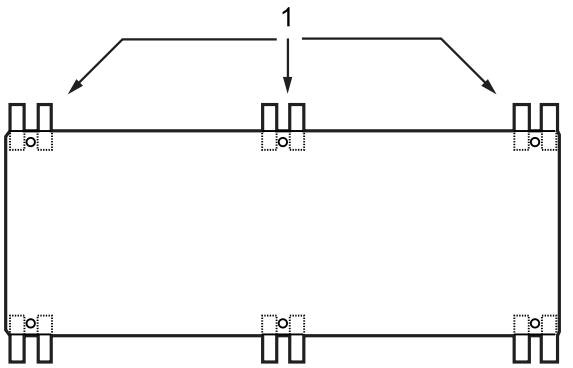
Figure 18: J-type bolts

Baseplate-mounting procedures

Prepare the baseplate for mounting

1. Remove all the attached equipment from the baseplate.
2. Clean the underside of the baseplate completely.
3. If applicable, coat the underside of the baseplate with an epoxy primer.
   Use an epoxy primer only if you used an epoxy-based grout.
4. Remove the rust-proofing coat from the machined mounting pads using an appropriate solvent.
5. Remove water and debris from the foundation-bolt holes.

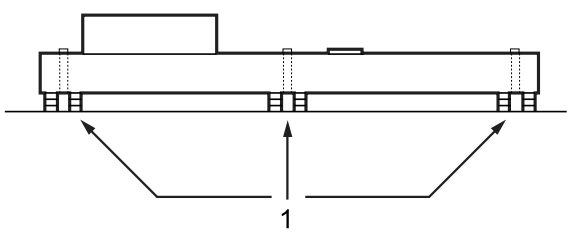
Install the baseplate using shims or wedges



Required tools:

- Two sets of shims or wedges for each foundation bolt

- Two machinist's levels
- Baseplate-leveling worksheet



This procedure is applicable to cast iron and fabricated steel baseplates.

1. If you use sleeve-type bolts, fill the bolt sleeves with packing material or rags to prevent grout from entering the bolt holes.
2. Put the sets of wedges or shims on each side of each foundation bolt.
   The sets of wedges should have a height of between 19 mm | 0.75 in. and 38 mm | 1.50 in.

1. Shims or wedges

Figure 19: Top view

1. Shims or wedges

Figure 20: Side view

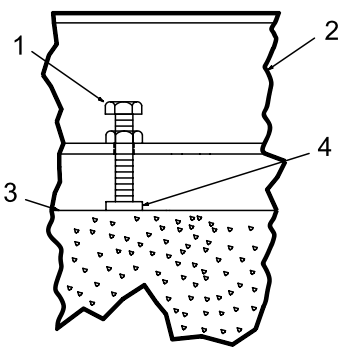
3. Lower the baseplate carefully onto the foundation bolts.
4. Put the machinist's levels across the mounting pads of the driver and the mounting pads of the pump.

NOTICE:
Remove all dirt from the mounting pads in order to ensure that the correct leveling is achieved. Failure to do so can result in equipment damage or decreased performance.

5. Level the baseplate both lengthwise and across by adding or removing shims or moving the wedges.
   These are the leveling tolerances:
   - A maximum difference of 3.2 mm | 0.125 in. lengthwise
   - A maximum difference of 1.5 mm | 0.059 in. across

   You can use the baseplate-leveling worksheet when you take the readings.
6. Hand-tighten the nuts for the foundation.

Install the baseplate using jackscrews



Tools required:

- Anti-seize compound
- Jackscrews
- Bar stock
- Two machinist's levels

- Baseplate-leveling worksheet

This procedure is applicable to the feature-fabricated steel baseplate and the advantage base baseplate.

1. Apply an anti-seize compound on the jackscrews.
   The compound makes it easier to remove the screws after you grout.
2. Lower the baseplate carefully onto the foundation bolts and perform these steps:
   a) Cut the plates from the bar stock and chamfer the edges of the plates in order to reduce stress concentrations.
   b) Put the plates between the jackscrews and the foundation surface.
   c) Use the four jackscrews in the corners in order to raise the baseplate above the foundation.
      Make sure that the distance between the baseplate and the foundation surface is between 19 mm | 0.75 in. and 38 mm | 1.50 in.
   d) Make sure that the center jackscrews do not touch the foundation surface yet.

1. Jackscrew
2. Baseplate
3. Foundation
4. Plate

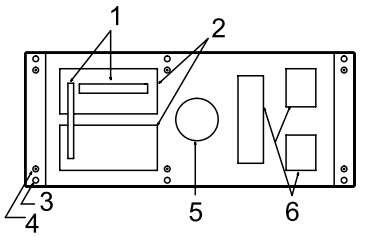


Figure 21: Jackscrews

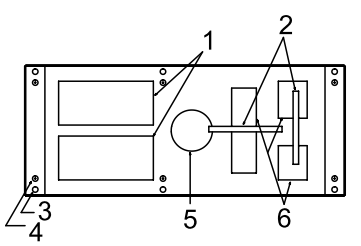
3. Level the driver mounting pads:

NOTICE:
Remove all dirt from the mounting pads in order to ensure that the correct leveling is achieved. Failure to do so can result in equipment damage or decreased performance.

   a) Put one machinist's level lengthwise on one of the two pads.
   b) Put the other machinist's level across the ends of the two pads.

c) Level the pads by adjusting the four jackscrews in the corners.
Make sure that the machinist's level readings are as close to zero as possible, both lengthwise and across.
Use the baseplate-leveling worksheet when you take the readings.



1. Machinist's levels
2. Driver's mounting pads
3. Foundation bolts
4. Jackscrews
5. Grout hole
6. Pump's mounting pads

Figure 22: Level driver mounting pads

4. Turn the center jackscrews down so that they rest on their plates on the foundation surface.
5. Level the pump mounting pads:

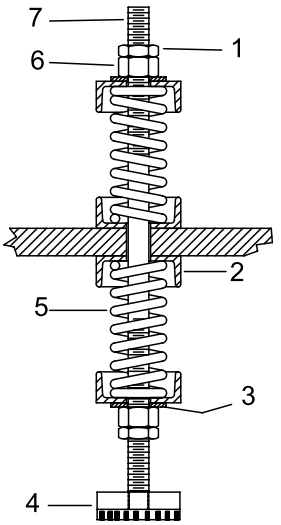
NOTICE:
Remove all dirt from the mounting pads in order to ensure that the correct leveling is achieved. Failure to do so can result in equipment damage or decreased performance.

a) Put one machinist's level lengthwise on one of the two pads.
b) Put the other level across the center of the two pads.
c) Level the pads by adjusting the four jackscrews in the corners.
Make sure that the machinist's level readings are as close to zero as possible, both lengthwise and across.

1. Driver's mounting pads
2. Machinist's levels
3. Foundation bolts
4. Jackscrews
5. Grout hole
6. Pump's mounting pads

Figure 23: Level pump mounting pads

6. Hand-tighten the nuts for the foundation bolts.
7. Check that the driver's mounting pads are level and adjust the jackscrews and the foundation bolts if necessary.
The correct level measurement is a maximum of 0.0167 mm/m | 0.002 in./ft .



Install the baseplate using spring mounting

NOTICE:
The spring-mounted baseplate is designed only to support piping loads from thermal expansion. Ensure that the suction and discharge piping are supported individually. Failure to do so may result in equipment damage.

The foundation pads are not provided with the baseplate. Make sure that the foundation pads are 316 stainless-steel plates, which have a 16-20 micro-inch surface finish.

Before you start this procedure, make sure that the foundation pads are correctly installed on the foundation/floor (see the manufacturer's instructions).

1. Put the baseplate on a support above the foundation/floor.
   Make sure that there is enough space between the baseplate and the foundation/floor in order to install the spring assemblies.
2. Install the lower part of the spring assembly:
   a) Screw the lower jam nut onto the spring stud.
   b) Screw the lower adjusting nut onto the spring-stud, on top of the jam nut.
   c) Set the lower adjusting nut to the correct height.
      The correct height depends on the required distance between the foundation/floor and the baseplate.
   d) Put a washer, a follower, a spring, and one more follower onto the lower adjusting nut.
3. Install the spring assembly on the baseplate:
   a) Insert the spring assembly into the baseplate's anchorage hole from below.
   b) Put a follower, a spring, another follower, and a washer onto the spring stud.
   c) Fasten the spring assembly with the upper adjusting nut by hand.
4. Thread the upper jam nut onto the spring stud by hand.
5. Repeat steps 2 through 4 for all the spring assemblies.
6. Lower the baseplate so that the spring assemblies fit into the foundation pads.
7. Level the baseplate and make the final height adjustments:
   a) Loosen the upper jam nuts and adjusting nuts.
   b) Adjust the height and level the baseplate by moving the lower adjusting nuts.
   c) When the baseplate is level, tighten the top adjusting nuts so that the top springs are not loose in their followers.
8. Fasten the lower and upper jam nuts on each spring assembly.

1. Upper jam nut
2. Follower
3. Washer
4. Foundation pads
5. Spring
6. Upper adjusting nut
7. Spring stud

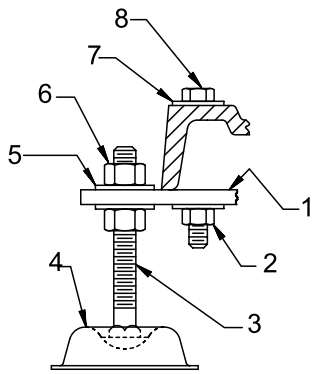


Figure 24: Example of an installed spring assembly

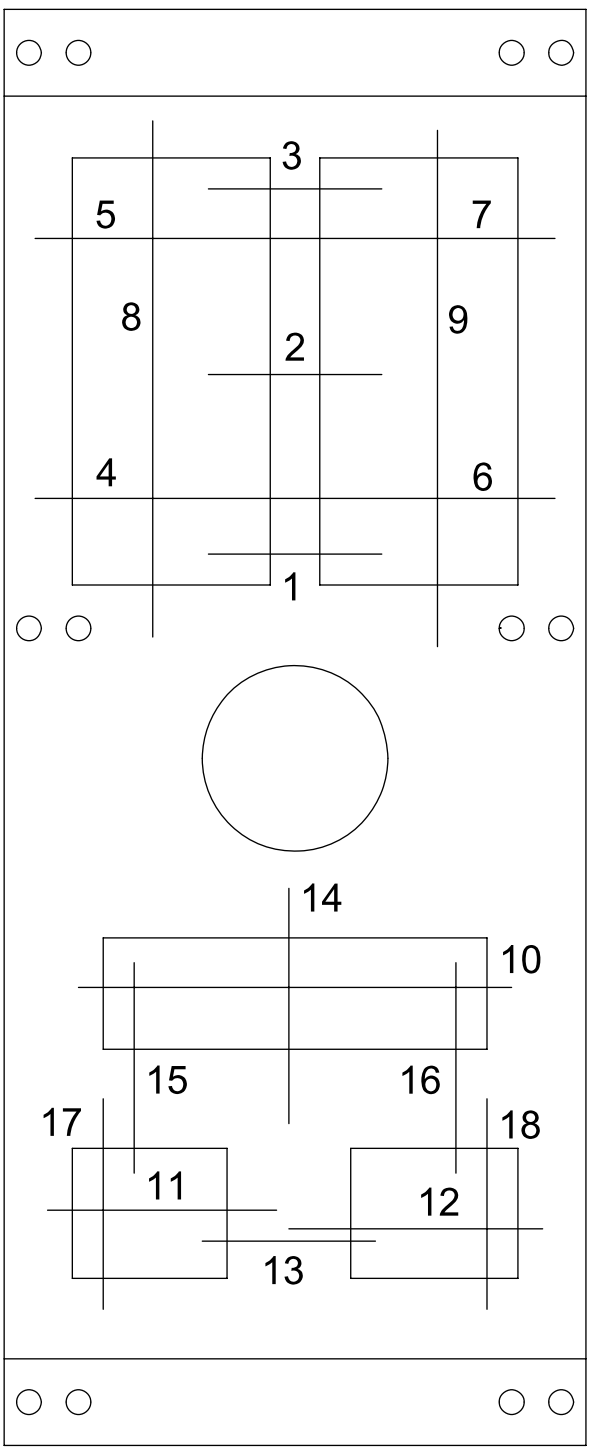
Install the baseplate using stilt mounting

NOTICE:

The stilt-mounted baseplate is not designed to support static piping loads. Ensure that the suction and discharge piping are supported individually. Failure to do so may result in equipment damage.

1. Put the baseplate on a support above the foundation/floor.
   Make sure that there is enough space between the baseplate and the foundation/floor to install the stilts.
2. Install the lower part of the stilt assembly:
   a) Screw the lower jam nut and adjusting nut onto the stilt.
   b) Set the lower adjusting nut to the correct height.
      The correct height depends on the required distance between the foundation/floor and the baseplate.
   c) Put a washer onto the lower adjusting- nut.
3. Install the stilt assembly on the baseplate:
   a) Insert the stilt assembly into the baseplate's anchorage hole from below.
   b) Put a washer onto the stilt.
   c) Fasten the stilt assembly with the upper adjusting nut by hand.
4. Screw the upper jam nut onto the stilt by hand.
5. Repeat steps 2 through 4 for all the stilt assemblies.
6. Lower the baseplate so that the stilts fit into the foundation cups.
7. Level the baseplate and make the final height adjustments:
   a) Loosen the upper jam nuts and adjusting nuts.
   b) Adjust the height and level the baseplate by moving the lower adjusting nuts.
   c) When the baseplate is level, tighten the top adjusting nuts.
8. Fasten the lower and upper jam nuts on each stilt.



1. Mounting plate
2. Mounting nut
3. Stilt bolt
4. Foundation cups
5. Washer
6. Upper adjustment nut
7. Mounting washer
8. Mounting bolt

Install the pump, driver, and coupling

1. Mount and fasten the pump on the baseplate. Use applicable bolts.
2. Mount the driver on the baseplate . Use applicable bolts and hand tighten.
3. Install the coupling.
   See the installation instructions from the coupling manufacturer.

Pump-to-driver alignment

Precautions

WARNING:

- Misalignment can cause decreased performance, equipment damage, and even catastrophic failure of frame-mounted units leading to serious injury. Proper alignment is the responsibility of the installer and the user of the unit. Check the alignment of all drive components prior to operating the unit.
  - Follow the coupling installation and operation procedures from the coupling manufacturer.
- Failure to disconnect and lock out driver power may result in serious physical injury or death. Always disconnect and lock out power to the driver before performing any installation or maintenance tasks.
  - Electrical connections must be made by certified electricians in compliance with all international, national, state, and local rules.
  - Refer to driver/coupling/gear manufacturer's installation and operation manuals (IOM) for specific instructions and recommendations.

