Remove the inboard labyrinth oil seal

Labyrinth oil-seal O-rings are part of the 3196 maintenance kits, and they are sold separately.

1. Determine the fit of your labyrinth oil seal.

Table 14: Labyrinth oil-seal fit

Model	Type of fit
STi	O-ring fit into the bearing-frame adapter (228A)
MTi, LTi, XLT-i and i17	O-ring fit into the frame adapter

2. Remove the O-rings (497H and 497J) and the seal (333A).

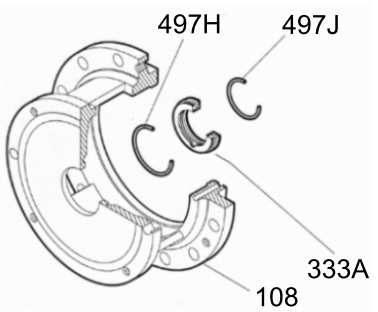

Figure 65: O-ring removal

Disassemble the power end (STi, MTi)

1. Remove the clamp screws (370C) and back off the jam nuts (423).
2. Tighten the jack screws (370D) evenly to move the bearing housing (134) out of the bearing frame (228A).

3. Remove the shaft assembly from the bearing frame (228A).

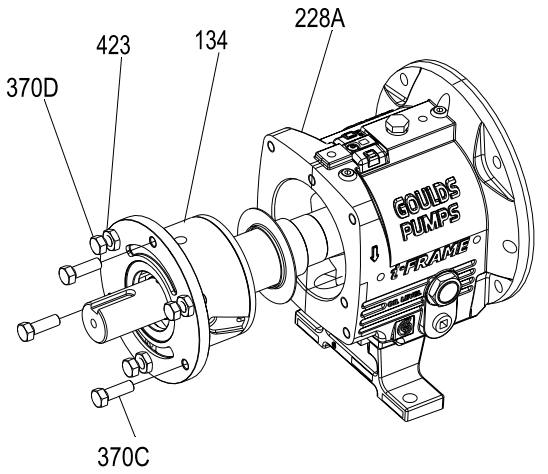

Figure 66: Shaft assembly removal

4. Remove the jack screws (370D) with nuts (423).
5. Remove the bearing housing O-ring (496) and the bearings.
6. Remove the outboard bearing retaining snap ring (361A).

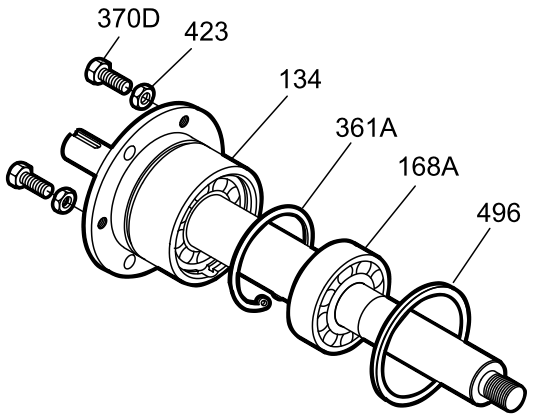

Figure 67: Outboard bearing retaining snap ring removal

7. Remove the bearing housing (134) and bearings (112A and 168A) from the shaft (122).

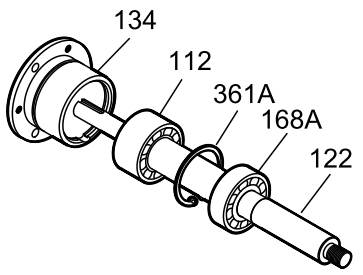

Figure 68: Bearing housing and bearings removal

8. Remove the bearing locknut (136) and bearing lock washer (382).
9. Remove the inboard bearing (168A).
10. Remove the outboard bearing (112A).

NOTICE:
Use force only on the inner race when pressing bearings from the shaft. Failure to do so may result in equipment damage.

NOTICE:
Do not reuse bearings if removed from shaft. Doing so may result in equipment damage. Replace the bearings before reassembly.

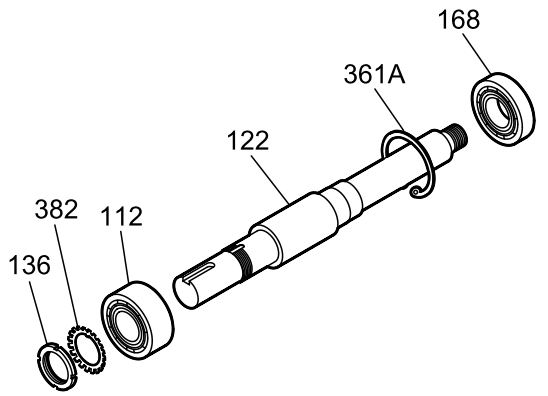

Figure 69: Outboard bearing removal

Disassemble the power end (STi and MTi with duplex bearings)

1. Remove the clamp screws (370C) and back off the jam nuts (423).
2. Tighten the jack screws (370D) evenly to move the bearing housing (134) out of the bearing frame (228A).
3. Remove the shaft assembly from the bearing frame (228A).

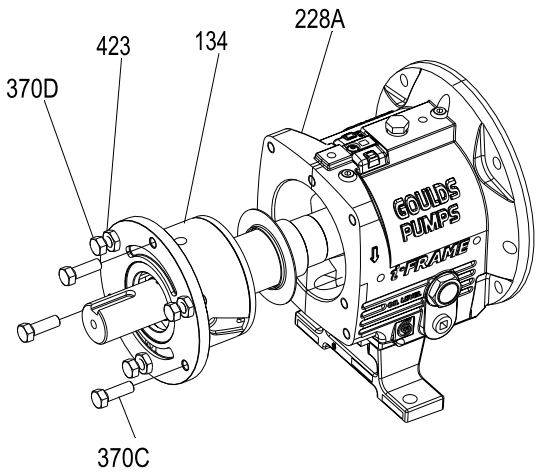

Figure 70: Shaft assembly removal

4. Remove the jack screws (370D) with the nuts (423).

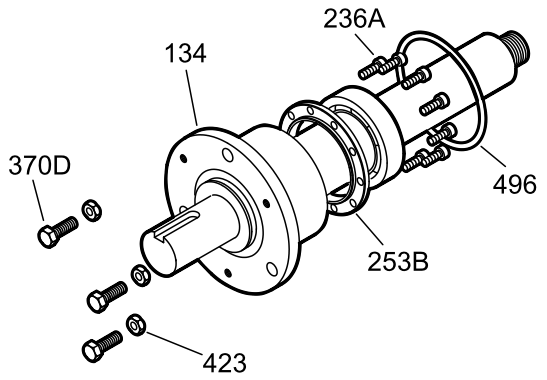

Figure 71: Jack screw removal

5. Remove the bearing housing O-ring (496).
6. Remove the clamp ring screws (236A) and separate the clamp ring (253B) from the bearing housing (134).
   You must remove the bearings before you can remove the clamp ring from the shaft.
7. Remove the bearing housing (134) and the bearings (112A and 168A) from the shaft (122).

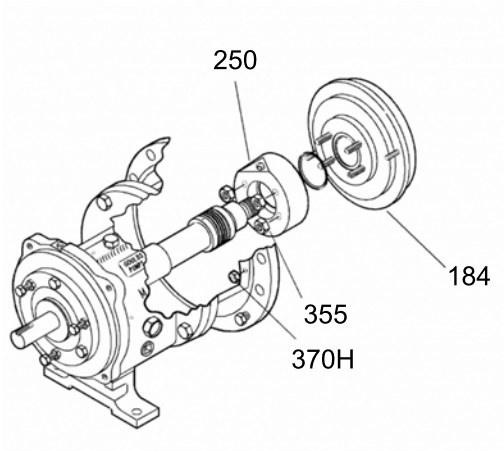

Figure 72: Bearing housing and bearing removal

8. Remove the inboard bearing (168A).

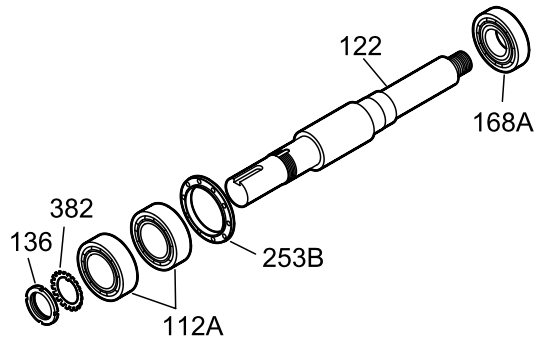

Figure 73: Inboard bearing removal

9. Remove the bearing locknut (136) and bearing lockwasher (382).
10. Remove the outboard bearings (112A).

NOTICE:
Use force only on the inner race when pressing bearings from the shaft. Failure to do so may result in equipment damage.

NOTICE:
Do not reuse bearings if removed from shaft. Doing so may result in equipment damage. Replace the bearings before reassembly.

11. Remove the outboard labyrinth oil seal (332A) from the bearing housing (134). Remove the O-rings (497F and 497G) if it is necessary. Labyrinth oil seal O-rings are part of the 3196 maintenance kits and they are sold separately.

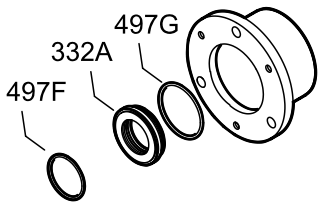

Figure 74: Outboard labyrinth oil seal removal

Disassemble the power end (LTi)

1. Remove the clamp screws (370C) and back off the jam nuts (423).
2. Evenly tighten the jack screws (370D) to move the bearing housing (134) out of the bearing frame (228A).
3. Remove the shaft assembly from the bearing frame (228A).

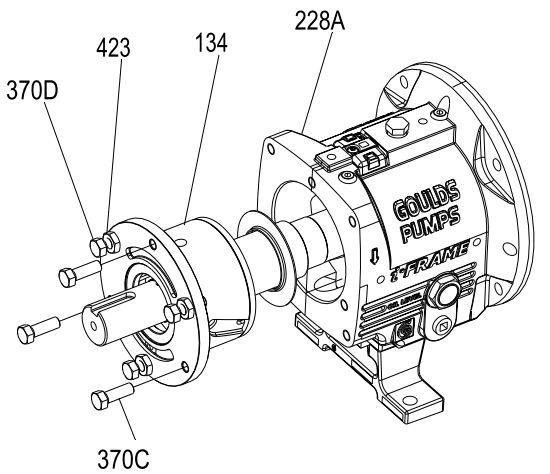

Figure 75: Shaft assembly removal

4. Remove the jack screws (370D) with the nuts (423).
5. Remove the clamp-ring screws (236A) and separate the clamp ring (253B) from the bearing housing (134).

You must remove the bearings before you can remove the clamp ring from the shaft.

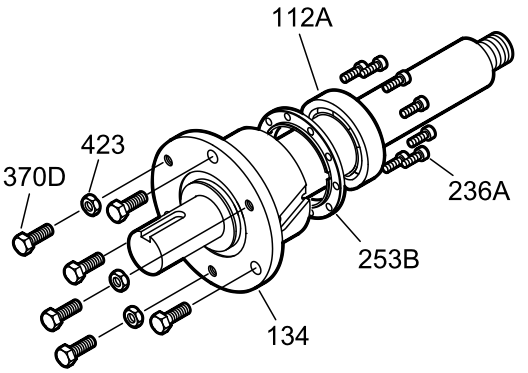

Figure 76: Clamp ring removal

6. Remove the bearing housing (134) and the bearings (112A and 168A) from the shaft (122).

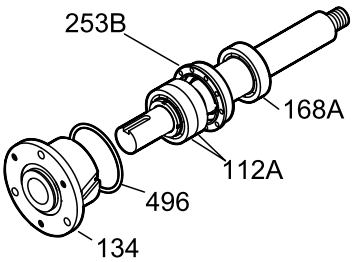

Figure 77: Bearing housing and bearing removal

7. Remove the bearing housing O-ring (496) and the inboard bearing (168A).

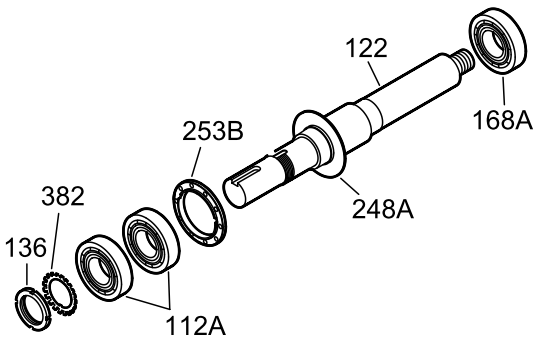

Figure 78: O-ring removal

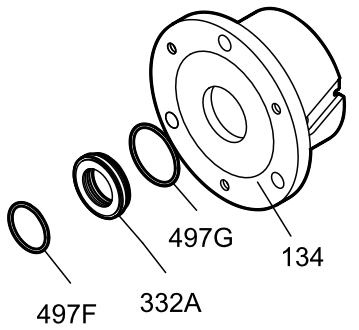
8. Remove the flinger so that the flinger seating surface on the shaft can be cleaned.
9. Remove the bearing locknut (136) and the bearing lockwasher (382).
10. Remove the outboard bearings (112A) and the clamp ring (253B).

NOTICE:
Use force only on the inner race when pressing bearings from the shaft. Failure to do so may result in equipment damage.

NOTICE:
Do not reuse bearings if removed from shaft. Doing so may result in equipment damage. Replace the bearings before reassembly.

11. Remove the outboard labyrinth oil seal (332A) from the bearing housing (134).
12. Remove the O-rings (497F and 497G) if it is necessary.
    Labyrinth oil-seal O-rings are part of the 3196 maintenance kits, and they are sold separately.



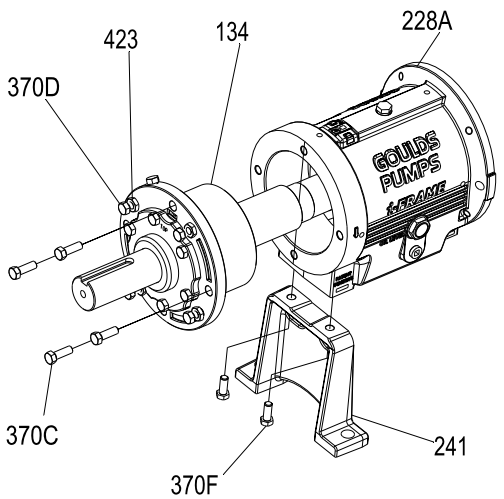


Figure 79: O-ring removal

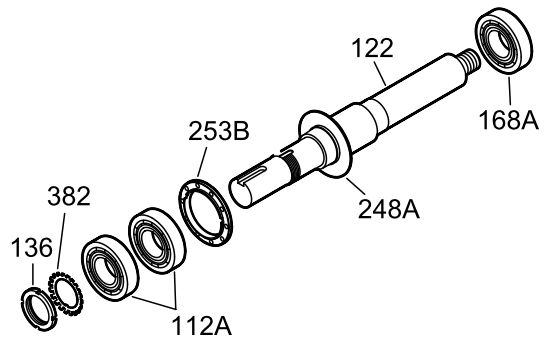
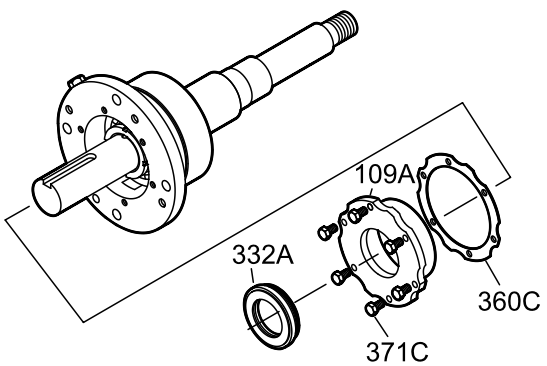
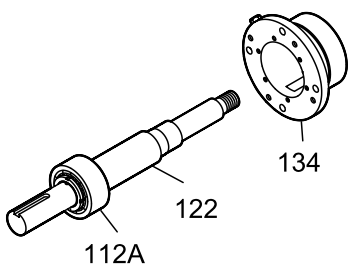


Disassemble the power end (XLT-i and i17)

1. Remove the bearing frame from the frame foot (241) using the frame-foot bolts (370F).

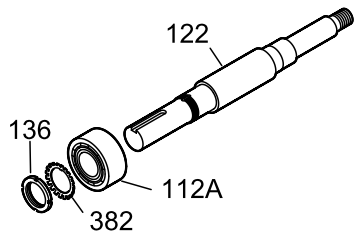


2. Remove the clamp screws (370C) and back off the jam nuts (423).
3. Tighten the jack screws (370D) evenly to move the bearing housing (134) out of the bearing frame (228A).
4. Remove the shaft assembly from the bearing frame (228A).
5. Remove the jack screws (370D), the nuts (423), and the bearing housing O-ring.



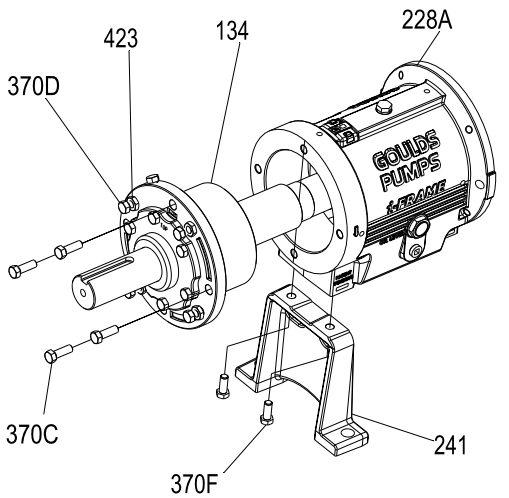
6. Remove the inboard bearing (168A).

7. Remove the bolts (371C), the bearing end cover (109A), and the gasket (360C).
8. Remove the outboard labyrinth oil seal (332A) from the end cover (109A).
9. Remove the O-rings (497F and 497G) if it is necessary.
   Labyrinth oil-seal O-rings are part of the 3196 maintenance kits, and they are sold separately.



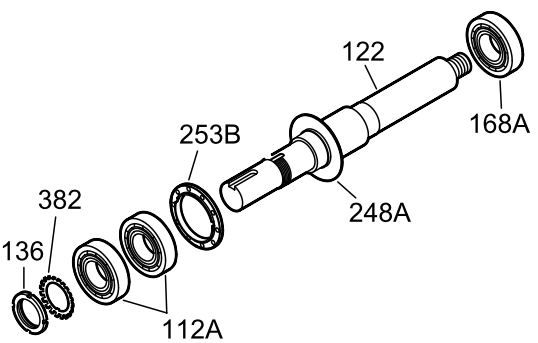
10. Remove the bearing housing (134) and the bearing (112A) from the shaft (122).

11. Remove the bearing locknut (136), the bearing lockwasher (382), and the outboard bearing (112A).

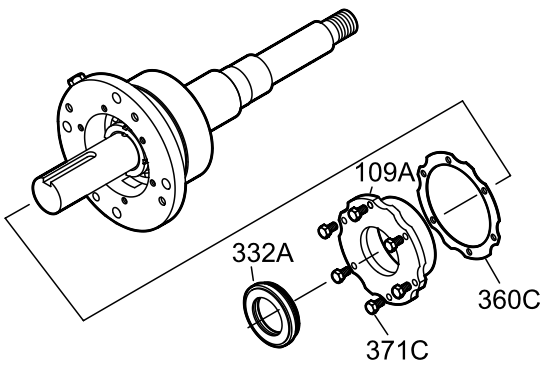


NOTICE:
Use force only on the inner race when pressing bearings from the shaft. Failure to do so may result in equipment damage.

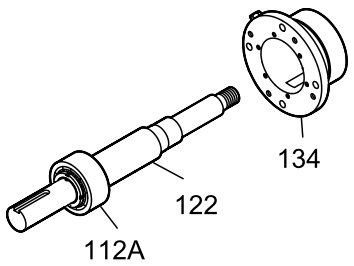
NOTICE:
Do not reuse bearings if removed from shaft. Doing so may result in equipment damage. Replace the bearings before reassembly.



Disassemble the power end (XLT-i and i17 with duplex bearings)

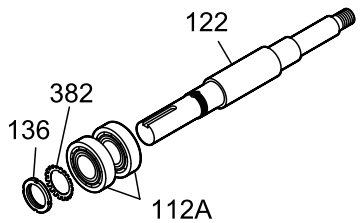


1. Remove the bearing frame to frame foot (241) using the frame-foot bolts (370F).



2. Remove the clamp screws (370C) and back off the jam nuts (423).
3. Tighten the jack screws (370D) evenly to move the bearing housing (134) out of the bearing frame (228A).
4. Remove the shaft assembly from the bearing frame (228A).
5. Remove the jack screws (370D) and the nuts (423).
6. Remove the bearing housing O-ring (496) and the inboard bearing (168A).

7. Remove the bolts (371C), the end cover (109A), and the gasket (360C).
8. If necessary, remove the outboard labyrinth oil seal (332A) from the end cover (109A) and remove the O-rings (497F and 497G).
   Labyrinth oil-seal O-rings are part of the 3196 maintenance kits, or they are sold separately.



9. Remove the bearing housing (134) and bearings (112A) from the shaft (122) .

10. Remove the bearing locknut (136), the bearing lockwasher (382), and the outboard bearing (112A).

NOTICE:
Use force only on the inner race when pressing bearings from the shaft. Failure to do so may result in equipment damage.

NOTICE:
Do not reuse bearings if removed from shaft. Doing so may result in equipment damage. Replace the bearings before reassembly.

Disassemble the bearing frame

1. Remove these plugs from the bearing frame (228A).
   - oil-fill plug (113A)

- oil-drain plug (408A)
- sight-oiler plug (408J)
- four oil mist/grease connection plugs (408H)
- oil-cooler inlet and outlet plugs (408L and 408M) or oil cooler

2. For the MTi and LTi models, remove the bearing frame foot-to-frame bolts (370F) and the frame foot (241).

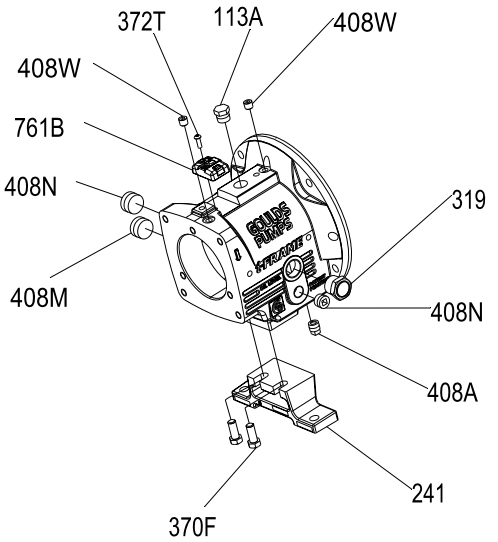


Figure 80: Plug removal

Guidelines for i-*ALERT*® Condition Monitor disposal

Precautions

WARNING:

- Explosive hazard and risk of personal injury. Heating to high temperatures could cause combustion of the condition monitor. Never heat the condition monitor to temperatures in excess of 149°C | 300°F or dispose of in a fire.

Guidelines

The battery contained in the condition monitor does not contain enough lithium to qualify as reactive hazardous waste. Use these guidelines when disposing of the condition monitor.

- The condition monitor is safe for disposal in the normal municipal waste stream.
- Adhere to local laws when you dispose of the condition monitor.

Disassemble the C-face adapter

WARNING:
Risk of personal injury and equipment damage from dropping or tipping motor. The motor must be properly supported with a clean, uncorroded eye bolt or a strap under both ends.

1. Loosen the motor-mounting bolts and remove the motor.

Table 15: Required number of motor-mounting bolts

This table shows the number of motor-mounting bolts.

Pump frame	Motor frame	Number of bolts
STi	All	4

Pump frame	Motor frame	Number of bolts
MTi and LTi	143-286	4
	324-365	8

2. Loosen the bolts attached to the bearing-frame flange and remove the C-face adapter from the bearing frame.

Pre-assembly inspections

Guidelines

Before you assemble the pump parts, make sure you follow these guidelines:

- Inspect the pump parts according to the information in these pre-assembly topics before you reassemble your pump. Replace any part that does not meet the required criteria.
- Make sure that the parts are clean. Clean the pump parts in solvent in order to remove oil, grease, and dirt.

NOTICE:
Protect machined surfaces while cleaning the parts. Failure to do so may result in equipment damage.

Replacement guidelines

Casing check and replacement

WARNING:
Risk of death or serious injury. Leaking fluid can cause fire and/or burns. Inspect and ensure gasket sealing surfaces are not damaged and repair or replace as necessary.

Inspect the casing for cracks and excessive wear or pitting. Thoroughly clean gasket surfaces and alignment fits in order to remove rust and debris.

Repair or replace the casing if you notice any of these conditions:

- Localized wear or grooving that is greater than 3.2 mm | 1/8 in. deep
- Pitting that is greater than 3.2 mm | 1/8 in. deep
- Irregularities in the casing-gasket seat surface

Casing areas to inspect

The arrows point to the areas to inspect for wear on the casing:

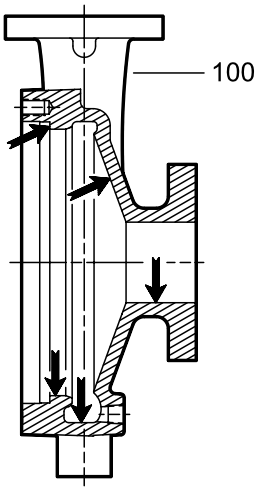

Figure 81: 3196, HT 3196, LF 3196, NM 3196, and 3198 casing

Impeller replacement

This table shows the criteria for replacing the impeller:

Impeller parts	When to replace
Impeller vanes	· When grooved deeper than 1.6 mm | 1/16 in., or · When worn evenly more than 0.8 mm | 1/32 in.
Pumpout vanes	When worn or bent more than 0.8 mm | 1/32 in.
Vane edges	When you see cracks, pitting, or corrosion damage

Impeller areas to inspect

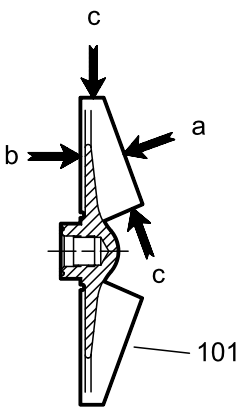

Figure 82: Areas to inspect for wear on the 3196 impeller.

Frame adapter check and replacement

- Replace the frame adapter if it has cracks or excessive corrosion damage.
- Make sure the gasket surface is clean.

Dynamic-seal repeller replacement

This table shows the criteria for replacing dynamic-seal repeller parts for the 3196, CV 3196, and LF 3196 pump models.

Dynamic seal part	When to replace
Dynamic-seal repeller vane	The grooves are deeper than 1.6 mm | 1/16 in. or are worn evenly more than 0.8 mm | 1/32 in..
Sleeve surface	The surface has grooves, pitting, or other damage.

Labyrinth seal replacement

Replace the labyrinth-seal O-ring if it has cuts and cracks.

Gaskets, O-rings, and seats replacement

WARNING:
Risk of death or serious injury. Leaking fluid can cause fire and/or burns. Replace all gaskets and O-rings at each overhaul or disassembly.

- Replace all gaskets and O-rings at each overhaul and disassembly.
- Inspect the seats. They must be smooth and free of physical defects.
  In order to repair worn seats, skin cut them in a lathe while you maintain dimensional relationships with other surfaces.
- Replace parts if the seats are defective.

Fastening

WARNING:
Risk of serious personal injury or property damage. Fasteners such as bolts and nuts are critical to the safe and reliable operation of the product. Ensure appropriate use of fasteners during installation or reassembly of the unit.

- Use fasteners of the proper size and material only.
- Replace all corroded fasteners.
- Ensure that all fasteners are properly tightened and that there are no missing fasteners.

Shaft and sleeve replacement guidelines

Two types of sleeves

The 3198 is offered with either a metallic sleeve that uses the standard 3196 shaft or a PTFE sleeve. The PTFE sleeve requires a special shaft and a different inboard labyrinth oil seal.

Shaft measurements check

Replace the shaft (122) if any measurements exceed acceptable values. See Bearing fits and tolerances.

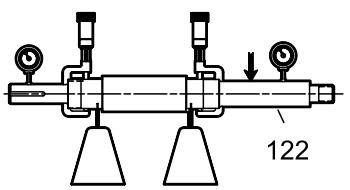

Figure 83: Shaft measurements check

Straightness check

Replace the shaft (122) if runout exceeds the values in this table:

Table 16: Shaft runout tolerances for sleeve fit and coupling fit

	Sleeve fit in millimeters | inches	Coupling fit in millimeters | inches
With sleeve	0.025 | 0.001	0.025 | 0.001
Without sleeve	0.051 | 0.002	0.025 | 0.001

Shaft and sleeve check

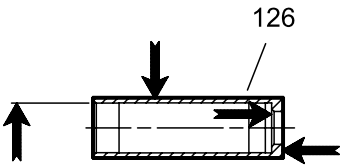

Figure 84: Shaft and sleeve check

- Check the shaft and sleeve (126) surface for grooves and pitting.
- Replace the shaft and sleeve if any grooves or pits are found.

Bearing-frame inspection

Checklist

Check the bearing frame for these conditions:

- Visually inspect the bearing frame and frame foot for cracks.
- Check the inside surfaces of the frame for rust, scale, or debris. Remove all loose and foreign material.
- Make sure that all lubrication passages are clear.
- If the frame has been exposed to pumped fluid, inspect the frame for corrosion or pitting.
- Inspect the inboard-bearing bores.
  If any bores are outside the measurements in the Bearing fits and tolerances table, replace the bearing frame.

Surface inspection locations

This figure shows the areas to inspect for wear on the bearing frame outside surface.

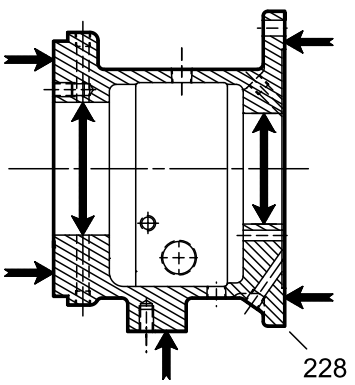

Figure 85: Outside surface inspection locations

This figure shows the areas to inspect for wear on the bearing frame inside surface.

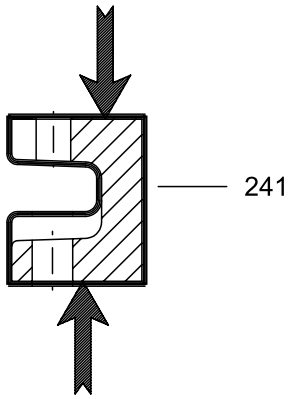

Figure 86: Inside surface inspection locations

C-face adapter inspection

Checklist

- Visually inspect the C-face adapter (340) for cracks.
- Check all surfaces for rust, scale, or debris and remove all loose and foreign material.
- Check for corrosion or pitting.

This figure shows the areas to inspect for cracks on the C-face adapter.

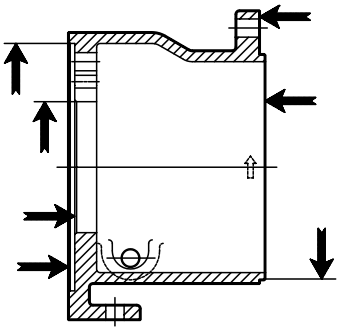

Figure 87: C-face adapter inspection locations

Seal chamber and stuffing box cover inspection

Checklist

Perform these checks when you inspect the seal chamber and stuffing box cover:

- Make sure that these surfaces are clean:
  - Seal chamber and stuffing box cover
  - Dynamic-seal backplate gasket
  - Mounting
- Make sure there is no pitting or wear greater than 3.2 mm | 1/8 in. deep. Replace the seal chamber and stuffing box cover if pitting or wear exceeds this measurement.
- Inspect the machined surfaces and mating faces noted in the figures.

These images point to the areas to inspect:

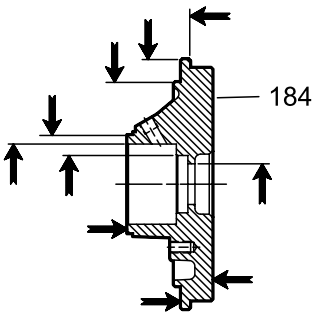

Figure 88: BigBore™ chamber

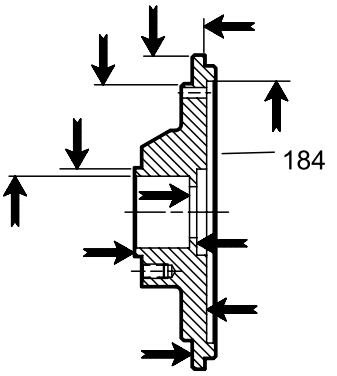

Figure 89: Stuffing box cover

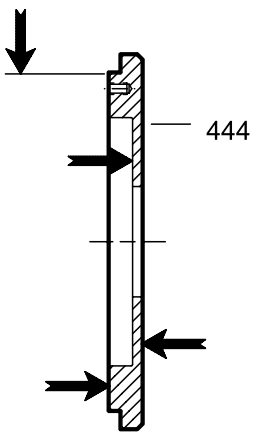

Figure 90: Dynamic-seal backplate

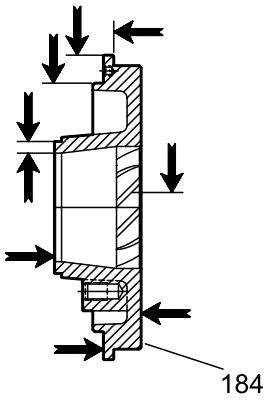

Figure 91: TaperBore™ Plus

Bearings inspection

Condition of bearings

Do not reuse bearings. The condition of the bearings provides useful information on operating conditions in the bearing frame.

Checklist

Perform these checks when you inspect the bearings:

- Inspect the bearings for contamination and damage.
- Note any lubricant condition and residue.
- Inspect the ball bearings to see if they are loose, rough, or noisy when you rotate them.
- Investigate any bearing damage to determine the cause. If the cause is not normal wear, correct the issue before you return the pump to service.

Bearing-housing inspection

Checklist

- Inspect the bearing-housing (134) bore according to the bearing fits and tolerances table.
- Replace the bearing housing if the dimensions exceed acceptable values. Reference: see Bearings fits and tolerances.
- Visually inspect the bearing housing for cracks and pits.

Checklist for specific models

This table shows bearing-housing checks that are required for specific models of pump.

Frame	Bearing-housing check
STi and MTi	Ensure that the snap-ring groove is not cracked.
LTi	Clear all grooves and holes.
XLT-i and i17	Clean the gasket surface.

Inspection locations

The following images point to the areas to inspect on the bearing housing.

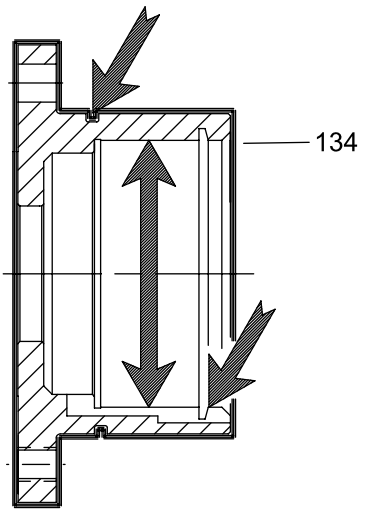

Figure 92: STi and MTi bearing housing

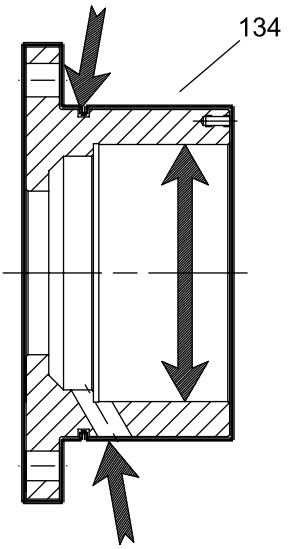

Figure 93: LTi bearing housing

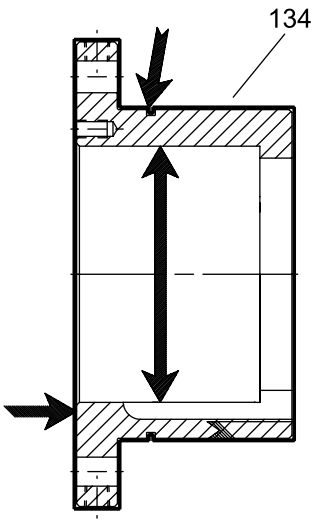

Figure 94: XLT-i and i17 bearing housing

Bearing fits and tolerances

Table 17: Bearing fits and tolerances table

This table references the bearing fits and tolerances according to the ABEC I standard.

	STi millimeters | inches	MTi millimeters | inches	LTi millimeters | inches	XLT-i, i-17 millimeters | inches
Shaft OD Inboard	35.014 | 1.3785 35.004 | 1.3781	45.014 | 1.7722 45.004 | 1.7718	55.016 | 2.1660 55.004 | 2.1655	65.016 | 2.5597 65.004 | 2.5592

Assemble the rotating element and the bearing frame (STi and MTi)

CAUTION:
Risk of physical injury from hot bearings. Wear insulated gloves when using a bearing heater.

NOTICE:
Ensure that the pipe threads are clean. Apply thread sealant to the plugs and fittings. Failure to do so may result in oil leaks and equipment damage.

NOTICE:
There are several methods used to install bearings. The recommended method is to use an induction heater that heats as well as demagnetizes the bearings. Failure to use this method may result in equipment damage.

1. Prepare the bearing frame (228) as follows (see the illustration):
   a) Install the oil-fill plug (113A).
   b) Install the oil-drain plug (408A).
   c) Install the sight glass (319).
   d) Install the sight oiler plug (408J).
   e) Install the plug for the oil-cooler inlet (408L).
   f) Install the plug for the oil-cooler outlet (408M).

g) Install four oil-mist connection plugs (408H).
Or: Install two grease fittings (193) and two grease-relief plugs (113).

h) Attach the bearing-frame foot (241) and fasten the bolts (370F) by hand.

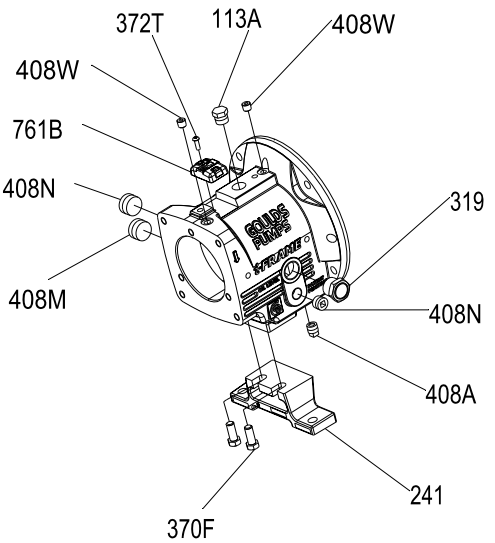

Figure 95: Oil mist connection plugs

2. Install the outboard bearing (112A) on the shaft (122).
The regreaseable bearing has a single shield. The outboard bearing is installed with the shield toward the impeller.
   a) Inspect the shaft (122) to ensure that it is clean, dimensionally correct, and is free of nicks and burrs.
   b) Lightly coat the bearing seating with a thin film of oil.
   c) Remove the bearing (112) from its packaging.
   d) Wipe the preservative from the bearing (112) bore and outer diameter.
   e) Use an induction heater with a demagnetizing cycle to heat the bearing (112) to an inner ring temperature of 110 °C | 230 °F.
   f) Position the bearing (112) on the shaft (122) against the shoulder and snug the locknut (136) against the bearing until it is cool.
   The locknut prevents the bearing from moving away from the shaft shoulder as it cools.
   g) Remove the bearing locknut (136) after the bearing (112) cools.
3. Put the lockwasher (382) onto the shaft (122).
4. Thread the locknut (136) onto the shaft (122) and tighten it until it is snug.
5. Bend the tangs of the lockwasher into the slots of the locknut.
6. Put the bearing-retaining ring (361A) onto the shaft (122).
Make sure that the flat side of the ring is towards the bearing.
7. Coat the inner surfaces of the bearings with lubricant.
8. Put the inboard bearing (168) onto the shaft (122).

The regreasable bearing has a single shield. Make sure that the bearing is installed with the shield away from the impeller.

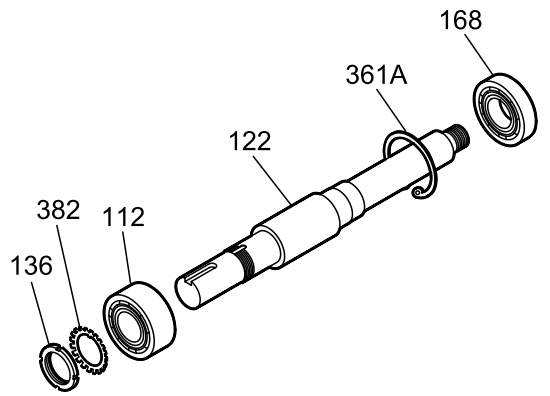

Figure 96: Inboard bearing reassembly

9. Prepare the shaft for assembly as follows (see the illustration):
   a) Install a new O-ring (496).
   b) Coat the outside of the outboard bearing (112A) with oil.
   c) Coat the bore of the bearing housing (134) with oil.
   d) Put the bearing housing (134) onto the shaft.
      Do not use force.
   e) Insert the bearing-retaining ring (361A) into the bore groove of the bearing housing (134).

NOTICE:
Ensure that the space between the ends of the retaining ring are located in the oil return groove. Failure to do so will cause oil-flow obstruction and result in equipment damage.

      Make sure that the shaft rotates freely.
   f) Install the outboard labyrinth oil-seal (332A) into the bearing housing (134).
      Place the drain slots of the oil seal at the bottom position (6 o'clock).
      Make sure that the edges of the keyway are free from burrs. To protect the O-ring, cover the keyway lengthwise with a piece of electrical tape before you install the oil seal.

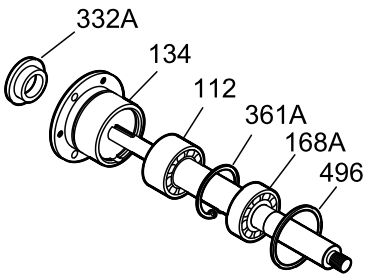

Figure 97: Outboard labyrinth oil-seal reassembly

10. Install the shaft assembly into the bearing frame as follows (see the illustration):
    a) Coat the outside of the bearing housing (134) with oil.
    b) Coat all the internal surfaces of the bearing frame (228) with oil.
    c) Install the shaft assembly into the bearing frame (228).
       Make sure that the shaft rotates freely.
    d) Install the clamp bolts (370C) in the bearing housing (134) and tighten by hand.

e) Install the jack bolts (370D) with the locknuts (423) in the bearing housing (134) and tighten by hand.

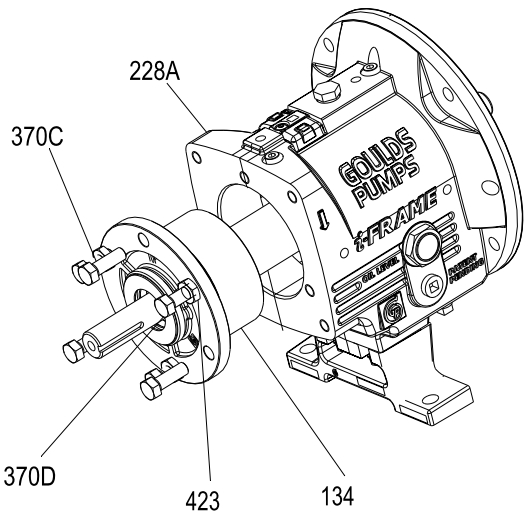

Figure 98: Jack bolt and locknut reassembly

Assemble the rotating element and the bearing frame (STi and MTi with duplex bearings)

WARNING:
Lifting and handling heavy equipment or components poses a crush hazard. Use caution during lifting and handling and wear appropriate Personal Protective Equipment (PPE, such as steel-toed shoes, gloves, etc.) at all times. Seek assistance if necessary.

CAUTION:
Risk of physical injury from hot bearings. Wear insulated gloves when using a bearing heater.

NOTICE:
Ensure that the pipe threads are clean. Apply thread sealant to the plugs and fittings. Failure to do so may result in oil leaks and equipment damage.

NOTICE:
There are several methods used to install bearings. The recommended method is to use an induction heater that heats as well as demagnetizes the bearings. Failure to use this method may result in equipment damage.

1. Prepare the bearing frame (228) as follows (see the illustration):
   a) Install the oil-fill plug (113A).
   b) Install the oil-drain plug (408A).
   c) Install the sight glass (319).
   d) Install the sight oiler plug (408J).
   e) Install the plug for the oil-cooler inlet (408L).
   f) Install the plug for the oil-cooler outlet (408M).

g) Install four oil-mist connection plugs (408H).
Or: Install two grease fittings (193) and two grease-relief plugs (113).

h) Attach the bearing-frame foot (241) and fasten the bolts (370F) by hand.

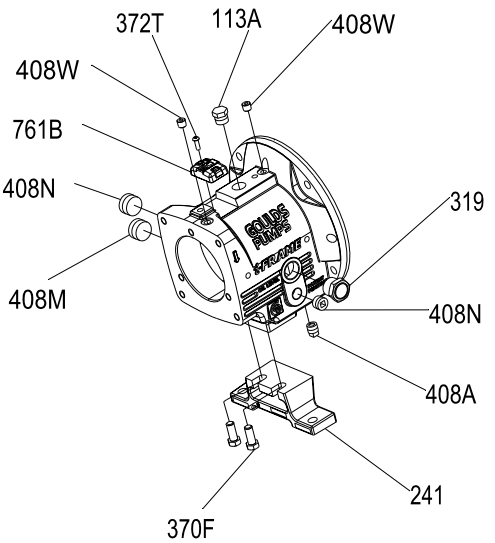

Figure 99: Bearing frame foot reassembly

2. Install the outboard bearings (112A) on the shaft (122).
The regreasable bearing has a single shield. Make sure that the bearing is installed with the shield away from the impeller.
The duplex bearings are mounted back-to-back. Make sure that the orientation of the bearings are correct.

a) Inspect the shaft (122) to ensure that it is clean, dimensionally correct, and is free of nicks and burrs.

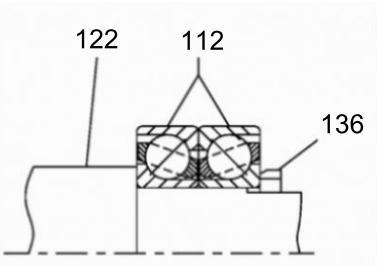

Figure 100: Shaft inspection

b) Lightly coat the bearing seating with a thin film of oil.

c) Remove the bearings (112) from their packaging.

d) Wipe the preservative from the bearing (112) bore and outer diameter.

e) Use an induction heater with a demagnetizing cycle to heat both bearings (112) to an inner ring temperature of 110 °C | 230 °F.

f) Place both bearings (112) on the shaft (122) with the large outer races together (back-to-back).

g) Position the bearings (112) on the shaft (122) against the shoulder and snug the locknut (136) against the bearings until they are cool.
The locknut prevents the bearings from moving away from the shaft shoulder as they cool. Rotate the outer bearing rings relative to each other as they are placed on the shaft to assure good alignment.

h) Remove the bearing locknut (136) after the bearings (112) are cool.

3. Put the lockwasher (382) onto the shaft (122).

4. Thread the locknut (136) onto the shaft (122) and tighten it until it is snug.

5. Bend the tangs of the lockwasher into the slots of the locknut.
6. Place the bearing-clamp ring (253B) onto the shaft (122).
   Make sure that the orientation of the bearing-clamp ring is correct.
7. Coat the inner surfaces of the bearings with lubricant.
8. Put the inboard bearing (168) onto the shaft (122).

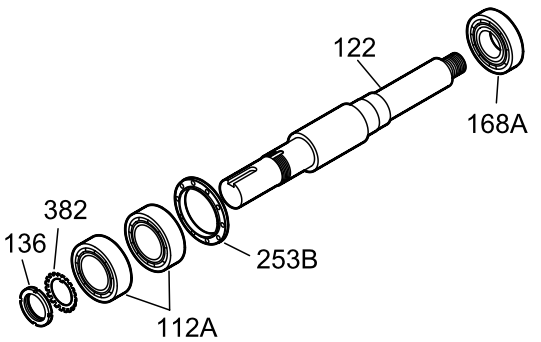

Figure 101: Inboard bearing reassemby

9. Install the bearing housing as follows (see the illustration):
   a) Coat the outside of the outboard bearing (112A) with oil.
   b) Coat the bore of the bearing housing (134) with oil.
   c) Put the bearing housing (134) onto the shaft.
      Do not use force.

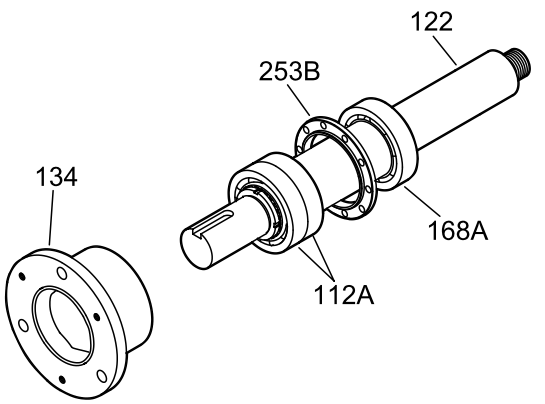

Figure 102: Bearing housing reassembly

10. Prepare the shaft for assembly as follows (see the illustration):
    a) Place the bearing-clamp ring (253B) onto the shaft (122).
    b) Fasten the clamp-ring bolts (236A) crosswise.
       See the specified torque values.
       Make sure that the shaft rotates freely.
    c) Install a new O-ring (496).

d) Install the outboard labyrinth oil-seal (332A) into the bearing housing (134).
Place the drain slots of the oil seal at the bottom position (6 o'clock).
Make sure that the edges of the keyway are free from burrs. To protect the O-ring, cover the keyway lengthwise with a piece of electrical tape before you install the oil seal.

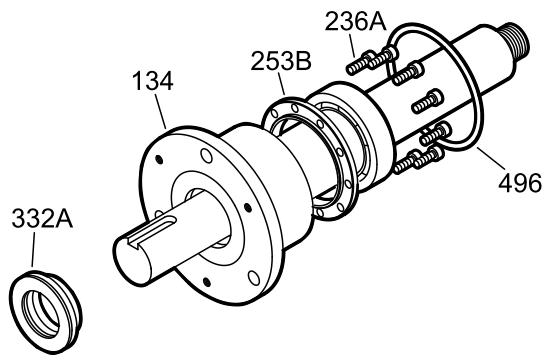

Figure 103: Outboard labyrinth oil seal reassembly

11. Install the shaft assembly into the bearing frame as follows (see the illustration):
    a) Coat the outside of the bearing housing (134) with oil.
    b) Coat all the internal surfaces of the bearing frame (228) with oil.
    c) Install the shaft assembly into the bearing frame (228).
    Make sure that the shaft rotates freely.
    d) Install the clamp bolts (370C) in the bearing housing (134) and tighten by hand.
    e) Install the jack bolts (370D) with the locknuts (423) in the bearing housing (134) and tighten by hand.

Assemble the rotating element and the bearing frame (LTi)

WARNING:
Lifting and handling heavy equipment poses a crush hazard. Use caution during lifting and handling and wear appropriate Personal Protective Equipment (PPE, such as steel-toed shoes, gloves, etc.) at all times. Seek assistance if necessary.

CAUTION:
Risk of physical injury from hot bearings. Wear insulated gloves when using a bearing heater.

NOTICE:
Ensure that the pipe threads are clean. Apply thread sealant to the plugs and fittings. Failure to do so may result in oil leaks and equipment damage.

NOTICE:
There are several methods used to install bearings. The recommended method is to use an induction heater that heats as well as demagnetizes the bearings. Failure to use this method may result in equipment damage.

1. Prepare the bearing frame (228) as follows (see the illustration):
    a) Install the oil-fill plug (113A).
    b) Install the oil-drain plug (408A).

c) Install the sight glass (319).

d) Install the sight oiler plug (408J).

e) Install the plug for the oil-cooler inlet (408L).

f) Install the plug for the oil-cooler outlet (408M).

g) Install four oil-mist connection plugs (408H).
Or: Install two grease fittings (193) and two grease-relief plugs (113).

h) Attach the bearing-frame foot (241) and fasten the bolts (370F) by hand.

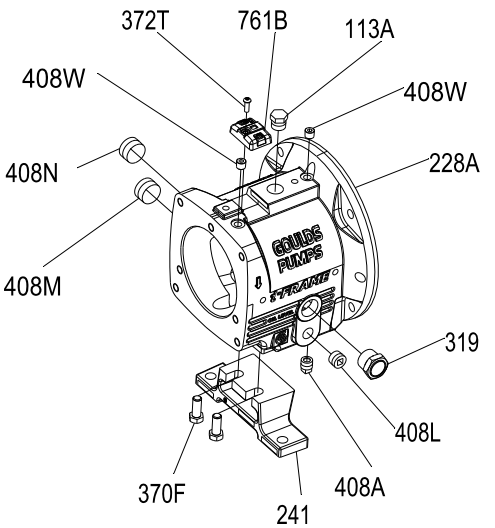

Figure 104: Attach the bearing-frame foot

2. Install the oil flinger (248A) onto the shaft (122).

NOTICE:
The oil flinger is press fitted onto the shaft. Use a properly sized driver. Failure to do so may result in damage to the oil flinger.

3. Place the bearing-clamp ring (253B) onto the shaft (122).
Make sure that the orientation of the bearing-clamp ring is correct.

4. Install outboard bearings (112A) on shaft (122).
The regreasable bearing has a single shield. Make sure that the bearing is installed with the shield away from the impeller.
The duplex bearings are mounted back-to-back. Make sure that the orientation of the bearings are correct.

a) Inspect the shaft (122) to ensure that it is clean, dimensionally correct, and is free of nicks and burrs.

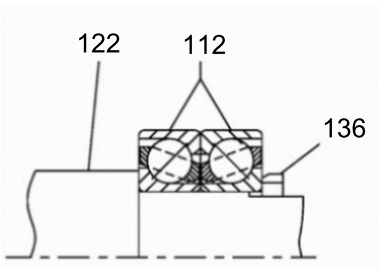

Figure 105: Shaft inspection

b) Lightly coat the bearing seating with a thin film of oil.

c) Remove the bearings (112) from their packaging.

d) Wipe the preservative from the bearing (112) bore and outer diameter.

e) Use an induction heater with a demagnetizing cycle to heat both bearings (112) to an inner ring temperature of 110 °C | 230 °F.

f) Place both bearings (112) on the shaft (122) with the large outer races together (back-to-back).

g) Position the bearings (112) on the shaft (122) against the shoulder and snug the locknut (136) against the bearings until they are cool.
The locknut prevents the bearings from moving away from the shaft shoulder as they cool. Rotate the outer bearing rings relative to each other as they are placed on the shaft to assure good alignment.

h) Remove the bearing locknut (136) after the bearings (112) are cool.

5. Put the lockwasher (382) onto the shaft (122).
6. Thread the locknut (136) onto the shaft (122) and tighten it until it is snug.
7. Bend the tangs of the lockwasher into the slots of the locknut.
8. Coat the inner surfaces of the bearings with lubricant.
9. Put the inboard bearing (168) onto the shaft (122).

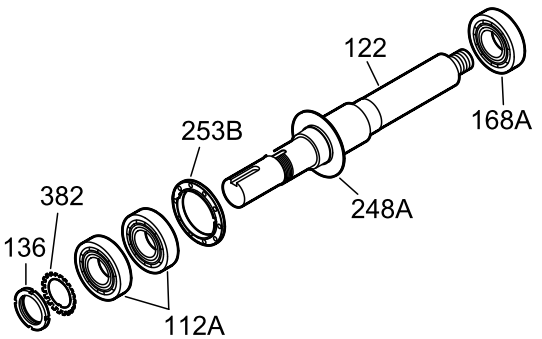

Figure 106: Inboard bearing reassembly

10. Install the bearing housing as follows (see the illustration):
    a) Coat the outside of the outboard bearing (112A) with oil.
    b) Coat the bore of the bearing housing (134) with oil.
    c) Put the bearing housing (134) onto the shaft.
    Do not use force.

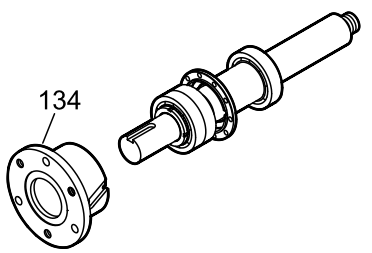

Figure 107: Bearing housing reassembly

11. Prepare the shaft for assembly as follows (see the illustration):
    a) Fasten the clamp-ring bolts (236A) crosswise.
    See the specified torque values.
    Make sure that the shaft rotates freely.
    b) Install a new O-ring (496).

c) Install the outboard labyrinth oil-seal (332A) into the bearing housing (134).
Place the drain slots of the oil seal at the bottom position (6 o'clock).
Make sure that the edges of the keyway are free from burrs. To protect the O-ring, cover the keyway lengthwise with a piece of electrical tape before you install the oil seal.

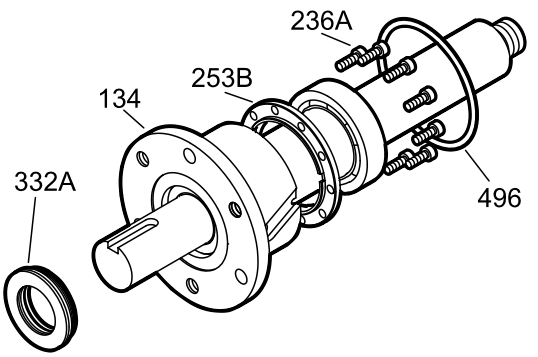

Figure 108: Outboard labyrinth oil-seal reassembly

12. Install the shaft assembly into the bearing frame as follows (see the illustration):
    a) Coat the outside of the bearing housing (134) with oil.
    b) Coat all the internal surfaces of the bearing frame (228) with oil.
    c) Install the shaft assembly into the bearing frame (228).
    Make sure that the shaft rotates freely.
    d) Install the clamp bolts (370C) in the bearing housing (134) and tighten by hand.
    e) Install the jack bolts (370D) with the locknuts (423) in the bearing housing (134) and tighten by hand.

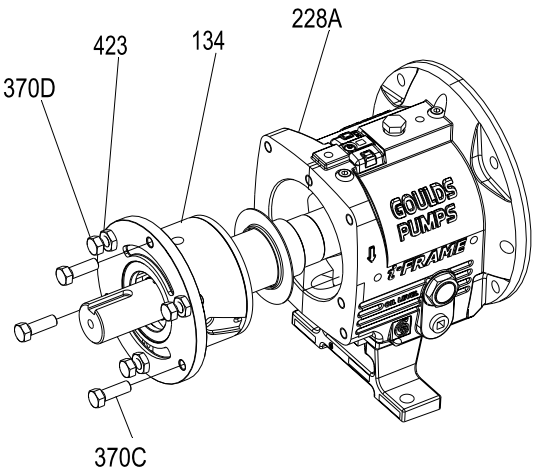

Figure 109: Jack bolt and locknut installation

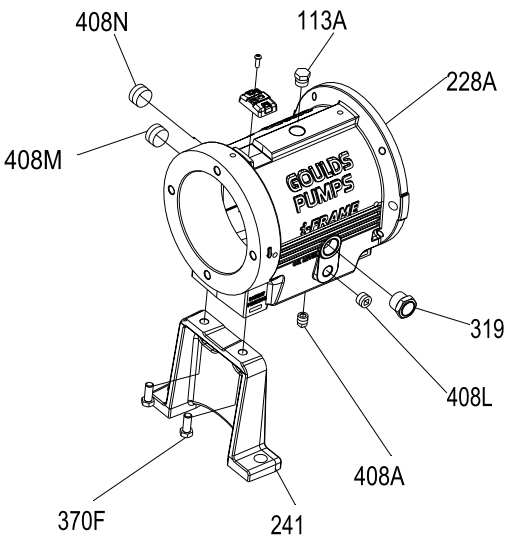
Assemble the rotating element and the bearing frame (XLT-i and i17)



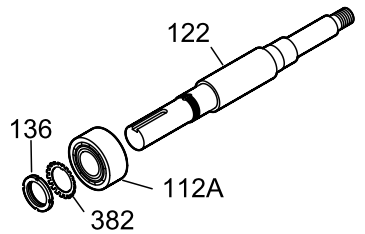
WARNING:
Lifting and handling heavy equipment or components poses a crush hazard. Use caution during lifting and handling and wear appropriate Personal Protective Equipment (PPE, such as steel-toed shoes, gloves, etc.) at all times. Seek assistance if necessary.

CAUTION:
Risk of physical injury from hot bearings. Wear insulated gloves when using a bearing heater.

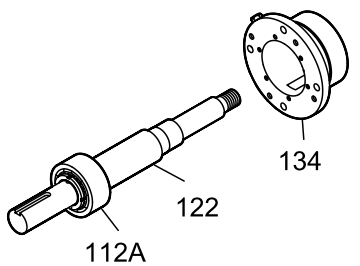
NOTICE:
Ensure that the pipe threads are clean. Apply thread sealant to the plugs and fittings. Failure to do so may result in oil leaks and equipment damage.

NOTICE:
There are several methods used to install bearings. The recommended method is to use an induction heater that heats as well as demagnetizes the bearings. Failure to use this method may result in equipment damage.

1. Prepare the bearing frame (228) as follows (see the illustration):
   a) Install the oil-fill plug (113A).
   b) Install the oil-drain plug (408A).
   c) Install the sight glass (319).
   d) Install the sight oiler plug (408J).
   e) Install the plug for the oil-cooler inlet (408L).
   f) Install the plug for the oil-cooler outlet (408M).
   g) Install four oil-mist connection plugs (408H).
      Or: Install two grease fittings (193) and two grease-relief plugs (113).

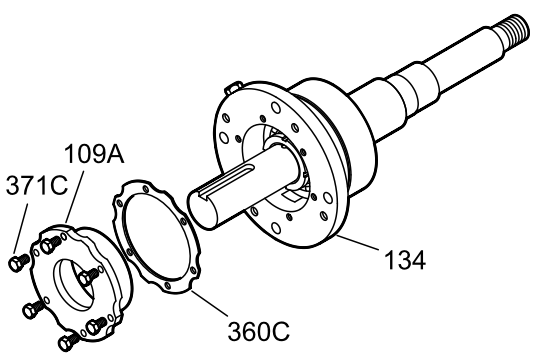


2. Install the outboard bearings (112A) on the shaft (122).
   The regreaseable bearing has a single shield. The outboard bearing is installed with the shield toward the impeller.
   a) Inspect the shaft (122) to ensure that it is clean, dimensionally correct, and is free of nicks and burrs.
   b) Lightly coat the bearing seating with a thin film of oil.
   c) Remove the bearing (112) from its packaging.
   d) Wipe the preservative from the bearing (112) bore and outer diameter.
   e) Use an induction heater with a demagnetizing cycle to heat the bearing (112) to an inner ring temperature of 110 °C | 230 °F.



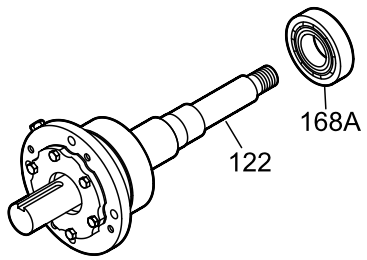
f) Position the bearing (112) on the shaft (122) against the shoulder and snug the locknut (136) against the bearing until it is cool.
The locknut prevents the bearing from moving away from the shaft shoulder as it cools.

g) Remove the bearing locknut (136) after the bearing (112) cools.

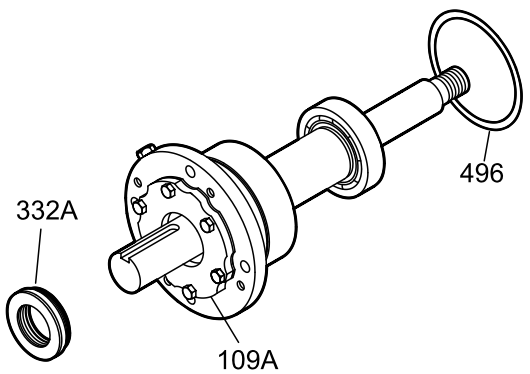


3. Put the lockwasher (382) onto the shaft (122).
4. Thread the locknut (136) onto the shaft (122) and tighten it until it is snug.
5. Bend the tangs of the lockwasher into the slots of the locknut.

6. Install the bearing housing as follows (see the illustration):
   a) Coat the outside of the outboard bearing (112A) with oil.
   b) Coat the bore of the bearing housing (134) with oil.
   c) Put the bearing housing (134) onto the shaft.
   Do not use force.

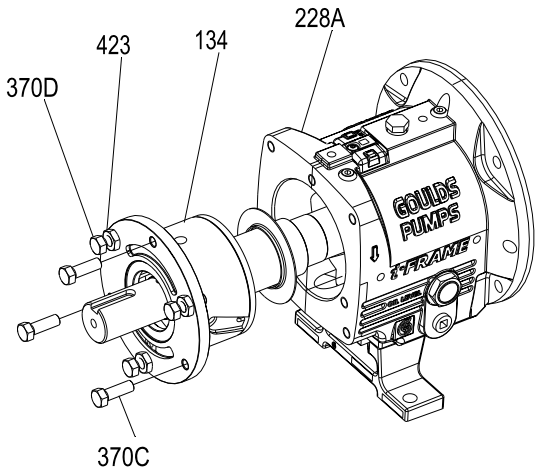


7. Fasten the gasket (360C) and the end cover (109A) with the bolts (371C).
   See the specified torque values.
   Make sure that the shaft rotates freely.



8. Install the inboard bearing as follows (see the illustration):
   a) Coat the inner surfaces of the bearings with lubricant.

b) Put the inboard bearing (168) onto the shaft (122).
The regreasable bearing has a single shield. Make sure that the bearing is installed with the shield away from the impeller.



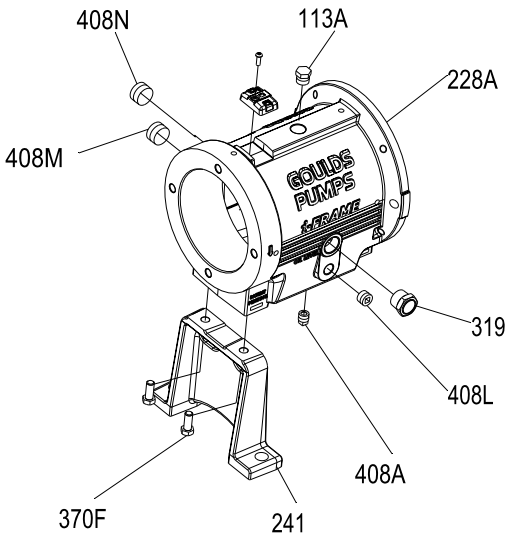
9. Install the remaining parts onto the bearing shaft as follows (see the illustration):
   a) Install a new O-ring (496).
   b) Install the outboard labyrinth oil-seal (332A) into the end cover (109A).
   Place the drain slots of the oil seal at the bottom position (6 o'clock).
   Make sure that the edges of the keyway are free from burrs. To protect the O-ring, cover the keyway lengthwise with a piece of electrical tape before you install the oil seal.

10. Install the shaft assembly into the bearing frame as follows (see the illustration):
   a) Coat the outside of the bearing housing (134) with oil.
   b) Coat all the internal surfaces of the bearing frame (228) with oil.
   c) Install the shaft assembly into the bearing frame (228).
   Make sure that the shaft rotates freely.
   d) Install the clamp bolts (370C) in the bearing housing (134) and tighten by hand.
   e) Install the jack bolts (370D) with the locknuts (423) in the bearing housing (134) and tighten by hand.

f) Attach the bearing-frame foot (241) and fasten the bolts (370F) by hand.

Assemble the rotating element and the bearing frame (XLT-i and i17 with duplex bearings)

WARNING:
Lifting and handling heavy equipment or components poses a crush hazard. Use caution during lifting and handling and wear appropriate Personal Protective Equipment (PPE, such as steel-toed shoes, gloves, etc.) at all times. Seek assistance if necessary.



CAUTION:
Risk of physical injury from hot bearings. Wear insulated gloves when using a bearing heater.

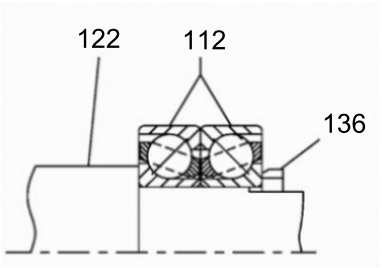
NOTICE:
Ensure that the pipe threads are clean. Apply thread sealant to the plugs and fittings. Failure to do so may result in oil leaks and equipment damage.

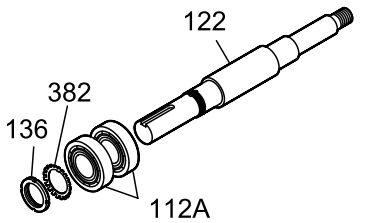
NOTICE:
There are several methods used to install bearings. The recommended method is to use an induction heater that heats as well as demagnetizes the bearings. Failure to use this method may result in equipment damage.

1. Prepare the bearing frame (228) as follows (see the illustration):
   a) Install the oil-fill plug (113A).
   b) Install the oil-drain plug (408A).
   c) Install the sight glass (319).
   d) Install the sight oiler plug (408J).
   e) Install the plug for the oil-cooler inlet (408L).
   f) Install the plug for the oil-cooler outlet (408M).

g) Install four oil-mist connection plugs (408H).
Or: Install two grease fittings (193) and two grease-relief plugs (113).

2. Install the outboard bearings (112A) on the shaft (122).
The regreasable bearing has a single shield. Make sure that the bearing is installed with the shield away from the impeller.
The duplex bearings are mounted back-to-back. Make sure that the orientation of the bearings are correct.
   a) Inspect the shaft (122) to ensure that it is clean, dimensionally correct, and is free of nicks and burrs.





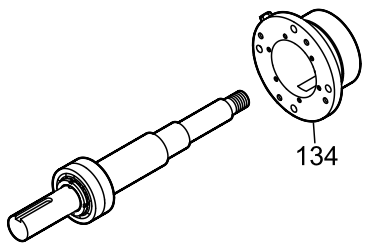


Figure 110: Shaft inspection

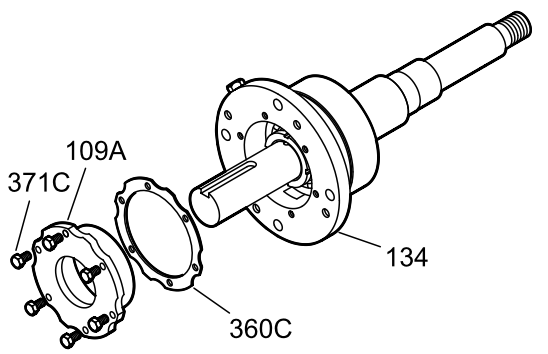
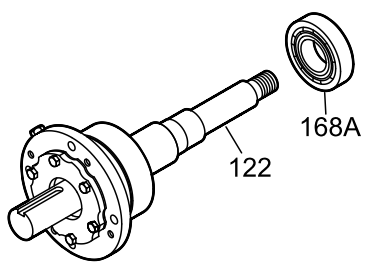
   b) Lightly coat the bearing seating with a thin film of oil.
   c) Remove the bearings (112) from their packaging.
   d) Wipe the preservative from the bearing (112) bore and outer diameter.
   e) Use an induction heater with a demagnetizing cycle to heat both bearings (112) to an inner ring temperature of 110 °C | 230 °F.
   f) Place both bearings (112) on the shaft (122) with the large outer races together (back-to-back).
   g) Position the bearings (112) on the shaft (122) against the shoulder and snug the locknut (136) against the bearings until they are cool.
   The locknut prevents the bearings from moving away from the shaft shoulder as they cool. Rotate the outer bearing rings relative to each other as they are placed on the shaft to assure good alignment.
   h) Remove the bearing locknut (136) after the bearings (112) are cool.
3. Put the lockwasher (382) onto the shaft (122).
4. Thread the locknut (136) onto the shaft (122) and tighten it until it is snug.

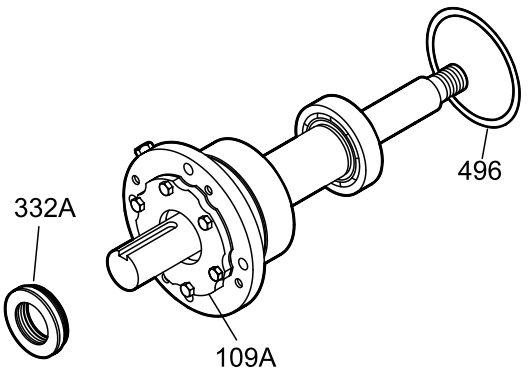


5. Bend the tangs of the lockwasher into the slots of the locknut.

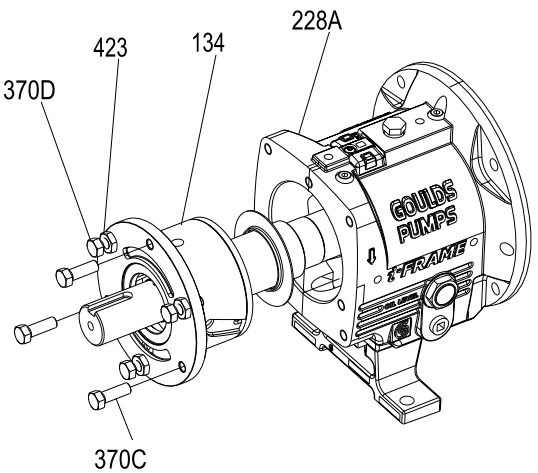


6. Install the bearing housing as follows (see the illustration):
   a) Coat the outside of the outboard bearing (112A) with oil.
   b) Coat the bore of the bearing housing (134) with oil.
   c) Put the bearing housing (134) onto the shaft.
      Do not use force.

7. Fasten the gasket (360C) and the end cover (109A) with the bolts (371C).
   See the specified torque values.
   Make sure that the shaft rotates freely.



8. Install the inboard bearing as follows (see the illustration):
   a) Coat the inner surfaces of the bearings with lubricant.
   b) Put the inboard bearing (168) onto the shaft (122).
      The regreasable bearing has a single shield. Make sure that the bearing is installed with the shield away from the impeller.



9. Install the remaining parts onto the bearing shaft as follows (see the illustration):
   a) Install a new O-ring (496).

b) Install the outboard labyrinth oil-seal (332A) into the end cover (109A).
Place the drain slots of the oil seal at the bottom position (6 o'clock).
Make sure that the edges of the keyway are free from burrs. To protect the O-ring, cover the keyway lengthwise with a piece of electrical tape before you install the oil seal.

10. Install the shaft assembly into the bearing frame as follows (see the illustration):
    a) Coat the outside of the bearing housing (134) with oil.
    b) Coat all the internal surfaces of the bearing frame (228) with oil.
    c) Install the shaft assembly into the bearing frame (228).
    Make sure that the shaft rotates freely.
    d) Install the clamp bolts (370C) in the bearing housing (134) and tighten by hand.
    e) Install the jack bolts (370D) with the locknuts (423) in the bearing housing (134) and tighten by hand.
    f) Attach the bearing-frame foot (241) and fasten the bolts (370F) by hand.

Assemble the frame

1. Support the frame assembly in a horizontal position.
2. Check the shaft-end play by moving the shaft forward and backward by hand, and note any indicator movement.
   If the total indicator reading is greater than the values in this table, then disassemble the shaft and determine the cause.

Table 18: Shaft-end play

Use this table as a reference for shaft-end play values.

Frame	Double row bearing	Duplex bearing
STi millimeters | inches	0.028 | 0.0011 0.048 | 0.0019	0.018 | 0.0007 0.025 | 0.0010
MTi millimeters | inches	0.033 | 0.0013 0.053 | 0.0021	0.023 | 0.0009 0.030 | 0.0012
LTi millimeters | inches	Not applicable	0.025 | 0.0010 0.038 | 0.0015
XLT-i, i-17 millimeters | inches	0.036 | 0.0014 0.058 | 0.0023	0.025 | 0.0010 0.038 | 0.0015

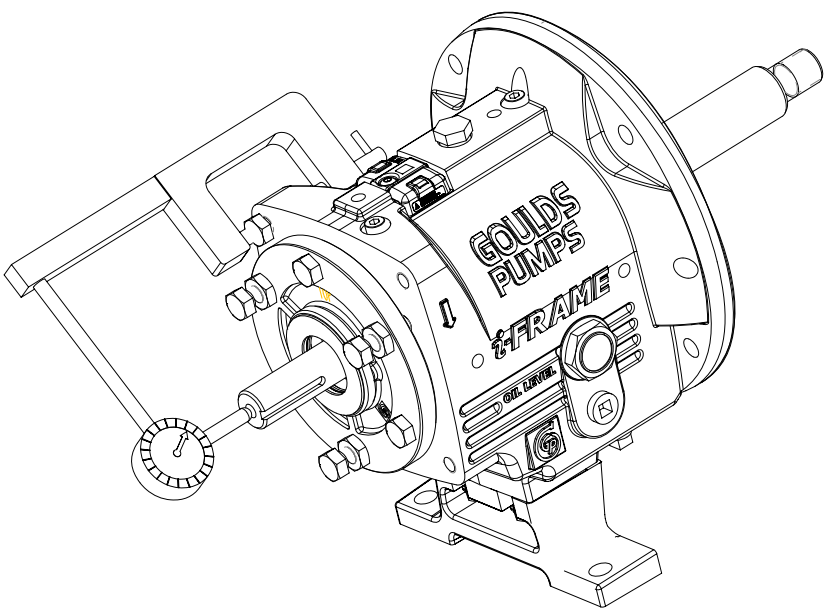


Figure 111: Check shaft end play

3. Check the shaft-sleeve (126) runout.
   a) Install the shaft sleeve.
   b) Thread the impeller on the shaft until hand tight.
   c) Rotate the shaft 360º.
   d) If the total indicator reading is greater than 0.051 mm | 0.002 in., then disassemble the shaft sleeve and determine the cause.

e) Remove the impeller and shaft sleeve.

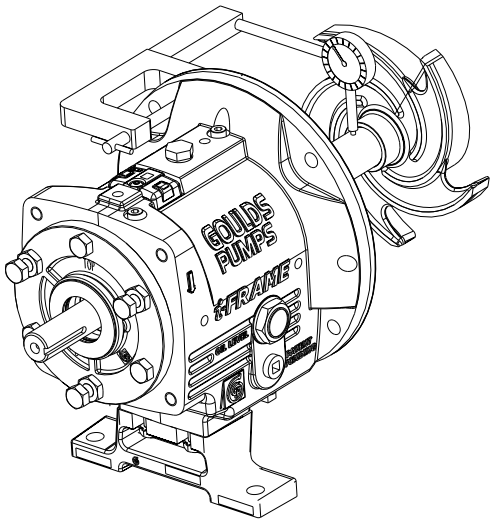

Figure 112: Remove impeller and shaft sleeve

4. Check the frame-face run-out by rotating the shaft so that the indicator measures the fit for 360º.
   If the total indicator reading is greater than 0.025 mm | 0.001 in., then disassemble and determine the cause.

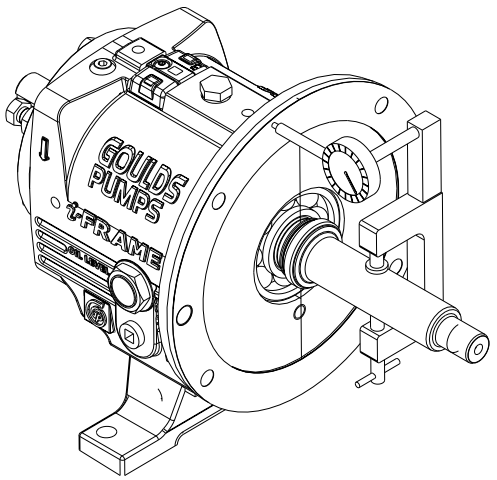

Figure 113: Check frame-face run-out

5. Place the manila gasket (360D) on the frame (228), and hold the gasket in place by inserting the dowel pins (469B) in their holes.
   The gasket is designed to fit only one way.
6. Install the frame adapter.
   a) Place the frame adapter (108) onto the frame assembly.

b) Align the bolt holes and dowel locations on the frame adapter with the bolt holes and dowel locations on the frame.

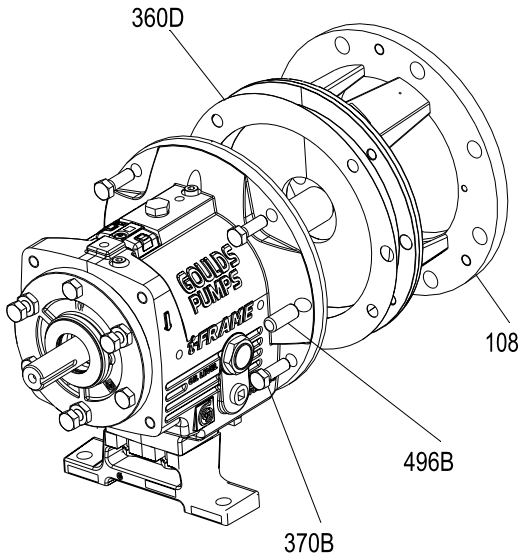

Figure 114: Align bolt holes and dowel locations

c) Install the dowel pins (469B) and bolts (370B). Tighten the bolts in a criss-cross pattern according to the specifications in the bolt torque values table.

d) Rotate the shaft 360º to check the adapter fit.
If the total indicator reading is greater than 0.13 mm | 0.005 in., then determine the cause and correct it before you proceed.

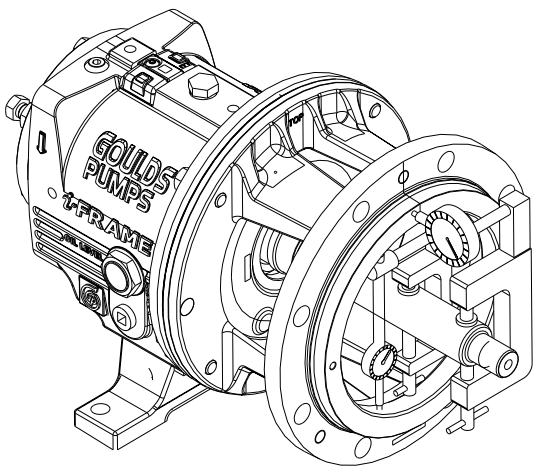

Figure 115: Check adapter fit

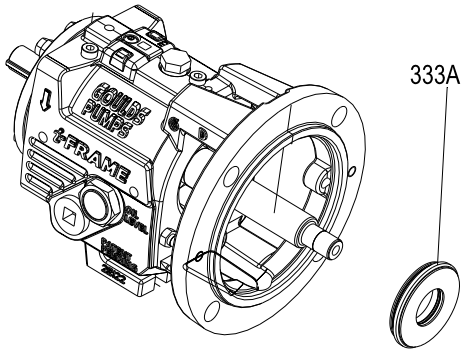
7. Install the labyrinth oil-seal (333A) into the adapter (108) and the bearing frame (228). The labyrinth oil seal is an O-ring fit.
8. Position the labyrinth oil-seal drain slots at the bottom (6 o'clock) position.

Refer to Assemble the INPRO labyrinth oil-seal for more information on the labyrinth oil-seal installation.



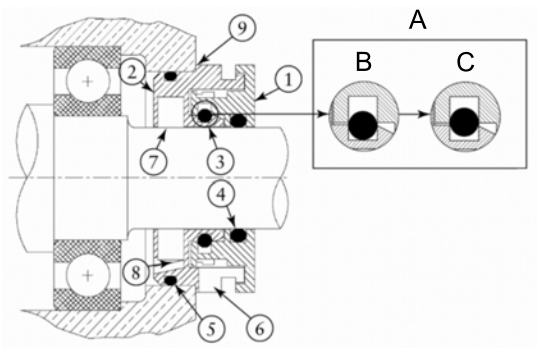


Figure 116: Position labyrinth oil-seal drain slots

INPRO labyrinth oil seal description

Description

The INPRO VBXX-D Labyrinth Oil Seal consists of the rotor (1), the stator (2), and the VBX Ring (3). The rotor (1) fits over the shaft and is held in place by an elastomeric drive ring (4). The drive ring causes the rotor to turn with the shaft and provides a positive, static seal against the shaft. Since there is no metal-to-metal contact, there are no friction or wear concerns.

NOTICE:
The labyrinth seal is a one-piece design. Do not attempt to separate the rotor from the stator. Doing so will damage the seal.

A	"VBX" O-ring action
B	Static
C	Dynamic
1	Rotor
2	Stator
3	"VBX" ring
4	Rotor drive ring
5	Stator gasket
6	Expulsion port
7	D groove
8	Lube return
9	Location shoulder

Figure 117: INPRO labyrinth oil seal

Assemble the INPRO labyrinth oil seal

1. Wrap electrical tape around the coupling end of the shaft to cover the keyway.

NOTICE:
The edges of the keyway can be sharp. Cover the keyway with tape. Failure to do so may result in damaging the o-ring and/or labyrinth seal.

2. Lightly lube the shaft and the drive ring (4) with lubricant.
   Lubricant helps in the installation process. Be sure that the lubricant is compatible with the O-ring material and the pump-system standards.
3. Use an arbor press to install the outboard INPRO VBXX-D into the bearing cover with the expulsion port (6) at the 6 o'clock position.
   Press the outboard INPRO VBXX-D down to where the stator location ramp (9) starts to avoid angular misalignment. There is a nominal 0.051 mm | 0.002 in. interference fit.
4. Discard any residual material from the stator gasket (5).
5. Complete the applicable step in this table depending on the model of your pump.

Pump model	Action
STi	Press the inboard seal along the shaft into the bearing frame.
All other models	After you install the frame adapter on the bearing frame, press the inboard seal over the shaft and into the adapter.

Assemble the C-face adapter

1. Mount the pump and the motor-coupling hubs if they are not already mounted.
2. Slide the C-face adapter over the pump shaft and mount it against the bearing-frame flange using four bolts.
3. Mount the motor to the C-face adapter using either four or eight motor bolts.

Table 19: Motor-bolt torque values for C-face adapter to frame

This table contains the motor-bolt torque values for assembling the C-face adapter to a frame.

Frame	Lubricated threads	Dry threads
STi	27 Nm | 20 ft-lb	41 Nm | 30 ft-lb
MTi	27 Nm | 20 ft-lb	41 Nm | 30 ft-lb
LTi	27 Nm | 20 ft-lb	41 Nm | 30 ft-lb

Table 20: Motor-bolt torque values for C-face adapter to motor

This table contains the motor-bolt torque values for assembling the C-face adapter to a motor.

Frame	Lubricated threads	Dry threads
143TC-145TC	11 Nm | 8 ft-lb	16 Nm | 12 ft-lb
182TC-286TC	20 ft-lb (27 Nm)	41 Nm | 30 ft-lb
324TC-365TC	39 ft-lb (53 Nm)	80 Nm | 59 ft-lb

Shaft sealing

WARNING:
The mechanical seal used in an Ex-classified environment must be properly certified.

CAUTION:
Running a mechanical seal dry, even for a few seconds, can cause seal failure and physical injury. Never operate the pump without liquid supplied to the mechanical seal.

Methods for sealing the shaft

These sections discuss the methods that you can use to seal the shaft.

- Seal the shaft with a dynamic seal.
- Seal the shaft with a cartridge-mechanical seal.
- Seal the shaft with a conventional inside-component mechanical seal.
- Seal the shaft with a conventional outside-component mechanical seal.
- Seal the shaft with a packed stuffing box.

Seal the shaft with a dynamic seal

1. Place the backplate (444) with the flat side down on the bench.

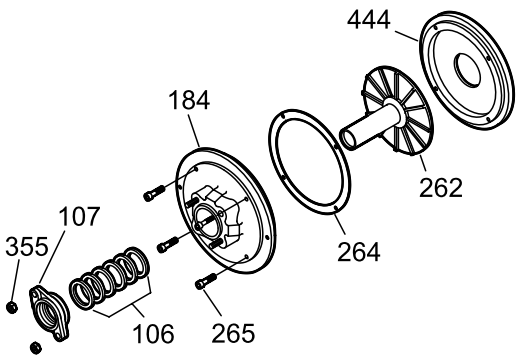

Figure 118: Backplate placement

2. Place the repeller (262) in the backplate (444) with the sleeve side up.
3. Place a PTFE gasket (264) on the backplate (444) and align the holes in the gasket with the holes in the backplate.
4. Place a stuffing-box cover (184) on the backplate (444) and align the holes in the gasket with the holes in the backplate.
5. Install four socket-head capscrews (265) and tighten them securely.
6. Install a new sealing element into the gland.
7. Install a gasket (360Q) and gland (107) on the stuffing-box cover (184).
8. Install the nuts (355).
9. Install a dynamic-seal assembly and nuts (370H).

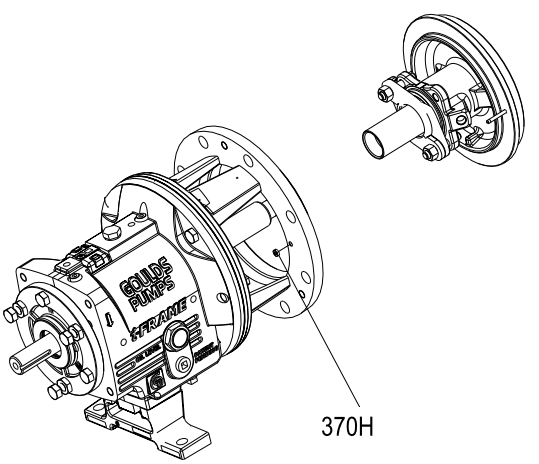

Figure 119: Dynamic seal installation

10. Check the stuffing-box-cover runout and rotate the indicator through 360 degrees.

An indicator reading that is greater than 0.013 mm | 0.005 in. indicates a problem.

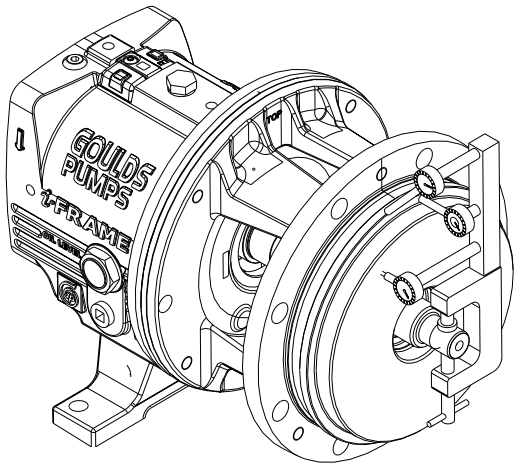

Figure 120: Checking for stuffing-box-cover runout

Seal the shaft with a packed stuffing box

WARNING:

Ex Packed stuffing boxes are not allowed in an ATEX-classified environment.

Pumps are shipped without the packing, lantern ring, or split gland installed. These parts are included with the box of fittings shipped with each pump and must be installed before startup.

1. Carefully clean the stuffing-box bore.
2. Twist the packing enough to get it around the shaft.

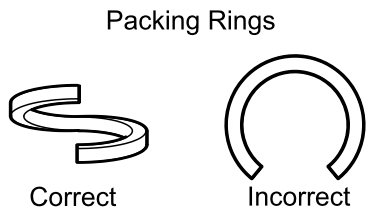

Figure 121: Packing rings

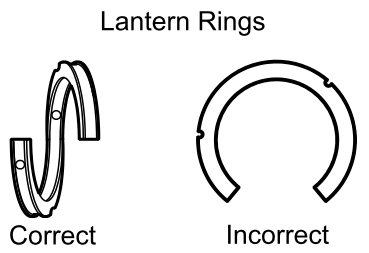

Figure 122: Lantern rings

3. Insert the packing and stagger the joints in each ring by 90°.
   Install the stuffing-box parts in this order:
   a) Two packing rings
   b) One lantern ring (two-piece)
   c) Three packing rings

NOTICE:
Make sure that the lantern ring is located at the flushing connection to ensure that flush is obtained. Failure to do so may result in decreased performance.

4. Install the gland halves and evenly hand-tighten the nuts.

Seal the shaft with a cartridge mechanical seal

WARNING:
The mechanical seal used in an Ex-classified environment must be properly certified.

CAUTION:
Running a mechanical seal dry, even for a few seconds, can cause seal failure and physical injury. Never operate the pump without liquid supplied to the mechanical seal.

1. Slide the cartridge seal onto the shaft or sleeve until it contacts the inboard labyrinth oil seal.
2. Assemble the seal chamber.
3. Slide the cartridge seal into the seal chamber and secure using the four studs and nuts.
4. Continue with the pump reassembly.
5. Set the impeller clearance.
   Refer to the Impeller clearance setting topic for more information.
6. Tighten the setscrews in the seal locking ring in order to secure the seal to the shaft.
7. Remove the centering clips from the seal.

Seal the shaft with a conventional inside-component mechanical seal

WARNING:
The mechanical seal used in an Ex-classified environment must be properly certified.

CAUTION:
Running a mechanical seal dry, even for a few seconds, can cause seal failure and physical injury. Never operate the pump without liquid supplied to the mechanical seal.

1. Assemble the seal chamber:

a) Install a seal-chamber cover or a backplate (184) and fasten with nuts (370H) with .

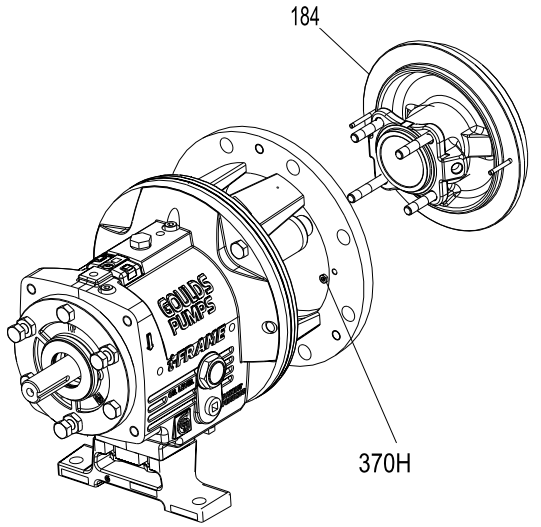

Figure 123: Assemble seal-chamber

b) Check the seal-chamber cover runout.

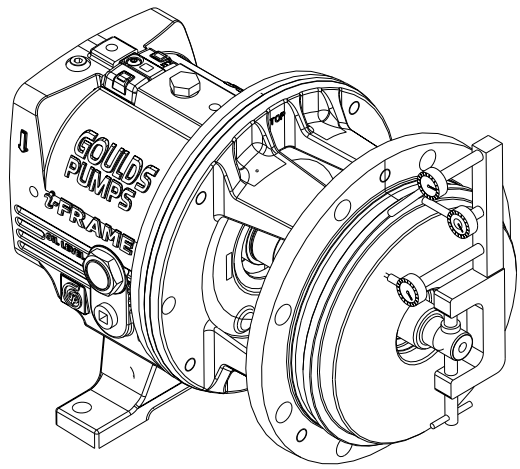

Figure 124: Check seal-chamber cover runout

Rotate the indicator through 360º. If the total indicator reading is greater than 0.13 mm | 0.005 inches, determine the cause and correct the issue before you proceed.

c) Install the shaft sleeve (126).

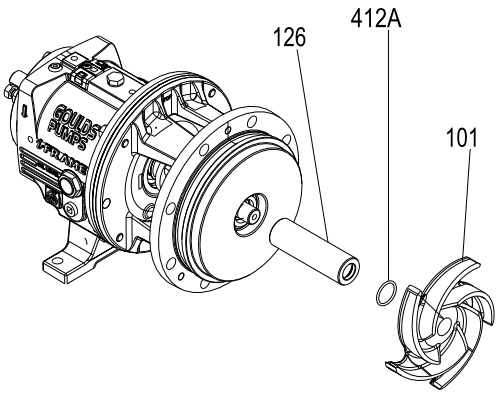

Figure 125: Install shaft sleeve

2. Mark the shaft and sleeve at the face of the seal chamber.
3. Continue the complete reassembly of the pump, except for the mechanical seal.
4. Set the impeller clearance.
   Refer to the Impeller Clearance Setting section for more information.
5. Scribe a line on the marked shaft and sleeve at the face of the seal chamber.
6. Remove the casing, the impeller, and the seal chamber.
7. If applicable, slide the gland, with the stationary seat and gland gasket installed, onto the shaft until it contacts the inboard labyrinth oil seal.
8. Install the mechanical-seal rotary unit according to the manufacturer's instructions.
   Use the scribed line and the seal-reference dimension.
9. Reinstall the seal chamber.
10. Slide the gland on the seal-chamber studs and secure them with the gland nuts.
    Tighten the nuts evenly so that the gland is seated on the seal-chamber pilot and is perpendicular to the shaft.
11. Complete the reassembly of the pump.

Seal the shaft with a conventional outside-component mechanical seal

WARNING:
The mechanical seal used in an Ex-classified environment must be properly certified.

CAUTION:
Running a mechanical seal dry, even for a few seconds, can cause seal failure and physical injury. Never operate the pump without liquid supplied to the mechanical seal.

1. Assemble the seal chamber.

a) Install the seal-chamber cover or backplate (184) and fasten with nuts (370H).