Alignment checks

When to perform alignment checks

You must perform alignment checks under these circumstances:

- The process temperature changes.
- The piping changes.
- The pump has been serviced.

Types of alignment checks

Type of check	When it is used
Initial alignment (cold alignment) check	Prior to operation when the pump and the driver are at ambient temperature.
Final alignment (hot alignment) check	After operation when the pump and the driver are at operating temperature.

Initial alignment (cold alignment) checks

When	Why
Before you grout the baseplate	This ensures that alignment can be accomplished.
After you grout the baseplate	This ensures that no changes have occurred during the grouting process.
After you connect the piping	This ensures that pipe strains have not altered the alignment. If changes have occurred, you must alter the piping to remove pipe strains on the pump flanges.

Final alignment (hot alignment) checks

When	Why
After the first run	This ensures correct alignment when both the pump and the driver are at operating temperature.
Periodically	This follows the plant operating procedures.

Permitted indicator values for alignment checks

NOTICE:
The specified permitted reading values are valid only at operating temperature. For cold settings, other values are permitted. The correct tolerances must be used. Failure to do so can result in misalignment.

When dial indicators are used to check the final alignment, the pump and drive unit are correctly aligned when these conditions are true:

- The Total Indicated Reading (T.I.R.) is at 0.05 mm | 0.002 in. or less at operating temperature.
- The tolerance of the indicator is 0.0127 mm per mm | 0.0005 in. per in. of indicator separation for the reverse dial indicator or laser method when the pump and driver are at operating temperature.

Cold settings for parallel vertical alignment

Introduction

This section shows the recommended preliminary (cold) settings for electric motor-driven pumps based on different temperatures of pumped fluid. Consult driver manufacturers for recommended cold settings for other types of drivers such as steam turbines and engines.

Recommended settings for models 3196, CV 3196, and LF 3196

Pumpage temperature	Recommended setting
10°C | 50°F	0.05 mm | 0.002 in., low
65°C | 150°F	0.03 mm | 0.001 in., high
120°C | 250°F	0.12 mm | 0.005 in., high
175°C | 350°F	0.23 mm | 0.009 in., high
218°C | 450°F	0.33 mm | 0.013 in., high
228°C | 550°F	0.43 mm | 0.017 in., high
343°C | 650°F	0.53 mm | 0.021 in., high
371°C | 700°F	0.58 mm | 0.023 in., high

Alignment measurement guidelines

Guideline	Explanation
Rotate the pump coupling half and the driver coupling half together so that the indicator rods have contact with the same points on the driver coupling half.	This prevents incorrect measurement.
Move or shim only the driver in order to make adjustments.	This prevents strain on the piping installations.
Make sure that the hold-down bolts for the driver feet are tight when you take indicator measurements.	This keeps the driver stationary since movement causes incorrect measurement.
Make sure that the hold-down bolts for the driver feet are loose before you make alignment corrections.	This makes it possible to move the driver when you make alignment corrections.
Check the alignment again after any mechanical adjustments.	This corrects any misalignments that an adjustment may have caused.

Attach the dial indicators for alignment

You must have two dial indicators in order to complete this procedure.

1. Attach two dial indicators on the pump coupling half (X):
   a) Attach one indicator (P) so that the indicator rod comes into contact with the perimeter of the driver coupling half (Y).
      This indicator is used to measure parallel misalignment.
   b) Attach the other indicator (A) so that the indicator rod comes into contact with the inner end of the driver coupling half.
      This indicator is used to measure angular misalignment.

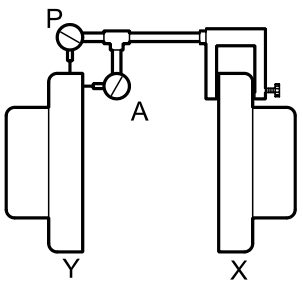

Figure 26: Dial indicator attachment

2. Rotate the pump coupling half (X) in order to check that the indicators are in contact with the driver coupling half (Y) but do not bottom out.
3. Adjust the indicators if necessary.

Pump-to-driver alignment instructions

Perform angular alignment for a vertical correction

1. Set the angular alignment indicator to zero at the top-center position (12 o'clock) of the driver coupling half (Y).
2. Rotate the indicator to the bottom-center position (6 o'clock).
3. Record the indicator reading.

When the reading value is...	Then...
Negative	The coupling halves are farther apart at the bottom than at the top. Perform one of these steps: · Add shims in order to raise the feet of the driver at the shaft end. · Remove shims in order to lower the feet of the driver at the other end.
Positive	The coupling halves are closer at the bottom than at the top. Perform one of these steps: · Remove shims in order to lower the feet of the driver at the shaft end. · Add shims in order to raise the feet of the driver at the other end.

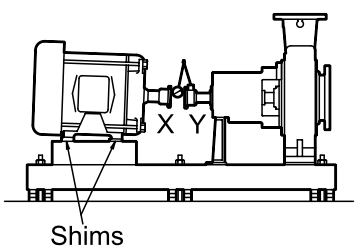

Figure 27: Side view of an incorrect vertical alignment

4. Repeat the previous steps until the permitted reading value is achieved.

Perform angular alignment for a horizontal correction

1. Set the angular alignment indicator (A) to zero on left side of the driver coupling half (Y), 90° from the top-center position (9 o'clock).
2. Rotate the indicator through the top-center position to the right side, 180° from the start position (3 o'clock).
3. Record the indicator reading.

When the reading value is...	Then...
Negative	The coupling halves are farther apart on the right side than the left. Perform one of these steps: · Slide the shaft end of the driver to the left. · Slide the opposite end to the right.
Positive	The coupling halves are closer together on the right side than the left. Perform one of these steps: · Slide the shaft end of the driver to the right. · Slide the opposite end to the left.

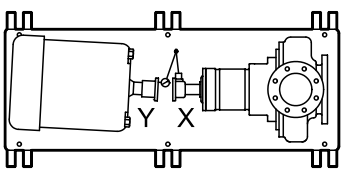

Figure 28: Top view of an incorrect horizontal alignment

4. Repeat the previous steps until the permitted reading value is achieved.

Perform parallel alignment for a vertical correction

Refer to the alignment table in "Permitted indicator values for alignment checks" (see Table of Contents for location of table) for the proper cold alignment value based on the motor temperature rise and the pump operating temperature.

Before you start this procedure, make sure that the dial indicators are correctly set up.

A unit is in parallel alignment when the parallel indicator (P) does not vary by more than 0.05 mm | 0.002 in. as measured at four points 90° apart at the operating temperature.

1. Set the parallel alignment indicator (P) to zero at the top-center position (12 o'clock) of the driver coupling half (Y).
2. Rotate the indicator to the bottom-center position (6 o'clock).
3. Record the indicator reading.

When the reading value is...	Then...
Negative	The pump coupling half (X) is lower than the driver coupling half (Y). Remove shims of a thickness equal to half of the indicator reading value under each driver foot.
Positive	The pump coupling half (X) is higher than the driver coupling half (Y). Add shims of a thickness equal to half of the indicator reading value to each driver foot.

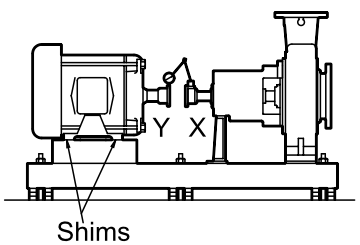

Figure 29: Side view of an incorrect vertical alignment

4. Repeat the previous steps until the permitted reading value is achieved.

NOTICE:
The specified permitted reading values are valid only at operating temperature. For cold settings, other values are permitted. The correct tolerances must be used. Failure to do so can result in misalignment.

Perform parallel alignment for a horizontal correction

NOTICE:
The specified permitted reading values are valid only at operating temperature. For cold settings, other values are permitted. The correct tolerances must be used. Failure to do so can result in misalignment.

A unit is in parallel alignment when the parallel indicator (P) does not vary by more than 0.05 mm | 0.002 in. as measured at four points 90° apart at the operating temperature.

1. Set the parallel alignment indicator (P) to zero on the left side of the driver coupling half (Y), 90° from the top-center position (9 o'clock).
2. Rotate the indicator through the top-center position to the right side, 180° from the start position (3 o'clock).
3. Record the indicator reading.

When the reading value is...	Then...
Negative	The driver coupling half (Y) is to the left of the pump coupling half (X).
Positive	The driver coupling half (Y) is to the right of the pump coupling half (X).

4. Slide the driver carefully in the appropriate direction. Make sure to slide the driver evenly. Failure to do so can negatively affect horizontal angular correction.

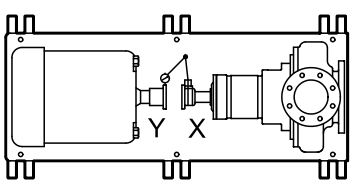

Figure 30: Top view of an incorrect horizontal alignment

5. Repeat the previous steps until the permitted reading value is achieved.

NOTICE:
The specified permitted reading values are valid only at operating temperature. For cold settings, other values are permitted. The correct tolerances must be used. Failure to do so can result in misalignment.

Perform complete alignment for a vertical correction

A unit is in complete alignment when both the angular indicator (A) and the parallel indicator (P) do not vary by more than 0.05 mm | 0.002 in. as measured at four points 90° apart.

1. Set the angular and parallel dial indicators to zero at the top-center position (12 o'clock) of the driver coupling half (Y).
2. Rotate the indicators to the bottom-center position (6 o'clock).
3. Record the indicator readings.
4. Make corrections according to the separate instructions for angular and parallel alignment until you obtain the permitted reading values.

Perform complete alignment for a horizontal correction

A unit is in complete alignment when both the angular indicator (A) and the parallel indicator (P) do not vary by more than 0.05 mm | 0.002 in. as measured at four points 90° apart.

1. Set the angular and parallel dial indicators to zero at the left side of the driver coupling half (Y), 90° from the top-center position (9 o'clock).
2. Rotate the indicators through the top-center position to the right side, 180° from the start position (3 o'clock).
3. Record the indicator readings.
4. Make corrections according to the separate instructions for angular and parallel alignment until you obtain the permitted reading values.

C-face adapter

Intended use

The C-face adapter is a device that attaches the pump to the drive unit to minimize the axial and radial play between the two coupling halves.

Illustration

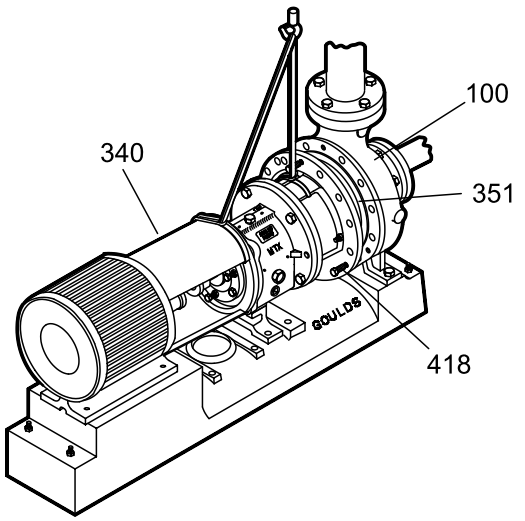

Figure 31: Example of the C-face adapter (340)

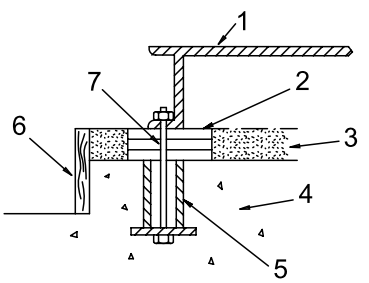
Alignment requirements

When you use a C-face adapter, you do not have to align the shaft. The rabbeted fit of the drive unit to the adapter and the adapter to the bearing housing automatically align the shafts to within the specified limits.

Specified limits

A C-face adapter can attain a nominal alignment of 0.18mm | 0.007 in. Total Indicated Runout (T.I.R.). However, because of the stack-up of the machining tolerances of the various parts, the alignment can be as high as 0.38mm | 0.015 inches TIR. Use of a flexible coupling with an elastomeric insert is required to maintain acceptable pump and motor life when using a c-face adapter.

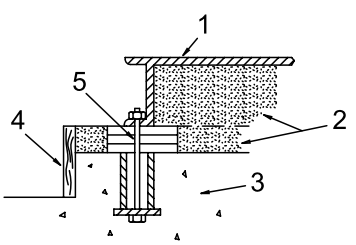


If high reliability (with shaft alignments of less than 0.05mm | 0.002 in.) is required for the pump, use a foot-mounted drive unit on a precision-machined baseplate and perform a conventional alignment.

Grout the baseplate

Required equipment:

- Cleaners: Do not use an oil-based cleaner because the grout will not bond to it. See the instructions provided by the grout manufacturer.
- Grout: Non-shrink grout is recommended.



1. Clean all the areas of the baseplate that will come into contact with the grout.
2. Build a dam around the foundation.
3. Thoroughly wet the foundation that will come into contact with the grout.
4. Pour grout through the grout hole into the baseplate up to the level of the dam.
   When you pour the grout, remove air bubbles from it by using one of these methods:
   - Puddle with a vibrator.
   - Pump the grout into place.
5. Allow the grout to set.

1. Baseplate
2. Shims or wedges
3. Grout
4. Foundation
5. Sleeve
6. Dam
7. Bolt

Figure 32: Pour grout into baseplate

6. Fill the remainder of the baseplate with grout, and allow the grout to set for at least 48 hours.

1. Baseplate
2. Grout
3. Foundation
4. Dam
5. Bolt

Figure 33: Fill remainder of baseplate with grout

7. Tighten the foundation bolts.

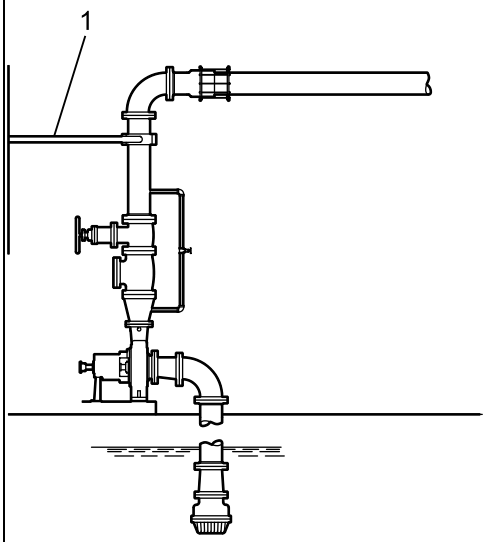
Piping checklists

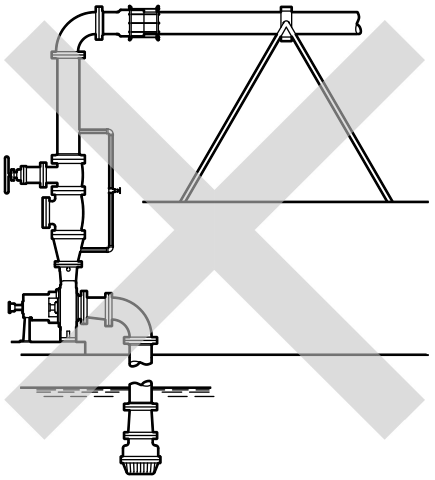
General piping checklist

Precautions

WARNING:
Risk of premature failure. Casing deformation can result in misalignment and contact with rotating parts, causing excess heat generation and sparks. Flange loads from the piping system, including those from the thermal expansion of the piping, must not exceed the limits of the pump.