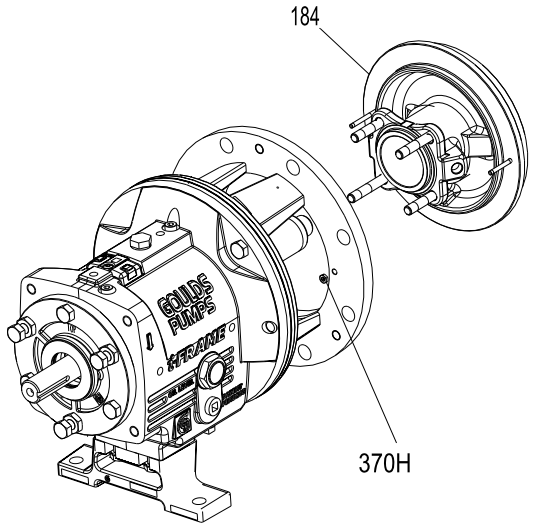

Figure 126: Seal-chamber cover or backplate installation

b) Check the seal-chamber cover runout.

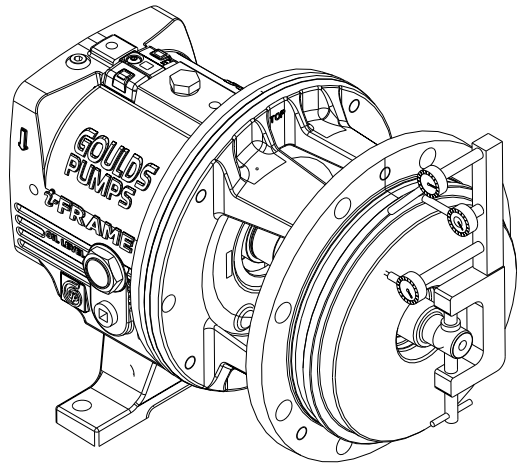

Figure 127: Check seal-chamber cover runout

Rotate the indicator through 360 degrees. If the total indicator reading is greater than 0.13 mm | 0.005 in., determine the cause and correct the issue before you proceed.

c) Install the shaft sleeve (126).

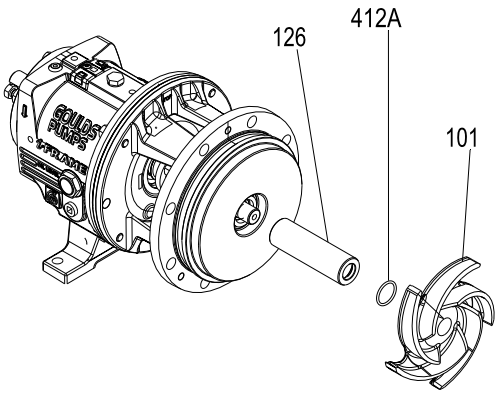

Figure 128: Install shaft sleeve

2. Mark the shaft and sleeve at the face of the seal chamber.
3. Continue the complete reassembly of the pump, except for the mechanical seal.
4. Set the impeller clearance.
   Refer to the Impeller clearance setting section for more information.
5. Scribe a line on the marked shaft and sleeve at the face of the seal chamber.
6. Remove the casing, the impeller, and the seal chamber.
7. Install the mechanical-seal rotary unit per the manufacturer's instructions.
   Use the scribed line as the seal-reference dimension. Be sure to secure the rotary unit in place using the set screws in the locking ring.
8. Install the gland, with the stationary seat and gland gaskets installed, on the seal chamber.
9. Reinstall the seal chamber.
10. Complete the reassembly of the pump.

Install the impeller

CAUTION:
Risk of physical injury from sharp edges. Wear heavy work gloves when handling impellers.

1. Install the impeller.

Pump size	Action
STi, MTi, and LTi	Install the impeller (101). Use a new impeller O-ring (412A).
XLT-i and i17	Install the impeller (101) and a PTFE washer (428D) on the plug (458Y). Use a new impeller O-ring (412A).

2. Attach a shaft wrench and a coupling key on the shaft.
   a) When the impeller (101) makes firm contact with the sleeve (126), raise the shaft wrench (counterclockwise, viewed from the impeller end of the shaft) off of the bench and slam it down (clockwise, viewed from the impeller end of shaft).
   b) Apply a few sharp raps to tighten the impeller (101).

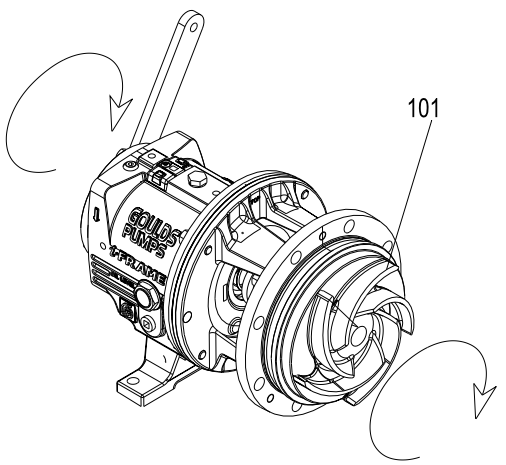

Figure 129: Tighten the impeller

3. Loosen the clamp bolts (370C) and the jack bolts (370D).

4. Measure the gap between the impeller (101) and the seal chamber and stuffing-box cover (184) with a feeler gauge.

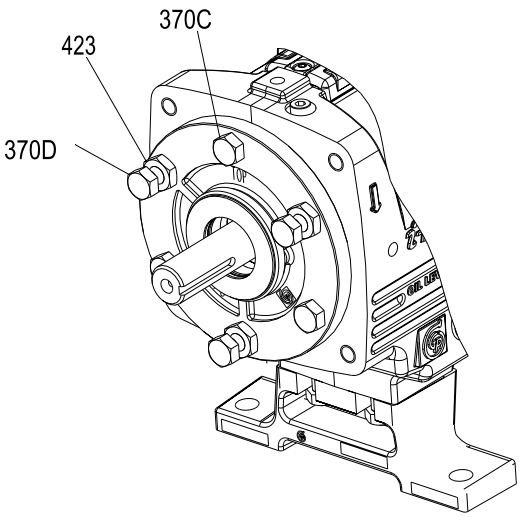

Figure 130: Loosen clamp bolts

5. When you reach a 0.76 mm | 0.030 in. clearance, tighten the clamp bolts (370C), jack bolts (370D), and lock nuts (423).
   This approximates the impeller position when it is set to 0.38 mm | 0.015 in. from the casing. Perform a final impeller adjustment after you install the impeller into the casing.
6. Check the impeller (101) runout.
   Check vane tip to vane tip. If the total indicator reading is greater than 0.13 mm | 0.005 in., determine the cause and correct the issue before you proceed.

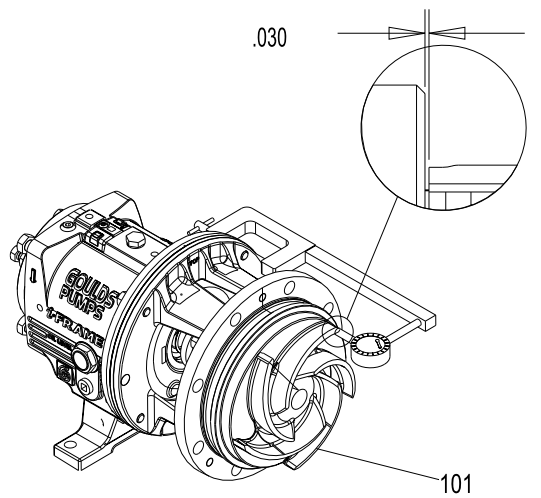

Figure 131: Check impeller run out

For more information on how to set the impeller clearances, refer to the Impeller-clearance checks and Impeller-clearance setting sections in Commissioning, Startup, Operation, and Shutdown.

Attach the i-*ALERT*® Condition Monitor to the pump

Tools required:

- 5/32 inch hex wrench

1. Attach the condition monitor (761B) to the bearing frame (228A) using the hex-head screw (372T) provided.

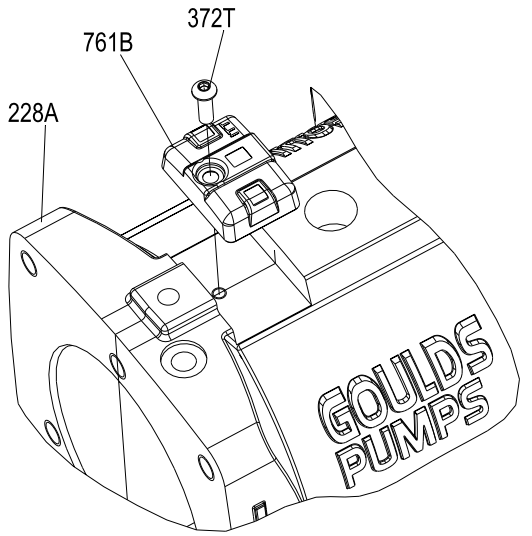

Figure 132: Attach condition monitor to bearing frame

2. Tighten the hex-head screw with a 5/32 inch hex wrench to 8 Nm | 6 ft-lbs.

Post-assembly checks

Perform these checks after you assemble the pump, then continue with pump startup:

- Rotate the shaft by hand in order to make sure that it rotates easily and smoothly and that there is no rubbing.
- Open the isolation valves and check the pump for leaks.

Install the back pull-out assembly (except HT 3196)

WARNING:
Lifting and handling heavy equipment poses a crush hazard. Use caution during lifting and handling and wear appropriate Personal Protective Equipment (PPE, such as steel-toed shoes, gloves, etc.) at all times. Seek assistance if necessary.

1. Clean the casing fit and install the casing gasket (351) on the seal chamber and stuffing-box cover.

2. Loosen the clamping bolts (370C) and jack bolts (370D) on the bearing housing.

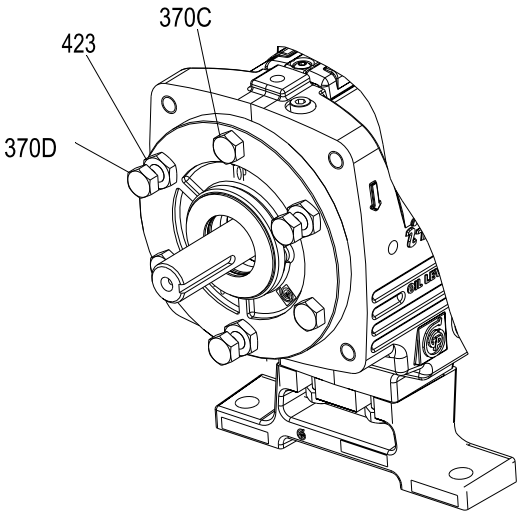

Figure 133: Loosen clamp bolts and jack bolts on bearing housing

3. Install the back pull-out assembly in the casing.

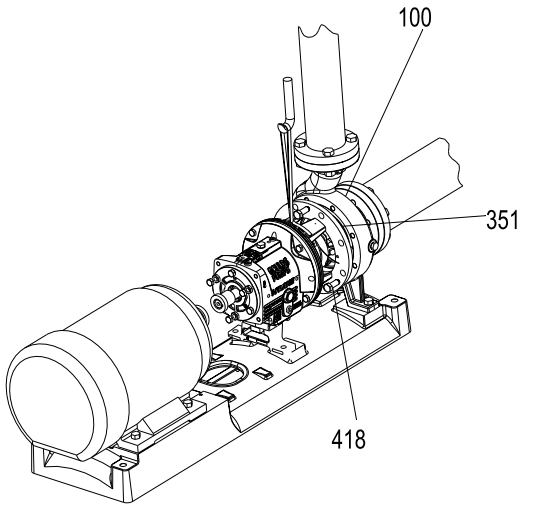

Figure 134: Install back pull-out assembly

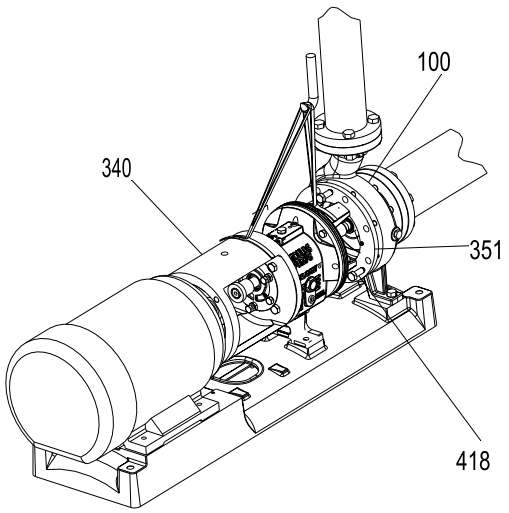

Figure 135: Install back pull-out assembly

4. Install and then hand-tighten the casing bolts (370).
   Refer to the bolt torque values for information on how to tighten the casing bolts.
5. Install and tighten the casing jackscrews (418).

NOTICE:
Do not overtighten the casing jackscrews. Doing so may result in equipment damage.

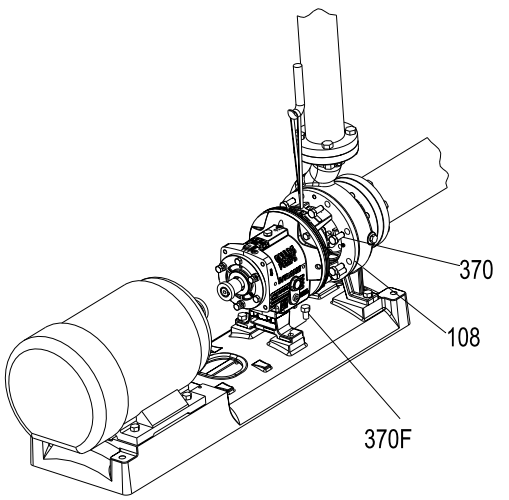

Figure 136: Install and tighten casing jackscrews

6. Reinstall the shims under the frame foot and tighten the frame foot to the baseplate.
   Make sure that you use the proper shim. Mount a dial indicator in order to measure the distance between the top of the frame and the baseplate. Make sure that the distance does not change as you tighten the frame-foot bolts.
7. Check the total clearance of the impeller in the casing.
   With new parts, an acceptable range is 0.76 mm | 0.030 in. to 1.65 mm | 0.065 in. If the impeller clearance is outside of this range, you either have the incorrect parts, an improper installation, or too much pipe strain. Determine the cause and correct the problem before you proceed.
8. Adjust the impeller clearance.
   Refer to the Impeller clearance setting section for more information.
9. Replace the auxiliary piping.

10. Fill the pump with the proper lubricant. See Lubricating-oil requirements.
11. Reinstall the coupling guard.
    See Install the coupling guard for more information.

NOTICE:
When a cartridge mechanical seal is used, ensure that the set screws in the seal locking ring are tightened and that the centering clips have been removed prior to startup. This prevents seal or shaft sleeve damage by ensuring that the seal is properly installed and centered on the sleeve.

Bolt torque values

Table 21: Bolt torque, Nm | lb-ft

This table provides the bolt torque values.

Location	Frame	3196, CV 3196, LF 3196, 3796		NM 3196		3198	
		Lube	Dry	Lube	Dry	Lube	Dry
Casing bolts (370) or casing nuts (425)	6-in. STi	Refer to the maximum torque values in Nm | lb-ft for casing bolts table.		36 | 27	53 | 40	N/A	N/A
	8-in. STi			27 | 20	40 | 30	47 | 35	71 | 53
	MTi, LTi			36 | 27	53 | 40	47 | 35	71 | 53
	XLT-i, i17			N/A	N/A	N/A	N/A
Frame-to-adapter bolts	All	27 | 20	40 | 30	27 | 20	40 | 30	27 | 20	40 | 30
Bearing-clamp ring bolts (236A) - duplex bearing only	STi, MTi	1.1* | 10	1.9* | 17	1.1* | 10	1.9* | 17	1.1* | 10	1.9* | 17
	LTi	6.2* | 55	9.4* | 83	6.2* | 55	9.4* | 83	6.2* | 55	9.4* | 83

Shaft-end play

Table 23: Shaft-end play

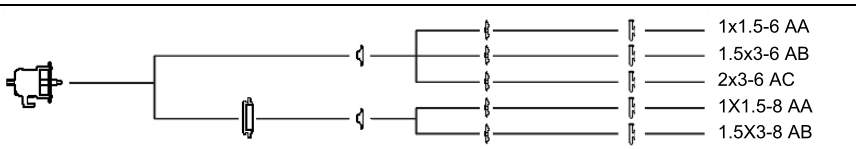
Use this table as a reference for shaft-end play values.

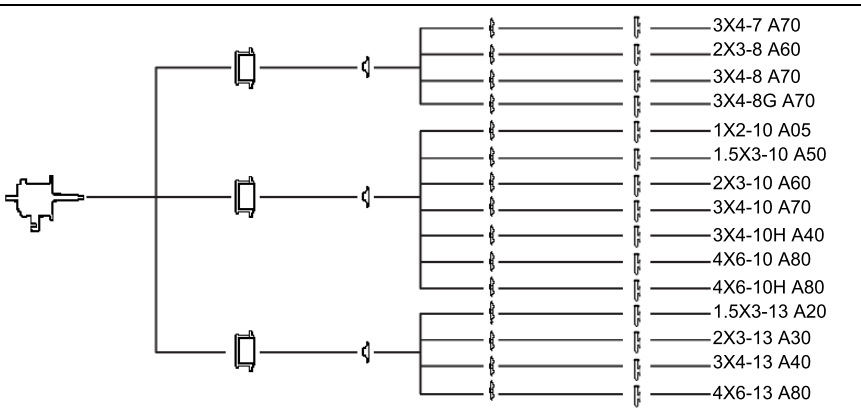
Frame	Double row bearing	Duplex bearing
STi millimeters | inches	0.028 | 0.0011 0.048 | 0.0019	0.018 | 0.0007 0.025 | 0.0010
MTi millimeters | inches	0.033 | 0.0013 0.053 | 0.0021	0.023 | 0.0009 0.030 | 0.0012
LTi millimeters | inches	Not applicable	0.025 | 0.0010 0.038 | 0.0015
XLT-i, i-17 millimeters | inches	0.036 | 0.0014 0.058 | 0.0023	0.025 | 0.0010 0.038 | 0.0015

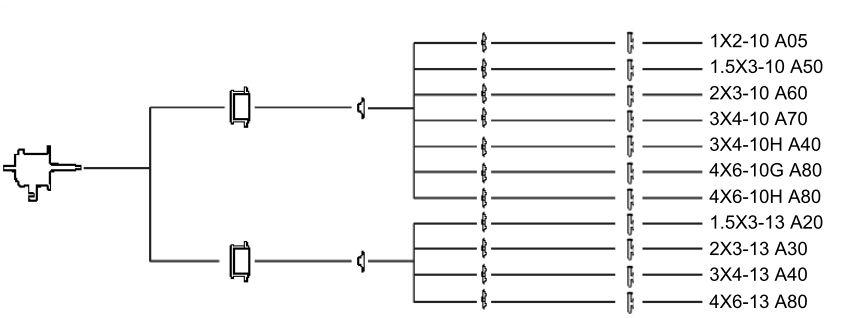
Bearing types

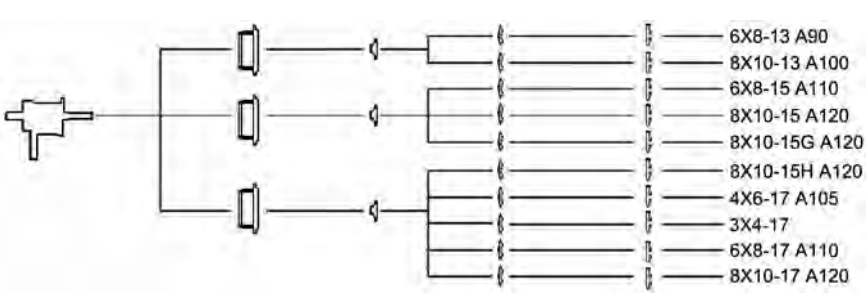
Table 24: Bearing types

Frame	Inboard bearing	Outboard bearing	
		Double row	Duplex
STi	6207	3306	7306
MTi	6309	3309	7309
LTi	6311	Not applicable	7310
XLT-i, i17	6313	3313	7313









Spare parts

Always state the serial number and indicate the part name and item number from the relevant sectional drawing when you order spare parts. It is imperative for service reliability to have a sufficient stock of readily available spare parts.

- Impeller (101)
- Shaft (122A)
- Shaft sleeve (126)
- Outboard bearing (112A)
- Inboard bearing (168A)
- Casing gasket (351)
- Frame-to-adapter gasket (360D)
- Bearing-housing retaining ring (361A)
- Bearing lockwasher (382)
- Bearing locknut (136)
- Impeller O-ring (412A)
- Bearing-housing O-ring (496)
- Outboard labyrinth-seal rotary O-ring (497F)
- Outboard labyrinth-seal stationary O-ring (497G)
- Inboard labyrinth-seal rotary O-ring (497H)
- Inboard labyrinth-seal stationary O-ring (497J)
- Lantern ring half (105) (packed stuffing box)
- Stuffing box packing (106) (packed stuffing box)
- Packing gland (107) (packed stuffing box)
- Impeller gasket (428D) (XLT-i and i17 only)

3196 interchangeability

Table 25: 3196 interchangeability drawing

Description	Shaft and Bearing Frame Assembly	Adapter	Seal Chamber	Impeller	Casing	Size
Model 3196 STi 1–3/8 in. Shaft Dia. Max BHP-40 HP						1x1.5-6 AA 1.5x3-6 AB 2x3-6 AC 1X1.5-8 AA 1.5X3-8 AB
Model 3196 MTi 1–3/4 in. Shaft Dia. Max BHP-122 HP						3X4-7 A70 2X3-8 A60 3X4-8 A70 3X4-8G A70 1X2-10 A05 1.5X3-10 A50 2X3-10 A60 3X4-10 A70 3X4-10H A40 4X6-10 A80 4X6-10H A80 1.5X3-13 A20 2X3-13 A30 3X4-13 A40 4X6-13 A80
Model 3196 LTi 2–1/8 in. Shaft Dia. Max BHP-200 HP						1X2-10 A05 1.5X3-10 A50 2X3-10 A60 3X4-10 A70 3X4-10H A40 4X6-10G A80 4X6-10H A80 1.5X3-13 A20 2X3-13 A30 3X4-13 A40 4X6-13 A80
Model 3196 XLT-i 2–1/2 in. Shaft Dia. Max BHP-250 HP 17 in. XLT-i has 2–3/4 in. Shaft Dia. Max BHP-350 HP						6X8-13 A90 8X10-13 A100 6X8-15 A110 8X10-15 A120 8X10-15G A120 8X10-15H A120 4X6-17 A105 3X4-17 6X8-17 A110 8X10-17 A120

Frame lubrication conversion

NOTICE:

- Avoid equipment damage or decreased performance. Never mix greases of different consistencies (NLGI 1 or 3 with NLGI 2) or with different thickeners. For example, never mix a lithium-based grease with a polyurea based grease. If it is necessary to change the grease type or consistency, remove the rotor and old grease from the housing before regreasing.

Use a grease that is suitable for high temperatures when you have frame pumpage temperatures greater than 177°C | 350°F. Ensure that mineral-oil greases have oxidation stabilizers and a consistency of NLGI 3.

Table 26: Lubricating-grease requirements

Most pumps use Sunoco 2EP grease. High temperature units with a pumpage temperature greater than 177°C | 350° F use Mobil SCH32.

This table shows which brand of grease to use when lubricating the pump.

	Pumpage temperature less than 177°C | 350°F	Pumpage temperature greater than 177°C | 350°F
NGLI consistency	2	3
Mobil	Mobilux EP2	SCH32
Exxon	Unirex N2	Unirex N3
Sunoco	Mutipurpose 2EP	N/A
SKF	LGMT 2	LGMT 3

Convert from greased-for-life or regreaseable to oil-lubricated bearings

1. Remove the plug from the oil-return slot in the frame located under the radial bearing. Use this table as a guide.

Pump model	Action
STi	Remove the epoxy from the return slot.
MTi, LTi, XLT-i, and i-17	Remove the set screw installed in the oil-return hole.

2. Remove the plug from the oil-return hole in the bearing housing (134).

NOTICE:
For the LTi, the bearing housing (134) and clamp ring (253B) require replacement with alternate parts. Failure to do so will cause oil-flow obstruction and result in equipment damage.

3. Replace both bearings with unshielded, oil-lubricated bearings.

Table 27: Bearing types

Frame	Inboard bearing	Outboard bearing	
		Double row	Duplex
STi	6207	3306	7306
MTi	6309	3309	7309
LTi	6311	Not applicable	7310
XLT-i, i17	6313	3313	7313

4. Remove the grease fittings (193) to prevent accidental greasing.
Two plugs (408H) are required to replace the two grease fittings.

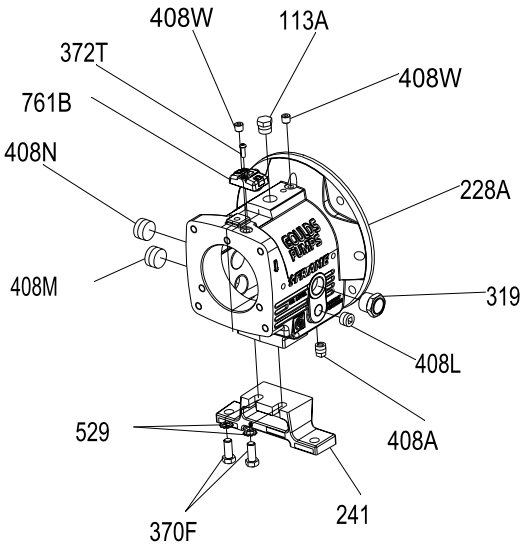


Figure 137: Replace two grease fittings with two plugs

Item Number	Size	Description	Quantity
113	1/4"-18 NPT	External hex/square head pipe plug	2
113A	1/2"-14 NPT	External hex/square head pipe plug	1
193	1/4"-18 NPT	Grease fitting	2
228	- - - -	Bearing frame	1
241	- - - -	Frame foot	1
370F	1/2"	Hex cap screw	2
408A	3/8"-18 NPT	External square head pipe plug (magnetic)	1
408J	1/4"-18 NPT	External hex/square head pipe plug	1
408L	1/2"-14 NPT	Square countersunk headless pipe plug	1
408M	1" 11-1/2" NPT	Square countersunk headless pipe plug	1
529	1/2"	Light helical spring lock washer	2

Conversion from flood-oil to pure-oil mist

NOTICE:
The LTX requires that you change the bearing housing when you make the conversion from flood oil to oil mist lubrication. After you install the proper bearing housing, follow the instructions as they apply to STX, MTX, XLT-X, and X17. Failure to do so may result in equipment damage or decreased performance.

Consult your local ITT representative for further information on this topic.

Oil-mist systems

The ITT X-Series Power Ends accept a variety of oil-mist systems. These are the two popular systems that you can use:

- vented oil-mist system
- non-vented oil-mist system

Convert from flood oil to regreaseable

Consult your local ITT representative for further information on this topic.

Troubleshooting

Operation troubleshooting

Symptom	Cause	Remedy
The pump is not delivering liquid.	The pump is not primed.	Re-prime the pump and check that the pump and suction line are full of liquid.
	The suction line is clogged.	Remove the obstructions.
	The impeller is clogged.	Back-flush the pump in order to clean the impeller.
	The shaft is rotating in the wrong direction.	Change the rotation. The rotation must match the arrow on the bearing housing or pump casing.
	The foot valve or suction pipe opening is not submerged enough.	Consult an ITT representative for the proper submersion depth. Use a baffle in order to eliminate vortices.
	The suction lift is too high.	Shorten the suction pipe.
The pump is not producing the rated flow or head.	The gasket or O-ring has an air leak.	Replace the gasket or O-ring.
	The stuffing box has an air leak.	Replace or readjust the mechanical seal.
	The impeller is partly clogged.	Back-flush the pump in order to clean the impeller.
	The clearance between the impeller and the pump casing is excessive.	Adjust the impeller clearance.
	The suction head is not sufficient.	Make sure that the suction-line shutoff valve is fully open and that the line is unobstructed.
	The impeller is worn or broken.	Inspect and replace the impeller if necessary.
The pump starts and then stops pumping.	The pump is not primed.	Re-prime the pump and check that the pump and suction line are full of liquid.
	The suction line has air or vapor pockets.	Rearrange the piping in order to eliminate air pockets.
	The suction line has an air leak.	Repair the leak.
The bearings are running hot.	The pump and driver are not aligned properly.	Realign the pump and driver.
	There is not sufficient lubrication.	Check the lubricant for suitability and level.
	The lubrication was not cooled properly.	Check the cooling system.
The pump is noisy or vibrates.	The pump and driver are not aligned properly.	Realign the pump and driver.
	The impeller is partly clogged.	Back-flush the pump in order to clean the impeller.
	The impeller or shaft is broken or bent.	Replace the impeller or shaft as necessary.
	The foundation is not rigid.	Tighten the hold-down bolts of the pump and motor. Make sure the baseplate is properly grouted without voids or air pockets.
	The bearings are worn.	Replace the bearings.
	The suction or discharge piping is not anchored or properly supported.	Anchor the suction or discharge piping as necessary according to recommendations in the Hydraulic Institute Standards Manual.
	The pump is cavitating.	Locate and correct the system problem.
The mechanical seal is leaking excessively.	The packing gland is not adjusted properly.	Tighten the gland nuts.
	The stuffing box is not packed properly.	Check the packing and repack the box.
	The mechanical seal parts are worn.	Replace the worn parts.
	The mechanical seal is overheating.	Check the lubrication and cooling lines.
	The shaftor shaft sleeve is scored.	Machine or replace the shaft sleeve as necessary.
The motor requires excessive power.	The discharge head has dropped below the rated point and is pumping too much liquid.	Install a throttle valve. If this does not help, then trim the impeller diameter. If this does not help, then contact your ITT representative.
	The liquid is heavier than expected.	Check the specific gravity and viscosity.
	The stuffing-box packing is too tight.	Readjust the packing. If the packing is worn, then replace the packing.
	Rotating parts are rubbing against each other.	Check the parts that are wearing for proper clearances.
	The impeller clearance is too tight.	Adjust the impeller clearance.

Alignment troubleshooting

Symptom	Cause	Remedy
Horizontal (side-to-side) alignment cannot be obtained (angular or parallel).	The driver feet are bolt-bound.	Loosen the pump's hold-down bolts, and slide the pump and driver until you achieve horizontal alignment.
	The baseplate is not leveled properly and is probably twisted.	1. Determine which corners of the base-plate are high or low. 2. Remove or add shims at the appropri-ate corners. 3. Realign the pump and driver.

Assembly troubleshooting

Symptom	Cause	Remedy
There is excessive shaft end play.	The internal clearance of the bearings ex-ceeds the recommended amount.	Replace the bearings with a bearing of the correct type.
	The snap ring is loose in the bearing-housing groove.	Re-seat the snap ring.
There is excessive shaft and sleeve runout.	The sleeve is worn.	Replace the sleeve.
	The shaft is bent.	Replace the shaft.
There is excessive bearing-frame flange runout.	The shaft is bent.	Replace the shaft.
	The flange of the bearing frame is distorted.	Replace the bearing-frame flange.
There is excessive frame-adapter runout.	There is corrosion on the frame adapter.	Replace the frame adapter.
	The adapter-to-frame gasket is not seated properly.	Re-seat the frame adapter and make sure that the adapter-to-frame gasket is seated properly.
There is excessive seal chamber or stuffing-box cover runout.	The seal chamber or the stuffing-box cover is not properly seated in the frame adapter.	Re-seat the seal chamber or stuffing-box cover.
	There is corrosion or wear on the seal chamber or stuffing-box cover.	Replace the seal chamber or stuffing-box cover.
There is excessive vane-tip runout of the impeller.	The vane is bent.	Replace the impeller.

i-ALERT® Condition Monitor troubleshooting

To troubleshoot t the i-ALERT®2 monitor, please refer to the i-ALERT®2 IOM or i-ALERT2.com.

Symptom	Cause	Remedy
There are no green or red flashing LEDs.	The battery is dead.	Replace the condition monitor.
	The unit is deactivated.	Activate the condition monitor.
	The unit is malfunctioning.	Consult your ITT representative for a warranty replacement.
The red LEDs are flashing, but the temperature and vibration are at acceptable levels.	The baseline is bad.	Check the temperature and vi-bration levels and reset the con-dition monitor.
	The unit is malfunctioning.	Consult your ITT representative for a warranty replacement.

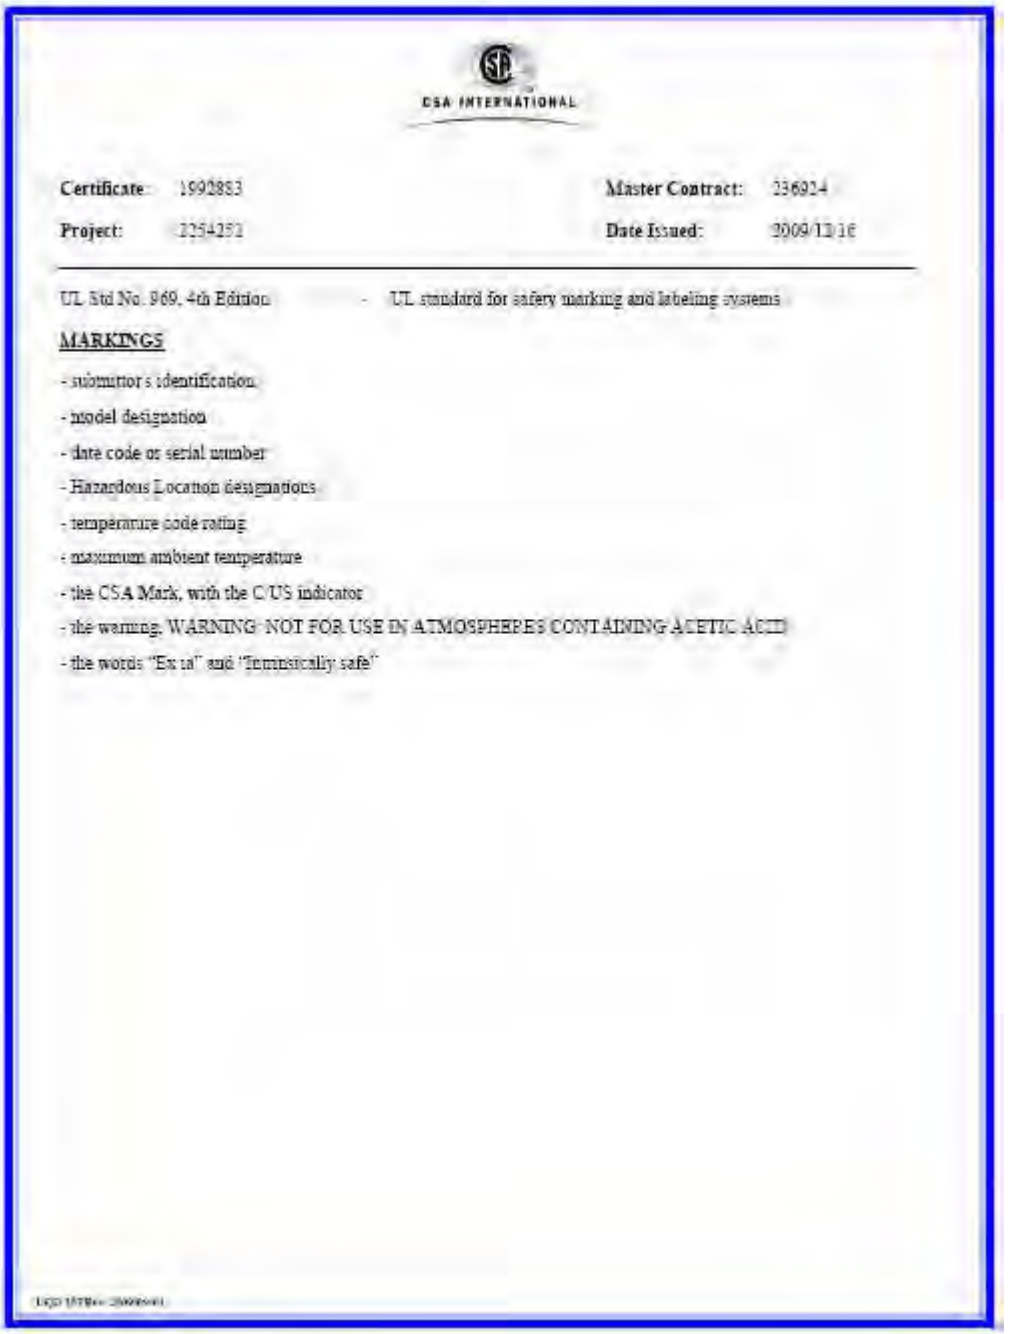
PRODUCTS

CLASS 2258 03 - PROCESS CONTROL EQUIPMENT - Intrinsically Safe and Non-Incendive Systems - For Hazardous Locations

CLASS 2258 83 - PROCESS CONTROL EQUIPMENT-Intrinsically Safe and Non-Incendive - Systems-For Hazardous Locations-Certified to U.S. Standards

Class I, Division 1, Group A, B, C and D, Class II, Group E, F and G; Class III



- Condition Monitor, Model LCCM, p/n C07657A, battery operated (non-replaceable, non-rechargeable), intrinsically safe, temperature code T4 (at max ambient of 100C)

APPLICABLE REQUIREMENTS

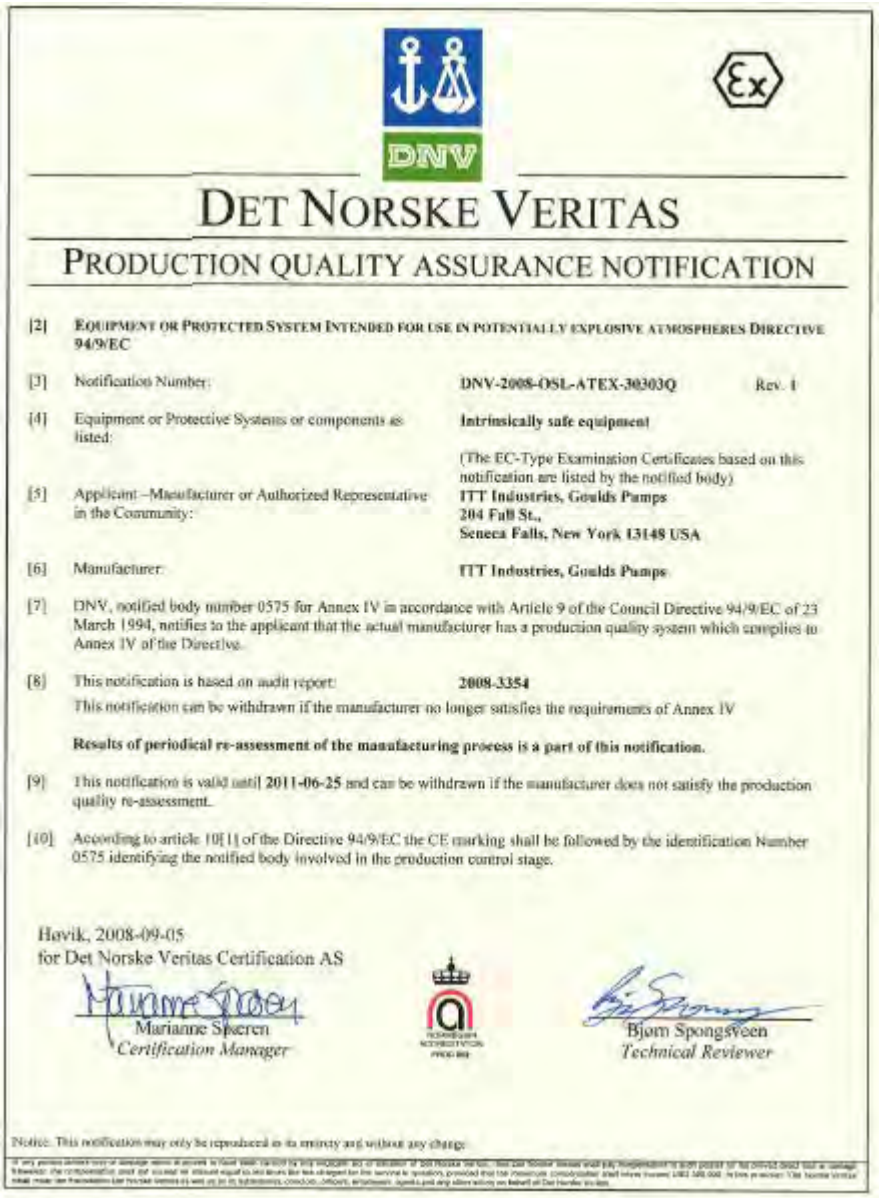
CAN/CSA-C22.2 No. 0-M91 - General Requirements – Canadian Electrical Code, Part II

CAN/CSA-C22.2 No.157-92 - Intrinsically Safe and Non-Incendive Equipment for Use in Hazardous Locations

UL Std.No.913, Ed. 7 - Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II and III, Division 1, Hazardous Locations

CSA INTERNATIONAL

Certificate: 1992883 **Master Contract:** 236924



Project: 2254251 **Date Issued:** 2009/12/16

UL Std No. 969, 4th Edition - UL standard for safety marking and labeling systems

MARKINGS

- submittor's identification
- model designation
- date code or serial number
- Hazardous Location designations
- temperature code rating
- maximum ambient temperature
- the CSA Mark, with the C/US indicator
- the warning: WARNING: NOT FOR USE IN ATMOSPHERES CONTAINING ACETIC ACID
- the words "Ex ia" and "Intrinsically safe"

DET NORSKE VERITAS

PRODUCTION QUALITY ASSURANCE NOTIFICATION

[2] EQUIPMENT OR PROTECTED SYSTEM INTENDED FOR USE IN POTENTIALLY EXPLOSIVE ATMOSPHERES DIRECTIVE 94/9/EC

[3] Notification Number: **DNV-2008-OSL-ATEX-30303Q** Rev. 1

[4] Equipment or Protective Systems or components as listed: **Intrinsically safe equipment**

(The EC-Type Examination Certificates based on this notification are listed by the notified body)

[5] Applicant –Manufacturer or Authorized Representative in the Community: **ITT Industries, Goulds Pumps**
204 Fall St.,
Seneca Falls, New York 13148 USA

[6] Manufacturer: **ITT Industries, Goulds Pumps**

[7] DNV, notified body number 0575 for Annex IV in accordance with Article 9 of the Council Directive 94/9/EC of 23 March 1994, notifies to the applicant that the actual manufacturer has a production quality system which complies to Annex IV of the Directive.

[8] This notification is based on audit report: **2008-3354**
This notification can be withdrawn if the manufacturer no longer satisfies the requirements of Annex IV

Results of periodical re-assessment of the manufacturing process is a part of this notification.

[9] This notification is valid until **2011-06-25** and can be withdrawn if the manufacturer does not satisfy the production quality re-assessment.

[10] According to article 10[1] of the Directive 94/9/EC the CE marking shall be followed by the identification Number 0575 identifying the notified body involved in the production control stage.

IECEx Certificate of Conformity

Certificate No.: IECEx LCI 08.0038

Date of Issue: 2008-09-16 Issue No.: 0

Page 2 of 3

Manufacturer: ITT Corp.
Goulds pumps
240 Fall Street
Seneca Falls, NY 13148
United States of America

Manufacturing location(s):

This certificate is issued as verification that a sample(s), representative of production, was assessed and tested and found to comply with the IEC Standard list below and that the manufacturer's quality system, relating to the Ex products covered by this certificate, was assessed and found to comply with the IECEx Quality system requirements. This certificate is granted subject to the conditions as set out in IECEx Scheme Rules, IECEx 02 and Operational Documents as amended

STANDARDS:
The electrical apparatus and any acceptable variations to it specified in the schedule of this certificate and the identified documents, was found to comply with the following standards

IEC 60079-0 : 2004 Electrical apparatus for explosive gas atmospheres - Part 0: General requirements
Edition: 4.0
IEC 60079-11 : 2006 Explosive atmospheres - Part 11: Equipment protection by intrinsic safety "i"
Edition: 5

This Certificate does not indicate compliance with electrical safety and performance requirements other than those expressly included in the Standards listed above.

TEST & ASSESSMENT REPORTS:
A sample(s) of the equipment listed has successfully met the examination and test requirements as recorded in

Test Report:

FR/LCIE/ExTR08.0003/00

Quality Assessment Report:
NO/DNV/QAR08.0006/00

MANUAL GERAL DE INSTALAÇÃO, OPERAÇÃO E MANUTENÇÃO DE MOTORES ELÉTRICOS

Este manual apresenta informações referentes aos motores elétricos WEG de indução com rotor de gaiola, com rotor de ímãs permanentes ou híbridos, de baixa e alta tensão, nas carcaças IEC 56 a 630 e NEMA 42 a 9606/10.
As linhas listadas abaixo possuem informações adicionais, encontradas em manuais específicos:

- Motores para extração de fumaça (*Smoke Extraction Motor*);
- Motores com freio eletromagnético;
- Motores para áreas classificadas.

Estes produtos estão de acordo com as seguintes normas, quando aplicáveis:

- NBR 17094-1: Máquinas Elétricas Girantes - Motores de Indução Parte 1: trifásicos.
- NBR 17094-2: Máquinas Elétricas Girantes - Motores de Indução - Parte 2: monofásicos.
- IEC 60034-1: Rotating Electrical Machines - Part 1: Rating and Performance.
- NEMA MG 1: Motors and Generators.
- CSA C 22.2 N°100: Motors and Generators.
- UL 1004-1: Rotating Electrical Machines - General Requirements.

Em caso de dúvidas sobre a aplicabilidade desse material, contate a WEG.

1. DEFINIÇÕES

Balanceamento: procedimento pelo qual a distribuição de massa de um corpo é verificada e, se necessário, ajustada para garantir que o desbalanceamento residual ou as vibrações e forças nos mancais na frequência de rotação mecânica estejam dentro de limites especificados nas normas internacionais.
Grau de balanceamento: indica a amplitude de pico da velocidade de vibração, expressa em mm/s, de um rotor girando livre no espaço e é produto de um desbalanceamento específico e a velocidade angular do rotor na velocidade máxima de operação.
Parte aterrada: partes metálicas eletricamente conectadas ao sistema de aterramento.
Parte viva: condutor ou parte condutora destinada para ser energizada em condições normais de uso, incluindo o condutor neutro.
Pessoal autorizado: trabalhador que tem anuência formal da empresa.
Pessoal capacitado: trabalhador que atenda as seguintes condições, simultaneamente:
- Receba capacitação sob orientação e responsabilidade de profissional habilitado e autorizado;
- Trabalhe sob responsabilidade de profissional habilitado e autorizado.

Nota: a capacitação só é válida para a empresa que o capacitou e nas condições estabelecidas pelo profissional habilitado e autorizado responsável pela capacitação.

Pessoal habilitado: trabalhador previamente qualificado e com registro no conselho de classe competente.
Pessoal qualificado: trabalhador que comprovar conclusão de curso específico na área elétrica pelo sistema oficial de ensino.

2. RECOMENDAÇÕES INICIAIS

Motores elétricos possuem circuitos energizados, componentes girantes e superfícies quentes durante sua operação normal que podem causar danos às pessoas. Dessa forma, todas as atividades relacionadas ao seu transporte, armazenagem, instalação, operação e manutenção devem ser realizadas por pessoal capacitado. Devem ser observadas as normas e procedimentos vigentes no país de instalação. A não observação das instruções indicadas neste manual e demais referenciadas no site pode resultar em sérios danos pessoais e materiais e anular a garantia do produto.

Neste manual não são apresentadas todas as informações detalhadas sobre possíveis variantes construtivas e nem considerados todos os casos de montagem, operação ou manutenção. Este documento contém informações necessárias para que pessoas capacitadas possam executar o serviço. As imagens apresentadas são meramente ilustrativas.
Para aplicações e condições especiais de operação (manual 50026367 para motores Smoke Extraction, manual 50021973 para Motofreios, manual 50078700 para Motores Eletronicamente Controlados, manual 14629920 para motores Roller Table, manual 50106963 para motores WEG Lift Gearless) é necessário consultar o manual no site www.weg.net ou entrar em contato com a WEG.
Para motores fornecidos com sensor WEG Motor Scan, consulte as orientações de instalação através do Manual de Visão Geral do Recebimento à Operação (10008475131) disponível em www.weg.net.
Para informações sobre cargas radias e axiais admissíveis no eixo consultar o catálogo técnico do produto.

A correta definição das características do ambiente e da aplicação é de responsabilidade do usuário.

Durante o período de garantia do motor, os serviços de reparo, revisão e recuperação devem ser realizados por Assistentes Técnicos autorizados WEG para continuidade do termo de garantia.

2.1 SINAL DE ADVERTÊNCIA

Advertência sobre segurança e garantia.