NOTICE:
Vary the capacity with the regulating valve in the discharge line. Never throttle the flow from the suction side. This action can result in decreased performance, unexpected heat generation, and equipment damage.





Piping guidelines

Guidelines for piping are given in the Hydraulic Institute Standards available from the Hydraulic Institute at 9 Sylvan Way, Parsippany, NJ 07054-3802. You must review this document before you install the pump.

Checklist

Check	Explanation/comment	Checked
Check that all piping is supported independently of, and lined up naturally with, the pump flange.	This helps to prevent: · Strain on the pump · Misalignment between the pump and the drive unit · Wear on the pump bearings and the coupling · Wear on the pump bearings, seal, and shafting	
Keep the piping as short as possible.	This helps to minimize friction losses.	
Check that only necessary fittings are used.	This helps to minimize friction losses.	
Do not connect the piping to the pump until: · The grout for the baseplate or sub-base becomes hard. · The hold-down bolts for the pump and the driver are tightened.	—	
If the pump handles liquids at elevated temperatures, make sure that the expansion loops and joints are properly installed.	This helps to prevent misalignment due to linear expansion of the piping.	

Example: Installation for expansion

Correct	Incorrect
This illustration shows a correct installation for expansion:  1. Expansion loop/joint	This illustration shows an incorrect installation for expansion: 

Fastening

WARNING:
Risk of serious personal injury or property damage. Fasteners such as bolts and nuts are critical to the safe and reliable operation of the product. Ensure appropriate use of fasteners during installation or reassembly of the unit.

- Use fasteners of the proper size and material only.
- Replace all corroded fasteners.
- Ensure that all fasteners are properly tightened and that there are no missing fasteners.

Suction-piping checklist

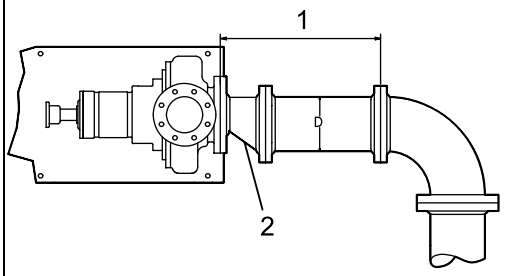
Performance curve reference

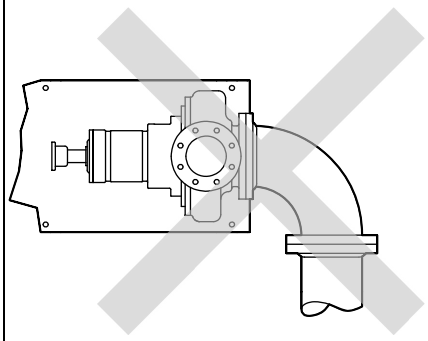
Net positive suction head available ($NPSH_A$) must always exceed NPSH required ($NPSH_R$) as shown on the published performance curve of the pump.

Suction-piping checks

Check	Explanation/comment	Checked
Check that the distance between the inlet flange of the pump and the closest elbow is at least two pipe diameters. Check that the distance between the inlet flange of the pump and the closest elbow is at least five pipe diameters.	This minimizes the risk of cavitation in the suction inlet of the pump due to turbulence. See the Example sections for illustrations.	
Check that elbows in general do not have sharp bends.	See the Example sections for illustrations. —	
Check that the suction piping is one or two sizes larger than the suction inlet of the pump. Install an eccentric reducer between the pump inlet and the suction piping.	The suction piping must never have a smaller diameter than the suction inlet of the pump. See the Example sections for illustrations.	

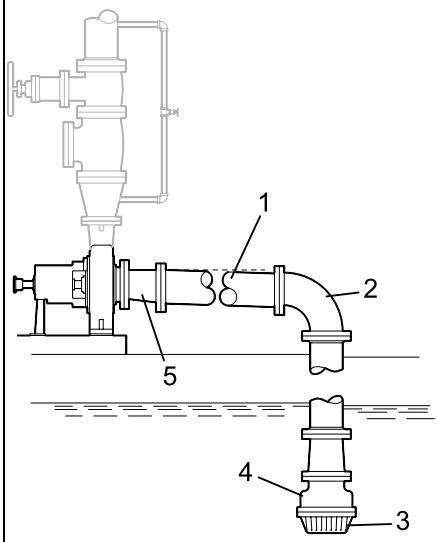
Check	Explanation/comment	Checked
Check that the eccentric reducer at the suction flange of the pump has the following properties: · Sloping side down · Horizontal side at the top	See the example illustrations.	
Suggested suction strainers are used. Check that they are at least three times the area of the suction piping. Monitor the pressure drop across the suction strainer. An increased pressure drop across the strainer of 5 psi (34.5 kPa) indicates that the strainer should be removed and cleaned. After a period of time (24 hours minimum) system flushing should be complete and the suction strainer can be removed.	Suction strainers help to prevent debris from entering the pump. Mesh holes with a minimum diameter of 1/16 in. (1.6 mm) are recommended. Liquids with specific gravity less than 0.60 a pressure drop across the suction strainer may be due to ice buildup. Ice buildup can cause turbulence, low pressure areas and pumpage vaporization.	
If more than one pump operates from the same liquid source, check that separate suction-piping lines are used for each pump.	This recommendation helps you to achieve a higher pump performance and prevent vapor locking especially with specific gravity of liquid less than 0.60.	
If necessary, make sure that the suction piping includes a drain valve and that it is correctly installed.	—	
Assure adequate insulation is applied for liquids with specific gravity less than 0.60.	To assure sufficient NPSHa.	

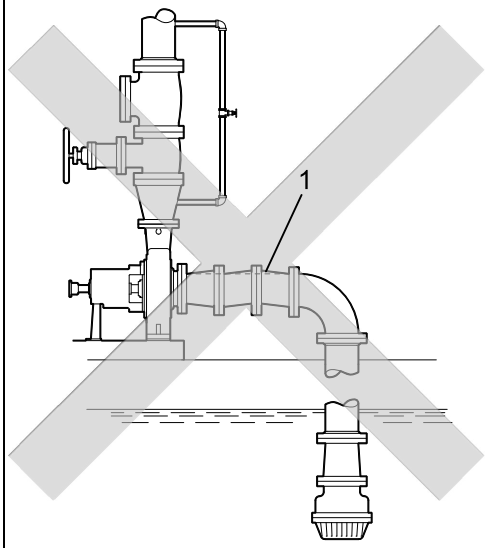




Liquid source below the pump

Check	Explanation/comment	Checked
Make sure that the suction piping is free from air pockets.	This helps to prevent the occurrence of air and cavitation in the pump inlet.	
Check that the suction piping slopes upwards from the liquid source to the pump inlet.	—	
If the pump is not self-priming, check that a device for priming the pump is installed.	Use a foot valve with a diameter that is at least equivalent to the diameter of the suction piping.	





Liquid source above the pump

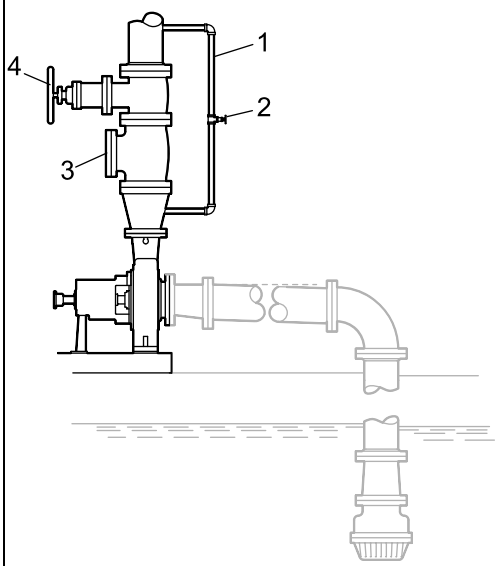
Check	Explanation/comment	Checked
Check that an isolation valve is installed in the suction piping at a distance of at least two times the pipe diameter from the suction inlet.	This permits you to close the line during pump inspection and maintenance. Do not use the isolation valve to throttle the pump. Throttling can cause these problems: · Loss of priming · Excessive temperatures · Damage to the pump · Voiding the warranty	
Make sure that the suction piping is free from air pockets.	This helps to prevent the occurrence of air and cavitation in the pump inlet.	
Check that the piping is level or slopes downward from the liquid source.	—	
Make sure that no part of the suction piping extends below the suction flange of the pump.	—	
Make sure that the suction piping is adequately submerged below the surface of the liquid source.	This prevents air from entering the pump through a suction vortex.	

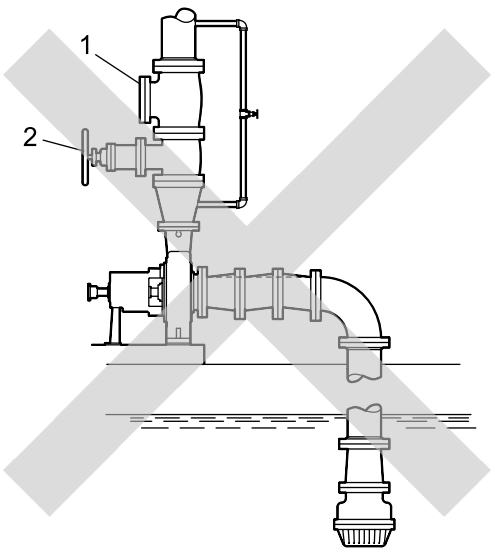
Example: Elbow close to the pump suction inlet

Correct	Incorrect
The correct distance between the inlet flange of the pump and the closest elbow must be at least five pipe diameters.  1. Enough distance to prevent cavitation 2. Eccentric reducer with a level top	

Example: Suction piping equipment

Correct	Incorrect
 1. Suction pipe sloping upwards from liquid source 2. Long-radius elbow 3. Strainer 4. Foot valve 5. Eccentric reducer with a level top	 1. Air pocket, because the eccentric reducer is not used and because the suction piping does not slope gradually upward from the liquid source





Discharge piping checklist

Checklist

Check	Explanation/comment	Checked
Check that an isolation valve is installed in the discharge line. For specific gravity less than 0.60, minimize distance from pump discharge.	The isolation valve is required for: · Priming · Regulation of flow · Inspection and maintenance of the pump · Reduce risk of pumpage vaporization and vapor locking at low flow rates for low specific gravity liquids. See Example: Discharge piping equipment for illustrations.	

Check	Explanation/comment	Checked
Check that a check valve is installed in the discharge line, between the isolation valve and the pump discharge outlet.	The location between the isolation valve and the pump allows inspection of the check valve. The check valve prevents damage to the pump and seal due to the back flow through the pump, when the drive unit is shut off. It is also used to restrain the liquid flow. See Example: Discharge piping equipment for illustrations.	
If increasers are used, check that they are installed between the pump and the check valve.	See Example: Discharge piping equipment for illustrations.	
If quick-closing valves are installed in the system, check that cushioning devices are used.	This protects the pump from surges and water hammer.	

Example: Discharge piping equipment

Correct	Incorrect
	
1. Bypass line 2. Shut-off valve 3. Check valve 4. Discharge isolation valve	1. Check valve (incorrect position) 2. The isolation valve should not be positioned between the check valve and the pump.

Commissioning, Startup, Operation, and Shutdown

Preparation for startup

WARNING:

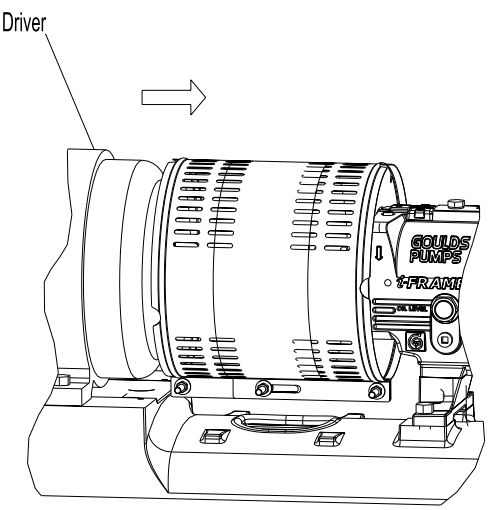
- Breach of containment can cause fire, burns, and other serious injury. Failure to follow these precautions before starting the unit may lead to dangerous operating conditions, equipment failure, and breach of containment.
- Risk of serious physical injury or death. Exceeding any of the pump operating limits (e.g. - pressure, temperature, power, etc.) could result in equipment failure, such as explosion, seizure, or breach of containment. Assure that the system operating conditions are within the capabilities of the pump.
- Risk of explosion and serious physical injury. Do not operate pump with blocked system piping or with suction or discharge valves closed. This can result in rapid heating and vaporization of pumpage.
- Risk of breach of containment and equipment damage. Ensure the pump operates only between minimum and maximum rated flows. Operation outside of these limits can cause high vibration, mechanical seal and/or shaft failure, and/or loss of prime.
- Running a pump without safety devices exposes operators to risk of serious personal injury or death. Never operate a unit unless appropriate safety devices (guards, etc.) are properly installed.
- Failure to disconnect and lock out driver power may result in serious physical injury or death. Always disconnect and lock out power to the driver before performing any installation or maintenance tasks.
  - Electrical connections must be made by certified electricians in compliance with all international, national, state, and local rules.
  - Refer to driver/coupling/gear manufacturer's installation and operation manuals (IOM) for specific instructions and recommendations.
- Starting the pump in reverse rotation can result in the contact of metal parts, heat generation, and breach of containment. Ensure correct driver settings prior to starting any pump.
- Risk of death or serious injury. Leaking fluid can cause fire and/or burns. Ensure all openings are sealed prior to filling the pump.

Precautions

NOTICE:

- Make sure that the temperature change does not exceed 19°C | 35°F per minute.
- Make sure that the temperature change does not exceed 11°C | 20°F per minute.
- The maximum allowable temperature change for an abnormal transient event such as thermal shock is 121°C | 250°F
- Excessive warm-up rates can cause equipment damage. Ensure the warm-up rate does not exceed 1.4°C | 2.5°F per minute.
- When a cartridge mechanical seal is used, ensure that the set screws in the seal locking ring are tightened and that the centering clips have been removed prior to startup. This prevents seal or shaft sleeve damage by ensuring that the seal is properly installed and centered on the sleeve.

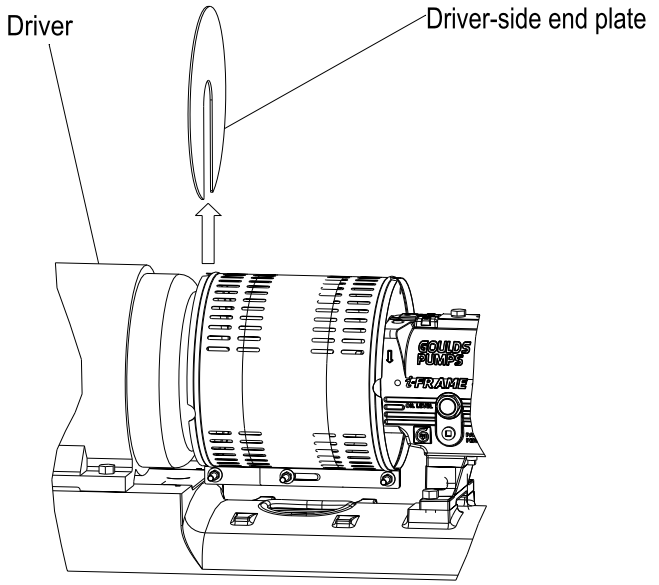
You must follow these precautions before you start the pump:



- Flush and clean the system thoroughly to remove dirt or debris in the pipe system in order to prevent premature failure at initial startup.

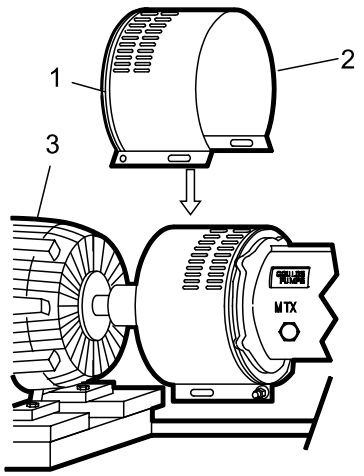
- Bring variable-speed drivers to the rated speed as quickly as possible.
- Run a new or rebuilt pump at a speed that provides enough flow to flush and cool the close-running surfaces of the stuffing-box bushing.
- If temperatures of the pumped fluid will exceed 93°C | 200°F, then warm up the pump prior to operation. Circulate a small amount of fluid through the pump until the casing temperature is within 38°C | 100°F of the fluid temperature. Accomplish this by flowing fluid from pump inlet to discharge drain (optionally, the casing vent can be included in warm-up circuit but not required). Soak for (2) hours at process fluid temperature.

At initial startup, do not adjust the variable-speed drivers or check for speed governor or over-speed trip settings while the variable-speed driver is coupled to the pump. If the settings have not been verified, then uncouple the unit and refer to instructions supplied by the driver manufacturer.

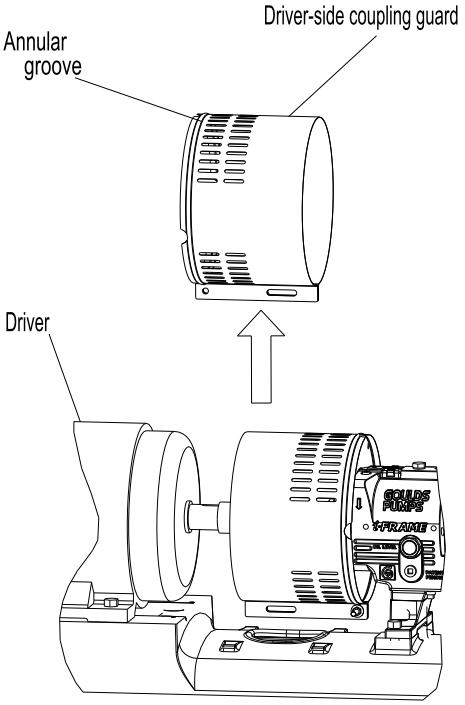


Remove the coupling guard

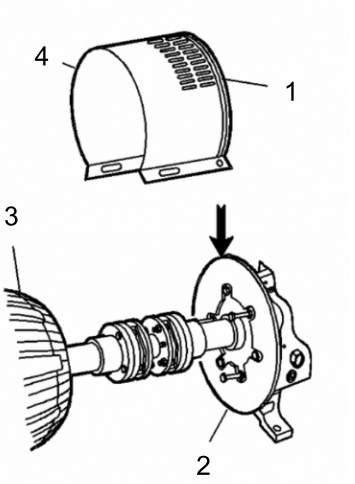
1. Remove the nut, bolt, and washers from the slotted hole in the center of the coupling guard.
2. Slide the driver half of the coupling guard toward the pump.



3. Remove the nut, bolt, and washers from the driver half of the coupling guard.



4. Remove the driver-side end plate.



5. Remove the driver half of the coupling guard:
   a) Slightly spread the bottom apart.
   b) Lift upwards.

1. Annular groove
2. Driver half of the coupling guard
3. Driver

6. Remove the remaining nut, bolt, and washers from the pump half of the coupling guard. It is not necessary to remove the end plate from the pump side of the bearing housing. You can access the bearing-housing tap bolts without removing this end plate if maintenance of internal pump parts is necessary.
7. Remove the pump half of the coupling guard:
   a) Slightly spread the bottom apart.
   b) Lift upwards.

1. Annular groove
2. Pump-side end plate
3. Driver
4. Pump half of the coupling guard

Check the rotation - Frame Mounted

WARNING:

- Starting the pump in reverse rotation can result in the contact of metal parts, heat generation, and breach of containment. Ensure correct driver settings prior to starting any pump.
- Failure to disconnect and lock out driver power may result in serious physical injury or death. Always disconnect and lock out power to the driver before performing any installation or maintenance tasks.
  - Electrical connections must be made by certified electricians in compliance with all international, national, state, and local rules.
  - Refer to driver/coupling/gear manufacturer's installation and operation manuals (IOM) for specific instructions and recommendations.

1. Lock out power to the driver.
2. Make sure that the coupling hubs are fastened securely to the shafts.
3. Make sure that the coupling spacer is removed.
   The pump ships with the coupling spacer removed.
4. Unlock power to the driver.
5. Make sure that everyone is clear, and then jog the driver long enough to determine that the direction of rotation corresponds to the arrow on the bearing housing or close-coupled frame.
6. Lock out power to the driver.

Impeller-clearance check

The impeller-clearance check ensures the following:

- The pump turns freely.
- The pump operates at optimal efficiency for long equipment life and low energy consumption.

Impeller clearances (3196 and HT 3196)

NOTICE:

Set the cold (ambient) impeller clearance according to this table. Failure to do so may result in heat generation and equipment damage. Higher clearances are used above 93°C | 200°F to prevent the impeller from contacting the casing due to thermal expansion.

Table 11: Impeller clearances

This pump requires the impeller clearances in the following table.

Service temperature	STi	MTi/LTi	XLT-i/i17
	mm | in.	mm | in.	mm | in.
-29 to 93°C | -20 to 200°F	0.13 | 0.005	0.20 | 0.008	0.38 | 0.015
Up to 121°C | 250°F	0.15 | 0.006	0.22 | 0.009	0.41 | 0.016
Up to 149°C | 300°F	0.18 | 0.007	0.25 | 0.010	0.43 | 0.017
Up to 177°C| 350°F	0.22 | 0.009	0.30 | 0.012	0.48 | 0.019
Up to 204°C | 400°F	0.25 | 0.010	0.33 | 0.013	0.50 | 0.020
Up to 232°C | 450°F	0.28 | 0.011	0.35 | 0.014	0.53 | 0.021
Up to 260°C| 500°F	0.30 | 0.012	0.38 | 0.015	0.56 | 0.022
Up to 288°C | 550°F	0.33 | 0.013	0.41 | 0.016	0.58 | 0.023
Up to 316°C | 600°F	0.36 | 0.014	0.43 | 0.017	0.61 | 0.024
Up to 343°C | 650°F	0.40 | 0.016	0.48 | 0.019	0.66 | 0.026
Up to 371°C | 700°F	0.43 | 0.017	0.50 | 0.020	0.69 | 0.027

Impeller-clearance setting

Importance of a proper impeller clearance

A proper impeller clearance ensures that the pump runs at high performance.

WARNING:

- Risk of mechanical seal damage leading to breach of containment. If a cartridge mechanical seal is used, ensure that the set screws in the seal locking ring are loosened and that the centering clips have been installed prior to clearance adjustment.

Impeller clearance methods

You can set the impeller clearance with either of these methods:

- Dial indicator method
- Feeler gauge method

Set the impeller clearance - dial indicator method (all except CV 3196)

WARNING:
Failure to disconnect and lock out driver power may result in serious physical injury or death. Always disconnect and lock out power to the driver before performing any installation or maintenance tasks.

- Electrical connections must be made by certified electricians in compliance with all international, national, state, and local rules.
- Refer to driver/coupling/gear manufacturer's installation and operation manuals (IOM) for specific instructions and recommendations.

1. Remove the coupling guard.
2. Set the indicator so that the button contacts either the shaft end or the face of the coupling.

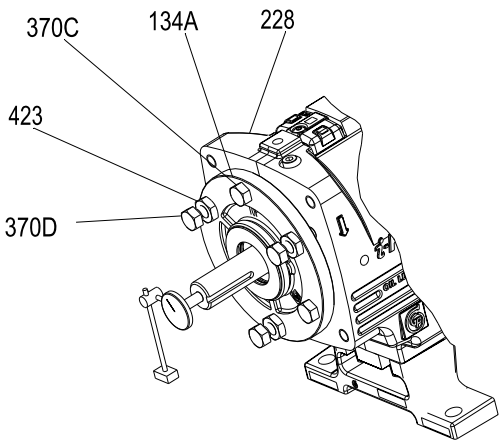


Figure 34: Dial indicator setting

3. Loosen the jam nuts (423) on the jack bolts (370D) , and then back the bolts out about two turns.
4. Tighten the locking bolts evenly (370C), bringing the bearing housing (134A) towards the frame (228) until the impeller contacts the casing.
5. Turn the shaft to ensure that there is contact between the impeller and the casing.
6. Set the indicator to zero and loosen the locking bolt (370C) about one turn.
7. Thread in the jack bolts (370D) until the jack bolts evenly contact the bearing frame.

8. Tighten the jack bolts evenly about one flat at a time, moving the bearing housing (134A) away from the bearing frame until the indicator shows the correct clearance.
   Refer to the impeller clearance table to determine the correct clearance.
9. Tighten the bolts evenly in this order:
   a) Tighten the locking bolts (370C).
   b) Tighten the jack bolts (370D).
   Make sure to keep the indicator reading at the proper setting.
10. Make sure the shaft turns freely.

Set the impeller clearance - feeler gauge method (all except CV 3196)

WARNING:
Failure to disconnect and lock out driver power may result in serious physical injury or death. Always disconnect and lock out power to the driver before performing any installation or maintenance tasks.

- Electrical connections must be made by certified electricians in compliance with all international, national, state, and local rules.
- Refer to driver/coupling/gear manufacturer's installation and operation manuals (IOM) for specific instructions and recommendations.

1. Lock out the driver power and remove the coupling guard.
2. Loosen the jam nuts (423B) on the jack bolts (371A), and then back the bolts out about two turns.

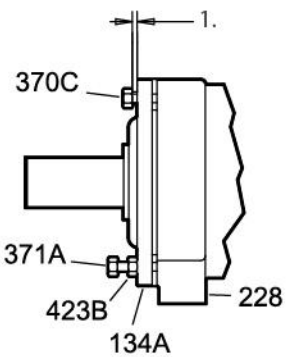

Figure 35: Loosen jam nuts

1. See impeller clearance table for distance

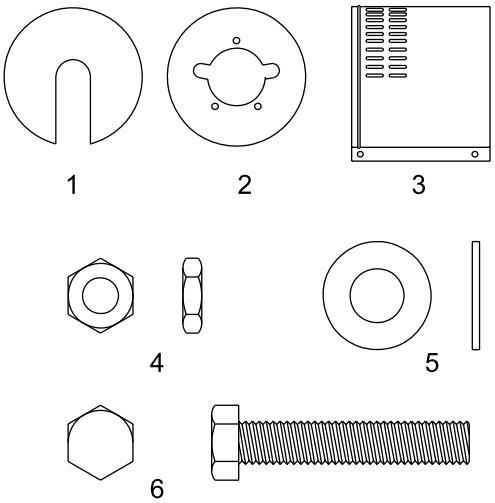
3. Evenly tighten the locking bolts (370C), bringing the bearing housing (134A) towards the frame (228) until the impeller contacts the casing.
4. Turn the shaft to ensure that there is contact between the impeller and the casing.
5. Use a feeler gauge to set the gap between the three locking bolts (370C) and the bearing housing (134A) to the correct impeller clearance.
   Refer to the impeller clearance table to determine the correct clearance.
6. Use the three jack bolts (370D) to evenly loosen the bearing housing (134A) until it contacts the locking bolts (370C).
7. Evenly tighten the jam nuts (423B).
8. Make sure the shaft turns freely.

Couple the pump and driver

WARNING:
Failure to disconnect and lock out driver power may result in serious physical injury or death. Always disconnect and lock out power to the driver before performing any installation or maintenance tasks.

- Electrical connections must be made by certified electricians in compliance with all international, national, state, and local rules.
- Refer to driver/coupling/gear manufacturer's installation and operation manuals (IOM) for specific instructions and recommendations.

Couplings must have proper certification to be used in an ATEX classified environment. Use the instructions from the coupling manufacturer in order to lubricate and install the coupling. Refer to driver/coupling/gear manufacturers IOM for specific instructions and recommendations.



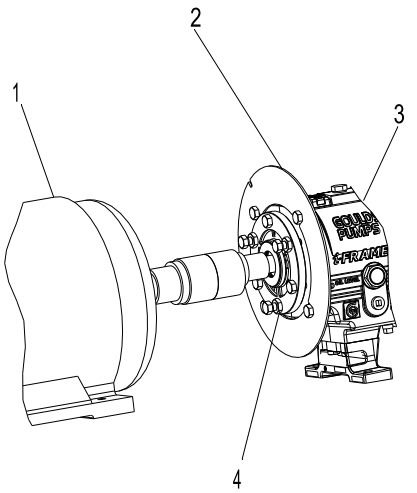
Install the coupling guard

WARNING:

- Running a pump without safety devices exposes operators to risk of serious personal injury or death. Never operate a unit unless appropriate safety devices (guards, etc.) are properly installed.
- Failure to disconnect and lock out driver power may result in serious physical injury or death. Always disconnect and lock out power to the driver before performing any installation or maintenance tasks.
  - Electrical connections must be made by certified electricians in compliance with all international, national, state, and local rules.
  - Refer to driver/coupling/gear manufacturer's installation and operation manuals (IOM) for specific instructions and recommendations.