VERIFICAÇÃO NO RECEBIMENTO

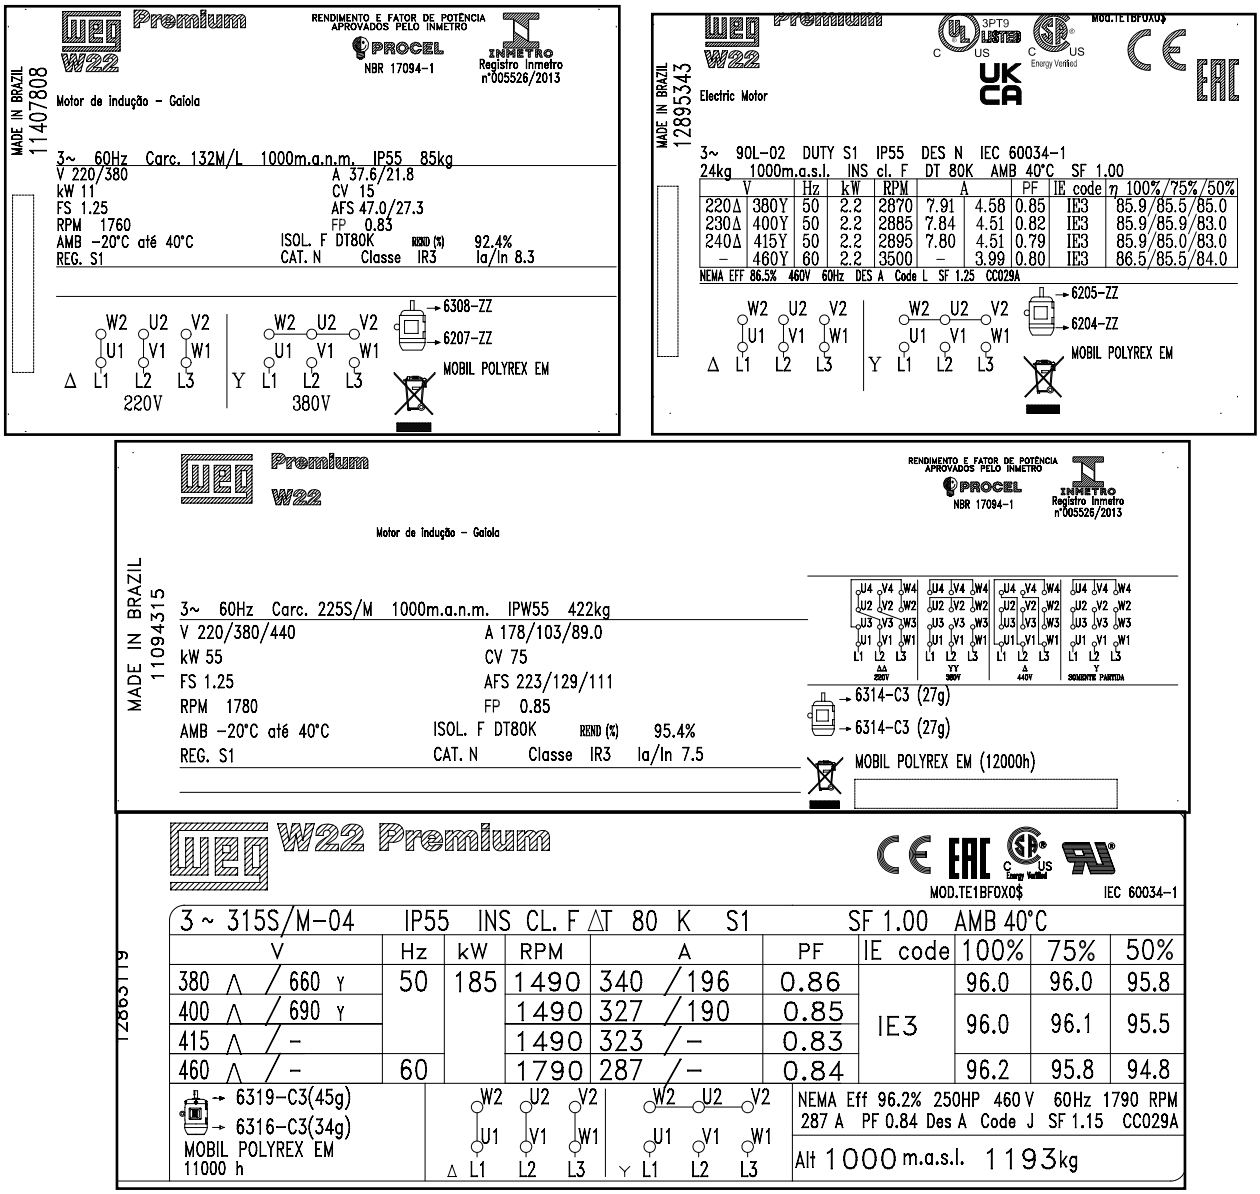
Todos os motores são testados durante o processo de fabricação.
No recebimento do motor, verificar se ocorreram danos durante o transporte. Na ocorrência de qualquer dano, registrar por escrito junto ao agente transportador, e comunicar imediatamente a companhia seguradora e a WEG. A não comunicação pode resultar no cancelamento da garantia.
Deve-se realizar uma inspeção completa no produto:
- Verificar se os dados contidos na placa de identificação estão de acordo com o pedido de compra;
- Remover os dispositivos de travamento de eixo (caso existam) e girar manualmente o eixo para verificar se o mesmo gira livremente. Nos motores Magnet e WQuattro, o eixo não gira livremente devido torque de alinhamento dos ímãs. Pode ser necessário o uso de uma alavanca para girar o eixo;

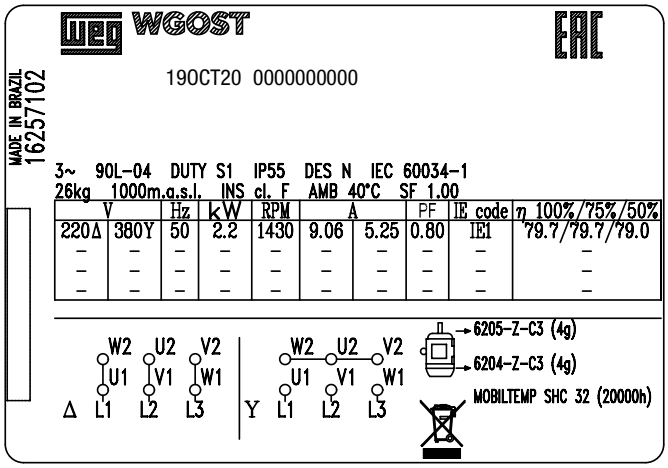
Ao girar o eixo de um motor Magnet ou WQuattro, deve-se garantir a isolação dos terminais da máquina, devido risco de choque elétrico causado pela tensão induzida durante o procedimento.

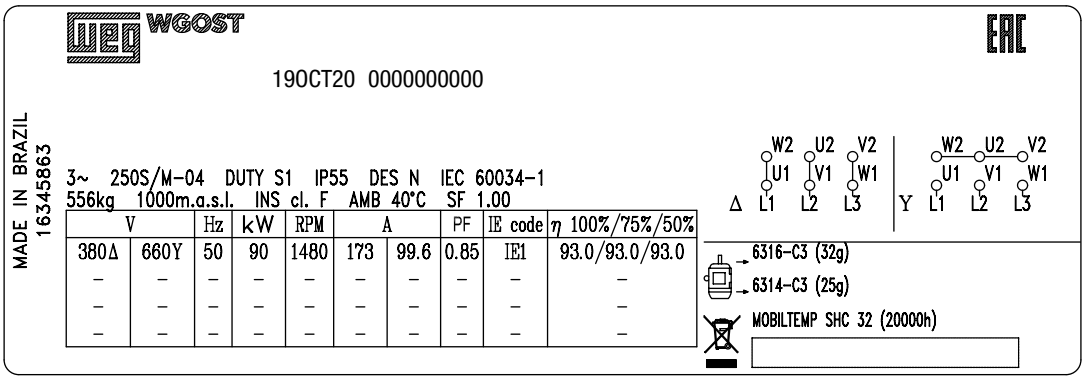
- Assegurar que o motor não tenha sido exposto à poeira e umidade excessiva durante o transporte;
- Não remover graxa de proteção da ponta do eixo, nem os tampões que fecham os furos da caixa de ligação, caso existam. Estes itens de proteção devem ser mantidos até que a instalação completa seja concluída.

2.2 PLACAS DE IDENTIFICAÇÃO

A placa de identificação contém as informações que descrevem as características construtivas e o desempenho do motor. Na Figura 1, Figura 2 e Figura 3 são apresentados exemplos de layouts das placas de identificação.







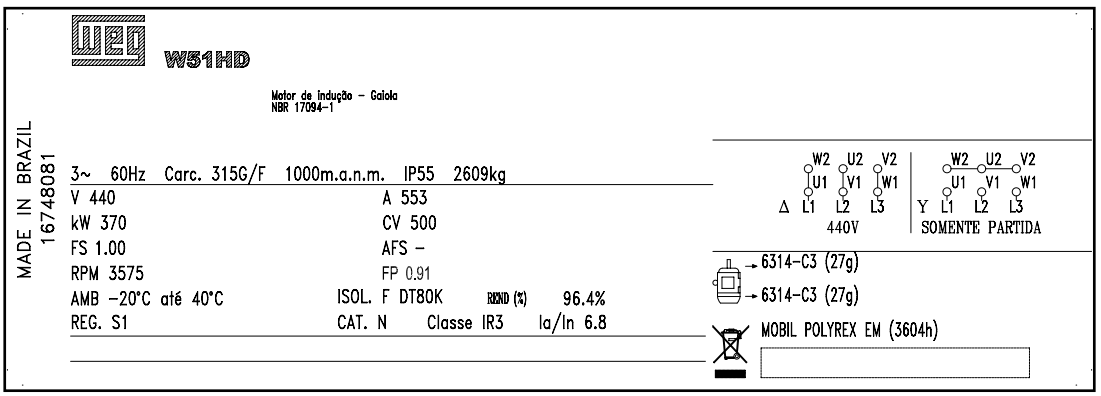


Figura 1 - Placa de identificação de motores IEC

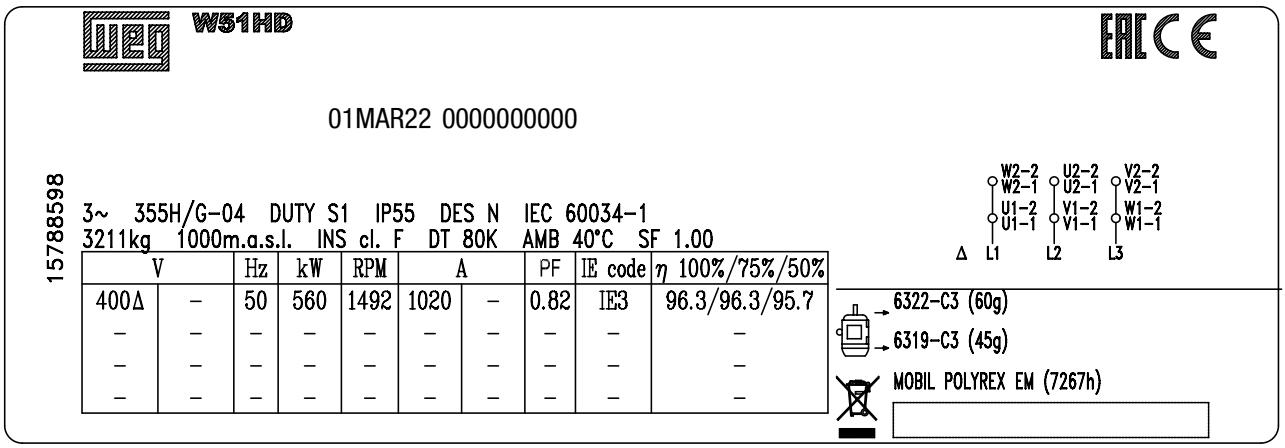

Figura 2 - Placa de identificação de motores IEC

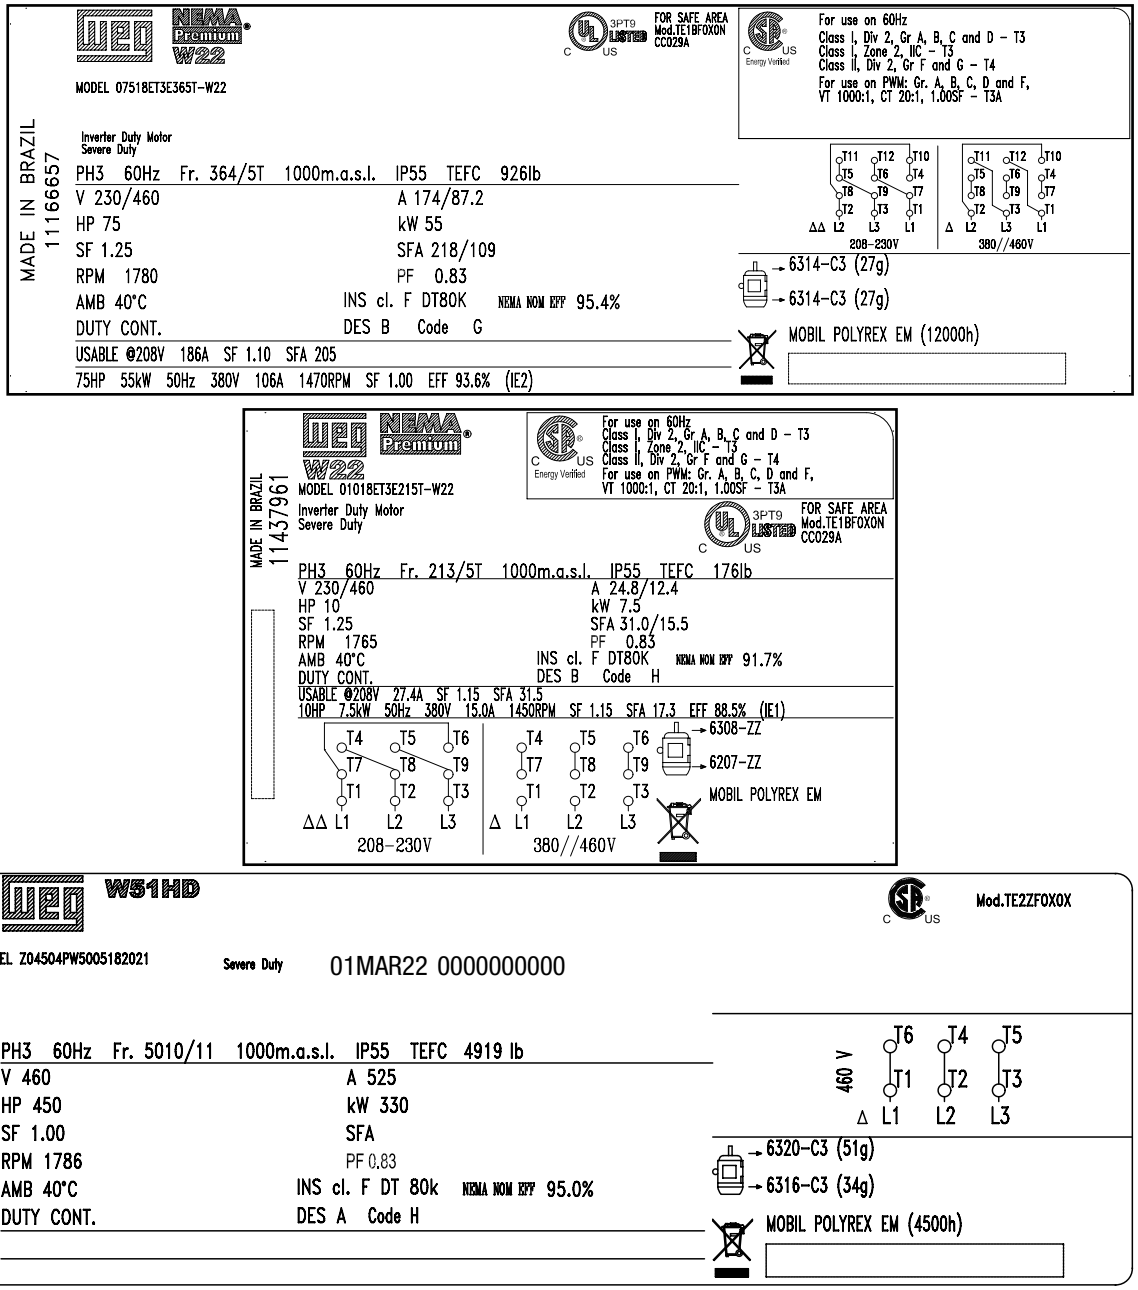

Figura 3 - Placa de identificação de motores NEMA

3. SEGURANÇA

Durante a instalação e manutenção, os motores devem estar desconectados da rede, estar completamente parados e cuidados adicionais devem ser tomados para evitar partidas acidentais.

Os profissionais que trabalham em instalações elétricas, seja na montagem, na operação ou na manutenção, devem utilizar ferramentas apropriadas e serem instruídos sobre a aplicação das normas e prescrições de segurança, inclusive sobre o uso de Equipamentos de Proteção Individual (EPI), que devem ser cuidadosamente observados.

Motores elétricos possuem circuitos energizados, componentes girantes e superfícies quentes durante sua operação normal que podem causar danos às pessoas. Dessa forma, todas as atividades relacionadas ao seu transporte, armazenagem, instalação, operação e manutenção devem ser realizadas apenas por pessoal capacitado.

Usuários de marca passo e pessoal não qualificado não devem abrir motores WMagnet e WQuattro, pois são utilizados ímãs de alta energia.

Sempre seguir as instruções de segurança, instalação, manutenção e inspeção de acordo com as normas vigentes em cada país.

4. MANUSEIO E TRANSPORTE

Motores embalados individualmente não devem ser içados pelo eixo ou embalagem, mas sim pelo(s) olhal(is) de içamento (quando existentes) e com dispositivos adequados. Os olhais de içamento são dimensionados para suportar apenas a massa do motor indicada na placa de identificação. Motores fornecidos em *pallets* devem ser içados pela base do *pallet*.

Em nenhuma circunstância, a embalagem deve ser tombada.

Não utilizar os olhais de içamento para suspender o motor em conjunto com outros equipamentos, como por exemplo: bases, polias, ventiladores, bombas, redutores, etc..
Olhais danificados, por exemplo, com trincas, deformações, etc., não devem ser utilizados. Verificar suas condições antes de utilizá-los.
Os olhais de içamento em componentes como tampas, kit de ventilação forçada, entre outros, devem ser utilizados somente para o içamento destes componentes de maneira isolada e nunca do motor completo.

Toda a movimentação deve ser realizada de forma suave, sem impactos, caso contrário os rolamentos podem ser danificados bem como os olhais serem expostos a esforços excessivos, podendo provocar o rompimento dos olhais.

Nunca manuseie os motores pelos componentes poliméricos: tampa defletora, chapéu, caixa de ligação e/ou tampa da caixa de ligação.

Os dispositivos de travamento do eixo (utilizados para proteção durante o transporte), em motores com rolamentos de rolos ou contato angular, devem ser utilizados para todo e qualquer transporte do motor, mesmo que isso requeira o desacoplamento da máquina acionada.
Todos os motores HGF, W50, W51 HD e W60, independentemente do tipo de mancal, devem ter seu rotor travado para transporte.
Motores verticais com mancais lubrificados a óleo devem ser transportados na posição vertical. Caso necessário transportar o motor na posição horizontal, utilizar o dispositivo de travamento do eixo em ambos os lados (dianteiro/traseiro) do motor.

4.1 IÇAMENTO

Antes de iniciar qualquer processo de içamento, certificar-se que os olhais estejam adequadamente fixos, totalmente parafusados e com sua base em contato com a superfície a ser içada, conforme Figura 4 (a Figura 5 exemplifica o uso incorreto).
Certificar-se que o equipamento utilizado no içamento e suas dimensões sejam adequados ao tamanho do olhal e da massa do motor.

Figura 4 - Maneira correta de fixação do olhal de içamento

Figura 5 - Maneira incorreta de fixação do olhal de içamento

O centro de gravidade pode mudar dependendo do projeto do motor e acessórios. Durante os procedimentos de içamento, o ângulo máximo de inclinação permitido nunca deve ser excedido, conforme especificado nos próximos itens.

4.1.1 Motores horizontais com um olhal de içamento

Para motores com um olhal de içamento, o ângulo máximo resultante durante o processo de içamento não poderá exceder 30° em relação ao eixo vertical, conforme Figura 6.

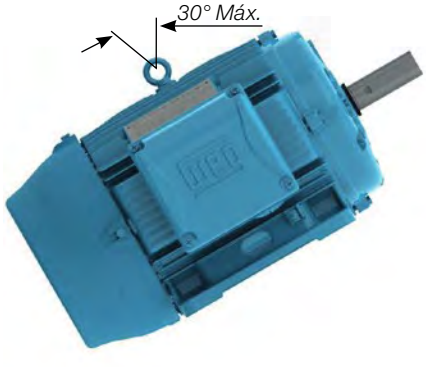

Figura 6 - Ângulo máximo resultante para motores com um olhal de içamento

4.1.2 Motores horizontais com dois ou mais olhais de içamento

Para motores que possuem dois ou mais olhais para o içamento, todos os ollhais fornecidos devem ser utilizados simultaneamente para o içamento.

Existem duas disposições de olhais possíveis (verticais e inclinados), conforme apresentadas a seguir:

- Motores com olhais verticais, conforme Figura 7, o ângulo máximo resultante deve ser de 45° em relação ao eixo vertical. Recomenda-se a utilização de uma barra separadora (spreader beam), para manter o elemento de içamento (corrente ou cabo) no eixo vertical e evitando danos à superfície do motor.

Figura 7 - Ângulo máximo resultante para motores com dois ou mais olhais de içamento

Para motores HGF, W40, W50 e W51 HD, conforme Figura 8, o ângulo máximo resultante deve ser de 30° em relação ao eixo vertical;

Figura 8 - Ângulo máximo resultante para motores HGF, W40, W50 e W51 HD horizontais

Para motores W60, conforme Figura 9, é necessária a utilização de uma barra separadora (spreader beam) para manter o elemento de içamento (corrente, cabo) no eixo vertical e assim também evitar danos à superfície do motor.

Figura 9 - Içamento de motores W60 com correntes paralelas

- Motores com olhais inclinados, conforme Figura 10, é necessária a utilização de uma barra separadora (spreader beam), para manter o elemento de içamento (corrente, cabo, etc.) no eixo vertical e assim também evitar danos à superfície do motor.

Figura 10 - Uso de barra separadora no içamento

4.1.3 Motores verticais

Para motores verticais é necessária a utilização de uma barra separadora (*spreader beam*), para manter o elemento de içamento (corrente, cabo) no eixo vertical e assim também evitar danos à superfície do motor (conforme Figura 11).

Figura 11 - Içamento de motores verticais

Utilizar sempre os olhais que estão dispostos na parte superior do motor em relação à posição de montagem e diametralmente opostos (ver Figura 12).

Figura 12 - Içamento de motores HGF, W50 e W51 HD

4.1.3.1. Procedimento para colocação de motores W22/WEG General Purpose/WIN na posição vertical

De forma geral, por questões de segurança durante o transporte, os motores verticais são embalados e fornecidos na posição horizontal.
Para a colocação de motores W22/WEG General Purpose/WIN com olhais inclinados (ver Figura 10) na vertical, devem ser seguidos os passos a seguir:

1. Certificar-se que os olhais estão adequadamente fixos (ver Figura 4);
2. Remover o motor da embalagem utilizando os olhais superiores (conforme Figura 13);

Figura 13 - Remoção do motor da embalagem

3. Instalar o segundo par de olhais (conforme Figura 14);

Figura 14 - Instalação do segundo par de olhais

4. Reduzir a carga sobre o primeiro par de olhais para iniciar a rotação do motor (conforme Figura 15). Esse procedimento deve ser realizado de forma lenta e cautelosa.

Figura 15 - Resultado final: motor posicionado na vertical

Para os motores da carcaça IEC 112 a 200 (e NEMA equivalentes), a WEG possui um kit de dispositivos para facilitar o tombamento do motor para a vertical, sendo ele ponta para cima ou para baixo (conforme Figura 16 e Figura 17).

Figura 16 - Olhal para tombamento na ponta de eixo, vertical ponta para cima (V6/V36)

Figura 17 - Olhais com prolongador fixos na tampa traseira, vertical ponta para baixo (V5/V35)

4.1.3.2. Procedimento para colocação de motores HGF, W50 e W51 HD na posição vertical

Os motores verticais HGF são fornecidos com oito pontos de içamento, sendo quatro na parte dianteira e quatro na parte traseira. Já os motores verticais W50 e W51 HD são fornecidos com nove pontos de içamento, sendo quatro na parte dianteira, uma na parte central e quatro na parte traseira. Geralmente são transportados na posição horizontal, mas para a instalação precisam ser colocados na posição vertical.
Para a colocação destes motores na posição vertical, devem ser seguidos os passos a seguir:
1. Levantar o motor através dos quatro olhais laterais, utilizando duas talhas (conforme Figura 18);

Olhal para tombamento na ponta de eixo, vertical ponta para cima (V6/V36)

Figura 18 - Içamento dos motores HGF, W50 e W51 HD utilizando duas talhas

2. Baixar a talha que está presa à parte dianteira do motor e ao mesmo tempo levantar a talha que está presa no lado traseiro do motor até que o motor atinja o equilíbrio (conforme Figura 19);

Olhais com prolongador fixos na tampa traseira, vertical ponta para baixo (V5/V35).

Figura 19 - Colocação dos motores HGF, W50 e W51 HD na vertical

3. Soltar a talha presa na parte dianteira do motor e girar o motor 180° para possibilitar a fixação da talha solta nos outros dois olhais da parte traseira do motor (conforme Figura 20);

Figura 20 - Suspensão de motores HGF, W50 e W51 HD pelos olhais traseiros

4. Fixar a talha solta nos outros dois olhais da parte traseira do motor e levantá-la até que o motor fique na posição vertical (conforme Figura 21).

Figura 21 - Motores HGF, W50 e W51 HD na posição vertical

Estes procedimentos servem para movimentação de motores construídos para a montagem na posição vertical. Estes mesmos procedimentos podem ser utilizados para a colocação do motor da posição horizontal para a posição vertical e vice-versa.

4.2 PROCEDIMENTO PARA TOMBAMENTO DE MOTORES W22/WEG GENERAL PURPOSE/WIN VERTICAIS

Para realizar o tombamento de motores W22/WEG General Purpose/WIN originalmente na vertical, siga os passos mostrados a seguir:

1. Certificar-se que os olhais estão adequadamente fixos (ver Figura 4);
2. Instalar o primeiro par de olhais e suspender o motor (conforme Figura 22);

Figura 22 - Instalação do primeiro par de olhais

3. Instalar o segundo par de olhais (conforme Figura 23);

Figura 23 - Instalação do segundo par de olhais

4. Reduzir a carga sobre o primeiro par de olhais para iniciar a rotação do motor (conforme Figura 24). Esse procedimento deve ser realizado de forma lenta e cautelosa.

Figura 24 - Motor está sendo girado para a posição horizontal

5. Remover o primeiro par de olhais (conforme Figura 25).

Figura 25 - Resultado final: motor posicionado na posição horizontal

Para os motores da carcaça IEC 112 a 200 (NEMA equivalente), a WEG possui um kit de dispositivos para facilitar o tombamento do motor para a vertical, sendo ele ponta para cima ou para baixo.

Para motores Easy Maintenance, Wash, Motofreio, com ventilação forçada, encoder ou planos de pintura 212 e 213, favor entrar em contato com a WEG.

5. ARMAZENAMENTO

Se os motores não forem instalados imediatamente, recomenda-se armazená-los em local seco com umidade relativa do ar de até 60%, com temperatura ambiente acima de 5 °C e abaixo de 40 °C, isento de poeira, vibrações, gases, agentes corrosivos, com temperatura uniforme, em posição normal e sem apoiar sobre eles outros objetos. Remova polias (caso existam) da ponta de eixo, e as mantenha livre e com graxa protetiva para evitar corrosão. Caso o motor possua resistência de aquecimento, esta deverá ser energizada sempre que o motor não estiver em operação. Isto se aplica também para os casos em que o motor estiver instalado, porém fora de uso por um longo período. Nestas situações, dependendo das condições do ambiente, poderá ocorrer condensação de água no interior do motor, provocando queda na resistência de isolamento. Os motores devem ser armazenados de tal modo que a drenagem seja facilitada (informações adicionais estão disponíveis no item 6).

As resistências de aquecimento nunca devem estar energizadas enquanto o motor estiver operando.

5.1 SUPERFÍCIES USINADAS EXPOSTAS

Todas as superfícies usinadas expostas (por exemplo, ponta de eixo e flange) são protegidas na fábrica por um inibidor de oxidação temporário. Esta película protetora deve ser reaplicada periodicamente durante o período de armazenagem (pelo menos a cada seis meses) ou quando for removida ou estiver deteriorada.

5.2 EMPILHAMENTO

O empilhamento de embalagens durante o armazenamento não deve ultrapassar 5 metros de altura, obedecendo-se aos critérios da Tabela 1:

Tipo de embalagem	Carcaças	Quantidade máxima de empilhamento
Caixa de papelão	IEC 56 a 132 NEMA 143 a 215	Indicada na aba superior da caixa de papelão
Engradado de madeira	IEC 56 a 315 NEMA 48 a 504/5	06
	IEC 355 NEMA 586/7 e 588/9	03
	W40 / W50 / W51 HD / W60 / HGF IEC 315 a 630 W40 / W50 / W51 HD / HGF NEMA 5000 a 9600	Indicado na própria embalagem

Tabela 1 - Empilhamento máximo recomendado

Notas:

1) Não empilhar embalagens maiores sobre menores;

2) Posicionar corretamente uma embalagem sobre a outra (ver Figura 26 e Figura 27);

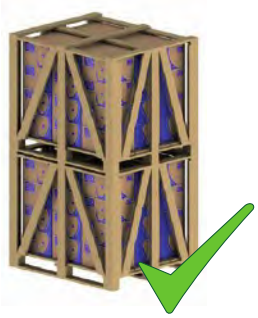

Figura 26 - Montagem adequada

Figura 27 - Montagem inadequada

3) Os pés das embalagens superiores devem estar apoiados sobre calços de madeiras (Figura 28) e não sobre as fitas de aço e nem tampouco ficar sem apoio (Figura 29);

Figura 28 - Empilhamento adequado

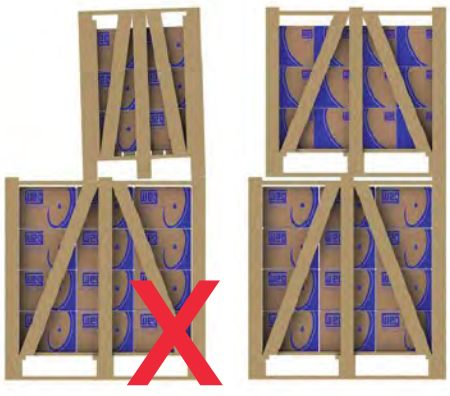

Figura 29 - Empilhamento inadequado

PORTUGUÊS

4) Para o empilhamento de um volume menor sobre um volume maior, acrescentar sarrafos transversais entre os mesmos, quando o maior não oferecer resistência ao peso do menor (ver Figura 30). Esta situação normalmente ocorre com os volumes dos motores de carcaça acima da IEC 225S/M (NEMA 364/5T).

Figura 30 - Utilização de sarrafos adicionais para empilhamento

5.3 MANCAIS

5.3.1 Mancais de rolamento lubrificados a graxa

Recomenda-se girar o eixo do motor pelo menos uma vez ao mês (manualmente, no mínimo cinco voltas, deixando o eixo em posição diferente da original). Nos motores WMagnet e WQuattro, o eixo não gira livremente devido torque de alinhamento dos ímãs. Pode ser necessário o uso de uma alavanca para girar o eixo.

Ao girar o eixo de um motor WMagnet ou WQuattro, deve-se garantir a isolação dos terminais da máquina, devido risco de choque elétrico causado pela tensão induzida durante o procedimento.

Obs.: Caso o motor possua dispositivo de travamento do eixo, este deve ser retirado antes de girar o eixo e ser recolocado novamente antes de transportar o motor.
Motores verticais podem ser armazenados na posição vertical ou na posição horizontal.
Para motores com rolamento aberto armazenados por mais de seis meses, os rolamentos devem ser relubrificados, conforme item 8.2, antes da entrada em operação.
Caso o motor permaneça armazenado por um período superior a dois anos, recomenda-se substituir os rolamentos ou então estes devem ser removidos, lavados, inspecionados e relubrificados (conforme item 8.2).

5.3.2 Mancais de rolamento com lubrificação a óleo

O motor deve ser armazenado na sua posição original de funcionamento e com óleo nos mancais. O nível do óleo deve ser respeitado, permanecendo na metade do visor de nível.
Durante o período de armazenagem, deve-se retirar o dispositivo de travamento do eixo e, mensalmente, rotacionar o eixo manualmente (cinco voltas), para recircular o óleo e conservar o mancal em boas condições. Sendo necessário movimentar o motor, o dispositivo de travamento do eixo deve ser reinstalado.
Para motores armazenados por período igual ou superior ao intervalo de troca de óleo, o óleo deverá ser trocado (conforme item 8.2), antes da entrada em operação.
Caso o motor permaneça armazenado por um período maior que dois anos, recomenda-se substituir os rolamentos ou então estes devem ser removidos, lavados, inspecionados e relubrificados (conforme item 8.2).
O óleo dos mancais dos motores verticais é retirado para evitar vazamento durante o transporte. Após o recebimento, os mancais devem ser lubrificados.

5.3.3 Mancais de rolamento com lubrificação do tipo *Oil Mist*

O motor deve ser armazenado na posição horizontal. Preencher os mancais com óleo mineral ISO VG 68 com a quantidade de óleo indicada na Tabela 2 (também válida para rolamentos com dimensões equivalentes). Após a colocação de óleo nos mancais, gire o eixo (mínimo de cinco voltas).
Durante o período de armazenagem, deve-se retirar o dispositivo de travamento do eixo (quando fornecido) e, semanalmente, rotacionar o eixo manualmente (cinco voltas), deixando o eixo em posição diferente da original. Sendo necessário movimentar o motor, o dispositivo de travamento do eixo deve ser reinstalado.
Caso o motor permaneça armazenado por um período maior que dois anos, recomenda-se substituir os rolamentos ou então estes devem ser removidos, lavados, inspecionados e relubrificados (conforme item 8.2).

Tamanho de rolamento	Quantidade de óleo (ml)	Tamanho de rolamento	Quantidade de óleo (ml)
6201	15	6309	65
6202	15	6311	90
6203	15	6312	105
6204	25	6314	150
6205	25	6315	200
6206	35	6316	250
6207	35	6317	300
6208	40	6319	350
6209	40	6320	400
6211	45	6322	550
6212	50	6324	600
6307	45	6326	650
6308	55	6328	700

Tabela 2 - Quantidade de óleo por rolamento

Durante qualquer manuseio do motor, os mancais devem estar sem óleo. Dessa forma, antes da entrada em operação, todo o óleo dos mancais deve ser drenado. Após a instalação, caso o sistema de névoa não esteja em operação, o óleo deve ser recolocado para garantir a conservação do mancal. Neste caso, deve-se também proceder com o giro semanal do eixo.

5.3.4 Mancais de deslizamento

O motor deve ser armazenado na sua posição original de funcionamento, e com óleo nos mancais. O nível do óleo deve ser respeitado, permanecendo na metade do visor de nível.
Durante o período de armazenagem, deve-se retirar o dispositivo de travamento do eixo e, mensalmente, rotacionar o eixo manualmente (cinco voltas) (e a 30 rpm, no mínimo) para recircular o óleo e conservar o mancal em boas condições de operação. Caso seja necessário movimentar o motor, o dispositivo de travamento do eixo deve ser reinstalado.
Para motores armazenados por período igual ou superior ao intervalo de troca de óleo, o óleo deverá ser trocado, (conforme item 8.2) antes da entrada em operação.
Caso o motor fique armazenado por um período maior que o intervalo de troca de óleo, ou não seja possível rotacionar o eixo do motor, o óleo deve ser drenado e aplicada uma proteção anticorrosiva e desumidificadores.

5.4 RESISTÊNCIA DE ISOLAMENTO

Recomenda-se medir periodicamente a resistência de isolamento dos motores, para assim avaliar as condições de armazenamento sob o ponto de vista elétrico. Se forem observadas quedas nos valores de resistência de isolamento, as condições do armazenamento devem ser analisadas, avaliadas e corrigidas, quando necessário.

5.4.1 Procedimento para medição da resistência de isolamento

A medição da resistência de isolamento deve ser realizada em área segura.

A resistência de isolamento deve ser medida com um megômetro e com o motor parado, frio e completamente desconectado da rede elétrica.

Para evitar o risco de choque elétrico, descarregue os terminais imediatamente antes e depois de cada medição. Caso o motor possua capacitores, estes devem ser descarregados.

É recomendável que cada fase seja isolada e testada separadamente, permitindo que seja feita uma comparação entre a resistência de isolamento em cada fase. Para testar uma das fases, as demais fases devem estar aterradas.
O teste de todas as fases simultaneamente avalia apenas a resistência de isolamento contra o terra. Neste caso não é avaliada a resistência de isolamento entre as fases.
Os cabos de alimentação, chaves, capacitores, e outros equipamentos externos ligados ao motor podem influenciar consideravelmente a medição da resistência de isolamento. Ao realizar estas medições, todos os equipamentos externos devem estar desconectados e aterrados.
A leitura da resistência de isolamento deve ser realizada após a tensão ser aplicada pelo período de um minuto (1 min). A tensão a ser aplicada deve obedecer a Tabela 3.

Tensão nominal do motor (V)	Tensão aplicada para a medição da resistência de isolamento (V)
< 1000	500
1000 - 2500	500 - 1000
2501 - 5000	1000 - 2500
5001 - 12000	2500 - 5000
> 12000	5000 - 10000

Tabela 3 - Tensão para medição da resistência de isolamento

A medição da resistência de isolamento deve ser corrigida para a temperatura de 40 °C conforme Tabela 4.

Temperatura de medição da resistência de isolamento (°C)	Fator de correção da resistência de isolamento para 40 °C	Temperatura de medição da resistência de isolamento (°C)	Fator de correção da resistência de isolamento para 40 °C
10	0,125	30	0,500
11	0,134	31	0,536
12	0,144	32	0,574
13	0,154	33	0,616
14	0,165	34	0,660
15	0,177	35	0,707
16	0,189	36	0,758
17	0,203	37	0,812
18	0,218	38	0,871
19	0,233	39	0,933
20	0,250	40	1,000
21	0,268	41	1,072
22	0,287	42	1,149
23	0,308	43	1,231
24	0,330	44	1,320
25	0,354	45	1,414
26	0,379	46	1,516
27	0,406	47	1,625
28	0,435	48	1,741
29	0,467	49	1,866
30	0,500	50	2,000

Tabela 4 - Avaliação do sistema de isolamento

A condição do isolamento do motor deverá ser avaliada comparando-se o valor medido com os valores da Tabela 5 (referenciados a 40 °C):

Valor limite para tensão nominal até 1,1 kV (MΩ)	Valor limite para tensão nominal acima de 1,1 kV (MΩ)	Situação
Até 5	Até 100	Perigoso, o motor não deve operar nessa condição.
Entre 5 e 100	Entre 100 e 500	Regular
Entre 100 e 500	Acima de 500	Bom
Acima de 500	Acima de 1000	Excelente

Tabela 5 - Avaliação do sistema de isolamento

Os dados indicados na Tabela 5 servem apenas como valores de referências. Sugere-se manter o histórico da resistência de isolamento do motor durante toda a sua vida.
Se a resistência de isolamento estiver baixa, o estator do motor pode estar úmido. Nesse caso, recomenda-se levá-lo até um Assistente Técnico Autorizado WEG para que sejam realizados a avaliação e o reparo adequado. Este serviço não é coberto pelo Termo de Garantia.
Para procedimento de adequação da resistência de isolamento, ver item 8.4.

6. INSTALAÇÃO

A instalação de motores deve ser feita por profissionais capacitados com conhecimentos sobre as normas e as prescrições de segurança.

Antes de continuar com o procedimento de instalação alguns pontos devem ser avaliados:

1. Resistência de isolamento: deve estar dentro dos valores aceitáveis (ver item 5.4).
2. Mancais: Caso o motor seja instalado e não entre em operação imediatamente, proceder com as orientações do item 5.3.
3. Condição dos capacitores de partida: para motores monofásicos armazenados por um período maior que dois anos, é recomendado que seus capacitores de partida sejam substituídos.
4. Caixa de ligação:
   a. Devem estar limpas e secas no seu interior.
   b. Os elementos de contato devem estar isentos de oxidação e corretamente conectados (ver itens 6.9 e 6.10).
   c. As entradas de cabos não utilizadas devem estar corretamente seladas, a tampa da caixa de ligação deve ser fechada e as vedações devem estar em condições apropriadas para atender o grau de proteção do motor.
5. Ventilação: as aletas, a entrada e a saída de ar devem estar limpas e desobstruídas. A distância de instalação recomendada entre as entradas de ar do motor e a parede não deve ser inferior a ¼ (um quarto) do diâmetro da entrada de ar. Deve-se assegurar espaço suficiente para realização de serviços de limpeza (ver item 7).

6. Acoplamento: remover o dispositivo de travamento do eixo (caso exista) e a graxa de proteção contra corrosão da ponta do eixo, incluindo a região da escova de aterramento, e do flange somente pouco antes de instalar o motor (ver item 6.4).
7. Dreno: devem sempre estar posicionados de forma que a drenagem seja facilitada (no ponto mais baixo do motor. Caso exista uma seta indicativa no corpo do dreno, o dreno deve ser montado para que a seta aponte para baixo). Motores com bujões de dreno de borracha, drenos roscados e demais drenos do tipo abre/fecha saem de fábrica na posição fechada e devem ser abertos periodicamente para permitir a saída da água condensada. Para ambientes com elevada condensação de água e motores com grau de proteção IP55, os drenos podem ser montados na posição aberta (ver Figura 31).
   Para motores com grau de proteção IP56, IP65 ou IP66, os drenos devem permanecer na posição fechada (ver Figura 31), sendo abertos apenas durante a manutenção do motor.
   Motores com lubrificação do tipo *Oil Mist* devem ter seus drenos conectados a um sistema de coleta específico (ver Figura 43).

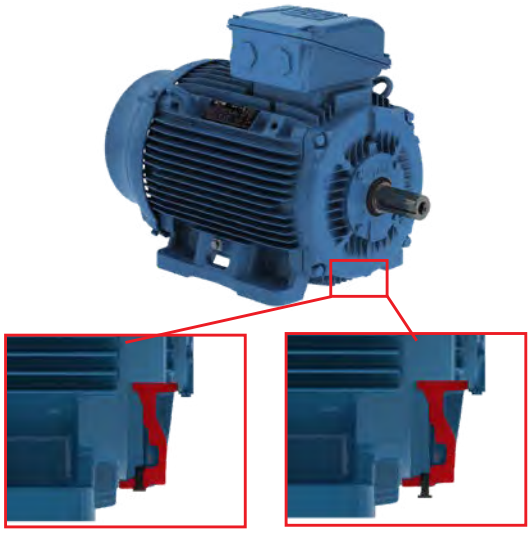

Figura 31 - Detalhe do dreno de borracha montado na posição fechado e aberto.

8. Recomendações adicionais:

a. Confira o sentido de rotação do motor, ligando-o a vazio antes de acoplá-lo à carga.
b. Para motores montados na vertical com a ponta de eixo para baixo, recomenda-se o uso de chapéu para evitar a penetração de corpos estranhos no interior do motor.
c. Para motores montados na vertical com a ponta de eixo para cima, recomenda-se o uso de um defletor de água (water slinger ring) para evitar a penetração de água pelo eixo.
d. Os elementos de fixação montados nos furos roscados passantes no invólucro do motor (como, por exemplo, no flange) devem ser vedados para assegurar o grau de proteção indicado na placa de identificação do motor.

Remova ou fixe completamente a chaveta antes de ligar o motor.

Qualquer alteração construtiva no motor, como instalação de graxeiras prolongadas ou modificação do sistema de lubrificação, instalação de acessórios em pontos alternativos, etc., somente pode ser realizada com prévio consentimento por escrito da WEG.

6.1 FUNDAÇÕES PARA O MOTOR

Fundação é o elemento estrutural, base natural ou preparada, destinada a suportar os esforços produzidos pelos equipamentos instalados, permitindo a operação destes com estabilidade, desempenho e segurança.
O projeto das fundações deve considerar as estruturas adjacentes para evitar influência de um equipamento sobre o outro, a fim de que não ocorra a propagação de vibrações.
A fundação deve ser plana e a sua escolha, detalhamento e execução exige as características:

a) Da construção do próprio equipamento, envolvendo não somente os valores e forma de atuação das cargas, como ainda sua finalidade e limites máximos das deformações e vibrações compatíveis em cada caso (exemplo, motores com valores reduzidos de: nível de vibração, planicidade dos pés, concentricidade do flange, batimento do flange, etc.);
b) Das construções vizinhas, compreendendo o estado de conservação, estimativa das cargas máximas aplicadas, tipo da fundação e fixação empregadas e níveis de vibração transmitidos por estas construções.

Quando o motor for fornecido com parafuso de alinhamento/nivelamento, deverá ser previsto na base uma superfície que permita o alinhamento/nivelamento.

Esforços gerados durante a operação pela carga acionada devem ser considerados como parte do dimensionamento das fundações.
O usuário é totalmente responsável pelo projeto, preparação e execução da fundação.

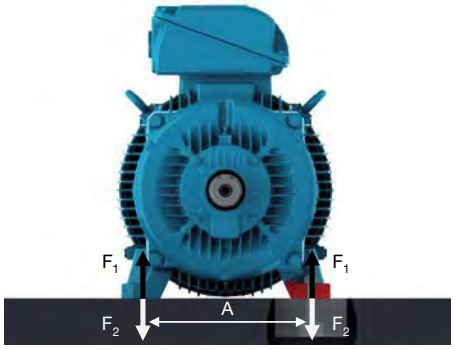
Os esforços do motor sobre a fundação podem ser calculados pelas equações (ver Figura 32):

$$F_1 = 0,5 * g * m - (4 * C_{máx.} / A)$$
$$F_2 = 0,5 * g * m + (4 * C_{máx.} / A)$$

Onde:

F_1 e F_2 = esforços em cada lado do motor (N);
g = aceleração da gravidade (9,8 m/s^2);
m = massa do motor (kg);
$C_{máx.}$ = torque máximo do motor (Nm);
A = distância entre furos de fixação nos pés do motor (vista frontal) (m).

Os motores podem ser montados sobre:
- Bases de concreto: mais recomendadas e usuais para os motores de grande porte (ver Figura 32);
- Bases metálicas: mais comuns para motores de pequeno porte (ver Figura 33).



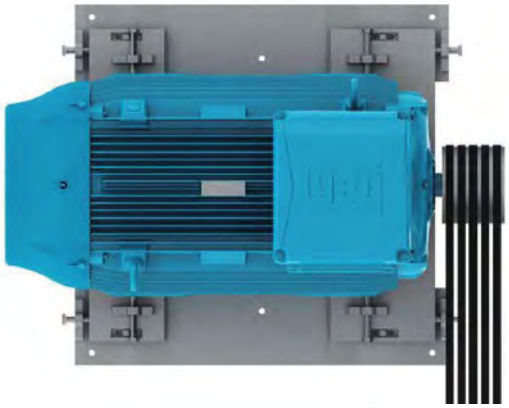


Figura 32 - Motor instalado sobre base de concreto

Figura 33 - Motor instalado sobre base metálica

Nas bases metálicas e de concreto pode existir um sistema de deslizamento. Normalmente são utilizados em aplicações em que o acionamento ocorre por polias e correias. São mais flexíveis permitindo montagens e desmontagens mais rápidas, além de permitir ajustes na tensão da correia. Outro aspecto importante é a posição dos parafusos de travamento da base, que devem ser opostos e na diagonal. O trilho mais próximo da polia motora é colocado de forma que o parafuso de posicionamento fique entre o motor e a máquina acionada. O outro trilho deve ser colocado com o parafuso na posição oposta (diagonal), como apresentado na Figura 34.
Para facilitar a montagem, as bases podem possuir características como:
- Ressaltos e/ou reentrâncias;
- Parafusos de ancoragem com placas soltas;
- Parafusos fundidos no concreto;
- Parafusos de nivelamento;
- Parafusos de posicionamento;
- Blocos de ferro ou de aço, placas com superfícies planas.

Figura 34 - Motor instalado sobre base deslizante.

Recomenda-se também que após a instalação do motor, as partes metálicas expostas sejam protegidas contra oxidação.