WARNING:
The coupling guard used in an ATEX classified environment must be constructed from a spark resistant material.

Required parts:

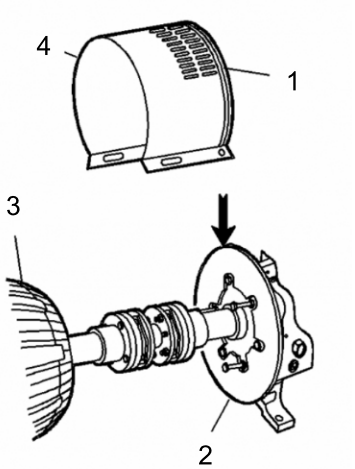


1. End plate, drive end
2. End plate, pump end
3. Guard half, 2 required
4. 3/8-16 nut, 3 required
5. 3/8 in. washer
6. 3/8-16 x 2 in. hex head bolt, 3 required

Figure 36: Required parts

1. De-energize the motor, place the motor in a locked-out position, and place a caution tag at the starter that indicates the disconnect.
2. Put the pump-side end plate in place.
   If the pump-side end plate is already in place, make any necessary coupling adjustments and then proceed to the next step.

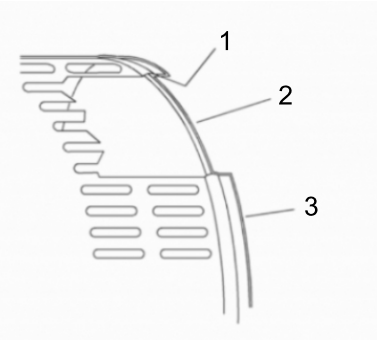
If the pump size is...	Then...
STi, MTi, LTi	Align the pump-side end plate to the bearing frame. You do not need to adjust the impeller.



If the pump size is...	Then...
XLT-i	1. Align the end plate on the pump side to the bearing housing so that you meet these conditions: 1. The large slots on the end plate do not touch the bearing housing tap bolts. 2. The small slots align with the impeller adjusting bolts. 2. Fasten the end plate to the bearing housing using the jam nuts on the impeller adjusting bolts. 3. Check the impeller clearance. Refer to the impeller clearance table for the correct impeller clearance.

1. Driver
2. Pump end plate
3. Bearing housing
4. Jam nut

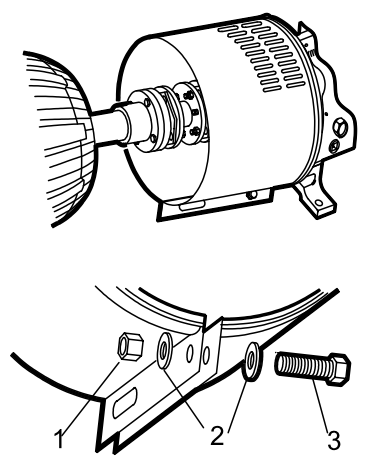
Figure 37: Pump-side end plate placement



3. Put the pump-half of the coupling guard in place:
   a) Slightly spread the bottom apart.
   b) Place the coupling guard half over the pump-side end plate.

1. Annular groove
2. Pump-side end plate
3. Driver
4. Pump half of the coupling guard

Figure 38: Guard half installation



The annular groove in the coupling guard half must fit around the end plate.

1. Annular groove
2. End plate (pump end)
3. Guard half

Figure 39: Annular groove in coupling guard

4. Use a bolt, a nut, and two washers to secure the coupling guard half to the end plate. Tighten securely.

1. Nut
2. Washer
3. Bolt

Figure 40: Secure coupling guard half to end plate

5. Put the driver half of the coupling guard in place:
   a) Slightly spread the bottom apart.

b) Place the driver half of the coupling guard over the pump half of the coupling guard. The annular groove in the coupling guard half must face the motor.

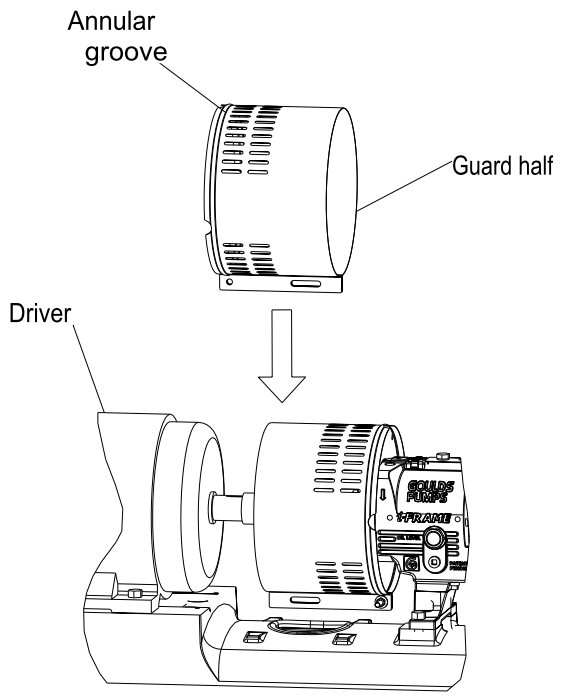


Figure 41: Placement of driver half of coupling guard

6. Place the driver-side end plate over the motor shaft.

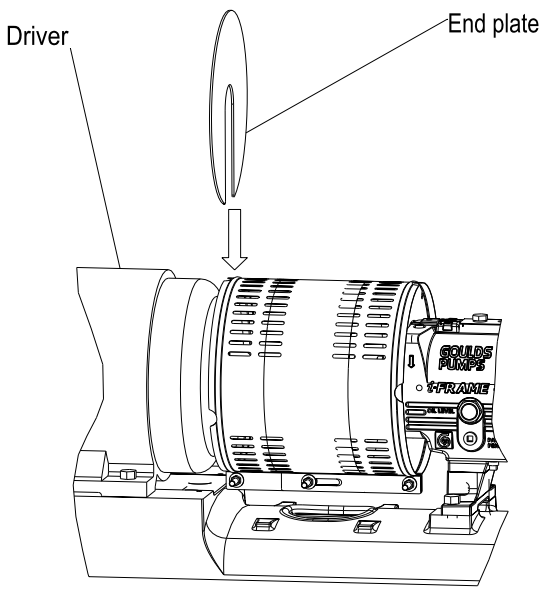

Figure 42: Placement of driver half of coupling guard

7. Place the driver-side end plate in the annular groove of the driver-half of the coupling guard.
8. Use a bolt, a nut, and two washers to secure the coupling guard half to the end plate. Hand-tighten only.
   The hole is located on the driver-side of the coupling guard half.

9. Slide the driver-half of the coupling guard towards the motor so that the coupling guard completely covers the shafts and coupling.

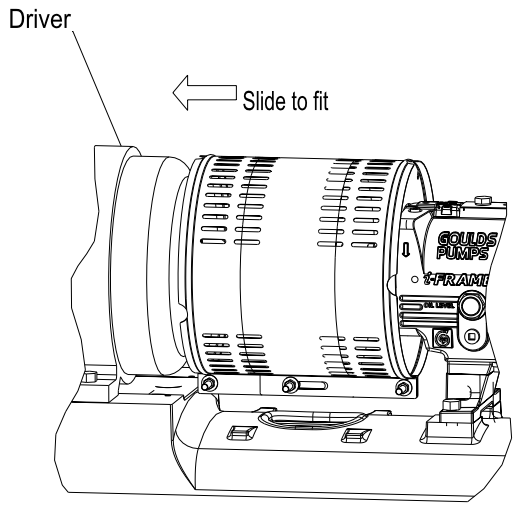

Figure 43: Slide driver-half of coupling guard towards motor

10. Use a nut, a bolt, and two washers to secure the coupling guard halves together.
11. Tighten all nuts on the guard assembly.

Bearing lubrication

WARNING:
Ex Risk of explosive hazard and premature failure from sparks and heat generation. Ensure bearings are properly lubricated prior to startup.

NOTICE:
Grease can settle in equipment left idle leaving bearings improperly lubricated. Check the greasing on a pump that has been out of service for a long period of time and re-grease if necessary.

Pumps are shipped without oil. You must lubricate oil-lubricated bearings at the job site.

Grease-lubricated bearings are lubricated at the factory.

The bearing manufacturer fills greased-for-life bearings with grease and seals them at the factory. You do not need to lubricate or seal these bearings.

Oil volumes

Oil volume requirements

This table shows the required amount of oil for oil-lubricated bearings.

Frame	ml	Qts.	Oz.
STi	400	0.5	16
MTi	1400	1.5	47
LTi	1400	1.5	48
XLT-i and i17	3000	3	96

Lubricating-oil requirements

Oil requirements based on temperature

For the majority of operating conditions, bearing temperatures run between 49°C | 120°F and 82°C | 180°F, and you can use an oil of ISO viscosity grade 68 at 38°C | 100°F. If temperatures exceed 82°C | 180°F, refer to the table for temperature requirements.

Temperature	Oil requirement
Bearing temperatures exceed 82°C | 180°F	Use ISO viscosity grade 100 with bearing-frame cooling or finned-tube oil cooler. The finned-tube oil cooler is standard with the HT 3196 model and optional for all other models.
Pumped-fluid temperatures exceed 177°C | 350°F	Use synthetic lubrication.

Acceptable oil for lubricating bearings

Acceptable lubricants

Examples of acceptable high quality turbine oils with rust and oxidation inhibitors.

Brand	Lubricant type
Chevron	GST Oil 68
Exxon	Teresstic EP 68
Mobil	DTE 68 Heavy Medium
Phillips 66	Turbine Oil VG68
Shell	Turbo T 68
Sunoco	Sunvis 968
Royal Purple	SYNFILM ISO VG 68 Synthetic Oil

Lubricate the bearings with oil

WARNING:

Ⓔx Risk of explosive hazard and premature failure from sparks and heat generation. Ensure bearings are properly lubricated prior to startup.

Use a high-quality turbine oil with rust and oxidation inhibitors.

1. Remove the fill plug.
2. Fill the bearing frame with oil through the filler connection, which is located on top of the bearing frame.
   Fill the bearing frame with oil until the oil level reaches the middle of the sight glass (319).
   The correct volume of oil required for each size of bearing frame can be found in the ‘Oil

Volume Requirements' section in the 'Bearing Maintenance' / 'Maintenance' portion of the IOM.

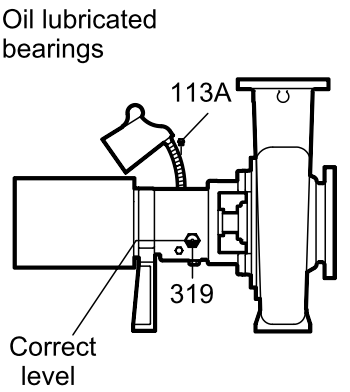

Figure 44: Oil filler connection

3. Replace the fill plug.

Lubricate the bearings with pure oil mist

Oil mist is an optional feature for this pump.

- To lubricate bearings with pure oil mist, follow the instructions provided by the manufacturer of the oil-mist generator.
  The inlet connections are on the top of the bearing frame.

Greased-for-life bearing lubrication

The bearing manufacturer fills greased-for-life bearings with grease and seals them at the factory. You do not need to lubricate or seal these bearings. Refer to the Maintenance chapter for re-greasing and maintenance procedures for these bearings.

Shaft-sealing options

In most cases, the manufacturer seals the shaft before shipping the pump. If your pump does not have a sealed shaft, see the Shaft-seal maintenance section in the Maintenance chapter.

This model uses these types of shaft seals:

- Cartridge mechanical seal
- Conventional inside-component mechanical seal
- Conventional outside-component mechanical seal
- Dynamic seal
- Packed-stuffing-box option

Mechanical seal options

Pumps are usually shipped with mechanical seals installed. If they are not, then refer to the mechanical seal manufacturer's installation instructions.

These are the mechanical seal options for this pump:

- Cartridge mechanical seal
- Conventional inside component mechanical seal
- Conventional outside component mechanical seal

Connection of sealing liquid for mechanical seals

Seal lubrication is required

Seal faces must have liquid film between them for proper lubrication. Locate the taps using the illustrations shipped with the seal.

Seal flushing methods

You can use these methods in order to flush or cool the seal:

Method	Description
Product flush	Run the piping so that the pump pushes the pumped fluid from the casing and injects it into the seal gland. If necessary, an external heat exchanger cools the pumped fluid before it enters the seal gland.
External flush	Run the piping so that the pump injects a clean, cool, compatible liquid directly into the seal gland. The pressure of the flushing liquid must be 0.35 to 1.01 kg/cm^2 | 5 to 15 psi greater than the seal chamber pressure. The injection rate must be 2 to 8 lpm | 0.5 to 2 gpm.
Other	You can use other methods that employ multiple gland or seal chamber connections. Refer to the mechanical seal reference drawing and piping diagrams.

Packed stuffing box option

WARNING:

Ex Packed stuffing boxes are not allowed in an ATEX-classified environment.

The factory does not install the packing, lantern ring, or split gland.

These parts are included with the pump in the box of fittings. Before you start the pump, you must install the packing, lantern ring, and split gland according to the Packed stuffing box maintenance section in the Maintenance chapter.

Connection of sealing liquid for a packed stuffing box

NOTICE:

Make sure to lubricate the packing. Failure to do so may result in shortening the life of the packing and the pump.

You must use an external sealing liquid under these conditions:

- The pumped fluid includes abrasive particles.
- The stuffing-box pressure is below atmospheric pressure when the pump is running with a suction lift or when the suction source is in a vacuum. Under these conditions, packing is not cooled and lubricated and air is drawn into pump.

Conditions for application of an external liquid

Condition	Action
The stuffing box pressure is above atmospheric pressure and the pumped fluid is clean.	Normal gland leaks of 40 to 60 drops per minute is usually sufficient to lubricate and cool the packing. You do not need sealing liquid.
The stuffing box pressure is below atmospheric pressure or the pumped fluid is not clean.	An outside source of clean compatible liquid is required.
An outside source of clean compatible liquid is required.	You must connect the piping to the lantern ring connection with a 40 to 60 drops-per-minute leak rate. The pressure must be 1.01 kg/cm^2 | 15 psi above the stuffing box pressure.

Dynamic-seal option

WARNING:

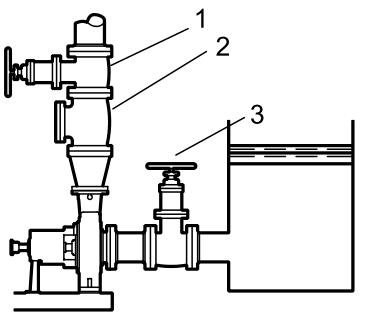
Ex Dynamic seals are not allowed in an ATEX-classified environment.

The dynamic seal consists of two parts:

- Repeller seal
- Secondary seal (one of the following):
  - Graphite packing
  - Elastomenic face seal

Table 12: Dynamic seal part function

Part	Function
Repeller seal	A repeller seal prevents liquid from entering the stuffing box during operation. The repeller normally does not require a flush. However, for services that allow a build-up of solids on the repeller, you must install a flush connection. If a danger of freezing exists, then you must install a drain connection to drain the repeller chamber.
Secondary seal (graphite packing)	This secondary seal prevents leaks during pump shutdown and is comprised of the following: · Graphite packing – Graphite packing provides adequate life running dry but can provide longer performance if lubricated with clean water or grease. · If you lubricate with clean water, then the repeller reduces both the quantity and pressure of seal water that is necessary. If the suction head is less than the repeller capability, then the stuffing box pressure is the same as the atmospheric pressure. Water pressure for the seal must be high enough to overcome static head when the pump is not operating to keep pumped fluid out of the packing. There must be enough flow to cool the packing. · If you lubricate with grease, then you must use spring-loaded grease lubricators to maintain a constant supply. · Elastomeric face seal – The elastomeric face seal consists of an elastomer rotary fitted to the shaft and a ceramic stationary seat fitted in the gland. To set an elastomeric face seal, refer to Set an elastomeric face seal. This seal is designed to run dry, so no flush is necessary.



Set an elastomeric face seal

This procedure ensures that the elastomeric seal attains proper contact. No other adjustments are necessary.

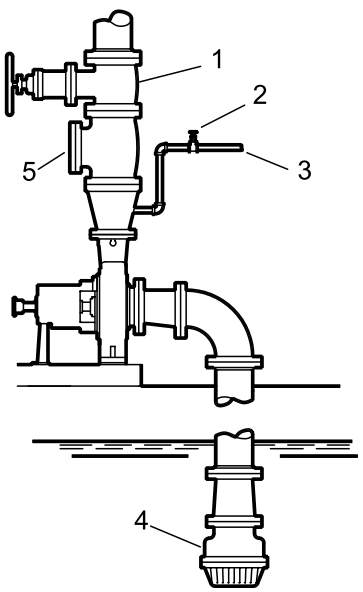
1. Remove the gland nuts.
2. Slide the gland back on the sleeve.
3. Pull the rotary back on the sleeve until the rotary is about 25 mm | 1 in. beyond the stuffing box face.
4. Push the gland back onto the studs, pushing the rotary back along the sleeve.
5. Tighten the gland nuts.

Prime the pump with the suction supply above the pump

1. Slowly open the suction isolation valve.
2. Open the air vents on the suction and discharge piping until the pumped fluid flows out.
3. Close the air vents.

1. Discharge isolation valve
2. Check valve
3. Suction isolation valve

Figure 45: Suction supply above pump

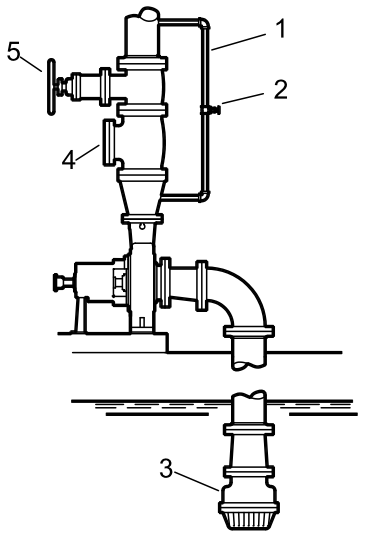


Prime the pump with the suction supply below the pump

Use a foot valve and an outside source of liquid in order to prime the pump. The liquid can come from one of these sources:

- A priming pump
- A pressurized discharge line
- Another outside supply

1. Close the discharge isolation valve.
2. Open the air vent valves in the casing.
3. Open the valve in the outside supply line until only liquid escapes from the vent valves.
4. Close the vent valves.
5. Close the outside supply line.



This illustration is an example of priming the pump with a foot valve and an outside supply:

1. Discharge isolation valve
2. Shutoff valve
3. From outside supply
4. Foot valve
5. Check valve

Figure 46: Pump priming with suction supply below pump

This illustration is an example of priming the pump with a foot valve using a bypass around the check valve:

1. By-pass line
2. Shutoff valve
3. Foot valve
4. Check valve
5. Discharge isolation valve

Figure 47: Pump priming with suction supply below pump with foot valve using bypass around check valve

Other methods of priming the pump

You can also use these methods in order to prime the pump:

- Prime by ejector
- Prime by automatic priming pump

Start the pump

WARNING:
Risk of equipment damage, seal failure and breach of containment. Ensure all flush and cooling systems are operating correctly prior to starting pump.

NOTICE:

- Risk of equipment damage due to dry operation. Immediately observe the pressure gauges. If discharge pressure is not quickly attained, stop the driver immediately, reprime, and attempt to restart the pump.
- To avoid risk of equipment damage, observe the pump for vibration levels, bearing temperature, and excessive noise. If normal levels are exceeded, shut down the pump and resolve the issue.

NOTICE:
Risk of equipment damage on pure or purge-oil mist-lubricated units. Remove the viewing port plugs to verify that oil mist is flowing properly. Reinstall the plugs after confirming.

Before you start the pump, you must perform these tasks:

- Open the suction valve.
- Open any recirculation or cooling lines.

1. Fully close or partially open the discharge valve, depending on system conditions.
2. Start the driver.
3. Slowly open the discharge valve until the pump reaches the desired flow.
4. Immediately check the pressure gauge to ensure that the pump quickly reaches the correct discharge pressure.
5. If the pump fails to reach the correct pressure, perform these steps:
   a) Stop the driver.
   b) Prime the pump again.
   c) Restart the driver.
6. Monitor the pump while it is operating:
   a) Check the pump for bearing temperature, excessive vibration, and noise.
   b) If the pump exceeds normal levels, then shut down the pump immediately and correct the problem.
      A pump can exceed normal levels for several reasons. See Troubleshooting for information about possible solutions to this problem.
7. Repeat steps 5 and 6 until the pump runs properly.

Activate the i-*ALERT*® Condition Monitor

WARNING:
Explosive hazard and risk of personal injury. Heating to high temperatures could cause combustion of the condition monitor. Never heat the condition monitor to temperatures in excess of 149°C | 300°F or dispose of in a fire.

By using the i-*ALERT*® Condition monitor or the i-*ALERT*®*2* Bluetooth Equipment Health Monitor, you agree to be bound by the Terms and Conditions of the *Software License Agreement* (page 18)

The condition monitor is ready for activation when the pump is running and has reached a steady flow, pressure, and temperature. This process only takes a few minutes.

1. Place a small magnet on the condition monitor over the ITT logo and then remove it, as this example shows.

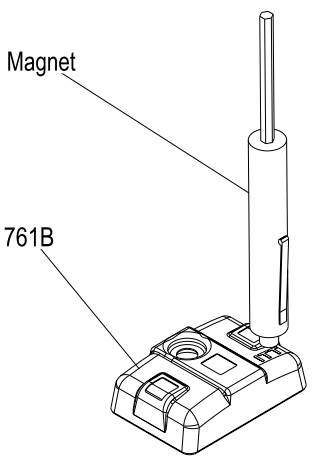


Figure 48: i-*ALERT*® condition monitor

When the condition monitor is activated it:

1. Displays a series of red LEDs followed by a solid green LED.
2. Collects eight samples that are spaced one second apart.
3. Averages these readings to establish the baseline vibration level.
4. Flashes a green LED after approximately twelve seconds.

For the first ten minutes, the green LED flashes every second for five consecutive flashes and then pauses to take a vibration reading. More frequent measurements (every six seconds) are taken in this startup period so that an alarm can be immediately detected.

i-*ALERT*® Condition Monitor routine operation

To install and/or activate the i-*ALERT*®*2* monitor, please refer to the i-*ALERT*®*2* IOM or*http://www.ittproservices.com/aftermarket-products/monitoring/i-alert2/* (i-ALERT2.com). Routine operation instructions are also included in the i-*ALERT*®*2* IOM.

Measurement interval

This table shows the measurement intervals for the condition monitor during normal operation and when the monitor is in alarm mode.

Mode	Measurement interval
Normal operating mode	Five minutes
Alarm mode	Two minutes

When the condition monitor measures a reading beyond the specified temperature and vibration limits, the appropriate red LED flashes. After the process or pump condition that causes the alarm is corrected, the condition monitor returns to normal mode after one normal-level measurement.

Alarm mode

When the condition monitor is in alarm mode, you should investigate the cause of the condition and make necessary corrections in a timely manner.

Magnetic device considerations

Be careful when you use magnetic devices in close proximity of the condition monitor, such as magnetic vibration-monitoring probes or dial indicators. These magnetic devices can accidentally activate or deactivate the condition monitor resulting in improper alarm levels or loss of monitoring.

Pump operation precautions

General considerations

NOTICE:

- Vary the capacity with the regulating valve in the discharge line. Never throttle the flow from the suction side. This action can result in decreased performance, unexpected heat generation, and equipment damage.
- Risk of equipment damage from unexpected heat generation. Do not overload the driver. Ensure that the pump operating conditions are suitable for the driver. The driver can overload in these circumstances:
  - The specific gravity or viscosity of the fluid is greater than expected
  - The pumped fluid exceeds the rated flow rate.
- Make sure to operate the pump at or near the rated conditions. Failure to do so can result in pump damage from cavitation or recirculation.

Operation at reduced capacity

WARNING:

- Risk of breach of containment and equipment damage. Excessive vibration levels can cause damage to bearings, stuffing box, seal chamber, and/or mechanical seal. Observe pump for vibration levels, bearing temperature, and excessive noise. If normal levels are exceeded, shut down and resolve.
- Risk of explosion and serious physical injury. Do not operate pump with blocked system piping or with suction or discharge valves closed. This can result in rapid heating and vaporization of pumpage.
- Risk of equipment damage and serious physical injury. Heat build-up can cause rotating parts to score or seize. Observe pump for excessive heat build-up. If normal levels are exceeded, shut down and resolve.

NOTICE:

Cavitation can cause damage to the internal surfaces of the pump. Ensure net positive suction head available ($NPSH_A$) always exceeds NPSH required ($NPSH_3$) as shown on the published performance curve of the pump.

Operation under freezing conditions

NOTICE:

Do not expose an idle pump to freezing conditions. Drain all liquid that is inside the pump and any auxiliary equipment. Failure to do so can cause liquid to freeze and damage the pump.

Shut down the pump

WARNING:

Precautions must be taken to prevent physical injury. The pump may handle hazardous and/or toxic fluids. Proper personal protective equipment should be worn. Pumpage must be handled and disposed of in conformance with applicable environmental regulations.

1. Slowly close the discharge valve.
2. Shut down and lock out the driver to prevent accidental rotation.

Deactivate the i-*ALERT*® Condition Monitor

NOTICE:

Always deactivate the condition monitor when the pump is going to be shut down for an extended period of time. Failure to do so will result in reduced battery life.

1. Touch and hold a small magnet to the condition monitor over the ITT logo until the red LEDs blink three times.
   This should take 10-15 seconds if the condition monitor is in normal operating mode and approximately five seconds if the condition monitor is in alarm mode.
2. Remove the magnet.

If the deactivation is successful, solid red LEDs will be displayed.

Reset the i-*ALERT*® Condition Monitor

To deactivate or reset the i-*ALERT*®*2* monitor, please refer to the i-*ALERT*®*2* IOM or i-ALERT2.com, *http://www.ittproservices.com/aftermarket-products/monitoring/i-alert2/*

Always reset the condition monitor when the pump is started after maintenance, system change, or being shut down for an extended period of time. Failure to do so may result in false baseline levels that could cause the condition monitor to alert in error.

1. Touch a magnet to the condition monitor over the ITT logo to turn the power on.The condition monitor begins to establish a new baseline vibration level.

Make the final alignment of the pump and driver

WARNING:

- Failure to disconnect and lock out driver power may result in serious physical injury or death. Always disconnect and lock out power to the driver before performing any installation or maintenance tasks.
  - Electrical connections must be made by certified electricians in compliance with all international, national, state, and local rules.
  - Refer to driver/coupling/gear manufacturer's installation and operation manuals (IOM) for specific instructions and recommendations.
- Misalignment can cause decreased performance, equipment damage, and even catastrophic failure of frame-mounted units leading to serious injury. Proper alignment is the responsibility of the installer and the user of the unit. Check the alignment of all drive components prior to operating the unit.
  - Follow the coupling installation and operation procedures from the coupling manufacturer.

You must check the final alignment after the pump and driver are at operating temperature. For initial alignment instructions, see the Installation chapter.

1. Run the unit under actual operating conditions for enough time to bring the pump, driver, and associated system to operating temperature.
2. Shut down the pump and the driver.
3. Remove the coupling guard.
   See Remove the coupling guard in the Maintenance chapter.
4. Check the alignment while the unit is still hot.
   See Pump-to-driver alignment in the Installation chapter.
5. Reinstall the coupling guard.
6. Restart the pump and driver.

Maintenance

Maintenance schedule

Maintenance inspections

A maintenance schedule includes these types of inspections:

- Routine maintenance
- Routine inspections
- Three-month inspections
- Annual inspections

Shorten the inspection intervals appropriately if the pumped fluid is abrasive or corrosive or if the environment is classified as potentially explosive.

Routine maintenance

Perform these tasks whenever you perform routine maintenance:

- Lubricate the bearings.
- Inspect the seal.

Routine inspections

Perform these tasks whenever you check the pump during routine inspections:

- Check the level and condition of the oil through the sight glass on the bearing frame.
- Check for unusual noise, vibration, and bearing temperatures.
- Check the pump and piping for leaks.
- Analyze the vibration.
- Inspect the discharge pressure.
- Inspect the temperature.
- Check the seal chamber and stuffing box for leaks.
  - Ensure that there are no leaks from the mechanical seal.
  - Adjust or replace the packing in the stuffing box if you notice excessive leaking.

Three-month inspections

Perform these tasks every three months:

- Check that the foundation and the hold-down bolts are tight.
- Check the packing if the pump has been left idle, and replace as required.
- Change the oil every three months (2000 operating hours) at minimum.
  - Change the oil more often if there are adverse atmospheric or other conditions that might contaminate or break down the oil.
- Check the shaft alignment, and realign as required.

Annual inspections

Perform these inspections one time each year:

- Check the pump capacity.
- Check the pump pressure.
- Check the pump power.