6.2 FIXAÇÃO DO MOTOR

Motores sem pés fornecidos com dispositivos de transporte, de acordo com a Figura 35, devem ter seus dispositivos retirados antes de iniciar a instalação do motor.

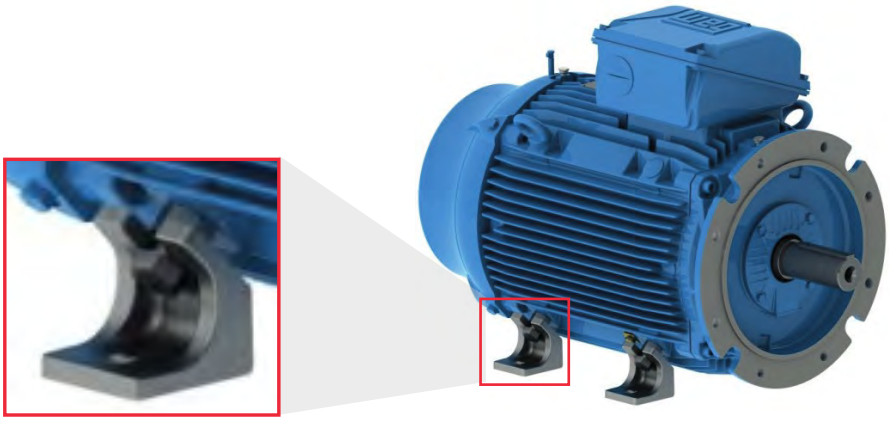

Figura 35 - Detalhe do dispositivo de transporte para motores sem pés

6.2.1 Fixação pelos pés

O dimensional da furação dos pés, baseado nas normas IEC ou NEMA, é informado no catálogo técnico do produto. O motor deve ser apoiado sobre a base, alinhado e nivelado a fim de que não provoque vibrações e esforços excessivos no eixo e nos mancais. Para mais detalhes, consultar item 6.3 e 6.6.
Recomenda-se que o parafuso de fixação tenha comprimento roscado livre de 1,5 vezes o diâmetro do parafuso. Em aplicações severas, pode ser necessária a utilização de um comprimento roscado livre maior. A Figura 36 representa a fixação do motor com pés indicando o comprimento livre mínimo do parafuso.

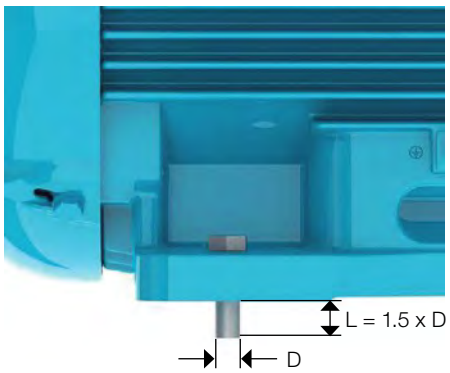

Figura 36 - Representação da fixação do motor por pés

6.2.2 Fixação por flange

O dimensional do flange, baseado nas normas IEC ou NEMA, é informado no catálogo eletrônico ou no catálogo técnico do produto. O flange do motor deve ser apoiado na base, que deve possuir dimensional de encaixe adequado para o tamanho do flange do motor, assegurando assim a a concentricidade do conjunto.
Dependendo do tipo do flange, a fixação pode ser realizada do motor para a base (flange FF (IEC) ou D (NEMA)) ou da base para o motor (flange C (DIN ou NEMA)). Para fixação da base para o motor, a determinação do comprimento do parafuso deve levar em consideração a espessura da base do usuário e a profundidade da rosca do flange do motor.

Nos casos que utilizam flanges de polímero com porca incorporada ou o flange em alumínio com furo sextavado, o comprimento do parafuso de fixação do motor não pode exceder o comprimento do furo, evitando assim desalinhamento e folga do acoplamento.

Nos casos onde a furação do flange é passante, o comprimento do parafuso de fixação do motor não deve exceder o comprimento roscado do flange, evitando assim contato com a bobina do motor.

Motores com com carcaça e/ou flange em alumínio podem ser fornecidos com furos sextavados para fixação do flange, estes furos estão aptos à receber parafusos cilíndricos compatíveis com as dimensões de acoplamento normalizadas, devendo-se atentar à classe mínima de resistência do parafuso, conforme catálogo do produto.
Para fixação do motor à base, recomenda-se que o parafuso de fixação tenha comprimento roscado livre de 1,5 vezes o diâmetro do parafuso. Em aplicações severas, pode ser necessária a utilização de um comprimento roscado livre maior.

Para fixação de motores de grande porte e/ou em aplicações severas, recomenda-se que além da fixação por flange, o motor seja apoiado (por pés ou *pad*). O motor nunca pode ser apoiado sobre suas aletas (ver Figura 37).

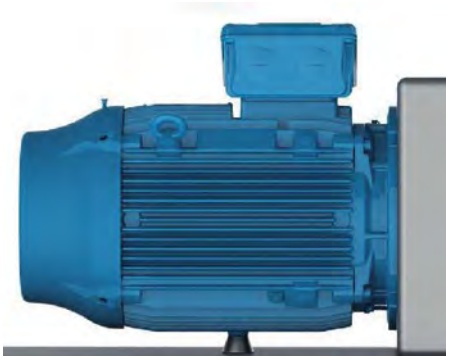

Figura 37 - Representação da fixação do motor com flange e apoio na base da carcaça

Para aplicação de motores com a presença de líquidos no interior do flange (ex.: óleo), a vedação do motor deve ser adequada para impedir a penetração de líquidos para o interior do motor.

Os torques de aperto indicados na Tabela 6 devem ser respeitados para:
- a fixação do pé e/ou flange de polímero no equipamento do cliente para motores W12/WEG General Purpose.
- a instalação de tampas defletoras de polímero de motores WEG General Purpose/WIN e/ou mudança de posição da caixa de ligação de motores W12/WEG General Purpose.

Para instalação de motores W12/WEG General Purpose nas carcaças IEC56, W63 e W71 na posição vertical com ponta de eixo para cima, o pé deve ser travado axialmente através da fixação de um parafuso de cabeça escareada conforme indicado na Tabela 6. O furo hexagonal nos flanges C-DIN de motores W12/WEG General Purpose nas carcaças IEC56/W63/W71 são aptos aos parafusos indicados na Tabela 6.

Carcaça	Componente	Especificação do Parafuso (bitola x comprimento)	Torque (Nm)
IEC56	Pé Polímero	M5x12	8
W63/W71		M5x16	8
IEC56/W63/ W71	Flange Polímero	-	8
	C-80	M5	5
	C-105	M6	6
160/180/200/W225/225/250/W280	Tampa defletora	M8 / M10	6 a 8
IEC 56/W63/W71	Caixa de ligação/Aterramento	M5	1,8 a 2,4
71/W80/90/W100/112/132	Caixa de ligação/Aterramento	M5	5

Tabela 6 - Torques de aperto e parafusos a serem utilizados em motores W12/WEG General Purpose

Para motores da linha WFL, o flange possui furos hexagonais aptos a parafusos M6 (torque máximo 8 Nm), os parafusos devem ter classe de resistência mínima de 5,6. O comprimento dos parafusos utilizados para fixar o motor no equipamento, não deve ultrapassar a espessura das paredes da tampa onde os mesmos são fixos, com risco de danificar a cabeça de bobina do motor e risco de choque elétrico. O parafuso da aplicação deve ser engastado na tampa com profundidade mínima de 7 mm e máxima de 9 mm, conforme indicado na Figura 38.

Figura 38 - Limites de profundidade do engaste

6.2.3 Fixação por *pad*

Esse tipo de fixação é normalmente utilizado em dutos de ventilação. A fixação do motor é feita através de furos roscados na estrutura do motor, cujo dimensional é informado no catálogo eletrônico ou no catálogo técnico do produto.
O dimensionamento da haste de fixação/parafuso do motor deve levar em consideração o dimensional do duto de ventilação ou a base de instalação e a profundidade da rosca no motor. As hastes de fixação e a parede do duto devem ter rigidez suficiente para evitar a vibração excessiva do conjunto (motor e ventilador). A Figura 39 representa a fixação por *pads*.

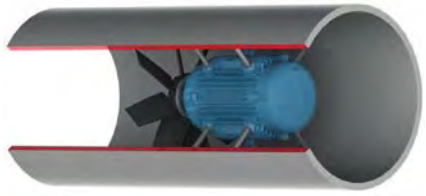

Figura 39 - Representação da fixação do motor no interior de um duto de ventilação

6.3 BALANCEAMENTO

Equipamentos desbalanceados geram vibrações que podem causar danos ao motor. Os motores WEG são balanceados dinamicamente com “meia chaveta” em vazio (desacoplados). Balanceamentos especiais devem ser solicitados no ato da compra.

Os elementos de transmissão tais como polias, acoplamentos, etc., devem ser balanceados antes de serem instalados nos eixos dos motores.

O grau de qualidade de balanceamento do motor segue as normas vigentes para cada linha de produto.
Recomenda-se que os desvios máximos de balanceamento sejam registrados no relatório de instalação.

6.4 ACOPLAMENTOS

Os acoplamentos são utilizados para a transmissão do torque do motor para a máquina acionada. Ao utilizar um acoplamento, devem ser observados os tópicos a seguir:

- Utilizar ferramentas apropriadas para a montagem e desmontagem dos acoplamentos e assim evitar danos ao motor;
- Recomenda-se a utilização de acoplamentos flexíveis, capazes de absorver pequenos desalinhamentos durante a operação do equipamento;
- As cargas máximas e limites de velocidade informados nos catálogos dos fabricantes dos acoplamentos e do motor não devem ser excedidos;
- Realizar o nivelamento e alinhamento do motor conforme itens 6.5 e 6.6, respectivamente.

6.4.1 Acoplamento direto

O acoplamento direto é caracterizado quando o eixo do motor está acoplado diretamente ao eixo da carga acionada, sem o uso de elementos de transmissão. O acoplamento direto apresenta menor custo, maior segurança contra acidentes e ocupa menos espaço.

Em aplicações com acoplamento direto, recomenda-se o uso de rolamentos de esferas.

6.4.2 Acoplamento por engrenagem

O acoplamento por engrenagens é utilizado quando há a necessidade de uma redução de velocidade.
É imprescindível que os eixos estejam perfeitamente alinhados, rigorosamente paralelos (no caso de engrenagens retas) e no ângulo de engrenamento (no caso de engrenagens cônicas ou helicoidais).

6.4.3 Acoplamento por polias e correias

É um tipo de transmissão utilizado quando há a necessidade de uma relação de velocidades entre o motor e a carga acionada.

Uma tensão excessiva nas correias danifica os rolamentos e pode provocar a ruptura do eixo do motor.

6.4.4 Acoplamento de motores equipados com mancais de deslizamento

Motores equipados com mancais de deslizamento devem estar acoplados diretamente à máquina acionada ou por meio de um redutor. Mancais de deslizamento não permitem o acoplamento através de polias e correias.
Os motores equipados com mancais de deslizamento possuem 3 (três) marcas na ponta do eixo, sendo que a marca central é a indicação do centro magnético e as outras 2 (duas) marcas externas indicam os limites de movimento axial permitidos para o rotor, conforme Figura 40.
O motor deve ser acoplado de maneira que a seta fixada na carcaça do mancal fique posicionada sobre a marca central, quando o motor está em operação. Durante a partida, ou mesmo em operação, o rotor pode mover-se livremente entre as duas ranhuras externas, caso a máquina acionada exerça algum esforço axial sobre o eixo do motor. No entanto, em hipótese alguma o motor pode operar de maneira constante com esforço axial sobre o mancal.

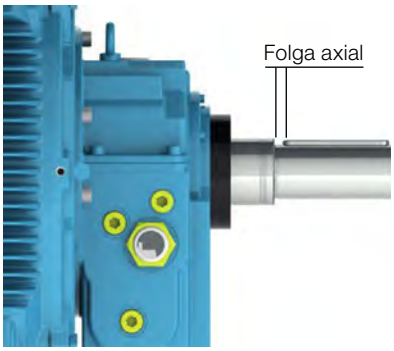

Figura 40 - Folga axial em motor equipado com mancal de deslizamento

Ao avaliar o acoplamento, deve-se considerar a folga axial máxima do mancal (conforme Tabela 7). As folgas axiais da máquina acionada e do acoplamento influenciam na folga máxima do mancal.

Tamanho do mancal	Folga axial total (mm)
9*	3 + 3 = 6
11*	4 + 4 = 8
14*	5 + 5 =10
18	7,5 + 7,5 = 15

Tabela 7 - Folgas utilizadas em mancais de deslizamento

** Para motores conforme a norma API 541, a folga axial total é 12,7 mm.*

Os mancais de deslizamento utilizados pela WEG não foram projetados para suportar esforço axial contínuo. Não é recomendada a operação contínua da máquina nos seus limites da folga axial.

6.5 NIVELAMENTO

O nivelamento do motor deve ser realizado para corrigir eventuais desvios de planicidade, que possam existir provenientes de outros processos e acomodações dos materiais. O nivelamento pode ser feito por meio de um parafuso de nivelamento fixo no pé ou flange do motor ou por meio de finas chapas de compensação. Após o nivelamento, a diferença de altura entre a base de fixação do motor e o motor não deve exceder 0,1 mm.
Caso uma base metálica seja utilizada para ajustar a altura da ponta de eixo do motor com a ponta de eixo da máquina acionada, esta deve ser nivelada na base de concreto.
Recomenda-se que os desvios máximos de nivelamento sejam registrados e armazenados no relatório de instalação.

6.6 ALINHAMENTO

O alinhamento entre a máquina motora e a acionada é uma das variáveis que mais contribuem para prolongar a vida do motor. O desalinhamento entre os acoplamentos geram elevadas cargas que reduzem a vida útil dos mancais, provocam vibrações e, em casos extremos, podem causar a ruptura do eixo. A Figura 41 ilustra o desalinhamento entre o motor e o equipamento acionado.

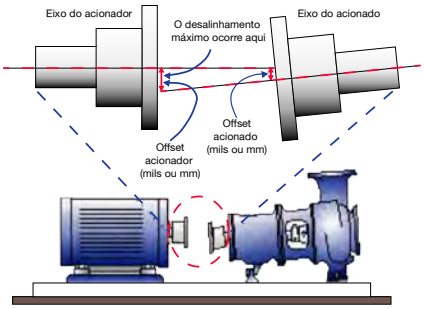

Figura 41 - Condição típica de desalinhamento

Para se efetuar um bom alinhamento do motor, devem-se utilizar ferramentas e dispositivos adequados, como relógio comparador, instrumento de alinhamento a laser, entre outros. O eixo deve ser alinhado axialmente e radialmente com o eixo da máquina acionada

O valor lido em relógios comparadores para o alinhamento, de acordo com a Figura 42, não deve exceder 0,03 mm, considerando um giro completo do eixo. Deve existir uma folga entre os acoplamentos, para compensar a dilatação térmica dos eixos, conforme especificação do fabricante do acoplamento.

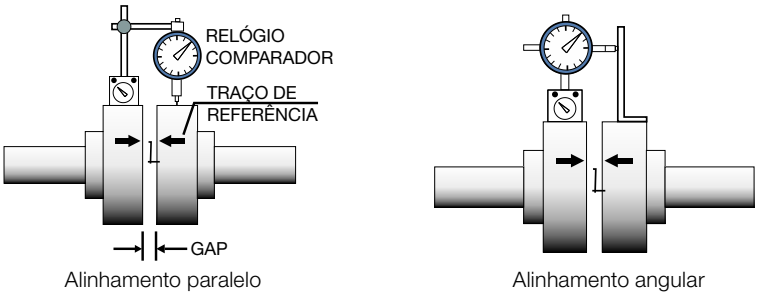

Figura 42 - Alinhamento com relógio comparador

Caso o alinhamento seja realizado através de um instrumento a laser, devem ser seguidas as instruções e recomendações fornecidas pelo fabricante do instrumento.
A verificação do alinhamento deve ser realizada na temperatura ambiente e na temperatura de trabalho dos equipamentos.

É recomendado que o alinhamento dos acoplamentos seja verificado periodicamente.

Para acoplamento por polias e correias, o alinhamento deve ser realizado de tal modo que o centro da polia motora esteja no mesmo plano do centro da polia movida e os eixos do motor e da máquina estejam perfeitamente paralelos.
Após a realização dos procedimentos descritos anteriormente, deve-se certificar de que os dispositivos de montagem do motor não permitam alterações no alinhamento e no nivelamento e não causem danos ao equipamento.
Recomenda-se que os desvios máximos de alinhamento sejam registrados e armazenados no relatório de instalação.

6.7 CONEXÃO DE MOTORES LUBRIFICADOS A ÓLEO OU DO TIPO *OIL MIST*

Nos motores com lubrificação a óleo ou do tipo *oil mist*, deve-se conectar os tubos de lubrificação existentes (entrada, saída do mancal e dreno do motor), conforme indicado na Figura 43.
O sistema de lubrificação deve garantir lubrificação contínua do mancal de acordo com as especificações do fabricante deste sistema.

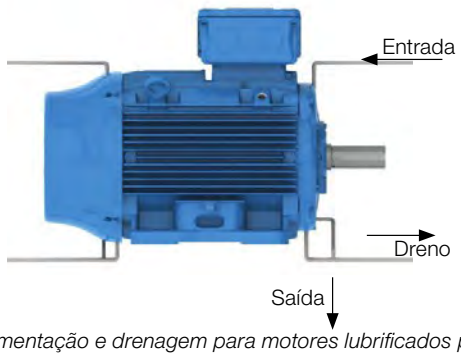

Figura 43 - Sistema de alimentação e drenagem para motores lubrificados por óleo ou do tipo Oil Mist

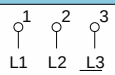
6.8 CONEXÃO DO SISTEMA DE REFRIGERAÇÃO À ÁGUA

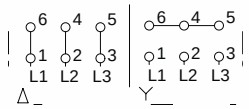
Nos motores com refrigeração à água, deve ser prevista a instalação de dutos na entrada e saída de água do motor para garantir a sua refrigeração. Deve-se observar (conforme item 7.2), a vazão mínima e temperatura da água na instalação.

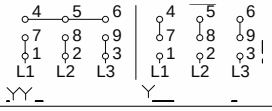
6.9 CONEXÃO ELÉTRICA

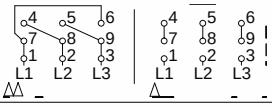
Para o dimensionamento dos cabos de alimentação e dispositivos de manobra e proteção devem ser considerados: corrente nominal do motor, fator de serviço, corrente de partida, condições do ambiente e da instalação, a máxima queda de tensão, etc., conforme as normas vigentes.
Todos os motores devem ser instalados com sistemas de proteção contra sobrecarga. Para motores trifásicos recomenda-se também a instalação de sistemas de proteção contra falta de fase.

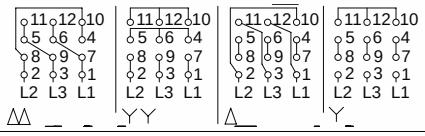
Antes de conectar o motor, verificar se a tensão e a frequência da rede são as mesmas marcadas na placa de identificação do motor. Seguir o diagrama de ligação indicado na placa de identificação do motor. Como referência, podem ser seguidos os diagramas de ligação apresentados nas Tabela 8 e Tabela 10. Para evitar acidentes, verificar se o aterramento foi realizado conforme as normas vigentes.

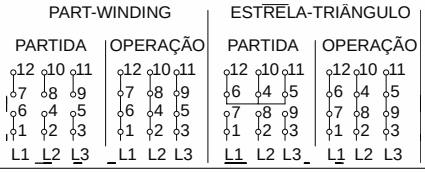


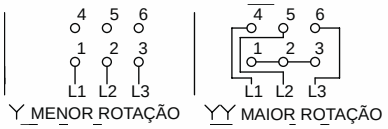


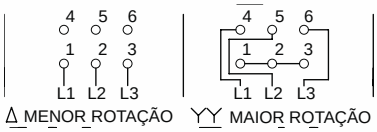


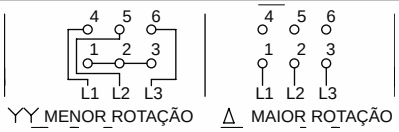


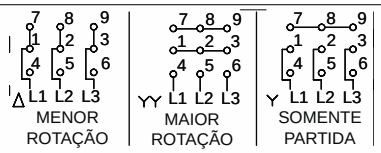












Configuração	Quantidade de cabos	Tipo de ligação	Diagrama de ligação
Velocidade única	3	-	
	6	Δ - Y	
	9	YY - Y	
		ΔΔ - Δ	
	12	ΔΔ - YY - Δ - Y	
		Δ - PWS Partida Part-winding	
Duas velocidades Dahlander	6	YY - Y Torque Variável	
		Δ - YY Torque Constante	
		YY - Δ Potência Constante	
	9	Δ - Y - YY	
Duas velocidades Duplo enrolamento	6	-	

Tabela 8 - Diagramas de ligação usuais para motores trifásicos

Identificação dos cabos no diagrama de ligação		1	2	3	4	5	6	7	8	9	10	11	12
Velocidade única	NEMA MG 1 Parte 2	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11	T12

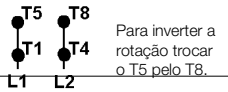
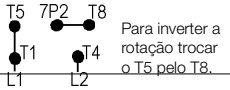
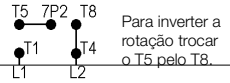
Duas velocidades (Dahlander e Duplo enrolamento)	NEMA MG 1 Parte 2[1)]	1U	1V	1W	2U	2V	2W	3U	3V	3W	4U	4V	4W
	IEC 60034-8	1U	1V	1W	2U	2V	2W	3U	3V	3W	4U	4V	4W

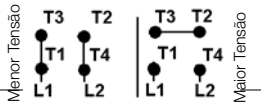
Tabela 9 - Tabela de equivalências para identificação dos cabos

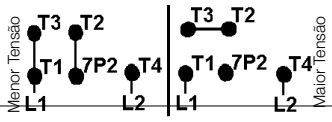
1) A norma NEMA MG 1 Parte 2 define T1 a T12 para dois ou mais enrolamentos, porém a WEG adota 1U a 4W.

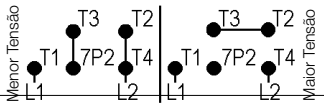


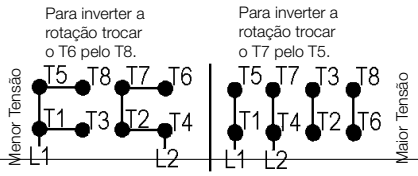


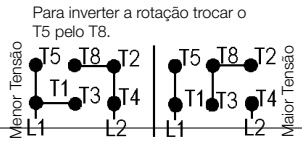


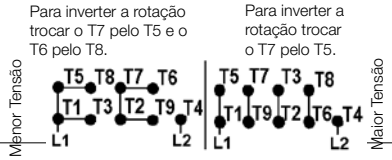


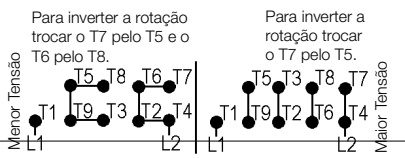


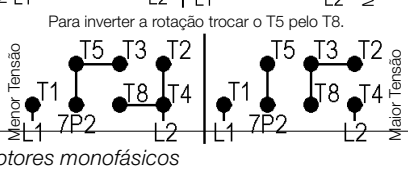












Tensão	Sentido de rotação	Proteção Térmica	Tipo	Diagrama de ligação
Única	Anti-horário ou Horário	Com ou Sem	Capacitores Partida / Permanente / Dois valores	
	Ambos	Sem		 Para inverter a rotação trocar o T5 pelo T8.
		Protetor Térmico Fenólico		 Para inverter a rotação trocar o T5 pelo T8.
		Termostato		 Para inverter a rotação trocar o T5 pelo T8.
Dupla	Anti-horário ou Horário	Sem	Capacitores Partida / Permanente / Dois valores ou Split Phase	
		Protetor Térmico Fenólico		
		Termostato		
	Ambos	Sem	Split Phase (sem capacitor)	 Para inverter a rotação trocar o T6 pelo T8. Para inverter a rotação trocar o T7 pelo T5.
			Capacitores Partida / Permanente / Dois valores	 Para inverter a rotação trocar o T5 pelo T8.
		Protetor Térmico Fenólico	Split Phase (sem capacitor)	 Para inverter a rotação trocar o T7 pelo T5 e o T6 pelo T8. Para inverter a rotação trocar o T7 pelo T5.
			Capacitores Partida / Permanente / Dois valores	 Para inverter a rotação trocar o T5 pelo T8.
		Termostato	Split Phase (sem capacitor)	 Para inverter a rotação trocar o T7 pelo T5 e o T6 pelo T8. Para inverter a rotação trocar o T7 pelo T5.
			Capacitores Partida / Permanente / Dois valores	 Para inverter a rotação trocar o T5 pelo T8.

Tabela 10 - Diagramas de ligação usuais para motores monofásicos

Motores da plataforma W12/WEG General Purpose com tampa da caixa de ligação em polímero tem o esquema de ligação impresso no seu interior e, para realizar a conexão dos cabos, observar na etiqueta de identificação o código do esquema que deve ser utilizado.

Para abrir a tampa da caixa de ligação use uma chave de fenda ou ferramenta similar, posicionando na região do encaixe como uma alavanca e levante o encaixe com cuidado, um de cada vez até que a tampa seja removida.

Assegurar que o motor esteja conectado corretamente à rede de alimentação elétrica através de contatos seguros e permanentes.

AVISO - Normas locais tem prioridade na definição dos padrões de conexão.

As conexões apresentadas abaixo são uma referência para a ligação dos cabos de alimentação do cliente em motores de baixa tensão com placas de bornes. As placas de bornes apresentadas abaixo são o padrão de cada linha, porém variações podem ocorrer. Recomenda-se sempre o uso de terminais em cobre eletrolítico ou latão, similares aos terminais utilizados nos cabos dos motores.

Placa de bornes K1M

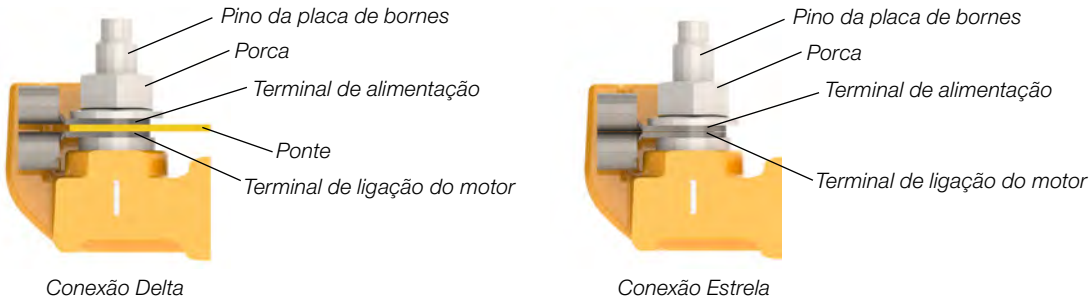


Figura 44 - Conexão dos cabos para motores com placa de bornes K1M

Placas de bornes KWLV e KWMV

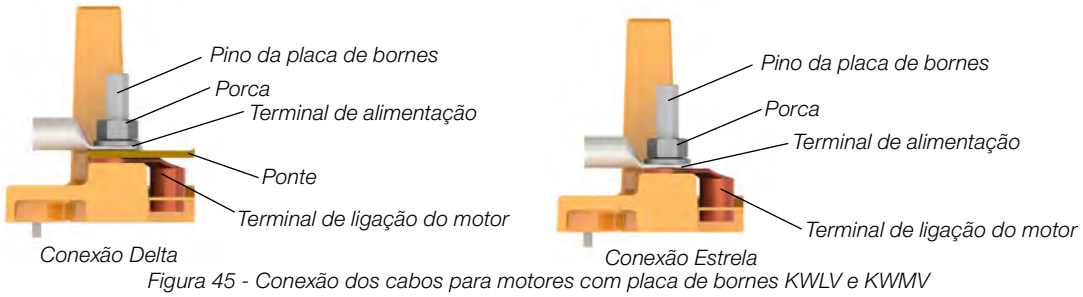

Figura 45 - Conexão dos cabos para motores com placa de bornes KWLV e KWMV

Para motores sem placa de bornes, isolar os cabos terminais do motor, utilizando materiais isolantes compatíveis com a tensão de alimentação e classe de isolamento informadas na placa de identificação.
Para a conexão do cabo de alimentação e do sistema de aterramento devem ser respeitados os torques de aperto indicados na Tabela 44.
A distância de isolação (ver Figura 46) entre partes vivas não isoladas entre si e entre partes vivas e partes aterradas deve respeitar a os valores indicados na Tabela 11.

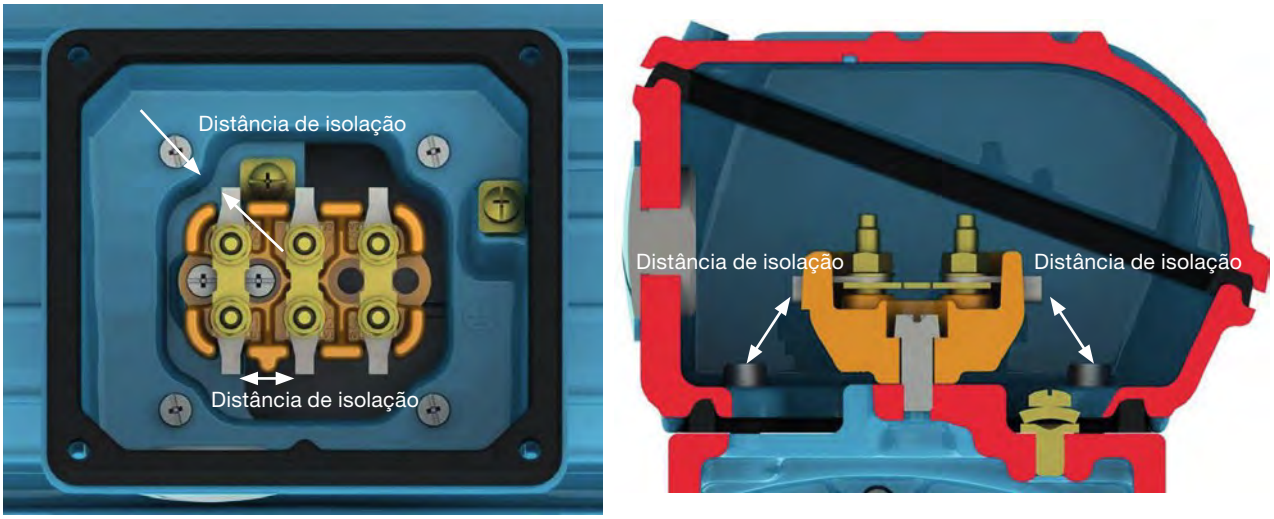

Figura 46 - Representação da distância de isolação.

Tensão	Distância mínima de isolação (mm)
U ≤ 440 V	4
440 < U ≤ 690 V	5.5
690 < U ≤ 1000 V	8
1000 < U ≤ 6900 V	45
6900 < U ≤ 11000 V	70
11000 < U ≤ 16500 V	105

Tabela 11 - Distância mínima de isolação (mm) x tensão de alimentação.

Mesmo com o motor desligado, pode existir energia elétrica no interior da caixa de ligação utilizada para a alimentação das resistências de aquecimento ou inclusive para energizar o enrolamento, quando este estiver sendo utilizado como elemento de aquecimento.
Os capacitores de motores podem reter energia elétrica, mesmo com o motor desligado. Não toque os capacitores e/ou os terminais do motor sem antes verificar a existência de tensão nos mesmos. Para as linhas WMagnet e WQuattro, mesmo com o motor desconectado da alimentação, pode haver tensão nos terminais de ligação caso o rotor se mova.

Após fazer a conexão do motor, certifique-se que nenhum corpo estranho permaneceu no interior da caixa de ligação.

Tomar as medidas necessárias para assegurar o grau de proteção indicado na placa de identificação do motor:
- nas entradas de cabos não utilizadas de caixas de ligação, que devem ser devidamente fechadas com bujões;
- nos componentes fornecidos em avulso (como, por exemplo, caixas de ligação montadas em separado).
As entradas de cabos utilizadas para alimentação e controle devem empregar componentes (como, por exemplo, prensa-cabos e eletrodutos) que atendem as normas e regulamentações vigentes em cada país.

Caso existam acessórios, como freio e ventilação forçada, estes devem ser conectados à rede de alimentação, seguindo as informações de suas placas de identificação e os cuidados indicados anteriormente.

Nos motores com caixa/tampa de ligação em polímero deve-se assegurar que os encaixes e as travas destes componentes estejam corretamente montados após executar a conexão dos cabos.

Em motores que tem knockouts na caixa de ligação, para remover os knockouts em alumínio use uma chave de fenda ou ferramenta similar e um martelo para destacar o knockout, martelando com a chave algumas vezes até remover o knockout. Remova primeiro o knockout interno e depois, se necessário, o externo de acordo com o tamanho do prensa cabos utilizado. Para caixas de ligação de polímero pode ser necessário o uso de uma lâmina ou furadeira para não danificar a caixa. Cuidado, não bata no interior da caixa de ligação e remova os resíduos do knockout destacado do interior da caixa.
Todas as proteções, inclusive as contra sobrecorrente, devem ser ajustadas com base nas condições nominais da máquina. Esta proteção também terá que proteger o motor em caso de curto-circuito, falta de fase, ou rotor bloqueado.
Os ajustes dos dispositivos de segurança dos motores devem ser feitos segundo as normas vigentes.

Verificar o sentido de rotação do motor. Caso não haja nenhuma limitação devido à utilização de ventiladores unidirecionais, é possível mudar o sentido de giro de motores trifásicos, invertendo duas fases de alimentação. Para motores monofásicos, verificar o esquema de ligação na placa de identificação.

6.10 CONEXÃO DOS DISPOSITIVOS DE PROTEÇÃO TÉRMICA

Quando fornecido com dispositivos de proteção ou de monitoramento de temperatura, como: protetor térmico bimetálico (termostatos), termistores, protetores térmicos do tipo Automático, Pt-100 (RTD), etc., seus terminais devem ser conectados aos dispositivos de controle correspondentes, de acordo com as placas de identificação dos acessórios. A não observação desse procedimento pode resultar em cancelamento da garantia e risco para a instalação.

Não aplicar tensão de teste superior a 2,5 V para termistores e corrente maior do que 1 mA para RTDs (Pt-100) de acordo com a norma IEC 60751.

O esquema de ligação dos protetores térmicos bimetálicos (termostatos) e termistores é mostrado nas Figura 47 e Figura 48, respectivamente.

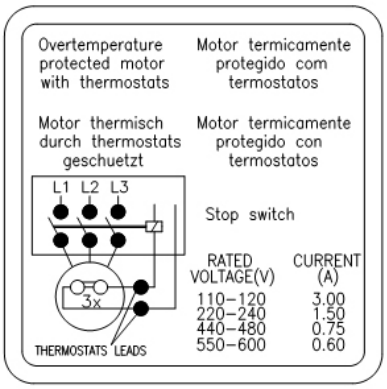

Figura 47 - Conexão dos protetores térmicos bimetálicos (termostatos)

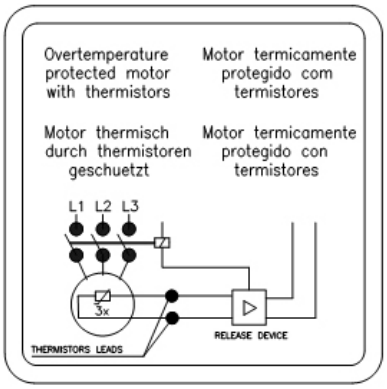

Figura 48 - Conexão dos termistores

Os limites de temperatura de alarme e desligamento das proteções térmicas podem ser definidos de acordo com a aplicação, porém não devem ultrapassar os valores indicados na Tabela 12.

Componente	Classe de isolamento	Temperatura máxima de operação (°C)	
		Alarme	Desligamento
Enrolamento	B	-	130
	F	130	155
	H	155	180
Mancal	Todas	110	120

Tabela 12 - Temperatura máxima de atuação das proteções térmicas

Notas:
1) A quantidade e o tipo de proteção térmica instalados no motor são informados nas placas de identificação dos acessórios do mesmo.
2) No caso de proteção térmica com resistência calibrada (por exemplo, Pt-100), o sistema de proteção deve ser ajustado nas temperaturas de operação indicada na Tabela 12.

6.11 TERMORRESISTORES (Pt-100)

São elementos, cuja operação está baseada na característica de variação da resistência com a temperatura, intrínseca em alguns materiais (geralmente platina, níquel ou cobre).
Possuem resistência calibrada, que varia linearmente com a temperatura, possibilitando um acompanhamento contínuo do processo de aquecimento do motor pelo *display* do controlador, com alto grau de precisão e sensibilidade de resposta. Sua aplicação é ampla nos diversos setores de técnicas de medição e automatização de temperatura das indústrias. Geralmente, aplica-se em instalações de grande responsabilidade, como por exemplo, em regime intermitente muito irregular. O mesmo detector pode servir tanto para alarme como para desligamento. A equivalência entre a resistência do Pt-100 e temperatura é apresentada na Tabela 13 e Figura 50. Na Figura 49 é apresentado o esquema de conexão do Pt-100 para enrolamento.

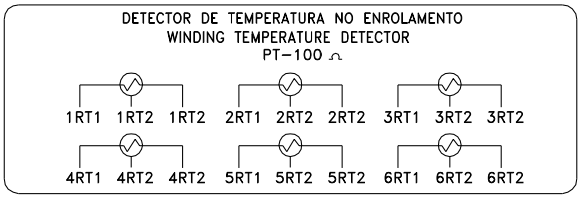

Figura 49 - Esquema de ligação do Pt-100 para enrolamento.

Tabela 13 - Equivalência entre a resistência do Pt-100 e temperatura

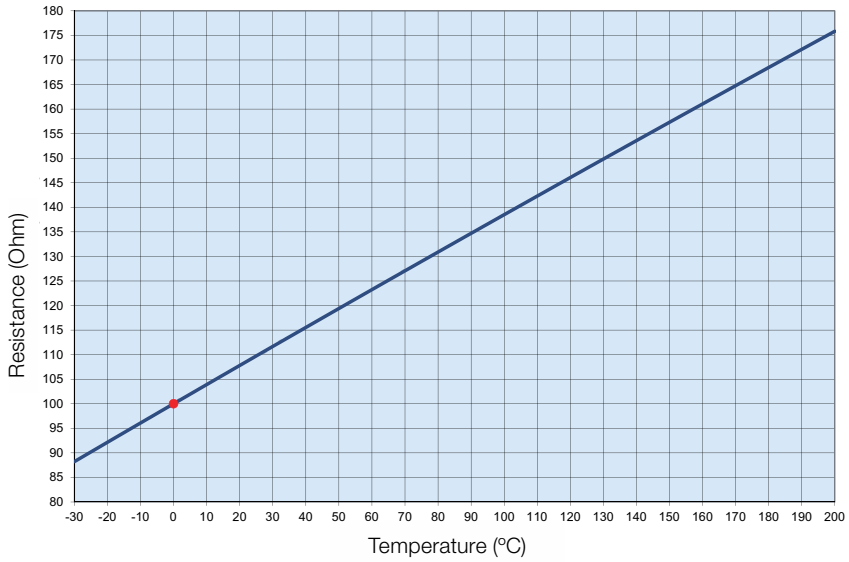

Figura 50 - Resistência ôhmica do Pt-100 x temperatura

6.12 CONEXÃO DA RESISTÊNCIA DE AQUECIMENTO

Antes de ligar a resistência de aquecimento, deve ser observado o esquema de ligação da resistência de aquecimento disponível na placa de identificação adicional. Para motores fornecidos com resistência de aquecimento que permite a sua ligação em duas tensões, ver Figura 51.

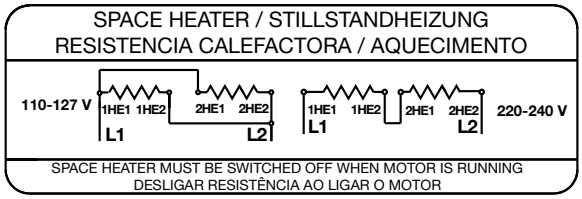

Figura 51 - Esquema de ligação da resistência de aquecimento para tensão 110-127/220-240 V.

As resistências de aquecimento nunca devem estar energizadas enquanto o motor estiver operando.

6.13 MÉTODOS DE PARTIDA

Sempre que possível, a partida do motor deve ser direta (em plena tensão). É o método mais simples, no entanto, somente é viável quando a corrente de partida não afeta a rede de alimentação. É importante seguir as regras vigentes da concessionária de energia elétrica.

Nos casos em que a corrente de partida do motor é alta, podem ocorrer as seguintes consequências:

a) Elevada queda de tensão no sistema de alimentação da rede, provocando interferência nos equipamentos instalados neste sistema;

b) O superdimensionamento do sistema de proteção (cabos, contatores), o que eleva os custos da instalação.

Caso a partida direta não seja possível devido aos problemas citados acima, pode-se usar o método de partida indireta compatível com a carga e a tensão do motor, para reduzir a corrente de partida.

Quando é utilizado um método de partida com tensão reduzida, o torque de partida do motor também será reduzido.

A Tabela 14 indica os métodos de partida indireta possíveis de serem utilizados de acordo com a quantidade de cabos do motor.

Quantidade de cabos	Métodos de partidas possíveis
3 cabos	Chave Compensadora Soft-starter
6 cabos	Chave Estrela - Triângulo Chave Compensadora Soft-starter
9 cabos	Chave Série - Paralela Chave Compensadora Soft-starter
12 cabos	Chave Estrela - Triângulo Chave Série - Paralela Chave Compensadora Soft-starter

Tabela 14 - Métodos de partida x quantidade de cabos

A Tabela 15 indica exemplos de métodos de partida indireta possíveis de serem utilizados, de acordo com a tensão indicada na placa de identificação do motor e a tensão da rede elétrica.

Tensão da placa de identificação	Tensão da rede elétrica	Partida com chave Estrela - Triângulo	Partida com chave Compensadora	Partida com chave Série - Paralela	Partida com Soft-Starter
220/380 V	220 V 380 V	SIM NÃO	SIM SIM	NÃO NÃO	SIM SIM
220/440 V	220 V 440 V	NÃO NÃO	SIM SIM	SIM NÃO	SIM SIM
230/460 V	230 V 460 V	NÃO NÃO	SIM SIM	SIM NÃO	SIM SIM
380/660 V	380 V	SIM	SIM	NÃO	SIM
220/380/440 V	220 V 380 V 440 V	SIM NÃO SIM	SIM SIM SIM	SIM SIM NÃO	SIM SIM SIM

Tabela 15 - Métodos de partida x tensão

Outro método de partida possível que não sobrecarregue a rede de alimentação é a utilização de um inversor de frequência. Para mais informações sobre motores alimentados com inversor de frequência ver item 6.14.

6.14 MOTORES ALIMENTADOS POR INVERSOR DE FREQUÊNCIA

A operação com inversor de frequência deve ser informada no momento da compra devido a possíveis diferenças construtivas necessárias para esse tipo de acionamento.

Motores WMagnet devem ser acionados somente por inversor de frequência. Os motores WQuattro devem ser acionados diretamente a partir da rede ou ser acionados por inversor de frequência em modo escalar.

O conversor utilizado para acionar motores com tensão de alimentação até 690 V deve possuir modulação PWM com controle vetorial.
Quando um motor opera com inversor de frequência abaixo da frequência nominal, é necessário reduzir o torque fornecido pelo motor a fim de evitar sobreaquecimento. Os valores de redução de torque (derating torque) podem ser encontrados no item 6.4 do "Guia Técnico Motores de Indução Alimentados por Inversores de Frequência PWM" disponível em www.weg.net.

Para operação acima da frequência nominal deve ser observado:
- Operação com potência constante;
- O motor pode fornecer no máximo 95% da potência nominal;
- Respeitar a rotação máxima, considerando os seguintes critérios:
  - Máxima frequência de operação informada na placa adicional;
  - Limite de rotação mecânica do motor.

Para motores WMagnet acionados por inversores que não sejam WEG, além do limite de rotação informado na folha de dados do motor, deve ser verificado o limite máximo de rotação permitida para evitar queima do inversor no caso de falta de energia. Deve ser considerado conforme equação abaixo:

$$RPM_{máx} = \frac{0.9 * V_{rmsMáx} * 1000}{ke}$$

Sendo,
$RPM_{máx}$ – Rotação máxima permitida para evitar queima do inversor no caso de falta de energia em [RPM].
$V_{rmsMáx}$ – Tensão rms de entrada máxima do inversor, conforme informado pelo fabricante do inversor em [V].
ke – Parâmetro informado na placa e na folha de dados do motor em [V/kRPM].

Recomendações para os cabos de conexão entre motor e inversor são indicadas no item 6.8 do "Guia Técnico Motores de Indução Alimentados por Inversores de Frequência PWM" disponível em www.weg.net.

6.14.1 Uso de filtros (dV/dt)

6.14.1.1. Motor com fio circular esmaltado

Motores com tensão nominal de até 690 V, quando alimentados por inversores de frequência, não requerem filtros, se observados os critérios da Tabela 16.

Tensão de operação do motor[1]	Tensão de pico no motor (max)	dV/dt na saída do conversor (max)	Rise Time[2] do conversor (mín)	MTBP[2] Tempo entre pulsos (min)
Vnom < 460 V	≤ 1600 V	≤ 5200 V/µs	≥ 0,1 µs	≥ 6 µs
460 ≤ Vnom < 575 V	≤ 2000 V	≤ 6500 V/µs		
575 ≤ Vnom ≤ 1000 V	≤ 2400 V	≤ 7800 V/µs		

Tabela 16 - Critérios para utilização de motores de fio circular esmaltado alimentados por inversor de frequência

1. Para motores com dupla tensão, exemplo 380/660 V, devem ser observados os critérios da tensão menor (380 V).
2. Informações fornecidas pelo fabricante do inversor.

6.14.1.2. Motor com bobina pré-formada

Motores com bobina pré-formada (média e alta tensão, independente do tamanho da carcaça e baixa tensão a partir da carcaça IEC 315 / NEMA 50) específicos para utilização com inversor de frequência não requerem filtros, se observados os critérios da Tabela 17.

Tensão de operação do motor	Tipo de modulação	Isolação da espira (fase-fase)		Isolação principal (fase-terra)	
		Tensão de pico nos terminais do motor	dV/dt nos terminais do motor	Tensão de pico nos terminais do motor	dV/dt nos terminais do motor
690 < Vnom ≤ 4160 V	Senoidal	≤ 5900 V	≤ 500 V/µs	≤ 3400 V	≤ 500 V/µs
	PWM	≤ 9300 V	≤ 2700 V/µs	≤ 5400 V	≤ 2700 V/µs
4160 < Vnom ≤ 6600 V	Senoidal	≤ 9300 V	≤ 500 V/µs	≤ 5400 V	≤ 500 V/µs
	PWM	≤ 14000 V	≤ 1500 V/µs	≤ 8000 V	≤ 1500 V/µs

Tabela 17 - Critérios para utilização de motores com bobina pré-formada alimentados com inversor de frequência

6.14.2 Isolamento dos mancais

Recomenda-se isolar os mancais para operação com inversor de frequência de acordo com a Tabela 18.

Carcaça	Recomendação
IEC 315 e 355 NEMA 445/7 a L5810/11	Um mancal isolado Aterramento entre eixo e carcaça por meio de escova
IEC 400 e acima NEMA 6800 e acima	Mancal traseiro isolado Aterramento entre eixo e carcaça por meio de escova

Tabela 18 - Recomendação sobre o isolamento dos mancais para motores acionados por inversor de frequência

Para motores fornecidos com sistema de aterramento do eixo, deve ser observado constantemente o estado de conservação da escova e, ao chegar ao fim de sua vida útil, a mesma deve ser substituída por outra de mesma especificação.
Se um motor é fornecido com uma escova de aterramento interna, identificado por uma etiqueta no produto, é necessário que esta seja verificada toda vez que ocorrer manutenção dos rolamentos ou qualquer parte interna do motor.
Motores das carcaças IEC 315, NEMA 445/7 e acima, quando acionados por inversor de frequência, devem ser equipados com kits de aterramento para o eixo.

Para motores de área segura e para fins de testes de verificação, pinos de contato podem ser instalados dos dois lados do isolamento do mancal, de modo a permitir a realização de medições da tensão sobre o mancal, ou, caso os pinos sejam conectados por um cabo ou cordoalha metálica (curto-circuitando o isolamento do mancal), da corrente pelo mancal. Deve-se observar, porém, que durante a operação normal do motor o isolamento do mancal não deve estar curto-circuitado (Figura 52).