If the pump performance does not satisfy your process requirements, and the process requirements have not changed, then perform these steps:

1. Disassemble the pump.
2. Inspect it.

3. Replace worn parts.

Bearing maintenance

 These bearing lubrication sections list different temperatures of the pumped fluid. If the pump is ATEX-certified and the temperature of the pumped fluid exceeds the permitted temperature values, then consult your ITT representative.

Bearing lubrication schedule

Type of bearing	First lubrication	Lubrication intervals
Oil-lubricated bearings	Add oil before you install and start the pump. Change the oil after 200 hours for new bearings.	After the first 200 hours, change the oil every 2000 operating hours or every three months.
Grease-lubricated bearings	Grease-lubricated bearings are initially lubricated at the factory.	Regrease bearings every 2000 operating hours or every three months.

Lubricating-oil requirements

Oil requirements based on temperature

For the majority of operating conditions, bearing temperatures run between 49°C | 120°F and 82°C | 180°F, and you can use an oil of ISO viscosity grade 68 at 38°C | 100°F. If temperatures exceed 82°C | 180°F, refer to the table for temperature requirements.

Temperature	Oil requirement
Bearing temperatures exceed 82°C	180°F	Use ISO viscosity grade 100 with bearing-frame cooling or finned-tube oil cooler. The finned-tube oil cooler is standard with the HT 3196 model and optional for all other models.
Pumped-fluid temperatures exceed 177°C	350°F	Use synthetic lubrication.

Oil volumes

Oil volume requirements

This table shows the required amount of oil for oil-lubricated bearings.

Frame	ml	Qts.	Oz.
STi	400	0.5	16
MTi	1400	1.5	47
LTi	1400	1.5	48
XLT-i and i17	3000	3	96

Acceptable oil for lubricating bearings

Acceptable lubricants

Examples of acceptable high quality turbine oils with rust and oxidation inhibitors.

Brand	Lubricant type
Chevron	GST Oil 68
Exxon	Teresstic EP 68
Mobil	DTE 68 Heavy Medium
Phillips 66	Turbine Oil VG68
Shell	Turbo T 68
Sunoco	Sunvis 968
Royal Purple	SYNFILM ISO VG 68 Synthetic Oil

Regrease the grease-lubricated bearings

NOTICE:
Risk of equipment damage. Ensure that the grease container, the greasing device, and the fittings are clean. Failure to do so can result in impurities entering the bearing housing while regreasing the bearings.

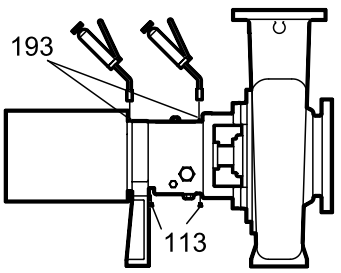

Figure 49: Bearing lubrication

1. Wipe dirt from the grease fittings.
2. Remove the two grease-relief plugs from the bottom of the frame.
3. Fill both of the grease cavities through the fittings with a recommended grease until the fresh grease comes out of the relief holes.
4. Make sure that the frame seals are seated in the bearing housing.
   If they are not, press them in place with the drains located at the bottom.
5. Reinstall the grease-relief plugs.
6. Wipe off any excess grease.
7. Recheck the alignment.

The bearing temperature usually rises after you regrease due to an excess supply of grease. Temperatures return to normal in about two to four operating hours as the pump runs and purges the excess grease from the bearings.

Lubricating-grease requirements

Precautions

NOTICE:

- Avoid equipment damage or decreased performance. Never mix greases of different consistencies (NLGI 1 or 3 with NLGI 2) or with different thickeners. For example, never mix a lithium-based grease with a polyurea based grease. If it is necessary to change the grease type or consistency, remove the rotor and old grease from the housing before regreasing.

Bearing temperature

Bearing temperatures are generally about 18°C | 20°F greater than bearing-housing outer surface temperatures.

This table shows the type of grease required for the operating temperature of the pump.

Bearing temperature	Type of grease
-15°C to 110°C | 5°F to 230°F	Use a lithium-based mineral-oil grease with a consistency of NLGI 2.
Exceed 177°C | 350°F	Use a high-temperature grease. Mineral-oil greases should have oxidation stabilizers and a consistency of NGLI 3.

Grease recommendations based on temperature

Most pumps use Sunoco 2EP grease. High temperature units that can pump fluids with a temperature greater than 177°C | 350°F use Mobil SCH32.

This table shows which brand of grease to use when lubricating the pump.

Brand	When temperature of pumped fluid is less than 177°C | 350°F NLGI consistency 2	When temperature of pumped fluid is greater than177°C | 350°F NLGI consistency 3
Mobil	Mobilux EP2	SCH32
Exxon	Unirex N2	Unirex N3
Sunoco	Mutipurpose 2EP	N/A
SKF	LGMT 2	LGMT 3

Lubricate the bearings after a shutdown period

1. Flush out the bearings and bearing frame with a light oil to remove contaminants. During flushing, make sure to rotate the shaft slowly by hand.
2. Flush the bearing housing with the proper lubricating oil to ensure oil quality after cleaning.
3. Refer to "Reassembly" section for proper bearing greasing procedure.

Mechanical-seal maintenance

WARNING:

The mechanical seal used in an Ex-classified environment must be properly certified.

CAUTION:

Running a mechanical seal dry, even for a few seconds, can cause seal failure and physical injury. Never operate the pump without liquid supplied to the mechanical seal.

Cartridge-type mechanical seals

Cartridge-type mechanical seals are commonly used. Cartridge seals are preset by the seal manufacturer and require no field settings. Cartridge seals installed by the user require disengagement of the holding clips prior to operation, allowing the seal to slide into place. If the seal has been installed in the pump by ITT, these clips have already been disengaged.

Other mechanical seal types

For other types of mechanical seals, refer to the instructions provided by the seal manufacturer for installation and setting.

Reference drawing

The manufacturer supplies a reference drawing with the data package. Keep this drawing for future use when you perform maintenance and seal adjustments. The seal drawing specifies the required flush fluid and attachment points.

Before you start the pump

Check the seal and all flush piping.

Mechanical seal life

The life of a mechanical seal depends on the cleanliness of the pumped fluid. Due to the diversity of operating conditions, it is not possible to give definite indications as to the life of a mechanical seal.

Packed stuffing-box maintenance

WARNING:

- Packed stuffing boxes are not allowed in an ATEX-classified environment.
- Failure to disconnect and lock out driver power may result in serious physical injury. Never attempt to replace the packing until the driver is properly locked out.

Accepted leakage rate

It is not necessary to shut down or disassemble the pump to inspect the packing operation. During normal operation, the packing should leak approximately one drop per second.

Adjustment of gland

Adjust the gland if the leakage rate is greater than or less than the specified rate.

Evenly adjust each of the two gland bolts with a one-quarter (1/4) turn until the desired leakage rate is obtained. Tighten the bolts to decrease the rate. Loosen the bolts to increase the rate.

Tightening of packing

NOTICE:

Never over-tighten packing to the point where less than one drop per second is observed. Over-tightening can cause excessive wear and power consumption during operation.

If you cannot tighten the packing to obtain less than the specified leakage rate, then replace the packing.

Dynamic-seal maintenance

WARNING:

Dynamic seals are not allowed in an ATEX-classified environment.

About the dynamic seal

Dynamic seal parts do not wear substantially to affect operation and do not require maintenance unless the service is particularly abrasive or corrosive.

Repeller

The dynamic repeller prevents pumpage leaks through the stuffing box when the pump operates under published acceptable conditions.

Static seal

A static seal prevents leakage when the pump is shut down. A static seal is either of the following:

- a lip seal
- an elastomeric-face seal
- graphite packing

The only maintenance that the lip seal and the elastomeric-face seal require is replacement when leakage becomes excessive.

The graphite packing should be installed as stuffing-box packing and is designed to run dry.

Disassembly precautions

WARNING:

- Risk of serious physical injury or death from rapid depressurization. Ensure pump is isolated from system and pressure is relieved before disassembling pump, removing plugs, opening vent or drain valves, or disconnecting piping.
- Risk of serious personal injury. Applying heat to impellers, propellers, or their retaining devices can cause trapped liquid to rapidly expand and result in a violent explosion. This manual clearly identifies accepted methods for disassembling units. These methods must be adhered to. Never apply heat to aid in their removal unless explicitly stated in this manual.
- Failure to disconnect and lock out driver power may result in serious physical injury or death. Always disconnect and lock out power to the driver before performing any installation or maintenance tasks.
  - Electrical connections must be made by certified electricians in compliance with all international, national, state, and local rules.
  - Refer to driver/coupling/gear manufacturer's installation and operation manuals (IOM) for specific instructions and recommendations.
- Handling heavy equipment poses a crush hazard. Use caution during handling and wear appropriate Personal Protective Equipment (PPE, such as steel-toed shoes, gloves, etc.) at all times.
- Precautions must be taken to prevent physical injury. The pump may handle hazardous and/or toxic fluids. Proper personal protective equipment should be worn. Pumpage must be handled and disposed of in conformance with applicable environmental regulations.
- Risk of serious personal injury from exposure to hazardous or toxic liquids. A small amount of liquid will be present in certain areas like the seal chamber upon disassembly.
- Risk of severe physical injury or death from explosion of trapped liquid. Never use heat to remove parts unless explicitly stated in this manual.

CAUTION:

- Avoid injury. Worn pump components can have sharp edges. Wear appropriate gloves while handling these parts.

Tools required

In order to disassemble the pump, you need these tools:

- Bearing puller
- Brass drift punch
- Cleaning agents and solvents
- Dial indicators
- Feeler gauges
- Hex wrenches
- Hydraulic press
- Induction heater
- Leveling blocks and shims
- Lifting sling
- Micrometer
- Rubber mallet
- Screwdriver
- Snap-ring pliers
- Torque wrench with sockets
- Wrenches
- Lifting eyebolt (dependent on pump size)

Drain the pump

CAUTION:

- Risk of physical injury. Allow all system and pump components to cool before handling.
- If the pumped fluid is non-conductive, drain and flush the pump with a conductive fluid under conditions that will not allow for a spark to be released to the atmosphere.

1. Leave the drain valve open and remove the drain plug located on the bottom of the pump housing.
   Do not reinstall the plug or close the drain valve until the reassembly is complete.
2. Remove the coupling guard.

Remove the coupling

1. Disconnect the coupling.
2. Remove the C-face adapter.
3. Remove the coupling-guard pump end-plate.

Remove the back pull-out assembly

WARNING:
Lifting and handling heavy equipment poses a crush hazard. Use caution during lifting and handling and wear appropriate Personal Protective Equipment (PPE, such as steel-toed shoes, gloves, etc.) at all times. Seek assistance if necessary.

1. Is your bearing frame oil lubricated?
   - If No: Proceed to step 2.
   - If Yes:
     1. Remove the bearing-frame drain plug (408A) in order to drain oil from the bearing frame.
     2. Replace the plug after the oil is drained.
     3. Remove the oil reservoir, if equipped.

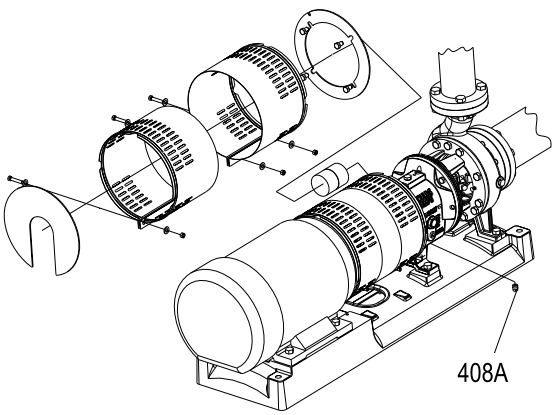

Figure 50: Back pull-out assembly removal (oil lubricated bearing frame)

Oil analysis should be part of a preventive maintenance program that determines the cause of a failure. Save the oil in a clean container for inspection.

2. Does your pump use a C-face adapter?
   - If Yes: Place one sling from the hoist through the frame adapter (108) or frame (228A) for the STi and a second sling from the hoist through the C-face adapter.

- If No: Place a sling from the hoist through the frame adapter (108) or the frame (228A) for the STi.

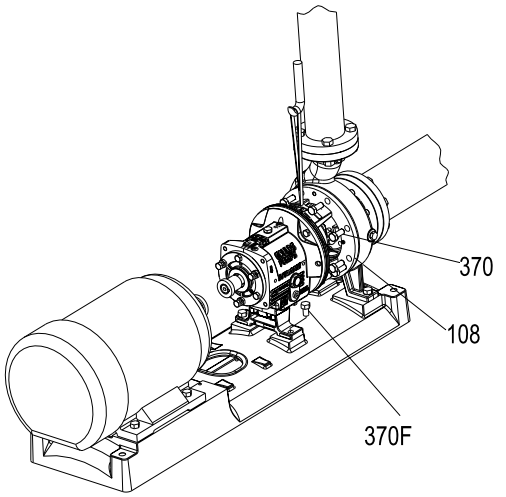

Figure 51: Back pull-out assembly removal (with C-face adapter)

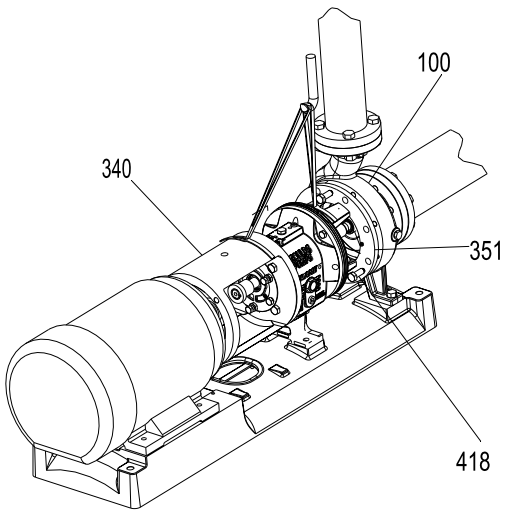

Figure 52: Back pull-out assembly removal (without C-face adapter)

3. Remove the hold-down bolts of the bearing frame foot.
4. Remove the casing bolts.

WARNING:

- Risk of severe physical injury or death from explosion of trapped liquid. Never use heat to remove parts unless explicitly stated in this manual.

5. Tighten the jackscrews evenly, using an alternating pattern, in order to remove the back pull-out assembly.
   You can use penetrating oil if the adapter to the casing joint is corroded.
6. Remove the back pull-out assembly from the casing (100).
7. Mark and remove the shims from under the frame foot and save them for reassembly.
8. Remove and discard the casing gasket.
   You will insert a new casing gasket during reassembly.
9. Remove the jackscrews.
10. Clean all gasket surfaces.

Clean surfaces prevent the casing gasket from partially adhering to the casing due to binders and adhesives in the gasket material.

Remove the coupling hub

1. Clamp the frame adapter securely to the workbench.
2. Remove the coupling hub.
   Mark the shaft for relocation of the coupling hub during reassembly.

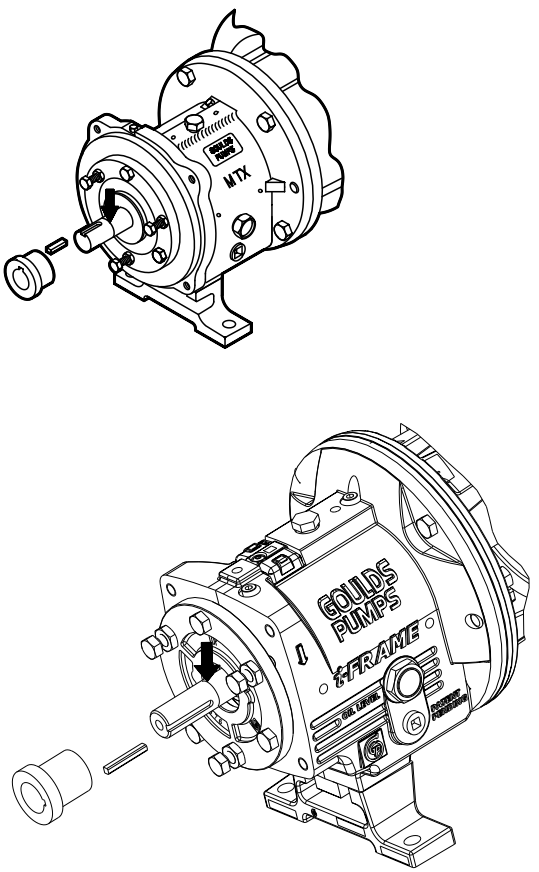

Figure 53: Coupling hub removal

Impeller removal

Remove the impeller (STi, MTi, and LTi)

WARNING:
Risk of severe physical injury or death from explosion of trapped liquid. Never use heat to remove parts unless explicitly stated in this manual.

CAUTION:
Risk of physical injury from sharp edges. Wear heavy work gloves when handling impellers.

1. Slide the shaft wrench (A05107A or A01676A) over the shaft (122) and key.
2. Rotate the impeller (101) clockwise (viewed from the impeller end of the shaft) and raise the wrench off of the work surface.

3. To loosen the impeller, quickly turn it counter-clockwise (viewed from the impeller end of the shaft) while impacting the wrench handle on the workbench or a solid block.

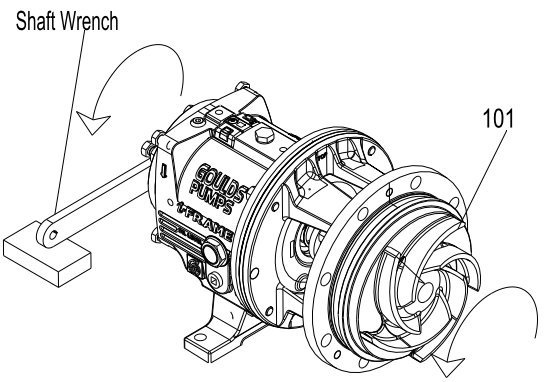

Figure 54: Loosen impeller

4. Repeat step 3 until the impeller becomes loose.
5. Remove and discard the impeller O-ring (412A). You will insert a new O-ring during reassembly.

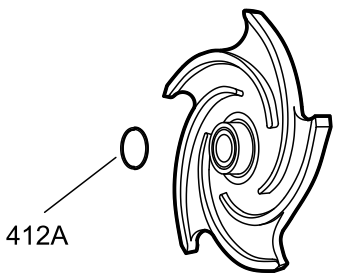

Figure 55: O-ring for models 3196, HT 3196, NM 3196, 3198, and 3796

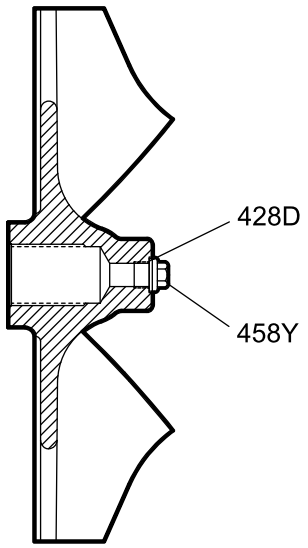
If the impeller cannot be removed by the previous methods, cut the shaft between the gland and the frame, remove the impeller, stuffing-box cover, gland, sleeve, and shaft end as a unit. Do not apply heat.

Remove the impeller (XLT-i, and i17)



WARNING:
Risk of severe physical injury or death from explosion of trapped liquid. Never use heat to remove parts unless explicitly stated in this manual.

CAUTION:
Risk of physical injury from sharp edges. Wear heavy work gloves when handling impellers.

Clamp the frame foot (241) to the workbench when you use this method to remove the impeller.

1. Remove the impeller plug (458Y) from the front of the impeller (101) and discard the PTFE gasket (428D).

2. Spray penetrating oil through the plug hole into the cavity at the end of the shaft and let it penetrate for 15 minutes.
3. While waiting, rotate the shaft several times to distribute the oil.
4. Slide the shaft wrench (A05107A) over the shaft (122) and key.
5. Rotate the impeller clockwise (viewed from the impeller end of the shaft) and raise the wrench off of the work surface.
6. To loosen the impeller, quickly turn the impeller counter-clockwise (viewed from the impeller end of the shaft) while impacting the wrench handle on the workbench or a solid block.
7. Repeat step 6 until the impeller becomes loose.
8. If step 6 and 7 do not work then do this:
   a) Place a socket wrench over the cast nut on the impeller hub.
   b) Turn the impeller counter-clockwise (viewed from the impeller end of the shaft).

   Be sure that the impeller wrench rests on the workbench or a solid block and that the power end is secure on the work surface.
9. Remove and discard the impeller O-ring (412A).
   You will insert a new O-ring during reassembly.

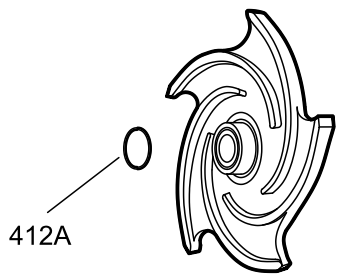


Figure 56: O-ring for models 3196 and HT 3196

If the impeller cannot be removed by the previous methods, cut the shaft between the gland and the frame, remove the impeller, stuffing-box cover, gland, sleeve, and shaft end as a unit. Do not apply heat.

Seal-chamber cover removal

Seal-chamber removal procedures

Choose from one of these procedures to remove the seal-chamber cover.

Table 13: Procedures for seal-chamber cover removal by model

Model	Procedure
3196, CV 3196, HT 3196, LF 3196, 3796	Remove the seal-chamber cover.
NM 3196, 3198	Remove the seal-chamber cover and/or backplate.

Remove the seal-chamber cover (3196, CV 3196, HT 3196, LF 3196, 3796)

1. Remove the gland stud nuts (355).
2. Remove the seal-chamber stud nuts (370H).
3. Remove the seal chamber (184).

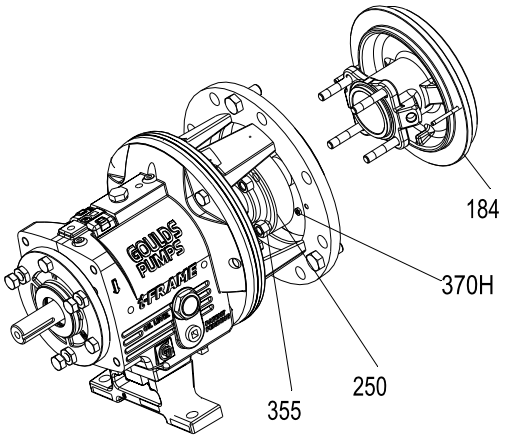

Figure 57: Seal chamber cover removal

4. Remove the shaft sleeve (126) if it is used.
   The mechanical seal is attached to the sleeve.

NOTICE:
Be careful with the mechanical seal. Carbon or ceramic components are brittle and easily broken.

5. Remove the rotary portion of the seal from the sleeve by loosening the setscrews and sliding it off the sleeve.
   Refer to the mechanical-seal instructions for more information.

6. Remove the gland (250), the stationary portion of the seal, and the O-ring (360Q).

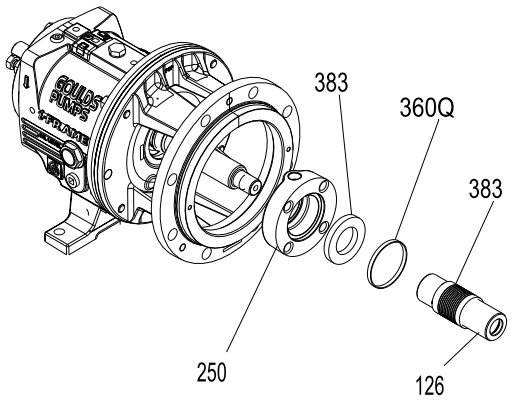

Figure 58: Gland removal

Remove the stuffing-box cover (3196, CV 3196, HT 3196, LF 3196, 3796)

1. Remove the gland nuts (355) and the gland (107).
2. Remove the stuffing-box-cover nuts (370H).
3. Remove the stuffing-box cover (184).

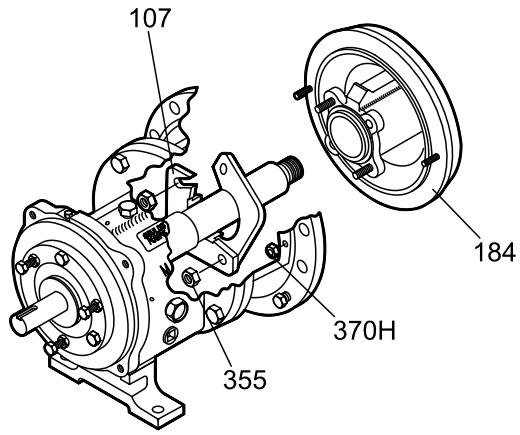

Figure 59: Stuffing box cover removal

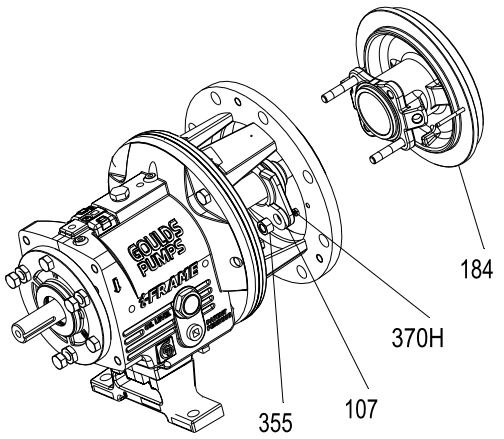

Figure 60: Stuffing box cover removal

4. Remove the shaft sleeve (126).

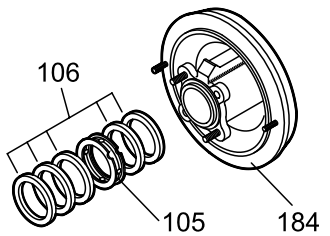

Figure 61: Remove the shaft sleeve

5. Remove the packing (106) and lantern ring (105) from the stuffing-box cover (184). A lantern ring does not come with self-lubricating graphite packing.

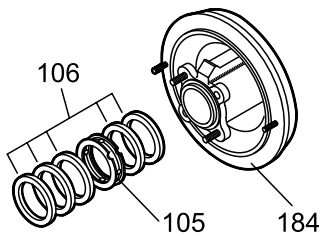

Figure 62: Packing and lantern ring removal

Remove the dynamic seal

1. Remove the stud nuts (370H).

2. Remove the dynamic-seal assembly.

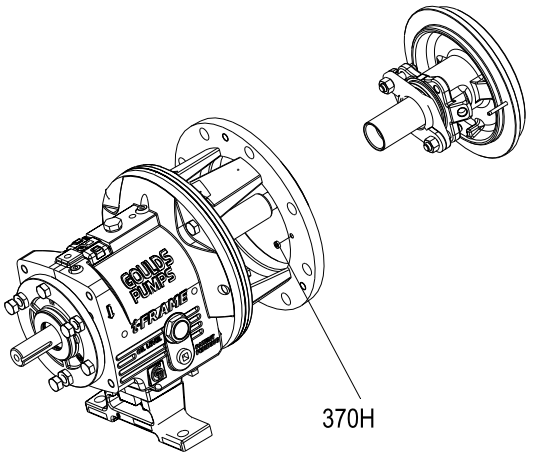

Figure 63: Dynamic seal removal

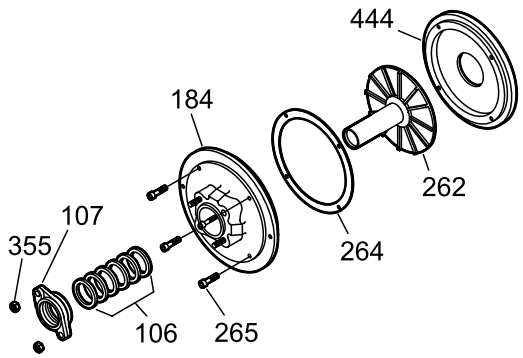
3. Remove the socket head cap screws (265).
4. Remove the packed stuffing box cover (184) and gasket (264).
5. Remove the repeller (262) from the backplate (444).



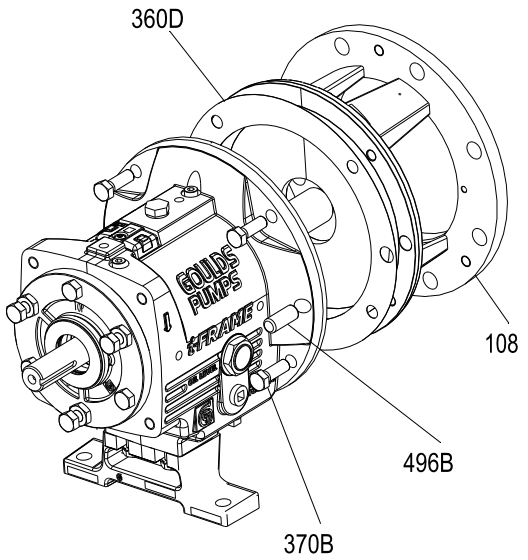


Figure 64: Repeller removal

Remove the frame adapter (MTi, LTi, XLT-i, i17)

The 3198 frame adapter is not interchangeable with the adapter of any other model.

1. Remove the dowel pins (469B) and the bolts (370B).
2. Remove the frame adapter (108).
3. Remove and discard the gasket (360D).

You will install a new gasket during reassembly.