Figura 52 - Cordoalha metálica

6.14.3 Frequência de chaveamento

A frequência mínima de chaveamento do inversor deverá ser de 2 kHz.
Recomenda-se que a frequência máxima de chaveamento do conversor seja de 5 kHz.

A não observação dos critérios e recomendações expostos neste manual pode resultar na anulação da garantia do produto.

6.14.4 Limite da rotação mecânica

As Tabela 19, Tabela 20, Tabela 21, Tabela 22 e Tabela 23 mostram as rotações máximas permitidas para motores acionados por inversor de frequência. Para motores WMagnet, consultar a folha de dados do motor ou entrar em contato com a WEG.

Notas:
1. *Quando o motor possuir vedações do tipo retentor ou Inproseal, entrar em contato com a WEG.*
2. *Para rotações acima da nominal, medir a vibração e a temperatura do mancal, se a temperatura e níveis de vibração ultrapassarem os limites especificados, contatar a WEG.*
3. *Verificar modelo do rolamento dianteiro na placa do motor*
4. *Condições diferentes das descritas nas Tabelas 19 a 23, consultar WEG.*

Para mais informações sobre o uso de inversor de frequência, ou como dimensioná-lo corretamente para a sua aplicação, favor contatar a WEG ou o "Guia Técnico Motores de Indução Alimentados por Inversores de Frequência PWM" disponível em www.weg.net.

7. OPERAÇÃO

7.1 PARTIDA DO MOTOR

Após executar os procedimentos de instalação, alguns aspectos devem ser verificados antes da partida inicial do motor, principalmente se o motor não foi colocado imediatamente em operação após sua instalação. Aqui devem ser verificados os seguintes itens:

- Se os dados que constam na placa de identificação (tensão, corrente, esquema de ligação, grau de proteção, refrigeração, fator de serviço, entre outras) estão de acordo com a aplicação;
- A correta montagem e alinhamento do conjunto (motor + máquina acionada);
- O sistema de acionamento do motor, considerando que a rotação do motor não ultrapasse a velocidade máxima estabelecida na Tabela 19, Tabela 20, Tabela 21, Tabela 22 e Tabela 23;
- A resistência de isolamento do motor, conforme item 5.4;
- O sentido de rotação do motor;
- A integridade da caixa de ligação, que deve estar limpa e seca, seus elementos de contato isentos de oxidação, suas vedações em condições apropriadas de uso e suas entradas de cabos corretamente fechadas/protegidas de acordo com o grau de proteção;
- As conexões do motor, verificando se foram corretamente realizadas, inclusive aterramento e cabos auxiliares, conforme recomendações do item 6.9;
- O correto funcionamento dos acessórios (freio, encoder, proteção térmica, ventilação forçada, etc.) instalados no motor;
- A condição dos rolamentos. Para motores armazenados e/ou instalados há mais de dois anos, mas que não entraram em operação, recomenda-se trocar os rolamentos, ou então, removê-los, lavá-los, inspecioná-los, e relubrificá-los antes de serem colocados em operação.
  Caso o armazenamento e/ou instalação tenham sido realizados conforme recomendações do item 5.3, realizar o procedimento de relubrificação conforme descrito no item 8.2. Para uma avaliação dos rolamentos podem ser utilizadas as técnicas de análise de vibração através de envelope ou demodulação;
- Nos motores com mancais de rolamento com lubrificação a óleo deve ser assegurado:
  - O nível correto de óleo do mancal. O mesmo deve estar na metade do visor (ver Figura 54 e Figura 55);
  - Que quando o motor for armazenado por período igual ou maior ao intervalo de troca de óleo, o óleo deverá ser trocado antes da colocação em funcionamento;
- Nos motores com mancais de deslizamento deve ser assegurado:
  - O nível correto de óleo do mancal. O mesmo deve estar na metade do visor (ver Figura 56);
  - Que o motor não parte e nem opere com cargas radiais ou axiais;
  - Que quando o motor for armazenado por período igual ou maior ao intervalo de troca de óleo, o óleo deverá ser trocado antes da colocação em funcionamento;
- A análise da condição dos capacitores, se existirem. Para motores instalados por um período superior a dois anos, mas que não entraram em operação, recomenda-se a substituição de seus capacitores de partida de motores monofásicos;
- Que entradas e saídas de ar estejam completamente desobstruídas. O mínimo espaço livre até a parede mais próxima (L) deve ser ¼ do diâmetro da entrada de ar da defletora (D), conforme Figura 53. O ar na entrada do motor deve estar na temperatura ambiente.

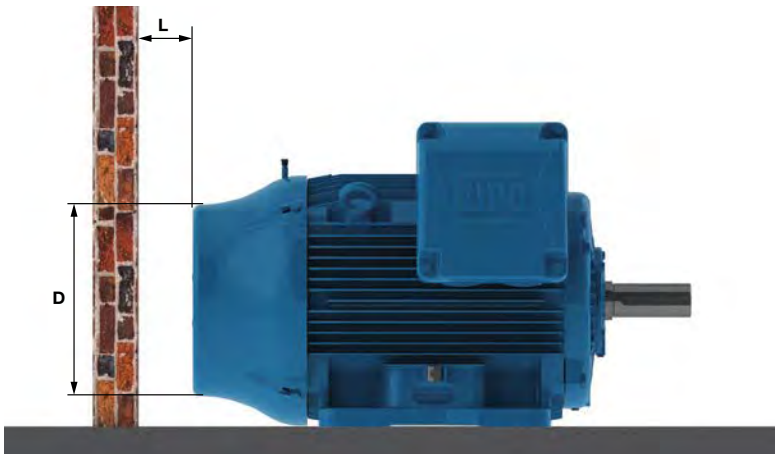

Figura 53 - Distancia mínima do motor até a parede

Como referência, podem ser seguidas as distâncias mínimas apresentadas na Tabela 24:

Carcaça		Distância entre a tampa defletora e a parede (L)	
IEC	**NEMA**	**mm**	**Inches**
63	-	25	0,96
71	-	26	1,02
80	-	30	1,18
90	143/5	33	1,30
100	-	36	1,43
112	182/4	41	1,61
132	213/5	50	1,98
160	254/6	71	2,79
180	284/6	72	2,83
200 / W225	324/6	83	3,27
225 250	364/5 404/5	92	3,62
280	444/5 445/7 447/9	108	4,23
315	L447/9 504/5 5006/7/8 5009/10/11	122	4,80
355	586/7 588/9 5807/8/9 5810/11/12	136	5,35
400	6806/7/8 6809/10/11	147	5,79
450	7006/10	159	6,26
500	8006/10	171	6,73
560	8806/10	185	7,28
630	9606/10	200	7,87

Tabela 24 - Rotação máxima dos motores W22 (em RPM)

- Que as vazões e temperaturas da água estejam corretas, quando uitlizadas na refrigeração do motor. Ver item 7.2.
- Que todas as partes girantes, como polias, acoplamentos, ventiladores externos, eixo, etc., estejam protegidas contra toques acidentais.

Outros testes e verificações que não constam nesta relação podem se fazer necessários, em função das características específicas da instalação, aplicação e/ou do motor.

Após todas as verificações terem sido realizadas, seguir o procedimento a seguir para efetuar a partida do motor:

- Ligar a máquina sem nenhuma carga (quando possível), acionando a chave de partida como se fosse um pulso, verificando o sentido de rotação, a presença de ruído, vibração ou outra condição anormal de operação;
- Religar o motor, que deve partir e funcionar de maneira suave. Caso isso não ocorra, desligue o motor, verifique novamente o sistema de montagem e conexões antes de uma nova partida.
- No caso de vibrações excessivas, verificar se os parafusos de fixação estão adequadamente apertados ou se a vibração é proveniente de máquinas adjacentes. Verificar periodicamente a vibração, respeitando os limites apresentados no item 7.2.1;
- Operar o motor sob carga nominal por um pequeno período de tempo e comparar a corrente de operação com a corrente indicada na placa de identificação;
- Recomenda-se ainda que algumas variáveis do motor sejam acompanhadas até seu equilíbrio térmico: corrente, tensão, temperatura nos mancais e na superfície externa da carcaça, vibração e ruído;
- Recomenda-se que os valores de corrente e tensão sejam registrados no relatório de instalação.

Devido ao valor elevado da corrente de partida dos motores de indução, o tempo gasto na aceleração nas cargas de inércia apreciável resulta na elevação rápida da temperatura do motor. Se o intervalo entre partidas sucessivas for muito reduzido, isso resultará no aumento da temperatura nos enrolamentos, danificando-os ou reduzindo a sua vida útil. Caso não seja especificado regime de serviço diferente de S1 / CONT. na placa de identificação do motor, os motores estão aptos para:

- Duas partidas sucessivas, sendo a primeira feita com o motor frio, isto é, com seus enrolamentos na temperatura ambiente e uma segunda partida logo a seguir, porém após o motor ter desacelerado até atingir seu repouso;
- Uma partida com o motor a quente, ou seja, com os enrolamentos na temperatura de regime.

O item 10 lista alguns problemas de mau funcionamento do motor, com suas possíveis causas.

7.2 CONDIÇÕES DE OPERAÇÃO

Caso nenhuma outra condição seja informada no momento da compra, os motores elétricos são projetados para operar a uma altitude limitada a 1000 m acima do nível do mar e em temperatura ambiente entre -20 °C e +40 °C. Qualquer variação das condições do ambiente, onde o motor irá operar, deve estar indicada na placa de identificação do motor.

Alguns componentes precisam ser trocados quando a temperatura ambiente é diferente da indicada acima. Favor contatar a WEG para verificar as características especiais.

Para temperaturas e altitudes diferentes das indicadas acima, deve-se utilizar a Tabela 25 para encontrar o fator de correção que deverá ser utilizado para definir a potência útil disponível (Pmax = Pnom x Fator de correção).

T (°C)	Altitude (m)								
	1000	1500	2000	2500	3000	3500	4000	4500	5000
10							0,97	0,92	0,88
15						0,98	0,94	0,90	0,86
20					1,00	0,95	0,91	0,87	0,83
25				1,00	0,95	0,93	0,89	0,85	0,81
30			1,00	0,96	0,92	0,90	0,86	0,82	0,78
35		1,00	0,95	0,93	0,90	0,88	0,84	0,80	0,75
40	1,00	0,97	0,94	0,90	0,86	0,82	0,80	0,76	0,71
45	0,95	0,92	0,90	0,88	0,85	0,81	0,78	0,74	0,69
50	0,92	0,90	0,87	0,85	0,82	0,80	0,77	0,72	0,67
55	0,88	0,85	0,83	0,81	0,78	0,76	0,73	0,70	0,65
60	0,83	0,82	0,80	0,77	0,75	0,73	0,70	0,67	0,62
65	0,79	0,76	0,74	0,72	0,70	0,68	0,66	0,62	0,58
70	0,74	0,71	0,69	0,67	0,66	0,64	0,62	0,58	0,53
75	0,70	0,68	0,66	0,64	0,62	0,60	0,58	0,53	0,49
80	0,65	0,64	0,62	0,60	0,58	0,56	0,55	0,48	0,44

Tabela 25 - Fatores de correção considerando a altitude e a temperatura ambiente

O ambiente no local de instalação deverá ter condições de renovação de ar da ordem de 1 m³ por segundo para cada 100 kW ou fração de potência do motor. Para motores ventilados, que não possuem ventilador próprio, a ventilação adequada do motor é de responsabilidade do fabricante do equipamento. Caso não haja especificação da velocidade de ar mínima entre as aletas do motor em uma placa de identificação, devem ser seguidos os valores indicados na Tabela 26. Os valores apresentados na Tabela 26 são válidos para motores aletados alimentados na frequência de 60 Hz. Para obtenção das velocidades mínimas de ar em 50 Hz deve-se multiplicar os valores da tabela por 0,83.

Carcaça		Polos			
IEC	NEMA	2	4	6	8
56 a 90	143/5	13	7	5	4
100 a 132	182/4 e 213/5	18	12	8	6
160 a 200	254/6 a 324/6	20	15	10	7
225 a 280	364/5 a 444/5	22	20	15	12
315 a 450	445/7 a 7008/9	25	25	20	15

Tabela 26 - Velocidade mínima de ar entre as aletas do motor (m/s)

As variações da tensão e frequência de alimentação podem afetar as características de desempenho e a compatibilidade eletromagnética do motor. Estas variações de alimentação devem seguir os valores estabelecidos nas normas vigentes. Exemplos:

- ABNT NBR 17094 - Partes 1 e 2. O motor está apto a fornecer torque nominal, sob as seguintes zonas de variação de tensão e frequência:
  - Zona A: ±5% de tensão e ±2% de frequência;
  - Zona B: ±10% de tensão e +3% -5% de frequência.

Quando operado na Zona A ou B, o motor pode apresentar variações de desempenho e atingir temperaturas mais elevadas. Estas variações são maiores para a operação na zona B. Não é recomendada uma operação prolongada do motor na zona B.

- IEC 60034-1. O motor está apto a fornecer torque nominal, sob as seguintes zonas de variação de tensão e frequência:
  - Zona A: ±5% de tensão e ±2% de frequência;
  - Zona B: ±10% de tensão e +3% -5% de frequência.

Quando operado na Zona A ou B, o motor pode apresentar variações de desempenho e atingir temperaturas mais elevadas. Estas variações são maiores para a operação na zona B. Não é recomendada a operação prolongada do motor na zona B. Para motores multitensão (exemplo 380-415/660 V) é permitida uma variação de tensão de ±5%.

- NEMA MG 1 Parte 12. O motor está apto a operar em uma das seguintes variações:
  - ±10% de tensão, com frequência nominal;
  - ±5 de frequência, com tensão nominal;
  - Uma combinação de variação de tensão e frequência de ±10%, desde que a variação de frequência não seja superior a ±5%.

Para motores que são resfriados através do ar ambiente, as entradas e saídas de ar devem ser limpas em intervalos regulares para garantir uma livre circulação do ar, já que o ar quente não deve retornar para o motor. O ar utilizado para refrigeração do motor deve estar na temperatura ambiente, limitada a faixa de temperatura indicada na placa de identificação do motor (quando não indicado, considerar uma faixa de temperatura entre -20 °C e +40 °C).
Para motores refrigerados à água, os valores da vazão da água para cada tamanho de carcaça, bem como a máxima elevação de temperatura da água após circular pelo motor são mostrados na Tabela 27. A temperatura da água na entrada não deve exceder 40 °C.

Carcaça		Vazão (litros/minuto)	Máxima elevação de temperatura de água (°C)
IEC	NEMA		
180	284/6	12	5
200	324/6	12	5
225	364/5	12	5
250	404/5	12	5
280	444/5 445/7 447/9	15	6
315	504/5	16	6
355	586/7 588/9	25	6

Tabela 27 - Vazão e máxima elevação de temperatura de água

Para motores da Linha W60, consultar os dados na placa fixa no radiador.
Para motores com lubrificação do tipo *Oil Mist*, em caso de falha do sistema de bombeamento de óleo, é permitida uma operação em regime contínuo com o tempo máximo de uma hora de operação.
Considerando-se que o calor do sol causa aumento da temperatura de operação, motores instalados externamente devem sempre estar protegidos contra a incidência direta dos raios solares.
Possíveis desvios em relação à operação normal (atuação de proteções térmicas, aumento do nível de ruído, vibração, temperatura e corrente) devem ser examinados e eliminados por pessoal capacitado. Em caso de dúvidas, desligar o motor imediatamente e contatar um Assistente Técnico Autorizado WEG.

A não observação dos critérios e recomendações expostos neste manual pode resultar na anulação da garantia do produto.

7.2.1 Limites da severidade de vibração

A severidade de vibração é o máximo valor de vibração encontrada, dentre todos os pontos e direções recomendados .
A Tabela 28 indica os valores admissíveis da severidade de vibração recomendados na norma IEC 60034-14 para as carcaças IEC 56 a 400, para os graus de vibração A e B.
Os limites de severidade da Tabela 28 são apresentados em termos do valor médio quadrático (= valor RMS ou valor eficaz) da velocidade de vibração em mm/s medidos em condição de suspensão livre (base elástica).

Altura do eixo [mm]	56 ≤ H ≤ 132	H ≥132
Grau de vibração	Severidade de vibração em base elástica [mm/s RMS]	
A	2.8	2.8
B	1.1	1.8

Tabela 28 - Limites recomendados para a severidade de vibração de acordo com a norma IEC 60034-14.

Notas:
1 - Os valores da Tabela 28 são válidos para medições realizadas com a máquina desacoplada e sem carga, operando na frequência e tensão nominais.
2 - Os valores da Tabela 28 são válidos independentemente do sentido de rotação da máquina.
3 - A Tabela 28 não se aplica para motores trifásicos com comutador, motores monofásicos, motores trifásicos com alimentação monofásica ou para máquinas fixadas no local de instalação, acopladas em suas cargas de acionamento ou cargas acionadas.

Para motor padrão, de acordo com a norma NEMA MG 1, o limite de vibração é de 0.15 in/s (polegadas/segundo pico), na mesma condição de suspensão livre e desacoplado.
Nota:
Para condição de operação em carga recomenda-se o uso da norma ISO 10816-3 para avaliação dos limites de vibração do motor. Na condição em carga, a vibração do motor será influenciada por vários fatores, entre eles, tipo de carga acoplada, condição de fixação do motor, condição de alinhamento com a carga, vibração da estrutura ou base devido a outros equipamentos, etc..

8. MANUTENÇÃO

A finalidade da manutenção é prolongar ao máximo possível a vida útil do equipamento. A não observância de um dos itens relacionados a seguir pode levar a paradas não desejadas do equipamento.
Caso, durante a manutenção, houver necessidade de transporte dos motores com rolamentos de rolos ou contato angular, devem ser utilizados os dispositivos de travamento do eixo fornecidos com o motor. Todos os motores HGF, W50, W51 HD e W60 independente do tipo de mancal, devem ter seu eixo travado durante o transporte.
Qualquer serviço em máquinas elétricas deve ser realizado apenas por pessoal capacitado, utilizando somente ferramentas e métodos adequados. Antes de iniciar qualquer serviço, as máquinas devem estar completamente paradas e desconectadas da rede de alimentação, inclusive os acessórios (resistência de aquecimento, freio, etc.).
Assistentes técnicos ou pessoal não capacitado e sem autorização para fazer manutenção e/ou reparar motores são totalmente responsáveis pelo trabalho executado e pelos eventuais danos que possam ocorrer durante o seu funcionamento.

Motores WMagnet e WQuattro possuem ímãs de alta energia e não devem ser abertos por pessoal não capacitado e por portadores de marca passo.

8.1 INSPEÇÃO GERAL

A frequência com que devem ser realizadas as inspeções depende do tipo do motor, da aplicação e das condições do local da instalação. Durante a inspeção, recomenda-se:

- Fazer uma inspeção visual do motor e do acoplamento, observando os níveis de ruído, da vibração, alinhamento, sinais de desgastes, oxidação e peças danificadas. Substituir as peças, quando for necessário;
- Medir a resistência de isolamento conforme descrito no item 5.4;
- Manter a carcaça limpa, eliminando todo acúmulo de óleo ou de pó na parte externa do motor para assim facilitar a troca de calor com o meio ambiente;
- Verificar a condição do ventilador e das entradas e saídas de ar, assegurando um livre fluxo do ar;
- Verificar o estado das vedações e efetuar a troca, se necessário;
- Drenar o motor. Após a drenagem, recolocar os drenos para novamente garantir o grau de proteção do motor. Os drenos devem estar sempre posicionados de tal forma que a drenagem seja facilitada (conforme item 6);
- Verificar a conexão dos cabos de alimentação, respeitando as distâncias de isolação entre partes vivas não isoladas entre si e entre partes vivas e partes aterradas de acordo com a Tabela 10.
- Verificar se o aperto dos parafusos de conexão, sustentação e fixação está de acordo com o indicado na Tabela 44;
- Verificar o estado da passagem dos cabos na caixa de ligação, as vedações dos prensa-cabos e as vedações nas caixas de ligação e efetuar a troca, se necessário;
- Verificar o estado dos mancais, observando o aparecimento de ruídos e níveis de vibração não habituais, verificando a temperatura dos mancais, o nível do óleo, a condição do lubrificante e o monitoramento das horas de operação versus a vida útil informada;
- Registrar e arquivar todas as modificações realizadas no motor.

Não reutilizar peças danificadas ou desgastadas. Substitua-as por novas, originais de fábrica.

8.2 LUBRIFICAÇÃO

A correta lubrificação é de vital importância para o bom funcionamento do motor.
Utilizar o tipo e quantidade de graxa ou óleo especificados e seguir os intervalos de relubrificação recomendados para os mancais. Estas informações podem ser encontradas na placa de identificação e este procedimento deve ser realizado conforme o tipo de lubrificante (óleo ou graxa).
Quando o motor utilizar proteção térmica no mancal, devem ser respeitados os limites de temperatura de operação indicados na Tabela 12.
Motores para aplicações especiais podem apresentar temperaturas máximas de operação diferentes das indicadas na tabela. O descarte da graxa e/ou óleo deve seguir as recomendações vigentes de cada país.

A utilização de motor em ambientes e/ou aplicações especiais sempre requer uma consulta prévia à WEG.

8.2.1 Mancais de rolamento lubrificados a graxa

Graxa em excesso provoca aquecimento do mancal e sua consequente falha.

Os intervalos de lubrificação especificados na Tabela 29, Tabela 30, Tabela 31, Tabela 32, Tabela 32, Tabela 34, Tabela 35, Tabela 36, Tabela 36, Tabela 38 e Tabela 39 consideram uma temperatura absoluta do mancal de 70 °C (até a carcaça IEC 200 / NEMA 324/6) e 85 °C (a partir da carcaça IEC 225 / NEMA 364/5), rotação nominal do motor, instalação horizontal e graxa Mobil Polyrex EM. Qualquer variação dos parâmetros indicados acima deve ser avaliada pontualmente.

Tabela 41 - Intervalo de lubrificação para rolamento de esferas - linhas WEG General Purpose e WIN

Os motores da linha WEG General Purpose e WIN com sistema de relubrificação (graxeira e rolamentos abertos) nas carcaças 225S/M, 250S/M e W280S/M dispõem de um local de armazenamento da graxa no interior do motor e não possuem abertura para saída da mesma. O volume interno destinado a armazenar a graxa usada possui capacidade para atender até 7 (sete) lubrificações, limitado a 5 anos de operação, sendo necessário a remoção da graxa após este período.

Para cada incremento de 15 °C na temperatura do mancal, o intervalo de relubrificação deverá ser reduzido pela metade. Motores originais de fábrica para posição horizontal, porém instalados na posição vertical (com autorização da WEG) devem ter seu intervalo de relubrificação reduzido pela metade.
Para aplicações especiais, tais como: altas e baixas temperaturas, ambientes agressivos, variação de velocidade (acionamento por inversor de frequência), etc., entre em contato com a WEG para obter informações referentes ao tipo de graxa e intervalos de lubrificação a serem utilizados.

8.2.1.1. Motores sem graxeira

Nos motores sem graxeira, a lubrificação deve ser efetuada conforme plano de manutenção preventiva existente. A desmontagem e montagem do motor deve ser feita conforme item 8.3.
Motores com rolamentos blindados (por exemplo, ZZ, DDU, 2RS, VV) devem ter os rolamentos substituídos ao final da vida útil da graxa.

8.2.1.2. Motores com graxeira

Para relubrificação dos rolamentos com o motor parado, deve-se proceder da seguinte maneira:
- Limpar as proximidades do orifício de entrada de graxa;
- Abrir a proteção da entrada de graxa;
- Remover a tampa de saída de graxa (não é necessária a remoção no caso de sistema de relubrificação automático, como motores IEEE Std 841);
- Colocar aproximadamente metade da graxa total recomendada na placa de identificação do motor e girar o motor durante aproximadamente 1 (um) minuto na rotação nominal;
- Desligar o motor e colocar o restante da graxa;
- Recolocar a proteção de entrada de graxa e a tampa da saída de graxa.

Para relubrificação dos rolamentos com o motor em operação, deve-se proceder da seguinte maneira:
- Limpar as proximidades do orifício de entrada de graxa;
- Abrir a proteção da entrada de graxa;
- Se possível e seguro, remover a tampa de saída de graxa;
- Colocar a quantidade total de graxa recomendada na placa de identificação do motor;
- Recolocar a proteção de entrada de graxa e a tampa da saída de graxa (caso tenha sido removida).

Para lubrificação, é indicado o uso de lubrificador manual.

Devido a espaços internos presentes no motor, é possível que, nas primeiras re-lubrificações dos mancais, a graxa não saia pela saída de graxa. Portanto, não aplique graxa em excesso esperando que a ela saia.

Nos motores fornecidos com dispositivo de mola, o excesso de graxa deve ser removido, puxando a vareta da mola e limpando a mola até que a mesma não contenha mais graxa.

8.2.1.3. Compatibilidade da graxa Mobil Polyrex EM com outras graxas

A graxa Mobil Polyrex EM possui espessante de poliuréia e óleo mineral, e não é compatível com outras graxas. Caso necessite de outro tipo de graxa, contate a WEG.
Não é recomendada a mistura de graxas, portanto é necessário a limpeza dos rolamentos e canais de lubrificação antes de aplicar uma nova graxa.
A graxa aplicada deve possuir em sua formulação aditivos inibidores de corrosão e oxidação.

8.2.2 Mancais de rolamento lubrificados a óleo

Nos motores com rolamento lubrificados a óleo, a troca de óleo deve ser feita com o motor parado, seguindo os procedimento a seguir:

- Abrir o respiro da entrada de óleo;
- Retirar o tampão de saída de óleo;
- Abrir a válvula e drenar todo o óleo;
- Fechar a válvula;
- Recolocar o tampão;
- Preencher com a quantidade e especificação do óleo indicados na placa de identificação;
- Verificar se o nível do óleo está na metade do visor;
- Fechar o respiro da entrada de óleo;
- Certificar-se que não há vazamento e que todos os furos roscados não utilizados estejam fechados.

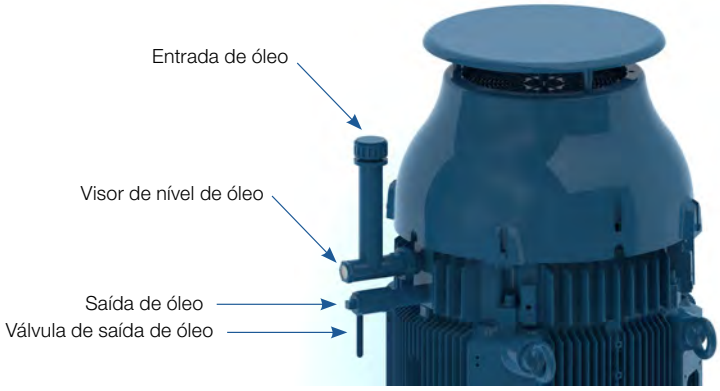

Figura 54 - Mancal vertical de rolamento lubrificado a óleo.

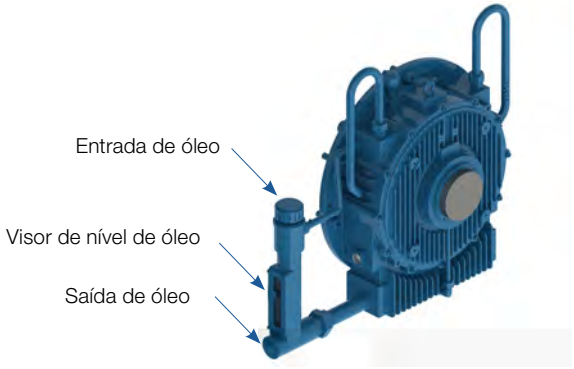

Figura 55 - Mancal horizontal de rolamento lubrificado a óleo.

A troca de óleo dos mancais deve ser realizada no intervalo indicado na placa de identificação ou sempre que o lubrificante apresentar alterações em suas características (viscosidade, pH, etc.).
O nível de óleo deve ser mantido na metade do visor de óleo e acompanhado diariamente.
O uso de lubrificantes com outras viscosidades requer contato prévio com a WEG.

Obs: motores HGF verticais para alto empuxo são fornecidos com mancais dianteiros lubrificados a graxa e com mancais traseiros, a óleo. Os mancais dianteiros devem seguir as recomendações do item 8.2.1. A Tabela 42 apresenta a quantidade e especificação de óleo para essa configuração.

Montagem alto empuxo	Carcaça		Polos	Rolamento	Óleo (L)	Intervalo (h)	Lubrificante	Especificação lubrificante
	IEC	NEMA						
	315L/A/B e 315C/D/E	5006/7/8T e 5009/10/11T	4 - 8	29320	20	8000	FUCHS Renolin DTA 40 / Mobil SHC 629	Óleo mineral ISO VG150 com aditivos anti-espuma e antioxidantes
	355L/A/B e 355C/D/E	5807/8/9T e 5810/11/12T	4 - 8	29320	26			
	400L/A/B e 400C/D/E	6806/7/8T e 6809/10/11T	4 - 8	29320	37			
	450	7006/10	4 - 8	29320	45			

Tabela 42 - Características de lubrificação para motores HGF vertical de alto empuxo e Vertical High Thrust

8.2.3 Mancais de rolamento com lubrificação do tipo *Oil Mist*

Verificar o estado das vedações e, sempre que for necessária alguma troca, usar apenas peças originais.
Realizar a limpeza dos componentes antes da montagem (anéis de fixação, tampas, etc.).
Aplicar veda juntas resistente ao óleo lubrificante utilizado, entre os anéis de fixação e as tampas.
A conexão dos sistemas de entrada, saída e dreno de óleo devem ser realizados conforme Figura 43.

8.2.4 Mancais de deslizamento

Para os mancais de deslizamento, a troca de óleo deve ser feita nos intervalos indicados na Tabela 43 e deve ser realizada, adotando os seguintes procedimentos:

- Para o mancal traseiro, retirar a tampa de inspeção da defletora;
- Drenar o óleo através do dreno localizado na parte inferior da carcaça do mancal (conforme Figura 56);
- Fechar a saída de óleo;
- Retirar o bujão da entrada de óleo;
- Preencher com o óleo especificado e com a quantidade indicada na Tabela 43;
- Verificar se o nível do óleo está na metade do visor;
- Fechar a entrada de óleo;
- Certificar-se que não há vazamento.

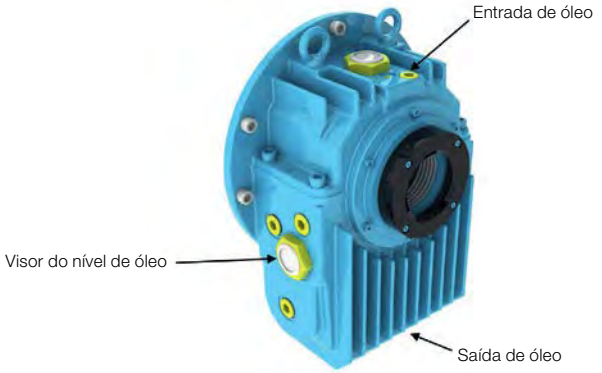

Figura 56 - Mancal de deslizamento

Carcaça		Polos	Mancal	Óleo (L)	Intervalo (h)	Lubrificante	Especificação lubrificante
IEC	NEMA						
315	5000	2	9-80	3.6	8000	FUCHS Renolin DTA 10	Óleo mineral ISO VG32 com aditivos anti-espuma e antioxidantes
355	5800						
400	6800						
450	7000						
315	5000	4 - 8	9-90		8000	FUCHS Renolin DTA 15	Óleo mineral ISO VG46 com aditivos anti-espuma e antioxidantes
355	5800		9-100				
400	6800		11-110	4.7			
450	7000		11-125				
500	8000						

Tabela 43 - Características de lubrificação para mancais de deslizamento

A troca de óleo dos mancais deve ser realizada no intervalo indicado na placa de identificação ou sempre que o lubrificante apresentar alterações em suas características (viscosidade, pH, etc.).
O nível de óleo deve ser mantido na metade do visor e acompanhado diariamente.
Não poderão ser usados lubrificantes com outras viscosidades sem antes consultar a WEG.

8.3 DESMONTAGEM E MONTAGEM

Serviços de reparo em motores devem ser efetuados apenas por pessoal capacitado seguindo as normas vigentes no país. Devem ser utilizados somente ferramentas e métodos adequados.

Qualquer serviço de desmontagem e montagem deve ser realizado com o motor totalmente desenergizado e completamente parado.

Mesmo o motor desligado pode apresentar energia elétrica no interior da caixa de ligação, nas resistências de aquecimento, no enrolamento e nos capacitores.

Motores acionados por inversor de frequência podem estar energizados mesmo com o motor parado.

Antes de iniciar o procedimento de desmontagem, registrar as condições atuais da instalação, tais como conexões dos terminais de alimentação do motor e alinhamento/nivelamento que devem ser considerados durante a posterior montagem.
Realizar a desmontagem de maneira cuidadosa, sem causar impactos contra as superfícies usinadas e/ou nas roscas.
Montar o motor em uma superfície plana para garantir uma boa base de apoio. Motores sem pés devem ser calçados/travados para evitar acidentes.
Cuidados adicionais devem ser tomados para não danificar as partes isoladas que operam sob tensão elétrica, como por exemplo, enrolamentos, mancais isolados, cabos de alimentação, etc.
Elementos de vedação, por exemplo, juntas e vedações dos mancais devem ser trocados sempre que apresentarem desgaste ou estiverem danificados.
Motores com grau de proteção superior ao IP55 são fornecidos com produto vedante Loctite 5923 (Henkel) nas juntas e parafusos. Antes de montar os componentes, limpar as superfícies e aplicar uma nova camada deste produto.

Na montagem de componentes poliméricos, deve ser respeitados os torques de aperto especificados na Tabela 6.

Para motores com rotor de ímãs permanentes (motores WQuattro e WMagnet), a montagem e desmontagem do motor requerem a utilização de dispositivos adequados devido a forças de atração ou de repulsão que ocorrem entre peças metálicas. Este serviço somente deve ser realizado por Assistente Técnico Autorizado WEG com treinamento específico para tal operação.
Pessoas que utilizam marca-passo não podem manusear estes motores. Os ímãs permanentes também podem causar distúrbios ou danos em outros equipamentos elétricos e componentes durante a manutenção.

Para motores das linhas W40, W50, W51 HD e HGF, fornecidos com ventiladores axiais, o motor e o ventilador axial possuem indicações de sentido de rotação distintas, para prevenir uma montagem incorreta. O ventilador deve ser montado de tal modo que a seta indicativa do sentido de rotação esteja sempre visível, olhando do lado externo do motor (no lado não acionado). A marcação indicada na pá do ventilador, CW para sentido de rotação horário ou CCW para sentido de rotação anti-horário, indica o sentido de rotação do motor (olhando para o lado acionado).

Em motores que utilizam encoder, o batimento da região do assento deste componente deve ser verificada antes da montagem do mesmo. O valor não deve ultrapassar o limite especificado pelo fabricante do encoder.

Em motores que utilizam tampa defletora de polímero, para retirar a tampa defletora, use duas chaves de fenda ou ferramenta similar posicionadas próximo dos encaixes e levante um encaixe de cada vez, repetindo o procedimento para cada lado até remover completamente a tampa defletora.

Motores com ventilador fixo somente por interferência no eixo, se desmontado, o componente deverá ser substituído por um novo.
Para motores que possuem tampas injetadas de alumínio sem usinagem, é necessário aquecer as tampas para montagem e desmontagem.

8.3.1 Caixa de ligação

Ao retirar a tampa da caixa de ligação para a conexão/desconexão dos cabos de alimentação e acessórios, devem ser adotados os seguintes cuidados:

- Assegurar que durante a remoção dos parafusos, a tampa da caixa não danifique os componentes instalados em seu interior;
- Caso a caixa de ligação seja fornecida com olhal de suspensão, este deve ser utilizado para movimentar a tampa da caixa de ligação;
- Para motores fornecidos com placa de bornes, devem ser assegurados os torques de aperto especificados na Tabela 44;

Para motores sem placa de bornes, não empurrar o comprimento excedente dos cabos de ligação para o interior do motor para evitar que os mesmos encostem no rotor.

- Assegurar que os cabos não entrem em contato com superfícies com cantos vivos;
- Adotar os devidos cuidados para garantir que o grau de proteção inicial, indicado na placa de identificação do motor não seja alterado. As entradas de cabos para a alimentação e controle devem utilizar sempre componentes (como por exemplo, prensa-cabos e eletrodutos) que atendam as normas e regulamentações vigentes de cada país;
- Assegurar que a janela de alívio de pressão (quando houver) não esteja danificada. As juntas de vedação da caixa de ligação devem estar em perfeito estado para reutilização e devem ser posicionadas corretamente para garantir o grau de proteção;
- Assegurar os torques de aperto dos parafusos de fixação da tampa da caixa conforme Tabela 44.

Tipo de parafuso e Junta	M4	M5	M6	M8	M10	M12	M14	M16	M20
Parafuso sextavado externo/ interno (junta rígida)	-	3,5 a 5	6 a 9	14 a 20	28 a 40	45 a 70	75 a 110	115 a 170	230 a 330
Parafuso fenda combinada (junta rígida)	1,5 a 3	3 a 5	5 a 10	10 a 18	-	-	-	-	-
Parafuso sextavado externo/ interno (junta flexível)	-	3 a 5	4 a 8	8 a 15	18 a 30	25 a 40	30 a 45	35 a 50	-
Parafuso fenda combinada (junta flexível)	-	3 a 5	4 a 8	8 a 15	-	-	-	-	-
Placa de Bornes	1 a 1,5	2 a 4[1)]	4 a 6,5	6,5 a 9	10 a 18	15,5 a 30	-	30 a 50	50 a 75
Aterramento	1,5 a 3	3 a 5	5 a 10	10 a 18	28 a 40	45 a 70	-	115 a 170	-

Tabela 44 - Torques de aperto para elementos de fixação [Nm]

Notas: 1) Para placa de bornes 12 pinos, aplicar o torque mínimo de 1,5 Nm e máximo 2,5 Nm.

8.4 PROCEDIMENTO PARA ADEQUAÇÃO DA RESISTÊNCIA DE ISOLAMENTO

O motor deve ser desmontado e suas tampas, rotor completo (com eixo), ventilador, defletora e caixa de ligação devem ser separados, de modo que apenas a carcaça com o estator passe por um processo de secagem em uma estufa apropriada, por um período de duas horas, a uma temperatura não superior a 120 ºC. Para motores maiores, pode ser necessário aumentar o tempo de secagem. Após esse período de secagem, deixar o estator resfriar até a temperatura ambiente e repetir a medição da resistência de isolamento, conforme item 5.4. Caso necessário, deve-se repetir o processo de secagem do estator.
Se, mesmo após repetidos processos de secagem do estator, a resistência de isolamento não voltar aos níveis aceitáveis, recomenda-se fazer uma análise criteriosa das causas que levaram à queda do isolamento do enrolamento e, eventualmente poderá culminar com o rebobinamento do motor.

Para evitar o risco de choque elétrico, descarregue os terminais imediatamente antes e depois de cada medição. Caso o motor possua capacitores, estes devem ser descarregados.

Motores WMagnet e WQuattro possuem ímãs de alta energia e não devem ser abertos por pessoal não capacitado e por portadores de marca passo.

8.5 PARTES E PEÇAS

Ao solicitar peças para reposição, informar a designação completa do motor, bem como seu código e número de série, que podem ser encontrados na placa de identificação do motor.
Partes e peças devem ser adquiridas da rede de Assistência Técnica Autorizada WEG. O uso de peças não originais pode resultar na queda do desempenho e causar a falha no motor.
As peças sobressalentes devem ser armazenadas em local seco com uma umidade relativa do ar de até 60%, com temperatura ambiente maior que 5 °C e menor que 40 °C, isento de poeira, vibrações, gases, agentes corrosivos, sem variações bruscas da temperatura, em sua posição normal e sem apoiar sobre as mesmas outros objetos.

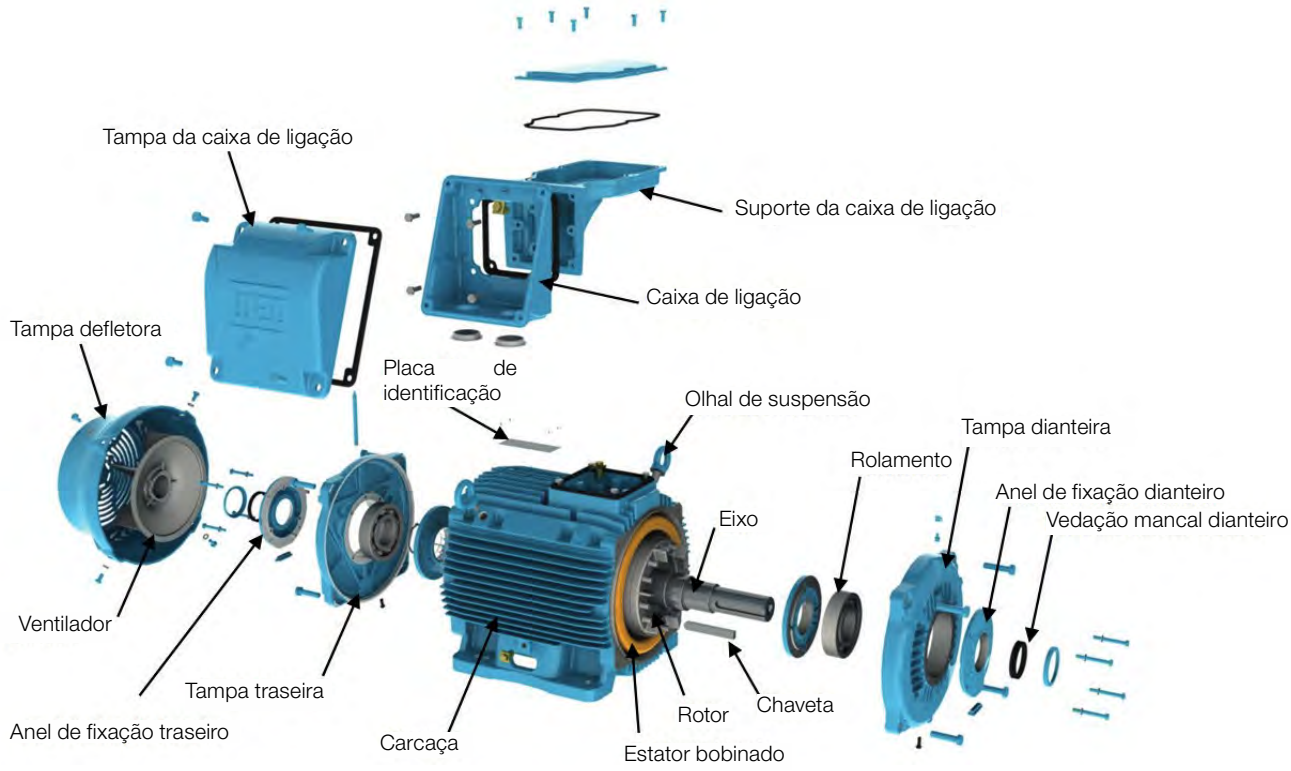

Figura 57 - Vista explodida dos componentes de um motor W22

PORTUGUÊS

9. INFORMAÇÕES AMBIENTAIS

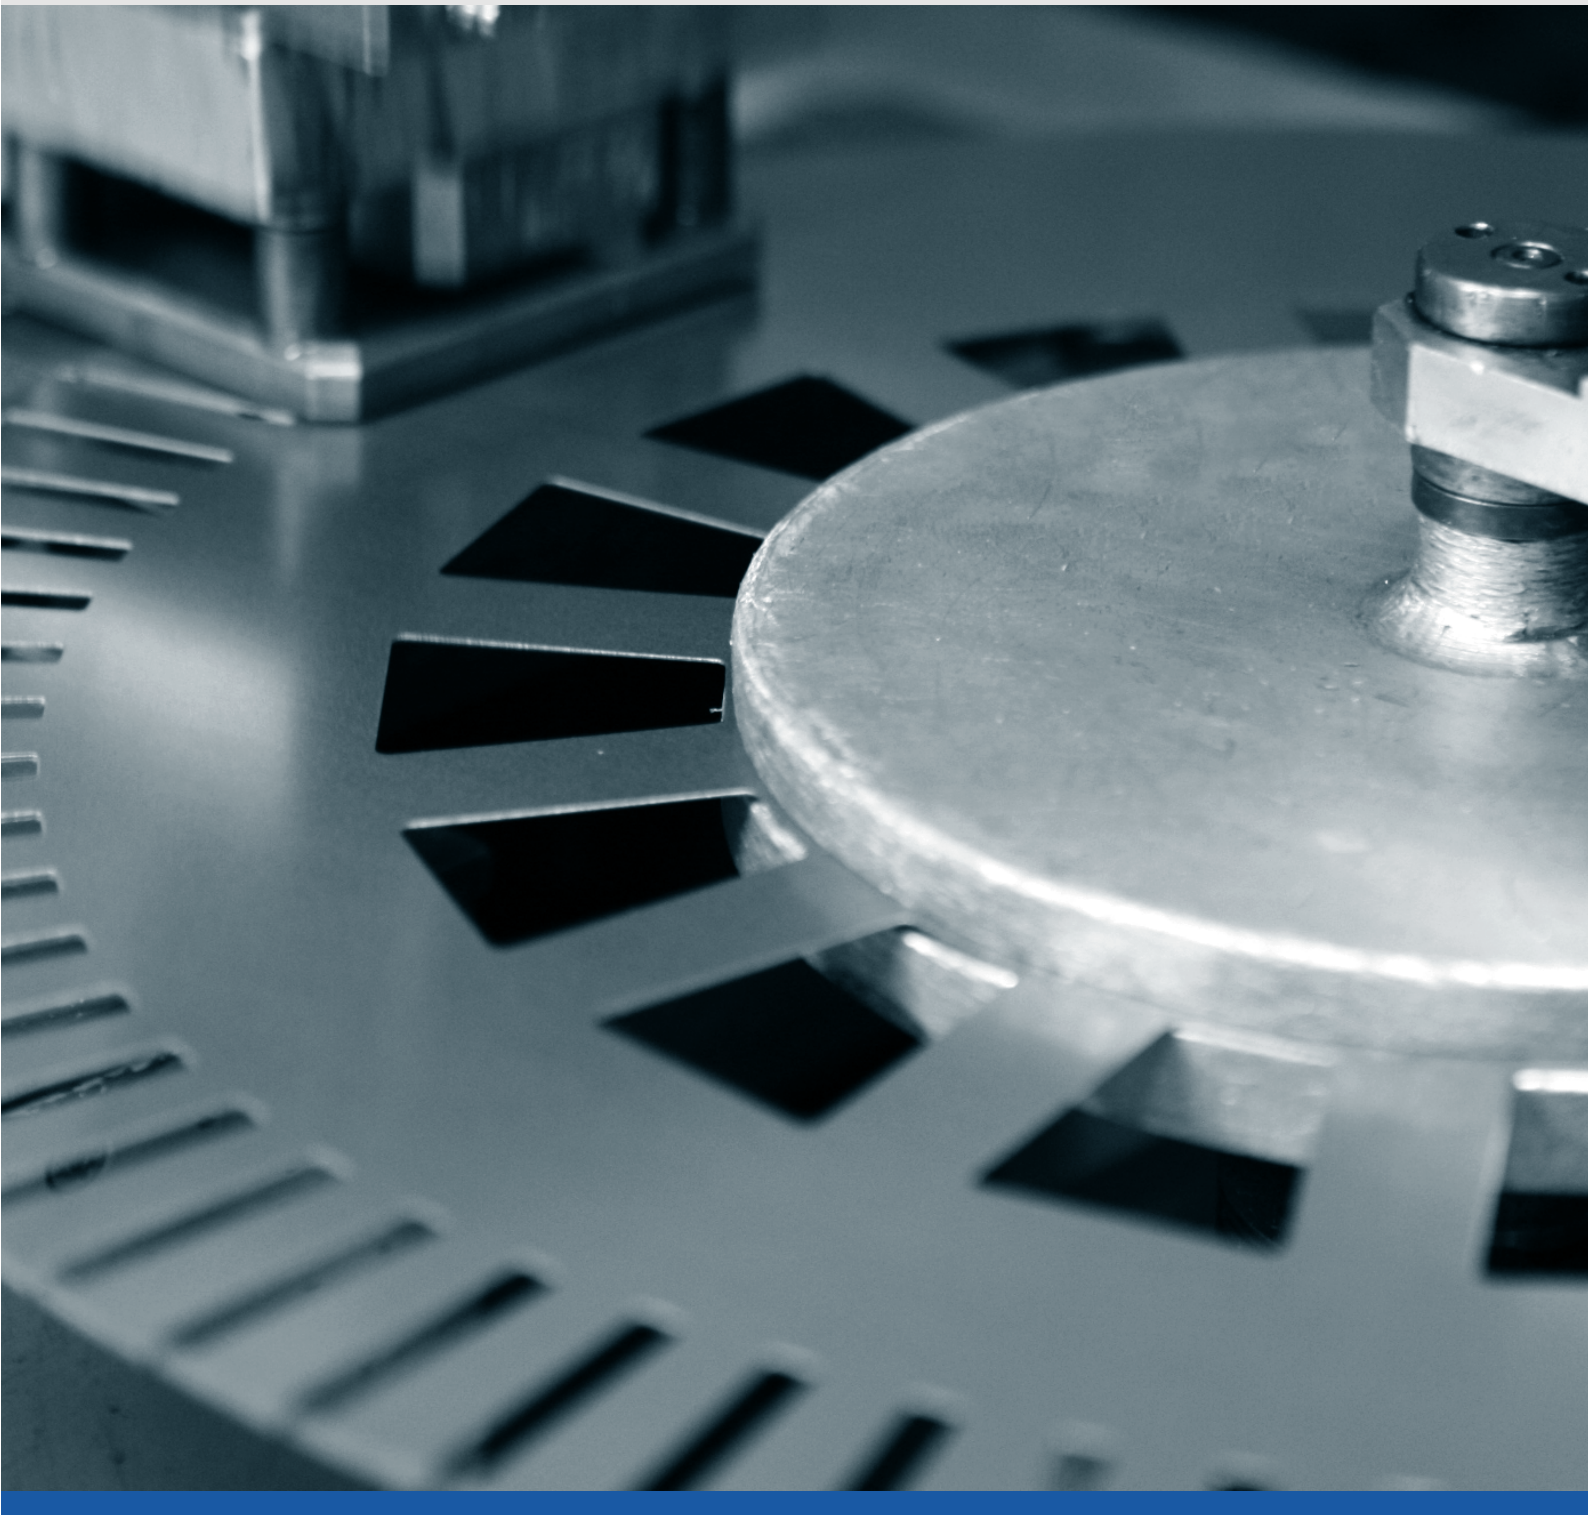
9.1 EMBALAGEM

Os motores elétricos são fornecidos em embalagens de papelão, plástico ou de madeira. Estes materiais são recicláveis ou reutilizáveis e devem receber o destino certo conforme as normas vigentes de cada país. Toda a madeira utilizada nas embalagens dos motores WEG provém de reflorestamento e não é submetida a nenhum tratamento químico para a sua conservação.

9.2 PRODUTO

Os motores elétricos, sob o aspecto construtivo, são fabricados essencialmente com metais ferrosos (aço, ferro fundido), metais não ferrosos (cobre, alumínio) e plástico.
O motor elétrico, de maneira geral, é um produto que possui vida útil longa, porém quando for necessário seu descarte, a WEG recomenda que os materiais da embalagem e do produto sejam devidamente separados e encaminhados para reciclagem.
Os materiais não recicláveis devem, como determina a legislação ambiental, ser dispostos de forma adequada, ou seja, em aterros industriais, co-processados em fornos de cimento ou incinerados. Os prestadores de serviços de reciclagem, disposição em aterro industrial, co-processamento ou incineração de resíduos devem estar devidamente licenciados pelo órgão ambiental de cada estado para realizar estas atividades.

10. PROBLEMAS X SOLUÇÕES



As instruções a seguir apresentam uma relação de problemas comuns com possíveis soluções. Em caso de dúvida, contatar o Assistente Técnico Autorizado ou a WEG.

Problema	Possíveis causas	Solução
Motor não parte, nem acoplado e nem desacoplado	Interrupção na alimentação do motor	Verificar o circuito de comando e os cabos de alimentação do motor.
	Fusíveis queimados	Substituir os fusíveis.
	Erro na conexão do motor	Corrigir as conexões do motor conforme diagrama de conexão.
	Mancal travado	Verificar se o mancal gira livremente.
Quando acoplado com carga, o motor não parte ou parte muito lentamente e não atinge rotação nominal	Carga com torque muito elevado durante a partida	Não aplicar carga na máquina acionada durante a partida.
	Queda de tensão muito alta nos cabos de alimentação	Verificar o dimensionamento da instalação (transformador, seção dos cabos, relés, disjuntores, etc.).
Ruído elevado/anormal	Defeito nos componentes de transmissão ou na máquina acionada	Verificar a transmissão de força, o acoplamento e o alinhamento.
	Base desalinhada/desnivelada	Realinhar/nivelar o motor e a máquina acionada.
	Desbalanceamento dos componentes ou da máquina acionada	Refazer balanceamento.
	Tipos diferentes de balanceamento entre motor e acoplamento (meia chaveta, chaveta inteira)	Refazer balanceamento.
	Sentido de rotação do motor errado	Inverter o sentido de rotação do motor.
	Parafusos de fixação soltos	Reapertar os parafusos.
	Ressonância da fundação	Verificar o projeto da fundação.
	Rolamentos danificados	Substituir o rolamento.
Aquecimento excessivo no motor	Refrigeração insuficiente	Limpar as entradas e saídas de ar da defletora e da carcaça.
		Verificar as distâncias mínimas entre a entrada da defletora de ar e paredes próximas (conforme item 7).
		Verificar temperatura do ar na entrada.
	Sobrecarga	Medir a corrente do motor, analisando sua aplicação e, se necessário, diminuir a carga.
	Excessivo número de partidas ou momento de inércia da carga muito elevado	Reduzir o número de partidas.
	Tensão muito alta	Verificar a tensão de alimentação do motor. Não ultrapassar a tolerância conforme item 7.2.
	Tensão muito baixa	Verificar a tensão de alimentação e a queda de tensão no motor. Não ultrapassar a tolerância (conforme item 7.2).
	Interrupção de um cabo de alimentação	Verificar a conexão de todos os cabos de alimentação
	Desequilíbrio de tensão nos terminais de alimentação do motor	Verificar se há fusíveis queimados, comandos errados, desequilíbrio nas tensões da rede de alimentação, falta de fase ou nos cabos de ligação.
	Sentido de rotação não compatível com o ventilador unidirecional	Verificar sentido de rotação conforme marcação do motor
Aquecimento do mancal	Graxa/óleo em demasia	Fazer limpeza do mancal e lubrificar segundo as recomendações.
	Envelhecimento da graxa/óleo	
	Utilização de graxa/óleo não especificados	
	Falta de graxa/óleo	Lubrificar segundo as recomendações.
	Excessivo esforço axial ou radial	Reduzir tensão nas correias.
		Redimensionar a carga aplicada ao motor.

INSTALLATION, OPERATION AND MAINTENANCE MANUAL OF ELECTRIC MOTORS

This manual provides information about WEG induction motors fitted with squirrel cage, permanent magnet or hybrid rotors, low, medium and high voltage, in frame sizes IEC 56 to 630 and NEMA 42 to 9606/10.
The motor lines indicated below have additional information that can be checked in their respective manuals:

- Smoke Extraction Motors;
- Electromagnetic Brake Motors;
- Hazardous Area Motors.

These motors meet the following standards, if applicable:

- NBR 17094-1: Máquinas Elétricas Girantes - Motores de Indução - Parte 1: trifásicos.
- NBR 17094-2: Máquinas Elétricas Girantes - Motores de Indução - Parte 2: monofásicos.
- IEC 60034-1: Rotating Electrical Machines - Part 1: Rating and Performance.
- NEMA MG 1: Motors and Generators.
- CSA C 22.2 N°100: Motors and Generators.
- UL 1004-1: Rotating Electrical Machines - General Requirements.

If you have any questions regarding this manual please contact your local WEG branch, contact details can be found at www.weg.net.

1. TERMINOLOGY

Balancing: the procedure by which the mass distribution of a rotor is checked and, if necessary, adjusted to ensure that the residual unbalance or the vibration of the journals and/or forces on the bearings at a frequency corresponding to service speed are within specified limits in International Standards.
[ISO 1925:2001, definition 4.1]
Balance quality grade: indicates the peak velocity amplitude of vibration, given in mm/s, of a rotor running free-in-space and it is the product of a specific unbalance and the angular velocity of the rotor at maximum operating speed.
Grounded Part: metallic part connected to the grounding system.
Live Part: conductor or conductive part intended to be energized in normal operation, including a neutral conductor.
Authorized personnel: employee who has formal approval of the company.
Qualified personnel: employee who meets the following conditions simultaneously:
- Receives training under the guidance and responsibility of a qualified and authorized professional;
- Works under the responsibility of a qualified and approved professional.

Qualified personnel: employee previously qualified and registered with the competent class council.
Qualified personnel: employee who proves completion of a specific course in the electrical area by the official education system.

Note*: The qualification is only valid for the company that trained the employee in the conditions set out by the authorized and qualified professional responsible for training.*

2. INITIAL RECOMMENDATIONS

Electric motors have energized circuits, exposed rotating parts and hot surfaces that may cause serious injury to people during normal operation. Therefore, it is recommended that transportation, storage, installation, operation and maintenance services are always performed by qualified personnel.
Also the applicable procedures and relevant standards of the country where the machine will be installed must be considered.
Noncompliance with the recommended procedures in this manual and other references on the WEG website may cause severe personal injuries and/or substantial property damage and may void the product warranty.

For practical reasons, it is not possible to include in this Manual detailed information that covers all construction variables nor covering all possible assembly, operation or maintenance alternatives.
This Manual contains only the required information that allows qualified and trained personnel to carry out their services. The product images are shown for illustrative purpose only.
For special applications and operating conditions(50026367 manual for Smoke Extraction Motors, 50021973 manual for Brake Motors, 50078700 manual for Electronically Conmutated Motors, 14629920 manual for Roller Table motors, 50106963 manual for WEG Lift Gearless motors) refer to the applicable manual on the website www.weg.net or contact WEG.
For motors supplied with WEG Motor Scan sensor, see installation guidelines Overview of Receipt to Operation Manual (10008475131) available on www.weg.net.

For information about permissible radial and axial shaft loads, please check the product technical catalogue.

The user is responsible for the correct definition of the installation environment and application characteristics.

During the warranty period, all repair, overhaul and reclamation services must be carried out by WEG authorized Service Centers to maintain validity of the warranty.

2.1 WARNING SYMBOL

Warning about safety and warranty.

2.2 RECEIVING INSPECTION

All motors are tested during the manufacturing process.
The motor must be checked when received for any damage that may have occurred during the transportation. All damages must be reported in writing to the transportation company, to the insurance company and to WEG. Failure to comply with such procedures will void the product warranty.
You must inspect the product:

- Check if nameplate data complies with the purchase order;
- Remove the shaft locking device (if any) and rotate the shaft by hand to ensure that it rotates freely. The shaft might not rotate freely in WMagnet and WQuattro motors, due to alignment torque from the magnets. It might be necessary to use a lever;

When rotating the shaft, it is necessary to certify that the terminals are insulated to eliminate the risc of electric shock from induced voltage.

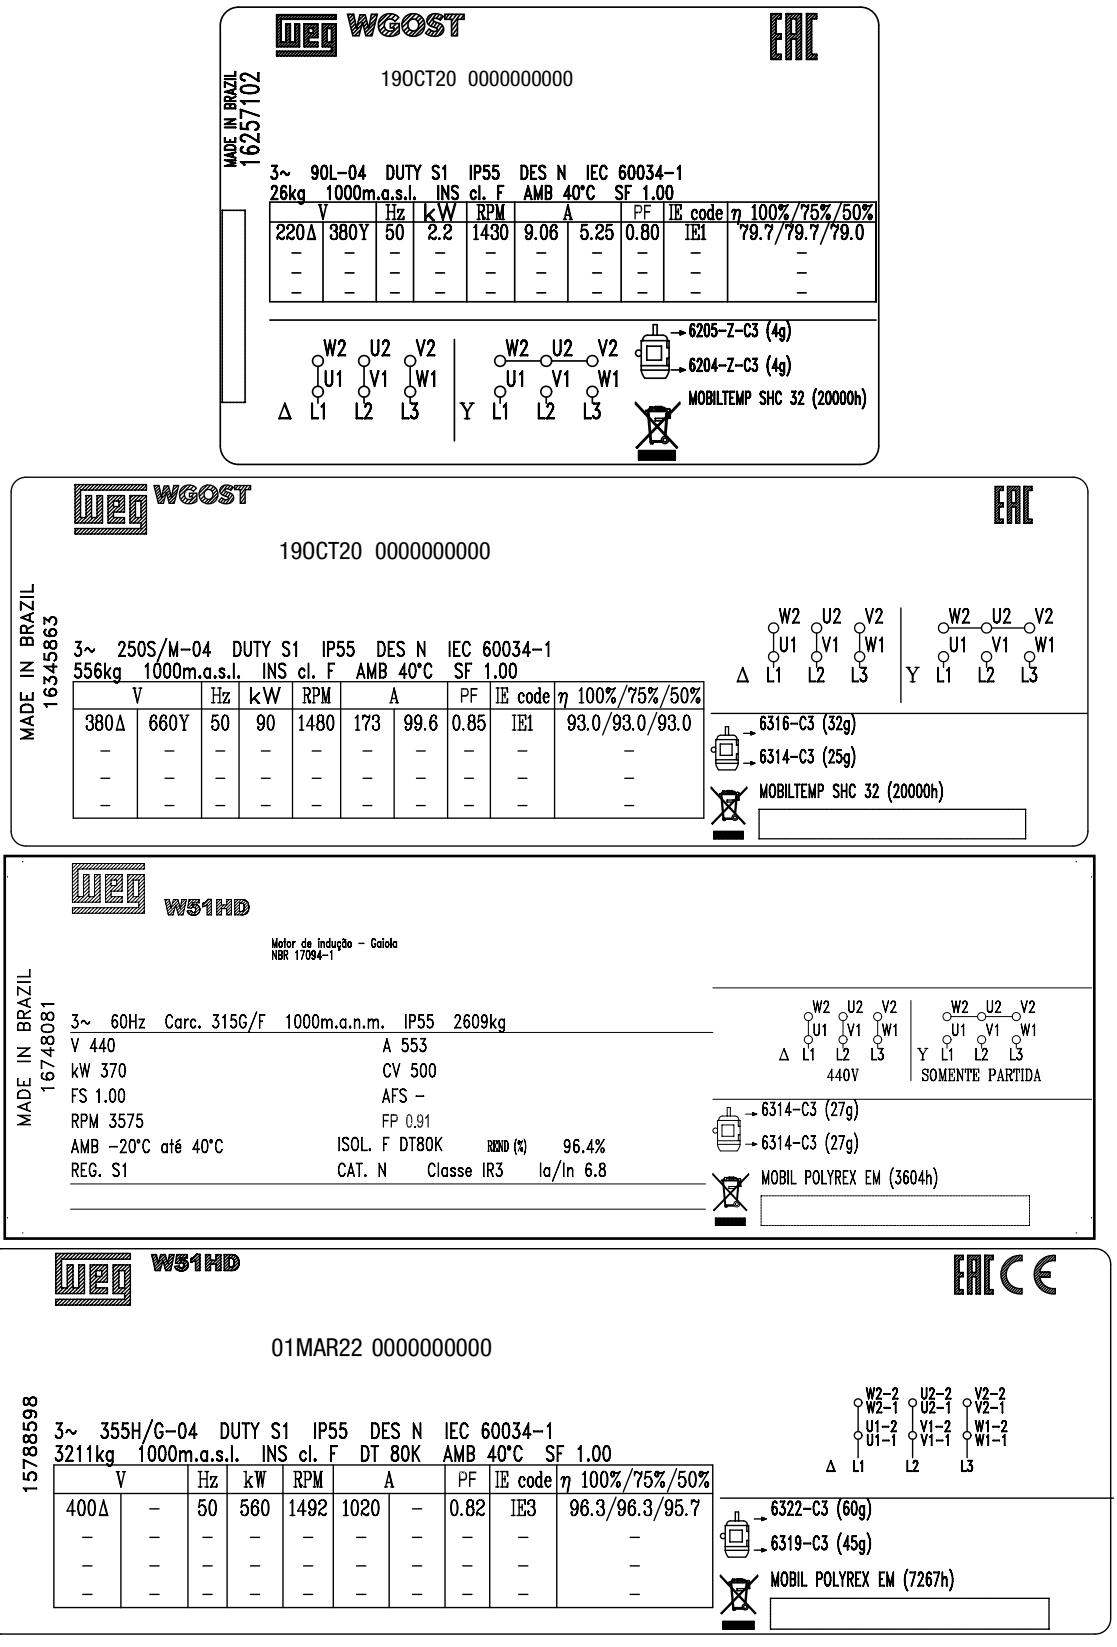
- Check that the motor has not been exposed to excessive dust and moisture during the transportation.

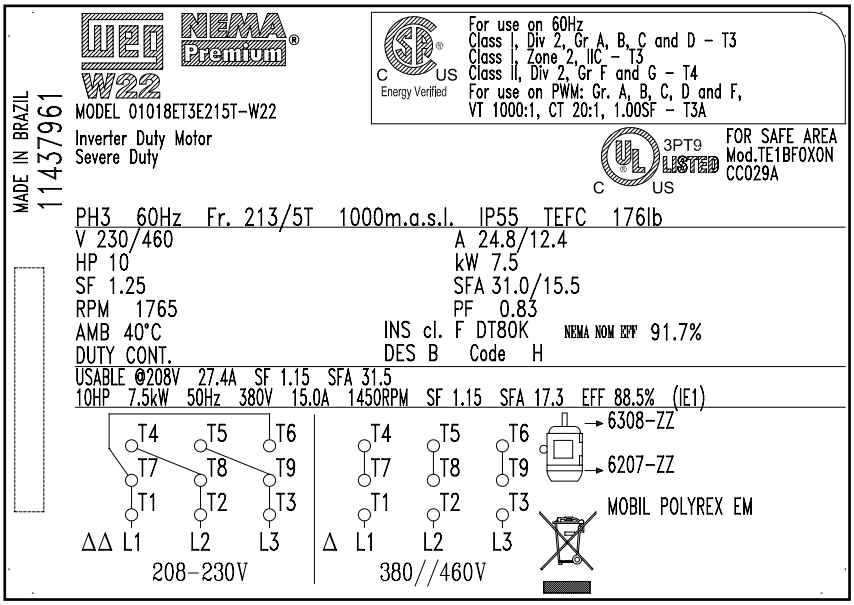
Do not remove the protective grease from the shaft, or the plugs from the cable entries. These protections must remain in place until the installation has been completed.

2.3 NAMEPLATES

The nameplate contains information that describes the construction characteristics and the performance of the motor. Figure 1, Figure 2 and Figure 3 show nameplate layout examples.

Figure 1 - IEC motor nameplate





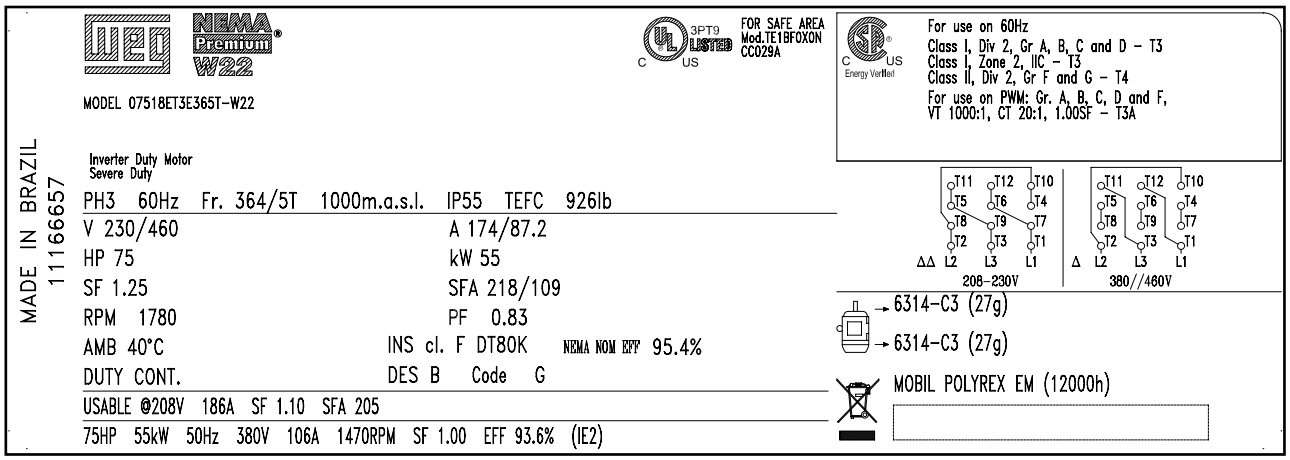


Figure 2 - IEC motor nameplate

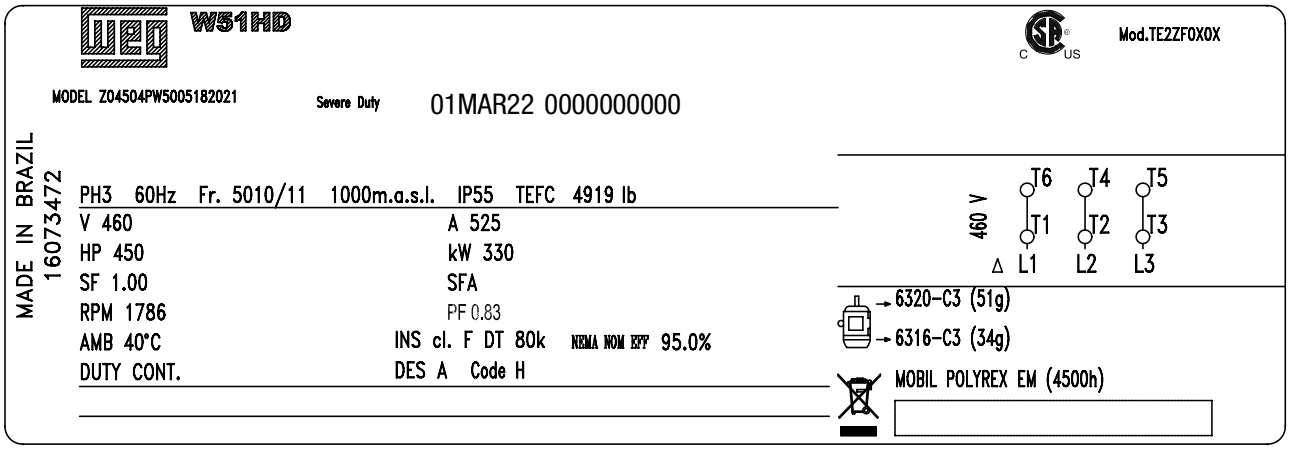

Figure 3 - NEMA motor nameplate

3. SAFETY INSTRUCTIONS

The motor must be disconnected from the power supply and be completely stopped before conducting any installation or maintenance procedures. Additional measures should be taken to avoid accidental motor starting.

Professionals working with electrical installations, either in the assembly, operation or maintenance, should use proper tools and be instructed on the application of standards and safety requirements, including the use of Personal Protective Equipment (PPE) that must be carefully observed in order to reduce risk of personal injury during these services.

Electric motors have energized circuits, exposed rotating parts and hot surfaces that may cause serious injury to people during normal operation. It is recommended that transportation, storage, installation, operation and maintenance services are always performed by qualified personnel.

Pacemaker users and unqualified personnel shall not open WMagnet and WQuattro motors, because high energy magnets are used.

Always follow the safety, installation, maintenance and inspection instructions in accordance with the applicable standards in each country.

4. HANDLING AND TRANSPORT

Individually packaged motors should never be lifted by the shaft or by the packaging. They must be lifted only by means of the eyebolts, when supplied. Use always suitable lifting devices to lift the motor. Eyebolts on the frame are designed for lifting the machine weight only as indicated on the motor nameplate. Motors supplied on pallets must be lifted by the pallet base with lifting devices fully supporting the motor weight. The package should never be dropped. Handle it carefully to avoid bearing damage.

Eyebolts provided on the frame are designed for lifting the machine only. Do not use these eyebolts for lifting the motor with coupled equipment such as bases, pulleys, pumps, reducers, etc..

Never use damaged, bent or cracked eyebolts. Always check the eyebolt condition before lifting the motor.

Eyebolts mounted on components, such as on end shields, forced ventilation kits, etc. must be used for lifting these components only. Do not use them for lifting the complete machine set.

Handle the motor carefully without sudden impacts to avoid bearing damage and prevent excessive mechanical stresses on the eyebolts resulting in its rupture.

Do not handle the motors by the polymeric components: fan cover, drip cover, terminal box and / or terminal box cover.

To move or transport motors with cylindrical roller bearings or angular contact ball bearings, use always the shaft locking device provided with the motor.
All HGF, W50, W51 HD and W60 motors, regardless of bearing type, must be transported with shaft locking device fitted.
Vertical mounted motors with oil-lubricated bearings must be transported in the vertical position. If necessary to move or transport the motor in the horizontal position, install the shaft locking device on both sides (drive end and non-drive end) of the motor.

4.1 LIFTING

Before lifting the motor ensure that all eyebolts are tightened properly and the eyebolt shoulders are in contact with the base to be lifted, as shown in Figure 4. Figure 5 shows an incorrect tightening of the eyebolt.
Ensure that lifting machine has the required lifting capacity for the weight indicated on the motor nameplate.

Figure 4 - Correct tightening of the eyebolt

Figure 5 - Incorrect tightening of the eyebolt

The center-of-gravity may change depending on motor design and accessories. During the lifting procedures the maximum allowed angle of inclination should never be exceeded as specified below.

4.1.1 Horizontal motors with one eyebolt

For horizontal motors fitted with only one eyebolt, the maximum allowed angle-of-inclination during the lifting process should not exceed 30° in relation to the vertical axis, as shown in Figure 6.

Figure 6 - Maximum allowed angle-of-inclination for motor with one eyebolt

4.1.2 Horizontal motor with two eyebolts

When motors are fitted with two or more eyebolts, all supplied eyebolts must be used simultaneously for the lifting procedure.
There are two possible eyebolt arrangements (vertical and inclined), as shown below:

- For motors with vertical lifting eyebolts, as shown in Figure 7, the maximum allowed lifting angle should not exceed 45° in relation to the vertical axis. We recommend to use a spreader beam for maintaining the lifting elements (chain or rope) in vertical position and thus preventing damage to the motor surface;

Figure 7 - Maximum resulting angle for motors with two or more lifting eyebolts

- For HGF, W40, W50 and W51 HD motors, as shown in Figure 8, the maximum resulting angle should not exceed 30° in relation to the vertical axis;

Figure 8 - Maximum resulting angle for horizontal HGF, W40, W50 and W51 HD motors

For W60 motors, as shown in Figure 9, the use of a spreader beam is required for maintaining the lifting elements (chain or rope) in vertical position and thus preventing damage to the motor surface.

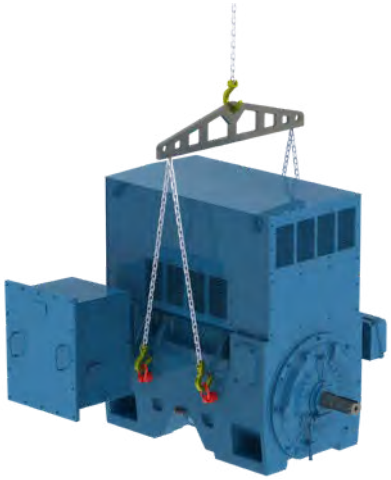

Figure 9 - Lifting for W60 motors with paralel chains

- For motors fitted with inclined eyebolts, as shown in Figure 10, the use of a spreader beam is required for maintaining the lifting elements (chain or rope) in vertical position and thus preventing damage to the motor surface.

Figure 10 - Use of a spreader beam for lifting

4.1.3 Vertical motors

For vertical mounted motors, as shown in Figure 11, the use of a spreader beam is required for maintaining the lifting element (chain or rope) in vertical position and thus preventing damage to the motor surface.

Figure 11 - Lifting of vertical mounted motors

Always use the eyebolts mounted on the top side of the motor, diametrically opposite, considering the mounting position. See Figure 12.

Figure 12 - Lifting of HGF, W50 and W51 HD motors.

4.1.3.1 Procedures to place W22/WEG General Purpose/WIN motors in the vertical position

For safety reasons during the transport, vertical mounted Motors are usually packed and supplied in horizontal position.
To place W22/WEG General Purpose/WIN motors fitted with eyebolts (see Figure 10), to the vertical position, proceed as follows:

1. Ensure that the eyebolts are tightened properly, as shown in Figure 4;
2. Remove the motor from the packaging, using the top mounted eyebolts, as shown in Figure 13;

Figure 13 - Removing the motor from the packaging

3. Install a second pair of eyebolts, as shown in Figure 14;

Figure 14 - Installation of the second pair of eyebolts

4. Reduce the load on the first pair of eyebolts to start the motor rotation, as shown in Figure 15. This procedure must be carried out slowly and carefully.

Figure 15 - End result: motor placed in vertical position

These procedures will help you to move motors designed for vertical mounting. These procedures are also used to place the motor from the horizontal position into the vertical position and vertical to horizontal.

For motors of IEC 112 to 200 frame (and equivalent NEMA), WEG has a kit of devices to facilitate the motor tipping to the vertical, with the point up or down (as shown in Figure 16 and Figure 17).

Figure 16 - Eyebolt to place the motor in vertical position, with the shaft end up (V6/V36)

Figure 17 - Eyebolts with extension fixed at NDE side to place the motor in vertical position, with the shaft end down (V5/V35)

4.1.3.2 Procedures to place HGF, W50 and W51 HD motors in the vertical position

HGF motors are fitted with eight lifting points: four at drive end and four at non-drive end. W50 and W51 HD motors are fitted with nine lifting points: four at drive end, one in the central part and four at non-drive end. The motors are usually transported in horizontal position, however for the installation they must be placed in the vertical position.

To place an these motors in the vertical position, proceed as follows:

1. Lift the motor by using the four lateral eyebolts and two hoists, see Figure 18;

Figure 18 - Lifting of HGF, W50 and W51 HD motors with two hoists

2. Lower the hoist fixed to motor drive end while lifting the hoist fixed to motor non-drive end until the motor reaches its equilibrium, see Figure 19;

Figure 19 - Placing HGF, W50 and W51 HD motors in vertical position

3. Remove the hoist hooks from the drive end eyebolts and rotate the motor 180° to fix the removed hooks into the two eyebolts at the motor non-drive end, see Figure 20;

Figure 20 - Lifting HGF, W50 and W51 HD motors by the eyebolts at the non-drive end

4. Fix the removed hoist hooks in the other two eyebolts at the non-drive end and lift the motor until the vertical position is reached, see Figure 21.

Figure 21 - HGF, W50 and W51 HD motors in the vertical position

These procedures will help you to move motors designed for vertical mounting. These procedures are also used to place the motor from the horizontal position into the vertical position and vertical to horizontal.

4.2 PROCEDURES TO PLACE W22/WEG GENERAL PURPOSE/WIN VERTICAL MOUNT MOTORS IN HORIZONTAL POSITION

To place W22/WEG General Purpose/WIN vertical mount motor in horizontal position, proceed as follows:
1. Ensure that all eyebolts are tightened properly, as shown in Figure 4;

2. Install the first pair of eyebolts and lift the motor as shown in Figure 22;

Figure 22 - Install the first pair of eyebolts

3. Install the second pair of eyebolts, as shown in Figure 23;

Figure 23 - Install the second pair of eyebolts

4. Reduce the load on the first pair of eyebolts for rotating the motor, as shown in Figure 24. This procedure must be carried out slowly and carefully;

Figure 24 - Motor is being rotated to horizontal position

5. Remove the first pair of eyebolts, as shown in Figure 25.

Figure 25 - Final result: motor placed in horizontal position

For IEC 112 to 200 (and NEMA equivalents), WEG has a device kit available to facilitate the procedure of tipping the motor for instalation in a vertical shaft up or shaft down position.

For Easy Maintenance, Wash, Brake motors, motors with forced ventilation, encoder or painting plan 212 or 213, please contact WEG.

5. STORAGE

If the motor is not installed immediately, it must be stored in a dry and clean environment, with relative humidity not exceeding 60%, with an ambient temperature between 5 °C and 40 °C, without sudden temperature changes, free of dust, vibrations, gases or corrosive agents. The motor must be stored in horizontal position, unless specifically designed for vertical operation, without placing objects on it. Do not remove the protection grease from shaft end to prevent rust.

If the motor are fitted with space heaters, they must always be turned on during the storage period or when the installed motor is out of operation. Space heaters will prevent water condensation inside the motor and keep the winding insulation resistance within acceptable levels. Store the motor in such position that the condensed water can be easily drained. If fitted, remove pulleys or couplings from the shaft end (more information are given on item 6).

The space heaters should never be energized when the motor is in operation.

5.1 EXPOSED MACHINED SURFACES

All exposed machined surfaces (like shaft end and flange) are factory-protected with temporary rust inhibitor. A protective film must be reapplied periodically (at least every six months), or when it has been removed and/or damaged.

5.2 STORAGE

The stacking height of the motor packaging during the storage period should not exceed 5 m, always considering the criteria indicated in Table 1:

Packaging type	Frame sizes	Maximum stacking quantity
Cardboard box	IEC 56 to 132 NEMA 143 to 215	Indicated on the top side of the cardboard box
Wood crate	IEC 56 to 315 NEMA 48 to 504/5	06
	IEC 355 NEMA 586/7 and 588/9	03
	W40 / W50 / W60 / W51 HD / HGF IEC 315 to 630 W40 / W50 / W51 HD / HGF NEMA 5000 to 9600	Indicated on the packaging

Table 1 - Maximum recommended stacking height

Notes:
1) Never stack larger packaging onto smaller packaging;
2) Align the packaging correctly (see Figure 26 and Figure 26);

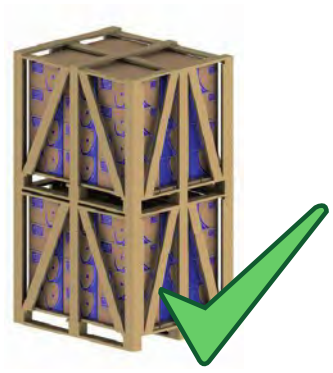

Figure 26 - Correct stacking

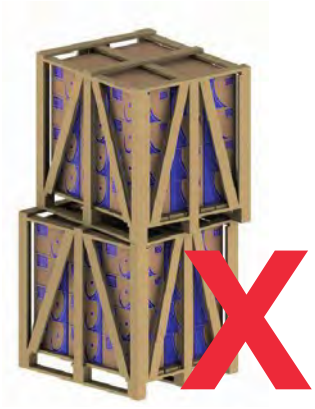

Figure 26 - Incorrect stacking

3) The feet of the crates above should always be supported by suitable wood battens (Figure 27) and never stand on the steel tape or without support (Figure 27);

ENGLISH

Figure 27 - Correct stacking

Figure 27 - Incorrect stacking

4) When stacking smaller crates onto longer crates, always ensure that suitable wooden supports are provided to withstand the weight (see Figure 28). This condition usually occurs with motor packaging above IEC 225S/M (NEMA 364/5T) frame sizes.

Figure 28 - Use of additional battens for stacking

5.3 BEARINGS

5.3.1 Grease lubricated bearings

We recommend rotating the motor shaft at least once a month (by hand, at least five revolutions, stopping the shaft at a different position from the original one). The shaft might not rotate freely in WMagnet and WQuattro motors, due to alignment torque from the magnets. It might be necessary to use a lever.

When rotating the shaft, it is necessary to certify that the terminals are insulated to eliminate the risc of electric shock from induced voltage.

If the motor is fitted with shaft locking device, remove it before rotating the shaft and install it again before performing any handling procedure.

Vertical motors may be stored in the vertical or in horizontal position. If motors with open bearings are stored longer than six months, the bearings must be relubricated according to item 8.2 before commissioning of the motor.

If the motor is stored for longer than 2 years, the bearings must be replaced or removed, washed, inspected and relubricated according to item 8.2.

5.3.2 Oil lubricated bearings

The motor must be stored in its original operating position and with oil in the bearings. Correct oil level must be ensured. It should be in the center of the sight glass.

During the storage period, remove the shaft locking device and rotate the shaft by hand every month, at least five revolutions, thus achieving an even oil distribution inside the bearing and maintaining the bearing in good operating conditions. Reinstall the shaft locking device every time the motor has to be moved.

If the motor is stored for a period equal or longer than the oil change interval, the oil must be replaced according to Item 8.2, before starting the operation. If the motor is stored for a period of over two years, the bearings must be replaced or removed, washed according to manufacturer instructions, checked and relubricated according to Item 8.2. The oil of vertical mounted motors is removed to prevent oils leaks during the transport. After receiving the motor the bearings must be lubricated.

5.3.3 Oil Mist lubricated bearings

The motor must be stored in horizontal position. Lubricate the bearings with ISO VG 68 mineral oil in the amount indicated in the Table 2 (this is also valid for bearings with equivalent dimensions). After filling with oil, rotate the shaft by hand, at least five revolutions)
During the storage period, remove the shaft locking device (if any) and rotate the shaft by hand every week, at least five revolutions, stopping it at a different position from the original one. Reinstall the shaft locking device every time the motor has to be moved. If the motor is stored for a period of over two years, the bearings must be replaced or removed, washed according to manufacturer instructions, checked and relubricated according to item 8.2.

Bearing size	Amount of oil (ml)	Bearing size	Amount of oil (ml)
6201	15	6309	65
6202	15	6311	90
6203	15	6312	105
6204	25	6314	150
6205	25	6315	200
6206	35	6316	250
6207	35	6317	300
6208	40	6319	350
6209	40	6320	400
6211	45	6322	550
6212	50	6324	600
6307	45	6326	650
6308	55	6328	700

Table 2 - Amount of oil per bearing

The oil must always be removed when the motor has to be handled. If the oil mist system is not operating after installation, fill the bearings with oil to prevent bearing rusting. During the storage period, rotate the shaft by hand, at least five revolutions, stopping it at a different position from the original one. Before starting the motor, all bearing protection oil must be drained from the bearing and the oil mist system must be switched ON.

5.3.4 Sleeve bearing

The motor must be stored in its original operating position and with oil in the bearings. Correct oil level must be ensured. It should be in the middle of the sight glass. During the storage period, remove the shaft locking device and rotate the shaft by hand every month, at least five revolutions, and at 30 rpm, thus achieving an even oil distribution inside the bearing and maintaining the bearing in good operating conditions. Reinstall the shaft locking device every time the motor has to be moved.
If the motor is stored for a period equal or longer than the oil change interval, the oil must be replaced, according to Item 8.2, before starting the operation.
If the motor is stored for a period longer than the oil change interval, or if it is not possible to rotate the motor shaft by hand, the oil must be drained and a corrosion protection and dehumidifiers must be applied.

5.4 INSULATION RESISTANCE

We recommend measuring the winding insulation resistance at regular intervals to follow-up and evaluate its electrical operating conditions. If any reduction in the insulation resistance values are recorded, the storage conditions should be evaluated and corrected, where necessary.

5.4.1 Insulation resistance measurement

The insulation resistance must be measured in a safe environment.

The insulation resistance must be measured with a megohmmeter. The machine must be in cold state and disconnected from the power supply.

To prevent the risk of an electrical shock, ground the terminals before and after each measurement. Ground the capacitor (if any) to ensure that it is fully discharged before the measurement is taken.

It is recommended to insulate and test each phase separately. This procedure allows the comparison of the insulation resistance between each phase. During the test of one phase, the other phases must be grounded.
The test of all phases simultaneously evaluates the insulation resistance to ground only but does not evaluate the insulation resistance between the phases.

The power supply cables, switches, capacitors and other external devices connected to the motor may considerably influence the insulation resistance measurement. Thus all external devices must be disconnected and grounded during the insulation resistance measurement.
Measure the insulation resistance one minute after the voltage has been applied to the winding. The applied voltage should be as shown in Table 3.

Winding rated voltage (V)	Testing voltage for measuring the insulation resistance (V)
< 1000	500
1000 - 2500	500 - 1000
2501 - 5000	1000 - 2500
5001 - 12000	2500 - 5000
> 12000	5000 - 10000

Table 3 - Voltage for the insulation resistance

The reading of the insulation resistance must be corrected to 40 °C as shown in the Table 4.

Measuring temperature of the insulation resistance (°C)	Correction factor of the insulation resistance corrected to 40 °C	Measuring temperature of the insulation resistance (°C)	Correction factor of the insulation resistance corrected to 40 °C
10	0.125	30	0.500
11	0.134	31	0.536
12	0.144	32	0.574
13	0.154	33	0.616
14	0.165	34	0.660
15	0.177	35	0.707
16	0.189	36	0.758
17	0.203	37	0.812
18	0.218	38	0.871
19	0.233	39	0.933
20	0.250	40	1.000
21	0.268	41	1.072
22	0.287	42	1.149
23	0.308	43	1.231
24	0.330	44	1.320
25	0.354	45	1.414
26	0.379	46	1.516
27	0.406	47	1.625
28	0.435	48	1.741
29	0.467	49	1.866
30	0.500	50	2.000

Table 4 - Correction factor for the insulation resistance corrected to 40 °C

The motor insulation condition must be evaluated by comparing the measured value with the values indicated in Table 5 (corrected to 40 °C):

Limit value for rated voltage up to 1.1 kV (MΩ)	Limit value for rated voltage above 1.1 kV (MΩ)	Situation
Up to 5	Up to 100	Dangerous. The motor can not be operated in this condition
5 to 100	100 to 500	Regular
100 to 500	Higher than 500	Good
Higher than 500	Higher than 1000	Excellent

Table 5 - Evaluation of the insulation system

The values indicated in the table should be considered only as reference values. It is advisable to log all measured values to provide a quick and easy overview on the machine insulation resistance.
If the insulation resistance is low, moisture may be present in the stator windings. In this case the motor should be removed and transported to a WEG authorized Service Center for proper evaluation and repair (This service is not covered by the warranty). To improve the insulation resistance through the drying process, see section 8.4.

6. INSTALLATION

The insulation resistance must be measured in a safe environment.

Check some aspects before proceeding with the installation:

1. Insulation resistance: must be within the acceptable limits. See item 5.4.
2. Bearings:
   If the motor is installed without running immediately, proceed as described in item 5.3.
3. Operating conditions of the start capacitors: If single-phase motors are stored for a period of over two years, it is recommended to change the start capacitors before motor starting since they lose their operating characteristics.
4. Terminal box:
   a. the inside of the terminal box must be clean and dry;
   b. the contacts must be correctly connected and corrosion free. See 6.9 and 6.10;
   c. the cable entries must be correctly sealed and the terminal box cover properly mounted in order to ensure the degree of protection indicated on the motor nameplate.
5. Cooling: the cooling fins, air inlet and outlet openings must be clean and unobstructed. The distance between the air inlet openings and the wall should not be shorter than ¼ (one quarter) of the diameter of the air inlet. Ensure sufficient space to perform the cleaning services. See item 7.
6. Coupling: remove the shaft locking device (where fitted) and the corrosion protection grease from the shaft end, including the grounding brush area, and flange immediately before installing the motor. See item 6.4.
7. Drain hole: the motor must always be positioned so the drain hole is at the lowest position (If there is any indication arrow on the drain, the drain must be so installed that the arrow points downwards).
   Motors supplied with rubber drain, threaded drain or any other open/close drain plugs must be opened periodically to allow the exit of condensed water. For environments with high water condensation levels and motor with degree of protection IP55, the drain plugs can be mounted in open position (see Figure 29).
   For motors with degree of protection IP56, IP65 or IP66, the drain plugs must remain at closed position (see Figure 29), being opened only during the motor maintenance procedures.
   The drain system of motors with Oil Mist lubrication system must be connected to a specific collection system (see Figure 29).

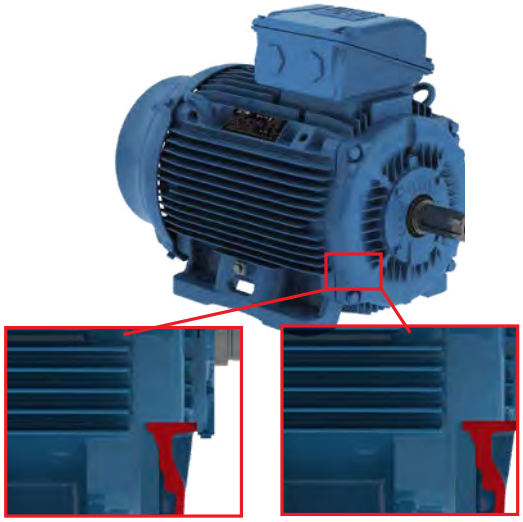

Figure 29 - Detail of the rubber drain plug mounted in closed and open position

8. Additional recommendations:
   a. Check the direction of motor rotation, starting the motor at no-load before coupling it to the load;
   b. Vertical mounted motors with shaft end down must be fitted with drip cover to protect them from liquids or solids that may drop onto the motors;
   c. Vertical mounted motors with shaft end up should be fitted with water slinger ring to prevent water ingress inside the motor.
   d. The fixing elements mounted in the threaded through holes in the motor enclosure (for example, the flange) must be properly sealed.

Remove or fix the shaft key before starting the motor.

Changes on the motor construction (features), such as installation of extended grease fittings or modification of the lubrication system, installation of accessories at alternative locations, etc., can be carried out only after prior written consent from WEG.

6.1 FOUNDATIONS

The foundation is the structure, structural element, natural or prepared base, designed to withstand the stresses produced by the installed equipment, ensuring safe and stable performance during operation. The foundation design should consider the adjacent structures to avoid the influences of other installed equipment and no vibration is transferred through the structure

The foundation must be flat and its selection and design must consider the following characteristics:

a) The features of the machine to be installed on the foundation, the driven loads, application, maximum allowed deformations and vibration levels (for instance, motors with reduced vibration levels, foot flatness, flange concentricity, axial and radial loads, etc. lower than the values specified for standard motors).

b) Adjacent buildings, conservation status, maximum applied load estimation, type of foundation and fixation and vibrations transmitted by theses constructions.

If the motor is supplied with leveling/alignment bolts, this must be considered in the base design.

Please consider for the foundation dimensioning all stresses that are generated during the operation of the driven load.
The user is responsible for the foundation designing and construction.

The foundation stresses can be calculated by using the following equations (see Figure 6.2):

$$F_1 = 0,5 * g * m - (4 * T_b / A)$$
$$F_2 = 0,5 * g * m + (4 * T_b / A)$$

Where:

F_1 and F_2 = lateral stresses (N);
g = gravitational acceleration (9,8 m/s^2);
m = motor weight (kg);
T_b = breakdown torque (Nm);
A = distance between centerlines of mounting holes in feet or base of the machine (end view) (m).

The motors may be mounted on:

- Concrete bases: are most used for large-size motors (Figure 30);
- Metallic bases: are generally used for small-size motors (Figure 31).

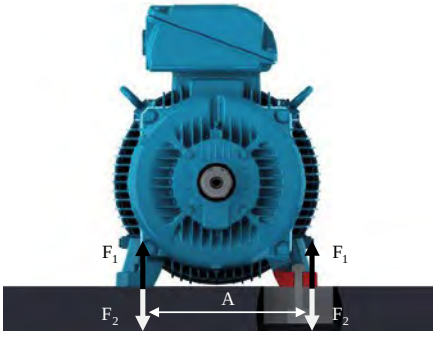

Figure 30 - Motor installed on concrete base

Figure 31 - Motor installed on metallic base

The metallic and concrete bases may be fitted with sliding system. These types of foundations are generally used where the power transmission is achieved by belts and pulleys. This power transmission system is easier to assemble/disassemble and allows the belt tension adjustment. Other important aspect of this foundation type is the location of the base locking screws that must be diagonally opposite. The rail nearest the drive pulley is placed in such a way that the positioning bolt is between the motor and the driven machine. The other rail must be placed with the bolt on the opposite side (diagonally opposite), as shown in Figure 32.

To facilitate assembly, the bases may have the following features:

- Shoulders and/or recesses;
- Anchor bolts with loose plates;
- Bolts cast in the concrete;
- Leveling screws;
- Positioning screws;
- Steel & cast iron blocks, plates with flat surfaces.

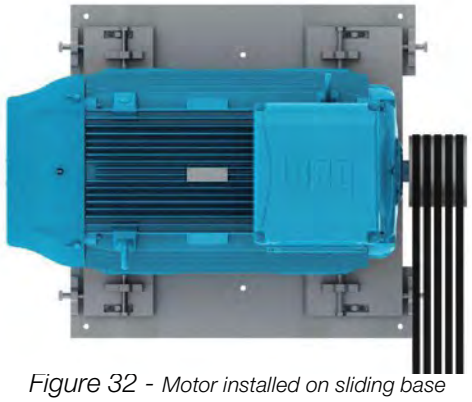

Figure 32 - Motor installed on sliding base

After completing the installation, it is recommended that all exposed machined surfaces are coated with suitable rust inhibitor.

6.2 MOTOR MOUNTING

Footless motors supplied with transportation devices, according to Figure 33, must have their devices removed before starting the motor installation.

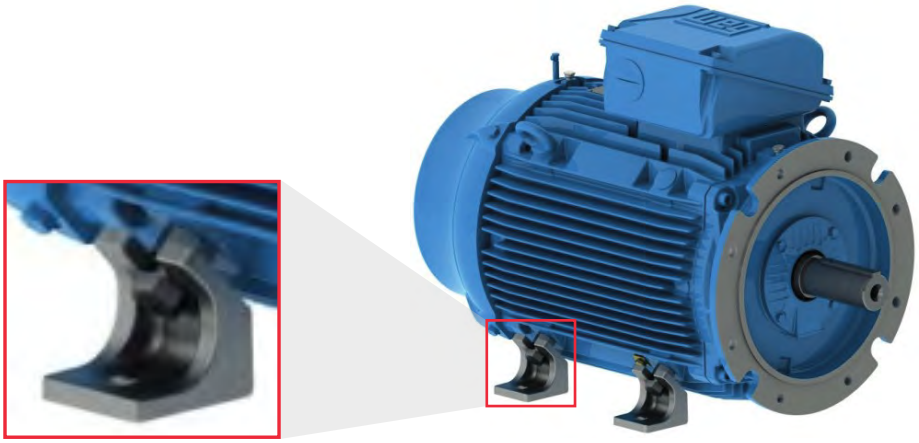

Figure 33 - Detail of the transportation devices for footless motors

6.2.1 Foot mounted motors

The drawings of the mounting hole dimensions for NEMA or IEC motors can be checked in the respective technical catalogue.
The motor must be correctly aligned and leveled with the driven machine. Incorrect alignment and leveling may result in bearing damage, generate excessive vibration and even shaft distortion/breakage.
For more details, see section 6.3 and 6.6. The thread engagement length of the mounting bolt should be at least 1.5 times the bolt diameter. This thread engagement length should be evaluated in more severe applications and increased accordingly.
Figure 6.6 shows the mounting system of a foot mounted motor indicating the minimum required thread engagement length.

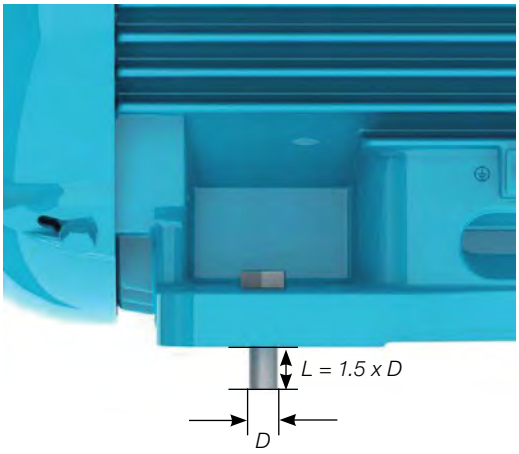

Figure 34 - Mounting system of a foot mounted motor

6.2.2 Flange mounted motors

The drawings of the flange mounting dimensions, IEC and NEMA flanges, can be checked in the technical catalogue. The coupling of the driven equipment to the motor flange must be properly dimensioned to ensure the required concentricity of the assembly.
Depending on the flange type, the mounting can be performed from the motor to the driven equipment flange (flange FF (IEC) or D (NEMA)) or from the driven equipment flange to the motor (flange C (DIN or NEMA)).
For the mounting process from the driven equipment flange to the motor, you must consider the bolt length, flange thickness and the thread depth of the motor flange.

In cases that use polymer flanges with a built-in nut or the aluminum flange with hexagonal hole, the length of the motor fixing screw must not exceed the length of the hole, thus avoiding misalignment and clearance of the coupling.

If the motor flange has tapped through-holes, the length of the mounting bolts must not exceed the tapped through-hole length of the motor flange, thus preventing damage to the winding head.

Motors with aluminum frame and/or flange can be supplied with hexagonal holes for flange mounting. These holes are suitable for receiving cylindrical screws compatible with standardized coupling dimensions, with attention to the minimum screw strength class according to the product catalog.
For flange mounting the thread engagement length of the mounting bolt should be at least 1.5 times the bolt diameter. In severe applications, longer thread engagement length may be required.

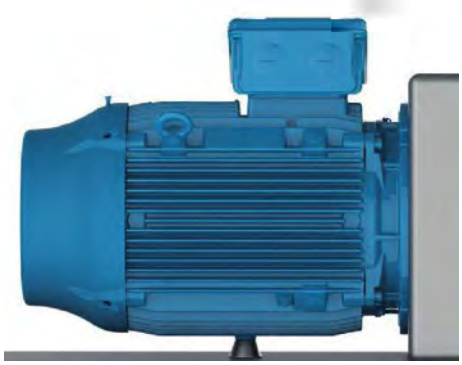

Figure 35 - Mounting method of flange mounted motors with frame base support

In severe applications or if large motors are flange mounted, a foot or pad mounting may be required in addition to the flange mounting (Figure 35). The motor must never be supported on its cooling fins.

The tightening torques indicated in Table 6 must be respected when:
- fixing a polymeric foot and/or flange to the customer equipment for W12/WEG General Purpose motors;
- installing polymeric fan covers for WEG General Purpose and WIN motors and/or changing/rotating the position of the terminal box for W12/WEG General Purpose motors.

For installation of W12/WEG General Purpose motors in frame sizes IEC56, W63 and W71 in the vertical position with the shaft upwards, the foot must be locked axially by the fixing of a flat head screw as indicated.
The hexagonal holes in the C-DIN flanges of W12/WEG General Purpose motors in frame sizes IEC56/W63/W71 are suitable for the screws indicated in Table 6.

Frame	Component	Bolt/Screw specification (Thread size x length)	Torque (Nm)
IEC56	Polymeric Foot	M5x12	8
W63/W71		M5x16	8
IEC56/W63/ W71	Polymeric Flange	-	8
	C-80	M5	5
	C-105	M6	6
160/180/200/W225/225/250/W280	Fan cover	M8 / M10	6 to 8
IEC 56/W63/W71	Terminal box/Grounding	M5	1,8 to 2,4
71/W80/90/W100/112/132	Terminal box/Grounding	M5	5

Table 6 - Tightening torque and screw specification for W12/WEG General Purpose motors.

Note:
When liquid (for example oil) is likely to come into contact with the shaft seal, please contact your local WEG representative.

For WFL motors, the flange has hexagonal holes suitable for M6 screws (maximum torque 8 Nm), and the screws must have at least a 5.6 resistance class. The length of the screws that will be used in the application to fix the motor to the equipment must not exceed the thickness of the endshield wall where they are mounted, at the risk of damaging the motor coil head and causing electric shock. The application screw must be embedded into the endshield with a minimum depth of 7 mm and a maximum of 9 mm.

6.2.3 Pad mounted motors

Typically, this method of mounting is used in axial fans. The motor is fixed by tapped holes in the frame. The dimensions of these tapped holes can be checked in the respective product catalogue. The selection of the motor mounting rods/bolts must consider the dimensions of the fan case, the installation base and the thread depth in the motor frame.
The mounting rods and the fan case wall must be sufficiently stiff to prevent the transmission of excessive vibration to the machine set (motor & fan). Figure 35 shows the pad mounting system.

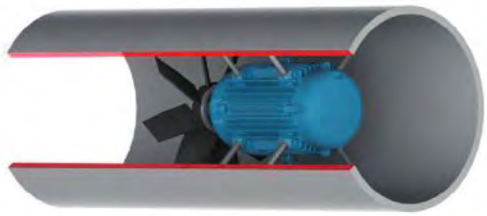

Figure 36 - Mounting of the motor inside the cooling duct

6.3 BALANCING

Unbalanced machines generate vibration which can result in damage to the motor. WEG motors are dynamically balanced with “half key” and without load (uncoupled). Special balancing quality level must be stated in the Purchase Order.

The transmission elements, such as pulleys, couplings, etc., must balanced with “half key” before they are mounted on the motor shaft.

The balance quality grade meets the applicable standards for each product line.
The maximum balancing deviation must be recorded in the installation report.

6.4 COUPLINGS

Couplings are used to transmit the torque from the motor shaft to the shaft of the driven machine. The following aspects must be considered when couplings are installed:

- Use proper tools for coupling assembly & disassembly to avoid damages to the motor and bearings;
- Whenever possible, use flexible couplings, since they can absorb eventual residual misalignments during the machine operation;
- The maximum loads and speed limits informed in the coupling and motor manufacturer catalogues cannot be exceeded;
- Level and align the motor as specified in sections 6.5 and 6.6, respectively.

Remove or fix the shaft key firmly when the motor is operated without coupling in order to prevent accidents.

6.4.1 Direct coupling

Direct coupling is characterized when the Motor shaft is directly coupled to the shaft of the driven machine without transmission elements. Whenever possible, use direct coupling due to lower cost, less space required for installation and more safety against accidents.

Do not use roller bearings for direct coupling, unless sufficient radial load is expected.

6.4.2 Gearbox coupling

Gearbox coupling is typically used where speed reduction is required.
Make sure that shafts are perfectly aligned and strictly parallel (in case of straight spur gears) and in the right meshing angle (in case of bevel and helical gears).

6.4.3 Pulley and belt coupling

Pulleys and belts are used when speed increase or reduction between motor shaft and driven load is required.

Excessive belt tension will damage the bearings and cause unexpected accidents such as breakage of the motor shaft.

6.4.4 Coupling of sleeve bearing motors

Motors designed with sleeve bearings must be operated with direct coupling to the driven machine or a gearbox. Pulley and belts can not be applied for sleeve bearing motors.

Motors designed with sleeve bearings have 3 (three) marks on the shaft end. The center mark is the indication of the magnetic center and the 2 (two) outside marks indicate the allowed limits of the rotor axial movement, as shown in Figure 36
The motor must be so coupled that during operation the arrow on the frame is placed over the central mark indicating the rotor magnetic center. During start-up, or even during operation, the rotor may freely move between the two outside marks when the driven machine exerts an axial load on the motor shaft. However, under no circumstance, the motor can operate continuously with axial forces on the bearing.

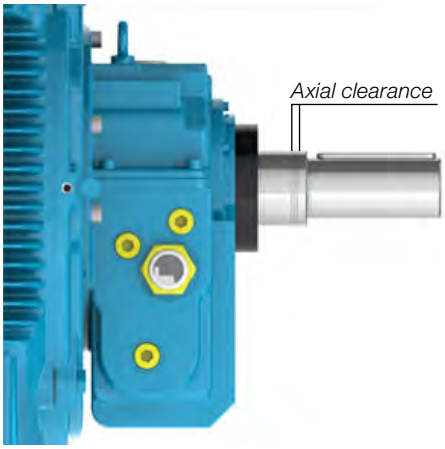

Figure 37 - Axial clearance of motor designed with sleeve bearing.

For coupling evaluation consider the maximum axial bearing clearance as shown in Table 7.
The axial clearance of the driven machine and coupling influence the maximum bearing clearance.

Bearing size	Total axial clearance (mm)
9*	3 + 3 = 6
11*	4 + 4 = 8
14*	5 + 5 =10
18	7,5 + 7,5 = 15

Table 7 - Clearance used for sleeve bearings

** For Motors in accordance with API 541, the total axial clearance is 12.7 mm*

The sleeve bearings used by WEG were not designed to support axial load continuously.
Under no circumstance must the motor be operated continuously at its axial clearance limits.

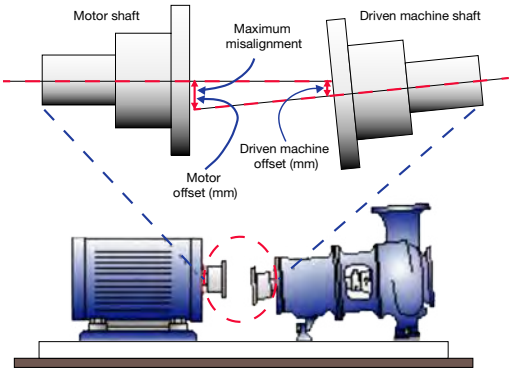
6.5 LEVELING

The motor must be leveled to correct any deviations in flatness arising from the manufacturing process and the material structure rearrangement. The leveling can be carried out by a leveling screw fixed on the motor foot or on the flange or by means of thin compensation shims. After the leveling process, the leveling height between the motor mounting base and the motor cannot exceed 0.1 mm.
If a metallic base is used to level the height of the motor shaft end and the shaft end of the driven machine, level only the metallic base relating to the concrete base.

Record the maximum leveling deviations in the installation report.

6.6 ALIGNMENT

The correct alignment between the motor and the driven machine is one of the most important variables that extends the useful service life of the motor. Incorrect coupling alignment generates high loads and vibrations reducing the useful life of the bearings and even resulting in shaft breakages. Figure38 illustrates the misalignment between the motor and the driven machine.



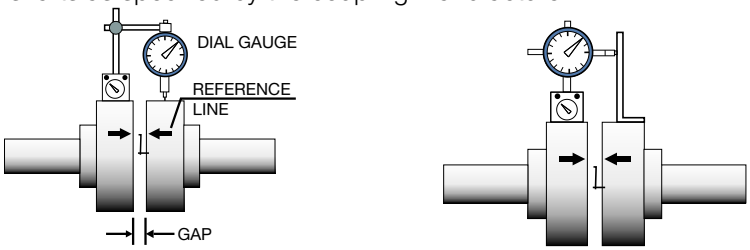


Figure 38 - Typical misalignment condition

Alignment procedures must be carried out using suitable tools and devices, such as dial gauge, laser alignment instruments, etc.. The motor shaft must be aligned axially and radially with the driven machine shaft.

The maximum allowed eccentricity for a complete shaft turn should not exceed 0.03 mm, when alignment is made with dial gauges, as shown in Figure 39. Ensure a gap between couplings to compensate the thermal expansion between the shafts as specified by the coupling manufacturer.

Parallel alignment *Angular alignment*

Figure 39 - Alignment with dial gauge

If alignment is made by a laser instrument, please consider the instructions and recommendations provided by the laser instrument manufacturer.
The alignment should be checked at ambient temperature with machine at operating temperature.

The coupling alignment must be checked periodically.

Pulley and belt couplings must be so aligned that the driver pulley center lies in the same plane of the driven pulley center and the motor shaft and the shaft of the driven machine are perfectly parallel.
After completing the alignment procedures, ensure that mounting devices do not change the motor and machine alignment and leveling resulting into machine damage during operation.

It is recommended to record the maximum alignment deviation in the Installation Report.

6.7 CONNECTION OF OIL LUBRICATED OR OIL MIST LUBRICATED MOTORS

When oil lubricated or oil mist lubricated motors are installed, connect the existing lubricant tubes (oil inlet and oil outlet tubes and motor drain tube), as shown in Figure 40. The lubrication system must ensure continuous oil flow through the bearings as specified by the manufacturer of the installed lubrication system.

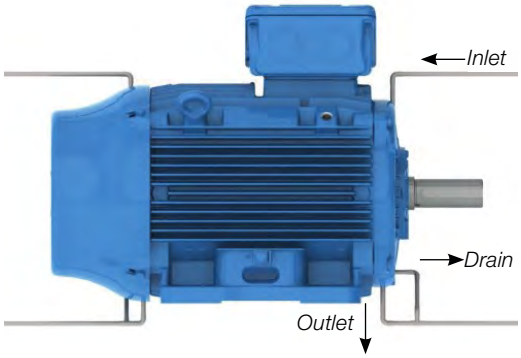

Figure 40 - Oil supply and drain system of oil lubricated or oil mist lubricated motors

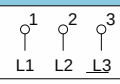
6.8 CONNECTION OF THE COOLING WATER SYSTEM

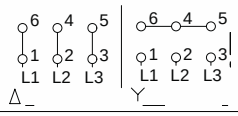
When water cooled motors are installed, connect the water inlet and outlet tubes to ensure proper motor cooling. According to item 7.2, ensure correct cooling water flow rate and water temperature in the motor cooling system.

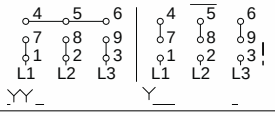
6.9 ELECTRICAL CONNECTION

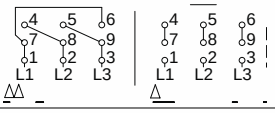
Consider the rated motor current, service factor, starting current, environmental and installation conditions, maximum voltage drop, etc. to select appropriate power supply cables and switching and protection devices.
All motors must be installed with overload protection systems. Three-phase motors should be fitted with phase fault protection systems.

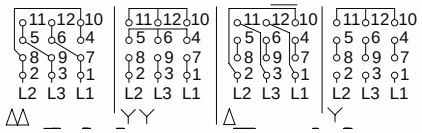
Before connecting the motor, check if the power supply voltage and the frequency comply with the motor nameplate data. All wiring must be made according to the connection diagram on the motor nameplate. Please consider the connection diagrams in the Tables 8 and 10 as reference value.
To prevent accidents, check if motor has been solidly grounded in accordance with the applicable standards.

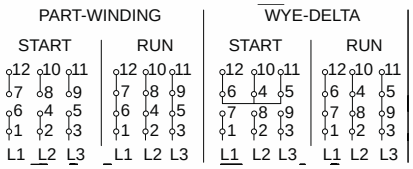


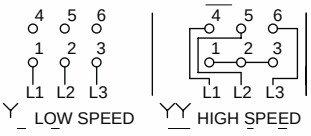


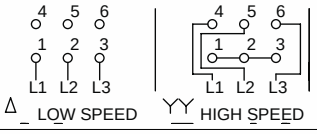


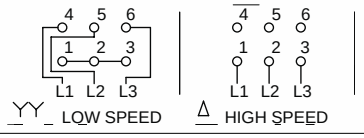


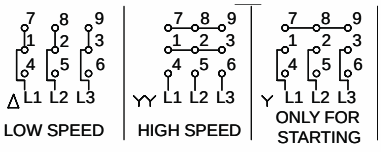












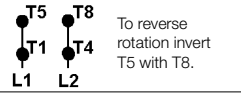
Configuration	Quantity of leads	Type of connection	Connection diagram
Single speed	3	-	
	6	Δ - Y	
	9	YY - Y	
		ΔΔ - Δ	
	12	ΔΔ - YY - Δ - Y	
		Δ - PWS Part-winding start	
Double speed Dahlander	6	YY - Y Variable Torque	
		Δ - YY Constant Torque	
		YY - Δ Constant Output	
	9	Δ - Y - YY	
Double speed Double winding	6	-	

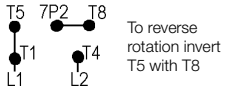
Table 8 - Typical connection diagram for three-phase motors.

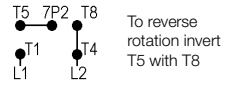
Lead identification on the wiring diagram		1	2	3	4	5	6	7	8	9	10	11	12
Single speed	NEMA MG 1 Part 2	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	T11	T12
	IEC 60034-8	U1	V1	W1	U2	V2	W2	U3	V3	W3	U4	V4	W4
Double speed (Dahlander / Double winding)	NEMA MG 1 Part 2[1)]	1U	1V	1W	2U	2V	2W	3U	3V	3W	4U	4V	4W
	IEC 60034-8	1U	1V	1W	2U	2V	2W	3U	3V	3W	4U	4V	4W

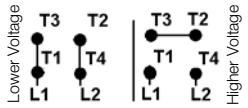
Table 9 - Equivalent table for lead identification

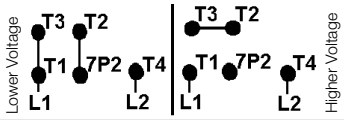
1) NEMA MG 1 Part 2 defines T1 to T12 for two or more winding, however WEG adopts 1U to 4W.

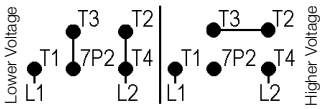


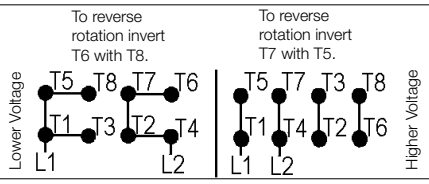


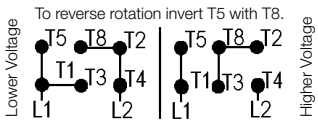


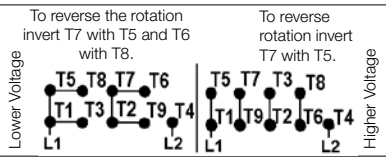


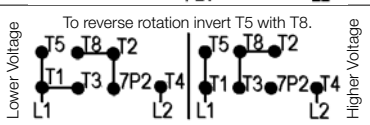


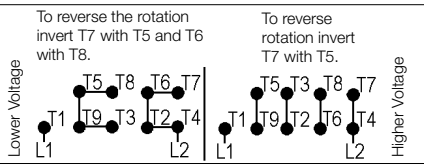


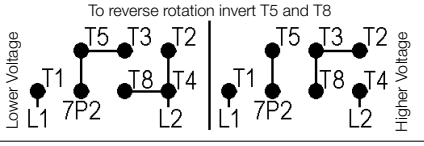












Voltage	Direction of Rotation	Thermal Protection	Type	Connection diagram
Single	CW or CCW	With or Without	Run / Permanent Capacitors Two values	
	Both	Without		
		Phenolic Thermal Protector		
		Thermostat		
Double	CW or CCW	Without	Run / Permanent Capacitors Two values or Split Phase	
		Phenolic Thermal Protector		
		Thermostat		
	Both	Without	Split Phase (without capacitor)	
			Run / Permanent Capacitors Two values	
		Phenolic Thermal Protector	Split Phase (without capacitor)	
			Run / Permanent Capacitors Two values	
		Thermostat	Split Phase (without capacitor)	
			Run / Permanent Capacitors Two values	

Table 10 - Typical connection diagram for single-phase motors.

W12/WEG General Purpose motors with polymeric terminal box cover have the connection diagram printed on its interior. To connect the cables, check on the nameplate the diagram code that must be used.

For motors with polymeric fan cover assembled by snap fit, to remove the polymeric fan cover use two crewdrivers or similar tool positioned near the snap fit region and remove one side by lifting carefully, repeat for the other sides until the complete removal of the fan cover.

Make sure that the motor is correctly connected to the power supply through safe and permanent contacts.

WARNING - Local Standards have priority on the definition of the connection standards.

The connections presented below are a reference for the connection of the customer's power cables on low voltage motors with terminal block. The terminal blocks presented below are the standard for each product line, however variations may occur.
It is recommended the use of terminals made of electrolytic copper or brass, similar to the terminals used on the motors cables.

K1M* terminal block

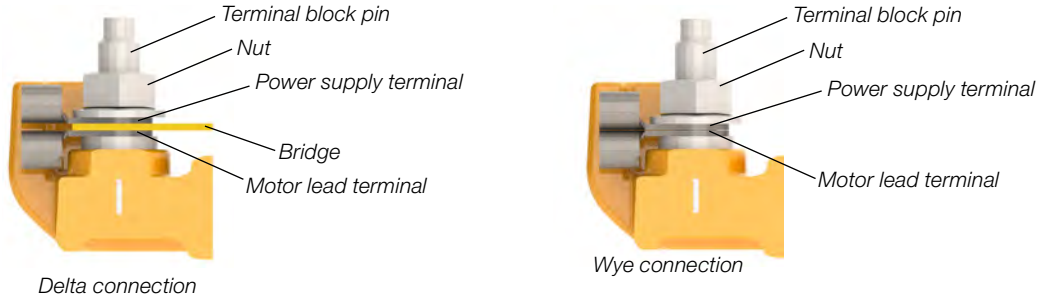


Figure 41 - Connetion for K1M terminal blocks*

KWLV* and KWMV* terminal blocks

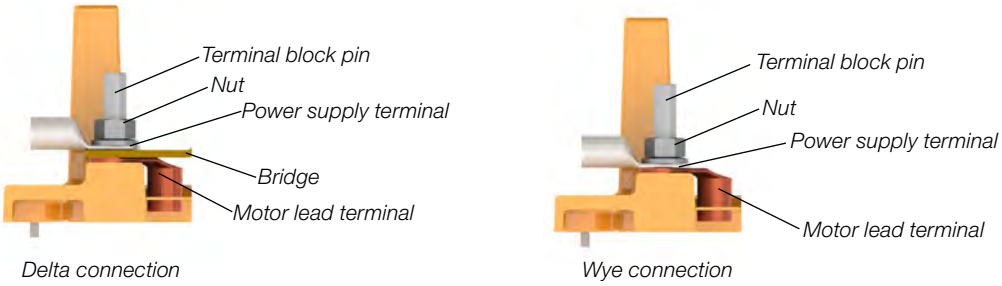

Figure 42 - Connetion for KWLV and KWMV* terminal blocks*

If motors are supplied without terminal blocks, insulate the cable terminals with suitable insulation material that meets the power supply voltage and the insulation class indicated on the motor nameplate.

Ensure correct tightening torque for the power cable and grounding connections as specified in Table 11.
The clearance distance (see Figure 6.15) between non-insulated live parts with each other and between grounded parts must be as indicated in Table 6.4.

Figure 43 - Minimum clearance distance (mm) x supply voltage

Voltage	Minimum clearance distance (mm)
U ≤ 440 V	4
440 < U ≤ 690 V	5.5
690 < U ≤ 1000 V	8
1000 < U ≤ 6900 V	45
6900 < U ≤ 11000 V	70
11000 < U ≤ 16500 V	105

Table 11 - Minimum clearance distance (mm) x supply voltage

Even when the motor is off, dangerous voltages may be present inside the terminal box used for the space heater supply or winding energization when the winding is used as heating element.
Motor capacitors will hold a charge even after the power has been cut off. Do not touch the capacitors and/or motor terminals, before discharging the capacitors completely. For WMagnet and WQuattro motors, even when the motor is disconnected from the power supply, there may be voltage in the motor's terminals if the rotor moves.

After the motor connection has been completed, ensure that no tool or foreign body has been left inside the terminal box.

Take the required measures in order to ensure the degree of protection indicated on the motor nameplate:
- unused cable inlet holes in the terminal boxes must be properly closed with threaded blanking plugs;
- components supplied loose (for example, terminal boxes mounted separately) must be properly closed and sealed.

The cable inlets used for power supply and control must be fitted with components (for example, cable-glands and conduits) that meet the applicable standards and regulations in each country.

If the motor is fitted with accessories, such as brakes and forced cooling systems, these devices must be connected to the power supply according to the information provided on their nameplates and with special care as indicated above.

In motors with polymeric terminal box and/or its cover, ensure that the fittings and locks of these components are correctly assembled after performing the cable connection.

For motors with terminal box knockouts, it is necessary to use a flathead screwdriver or similar tool and a hammer to detach the knockout, hammering the screwdriver several times until the knockout is removed. First, break the inside knockout, then if necessary, the external according to the cable gland size to be used. For the T-box polymeric knockouts, it can be necessary to use a blade or a driller to machine the hole and to not damage the auxiliary T-box. Caution, do not knock through to the inside of the terminal box and remove all material detached from the internal side of the t-box.
All protection devices, including overcurrent protection, must be set according to the rated machine conditions. These protection devices must protect the machine against short circuit, phase fault or locked rotor condition. The motor protection devices must be set according to the applicable standards.

Check the direction of rotation of the motor shaft. If there is no limitation for the use of unidirectional fans, the shaft rotation direction can be changed by reversing any two of the phase connections. For single-phase motor, check the connection diagram indicated on the motor nameplate.

6.10 CONNECTION OF THE THERMAL PROTECTION DEVICES

If the motor is supplied with temperature monitoring devices, such as, thermostat, thermistors, automatic thermal protectors, Pt-100 (RTD), etc., they must be connected to the corresponding control devices as specified on the accessory nameplates. The non-compliance with this procedure may void the product warranty and cause serious material damages.

Do not apply test voltage above 2.5 V on thermistors and current above 1 mA on RTDs (Pt-100) according to IEC 60751 standard.

Figure 43 and Figure 44 show the connection diagram of the bimetal thermal protector (thermostats) and thermistors, respectively.

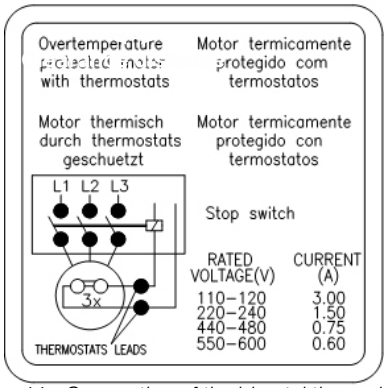

Figure 44 - Connection of the bimetal thermal protectors (thermostats)

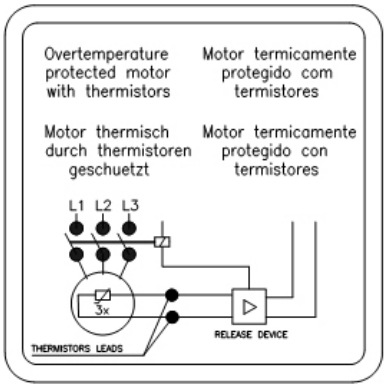

Figure 45 - Thermistor connection

The alarm temperature limits and thermal protection shutdowns can be defined according to the application; however these temperature limits can not exceed the values in Table 12

Component	Insulation class	Maximum temperature of the protection setting (°C)	
		Alarm	Tripping
Winding	B	-	130
	F	130	155
	H	155	180
Bearing	All	110	120

Table 12 - Maximum activation temperature of the thermal protections

Notes:
1) The number and type of the installed protection devices are stated on the accessory nameplate of the motor.
2) If the motor is supplied with calibrated resistance, (for example, Pt-100), the motor protection system must be set according to the operating temperatures indicated in Table 6.5.

6.11 RESISTANCE TEMPERATURE DETECTORS (PT-100)

The thermocouples Pt-100 are made of materials, whose resistance depends on the temperature variation, intrinsic property of some materials (usually platinum, nickel or copper), calibrated resistance. Its operation is based on the principle that the electric resistance of a metallic conductor varies linearly with the temperature, thus allowing a continuous monitoring of the motor warm-up through the controller display ensuring a high level of precision and answer stability. These devices are widely used for measuring temperatures in various industry sectors.
In general these devices are used in installations where precise temperature control is required, for example, in installation for irregular or intermittent duty. The same detector may be used for alarm and tripping purposes. Table 13 and Figure 45 show the equivalence between the Pt-100 resistance and the temperature. The Figure 46 shows the connection of a winding Pt-100.

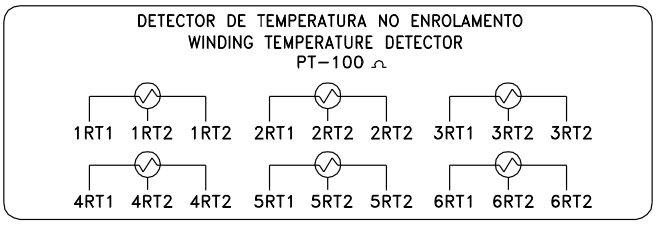

Figure 46 - Connection of winding Pt-100

Table 13 - Equivalence between the Pt-100 resistance and the temperature

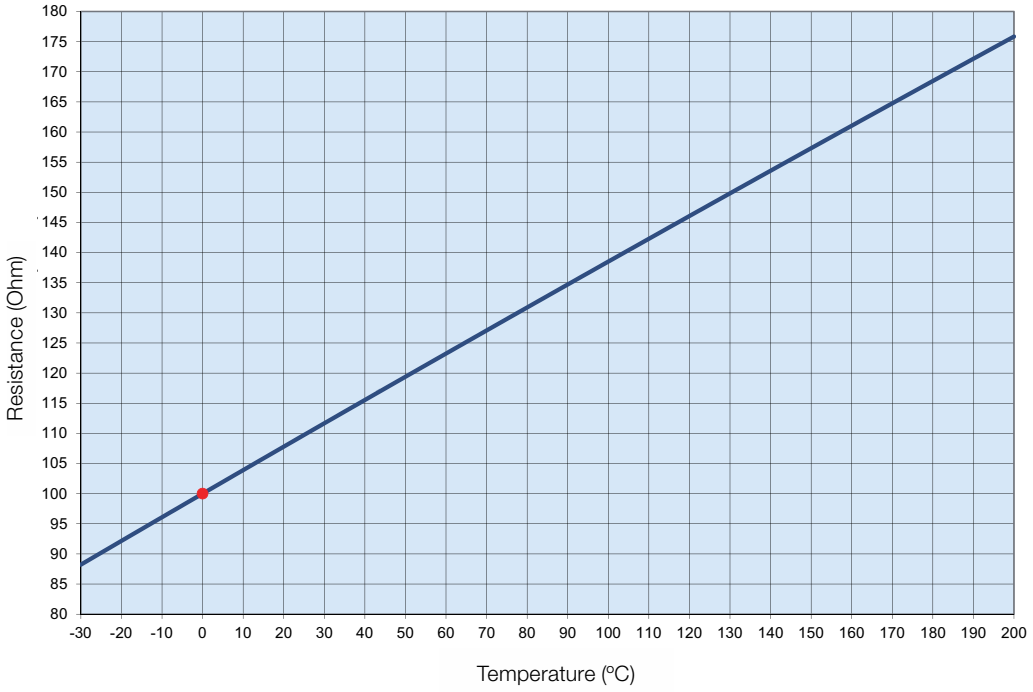

Figure 47 - Ohmic resistance of the Pt-100 x temperature

6.12 CONNECTION OF THE SPACE HEATERS

Before switching ON the space heaters, check if the space heaters connection have been made according to the connection diagram shown on the space heater nameplate. For motors supplied with dual voltage space heaters (110-127/220-240 V), see Figure 48.

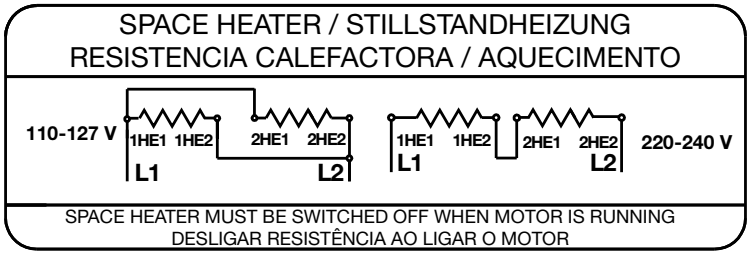

Figure 48 - Dual voltage space heater connection

The space heaters should never be energized when the motor is in operation.

6.13 STARTING METHODS

Whenever possible, the motor starting must be Direct On Line (DOL) at rated voltage. This is the most simple and feasible starting method. However, it must only be applied when the starting current does not affect the power supply. Please consider the local electric utility regulations when installing a motor.
High inrush current may result in:
a) high voltage drop in the power supply line creating unacceptable line disturbance on the distribution system; b) requiring oversized protection system (cables and contactor) increasing the installation costs.

If DOL starting is not allowed due to the reasons mentioned above, an indirect starting method compatible with the load and motor voltage to reduce the starting current may be used.
If reduced voltage starters are used for starting, the motor starting torque will also be reduced.

Table 14 shows the possible indirect starting methods that can be used depending on the number of the motor leads.

Number of leads	Possible starting methods
3 leads	Autotransformer Soft-starter
6 leads	Star-Delta Autotransformer Soft-starter
9 leads	Series/Parallel Part winding Autotransformer Soft-starter
12 leads	Star-Delta Series/Parallel Part winding Autotransformer Soft-starter

Table 14 - Starting method x number of motor leads

Table 15 shows examples of possible indirect starting methods to be used according to the voltage indicated on the motor nameplate and the power supply voltage.

Nameplate voltage	Operating voltage	Star-delta	Autotransformer starting	Starting by series/ parallel switch	Part-winding starting	Starting by Soft-starter
220/380 V	220 V 380 V	YES NO	YES YES	NO NO	NO NO	YES YES
220/440 V	220 V 440 V	NO NO	YES YES	YES NO	YES NO	YES YES
230/460 V	230 V 460 V	NO NO	YES YES	YES NO	YES NO	YES YES
380/660 V	380 V	YES	YES	NO	NO	YES
220/380/440 V	220 V 380 V 440 V	YES NO YES	YES YES YES	YES YES NO	YES YES NO	YES YES YES

Table 15 - Starting methods x voltage

Another possible starting method that does not overload the power supply network is the use of an inverter of frequency. For more information on motors powered by a frequency inverter, see item 6.14.

6.14 MOTORS DRIVEN BY FREQUENCY INVERTER

The operation with frequency inverter must be stated in the Purchase Order since this drive type may require some changes of the motor design.

The frequency inverter used to drive motors up to 690 V must be fitted with Pulse With Modulation (PWM) with vector control.
When a motor is driven by a frequency inverter at lower frequencies than the rated frequency, you must reduce the motor torque to prevent motor overheating. The torque reduction (derating torque) can be found in the item 6.4 of the “Technical Guidelines for Induction Motors driven by PWM Frequency inverters” available on the site www.weg.net.

If the motor is operated above the rated frequency, please note:
- That the motor must be operated at constant output;
- That the motor can supply max. 95% of its rated output;
- Do not exceed the maximum speed and please consider:
  - max. operating frequency stated on the additional nameplate;
  - mechanical speed limitation of the motor.

For WMagnet motors driven by non-WEG inverters, in addition to the speed limit stated in the motor data sheet, the maximum permitted speed limit must be checked to avoid burning the inverter in the event of a power failure. It should be considered according to the equation below:

$$RPM_{max} = \frac{0.9 * V_{rmsMax} * 1000}{ke}$$

Being,
RPM_{max} – Maximum speed allowed to avoid burning the inverter in the event of a power failure in [RPM].
V_{rmsMax} – Maximum input rms voltage of the inverter, as informed by the inverter manufacturer in [V].
ke – Parameter informed on the nameplate and in the motor data sheet in [V / kRPM].

Information on the selection of the power cables between the frequency inverter and the motor can be found in the item 6.4 of the "Technical Guidelines for Induction Motors driven by PWM Frequency inverters" available at www.weg.net.

6.14.1 Use of dV/dt filter

6.14.1.1 Motor with enameled round wire

Motors designed for rated voltages up to 690 V, when driven by frequency inverter, do not require the use of dV/dT filters, provided they comply with the criteria in Table 16.

Motor rated votage [1]	Peak voltage at the motor terminals (max)	dV/dt inverter output (max)	Inverter Rise Time [2] (min.)	MTBP [2] Time between pulses (min)
Vnom < 460 V	≤ 1600 V	≤ 5200 V/µs	≥ 0,1 µs	≥ 6 µs
460 ≤ Vnom < 575 V	≤ 2000 V	≤ 6500 V/µs		
575 ≤ Vnom ≤ 1000 V	≤ 2400 V	≤ 7800 V/µs		

Table 16 - Criteria for the selection of motors with round enameled wire when driven by frequency inverter

Notes:
1. For the application of dual voltage motors, example 380/660 V, consider the lower voltage (380 V).
2. Information supplied by the inverter manufacturer.

6.14.1.2 Motor with prewound coils

Motors with prewound coils (medium and high voltage motors regardless of frame sizes, and low voltage motors from IEC 500 / NEMA 800 frame on), designed for the use with frequency inverters, do not require the use of filters, provided they comply with the criteria in Table 17.

Motor rated voltage	Type of modulation	Turn to turn insulation (phase-phase)		Phase-ground insulation	
		Peak voltage at the motor terminals	dV/dt at the motor terminals	Peak voltage at the motor terminals	dV/dt at the motor terminals
690 < Vnom ≤ 4160 V	Sinusoidal	≤ 5900 V	≤ 500 V/µs	≤ 3400 V	≤ 500 V/µs
	PWM	≤ 9300 V	≤ 2700 V/µs	≤ 5400 V	≤ 2700 V/µs
4160 < Vnom ≤ 6600 V	Sinusoidal	≤ 9300 V	≤ 500 V/µs	≤ 5400 V	≤ 500 V/µs
	PWM	≤ 14000 V	≤ 1500 V/µs	≤ 8000 V	≤ 1500 V/µs

Table 17 - Criteria to be considered when using motor with prewound coils to be drive by frequency inverters

6.14.2 Bearing insulation

If motor must be driven by frequency inverter, insulate the bearing according to Table 18.

Frame size	Recommendation
IEC 315 and 355 NEMA 445/7 to L5810/11	■ Insulated bearing/end shield ■ Grounding between shaft and frame by grounding brush
IEC 400 and larger NEMA 680 and larger	■ Insulated NDE bearing ■ Grounding between shaft and frame by grounding brush

Table 18 - Recommendation on the bearing insulation for inverter driven motors

When motors are supplied with shaft grounding system, monitor the grounding brush constantly during its operation and, when it reaches the end of its useful life, it must be replaced by another brush with the same specification.
If a motor is supplied with an internal grounding brush, indicated by a tag in the product, it must be verified each time the bearings or any internal part of the motor is maintained.
Motors of frame sizes IEC 315, NEMA 445/7 and above, when inverter fed, must be equipped with shaft grounding kits.

For safe area motors and for verification testing purposes, contact pins can be installed on both sides of the bearing insulation, so that voltage measurements can be taken on the bearing, or, if the pins are connected by a cable or metallic strand (shorting-circuiting the bearing insulation), of the current through the bearing. It should be noted, however, that during the normal motor operation the bearing insulation must not be short-circuited.

Figure 49 - Metal flexible braid

6.14.3 Switching frequency

The minimum inverter switching frequency must not be lower than 2 kHz and should not exceed 5 kHz.

The non-compliance with the criteria and recommendations indicated in this manual may void the product warranty.

6.14.4 Mechanical speed limitation

Table below shows the maximum speeds allowed for motors driven by frequency inverter. For WMagnet motors, see the motor's data sheet or contact WEG.

Notes:
1. *When the motor has lip seals or Inproseals, contact WEG.*
2. *For speeds above the nominal one, measure the bearing vibration and temperature; if the temperature and vibration levels exceed the specified limits, contact WEG.*
3. *Check the DE bearing model on the motor plate.*
4. *For conditions other than those described in Tables 18 to 22, consult WEG.*

For more information on the application of frequency inverters, contact WEG or check the “Technical Guidelines for Induction Motors driven by PWM Frequency inverters” available at www.weg.net.

7. COMMISSIONING

7.1 INITIAL START-UP

After finishing the installation procedures and before starting the motor for the first time or after a long period without operation, the following items must be checked:

- If the nameplate data (voltage, current, connection diagram, degree of protection, cooling system, service factor, etc.) meet the application requirements;
- If the machine set (motor + driven machine) has been mounted and aligned correctly;
- If the motor driving system ensures that the motor speed does not exceed the max. allowed speed indicated in Table 6.12;
- Measure the winding insulation resistance, making sure it complies with the specified values in item 5.4;
- Check the motor rotation direction;
- Inspect the motor terminal box for damage and ensure that it is clean and dry and all contacts are rust-free, the seals are in perfect operating conditions and all unused threaded holes are properly closed thus ensuring the degree of protection indicated on the motor nameplate;
- Check if the motor wiring connections, including grounding and auxiliary equipment connection, have been carried out properly and are in accordance with the recommendations in item 6.9;
- Check the operating conditions of the installed auxiliary devices (brake, encoder, thermal protection device, forced cooling system, etc.);

- Check bearing operating conditions. If the motors are stored and/or installed for more than two years without running, it is recommended to change the bearings, or to remove, wash, inspect and relubricate them before the motor is started. If the motor is stored and/or installed according to the recommendations described in item 5.3, lubricate the bearings as described in item 8.2. For the bearing condition evaluation, it is recommended to use of the vibration analysis techniques: Envelope Analysis or Demodulation Analysis.
- For roller bearing motors with oil lubrication, ensure:
  - The oil level should be in the center of the sight glass (see Figure 51 and Figure 52);
  - That if the motor is stored for a period equal or longer than the oil change interval, the oil must be changed before starting the motor.
- When motors are fitted with sleeve bearings, ensure:
  - Correct oil level for the sleeve bearing. The oil level should be in the center of the sight glass (see Figure 8.3);
  - That the motor is not started or operated with axial or radial loads;
  - That if the motor is stored for a period equal or longer than the oil change interval, the oil must be changed before starting the motor.
- Inspect the capacitor operating condition, if any. If motors are installed for more than two years, but were never commissioned, it is recommended to change the start capacitors since they lose their operating characteristics;
- Ensure that the air inlet and outlet opening are not blocked. The minimum clearance to the nearest wall (L) should be at least ¼ of the fan cover diameter (D), see Figure 50. The intake air temperature must be at ambient temperature.

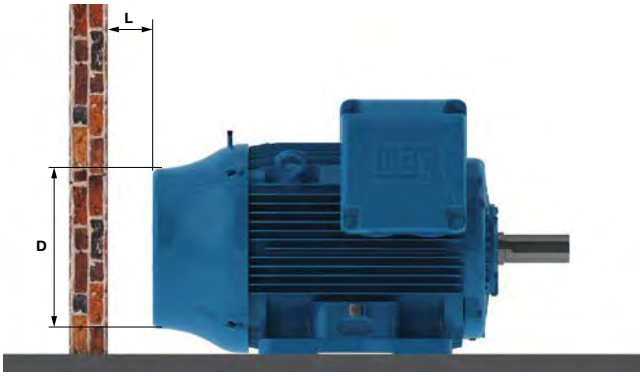

Figure 50 - Minimum clearance to the wall

Please consider the minimum distances shown in the Table 24 as reference value;

Frame size		Distance between the fan cover and the wall (L)

560	8806/10	185	7.28
630	9606/10	200	7.87

Table 24 - Minimum distance between the fan cover and wall

- Ensure correct water flow rate and water temperature when water cooled motors are used. See item 7.2;
- Ensure that all rotating parts, such as pulleys, couplings, external fans, shaft, etc. are protected against accidental contact.

Other tests and inspections not included in the manual may be required, depending on the specific installation, application and/or motor characteristics.

After all previous inspections have been carried out, proceed as follows to start the motor:

- Start the motor on no-load (if possible) and check the motor direction of rotation. Check for the presence of any abnormal noise, vibration or other abnormal operating conditions;
- Ensure the motor starts smoothly. If any abnormal operating condition is noticed, switch off the motor, check the assembly system and connections before the motor is started again;
- If excessive vibrations are noticed, check if the motor mounting bolts are well tightened or if the vibrations are not generated and transmitted from adjacent installed equipment. Check the motor vibration periodically and ensure that the vibration limits are as specified in item 7.2.1;
- Start the motor at rated load during a short time and compare the operating current with the rated current indicated on the nameplate;
- Continue to measure the following motor variables until thermal equilibrium is reached: current, voltage, bearing and motor frame temperature, vibration and noise levels;
- Record the measured current and voltage values on the Installation Report for future comparisons.

As induction motors have high inrush currents during start-up, the acceleration of high inertia load requires an extended starting time to reach full speed resulting in fast motor temperature rise. Successive starts within short intervals will result in winding temperature increases and can lead to physical insulation damage reducing the useful life of the insulation system. If the duty cycle S1 / CONT. is specified on the motor nameplate, this means that the motor has been designed for:

- Two successive starts: first start from cold condition, i. e., the motor windings are at room temperature and the second start immediately after the motor stops;
- One start from hot condition, i. e., the motor windings are at rated temperature.

The Troubleshooting Chart in section 10 provides a basic list of unusual cases that may occur during motor operation with the respective corrective actions.

7.2 OPERATING CONDITIONS

Unless otherwise stated in the Purchase Order, electric motors are designed and built to be operated at altitudes up to 1000 meters above sea level and in a temperature range from -20 °C to +40 °C. Any deviation from the normal condition of motor operation must be stated on the motor nameplate. Some components must be changed if the ambient temperature is different from the specified one. Please contact WEG to check the required special features.

For operating temperatures and altitudes differing from those above, the factors indicated in Table 25 must be applied to the nominal motor power rating in order to determine the derated available output (Pmax = Pnom x correction factor).

T (°C)	Altitude (m)								
	1000	1500	2000	2500	3000	3500	4000	4500	5000
10							0.97	0.92	0.88
15						0.98	0.94	0.90	0.86
20					1.00	0.95	0.91	0.87	0.83
25				1.00	0.95	0.93	0.89	0.85	0.81
30			1.00	0.96	0.92	0.90	0.86	0.82	0.78
35		1.00	0.95	0.93	0.90	0.88	0.84	0.80	0.75
40	1.00	0.97	0.94	0.90	0.86	0.82	0.80	0.76	0.71
45	0.95	0.92	0.90	0.88	0.85	0.81	0.78	0.74	0.69
50	0.92	0.90	0.87	0.85	0.82	0.80	0.77	0.72	0.67
55	0.88	0.85	0.83	0.81	0.78	0.76	0.73	0.70	0.65
60	0.83	0.82	0.80	0.77	0.75	0.73	0.70	0.67	0.62
65	0.79	0.76	0.74	0.72	0.70	0.68	0.66	0.62	0.58
70	0.74	0.71	0.69	0.67	0.66	0.64	0.62	0.58	0.53
75	0.70	0.68	0.66	0.64	0.62	0.60	0.58	0.53	0.49
80	0.65	0.64	0.62	0.60	0.58	0.56	0.55	0.48	0.44

Table 25 - Correction factors for altitude and ambient temperature

Motors installed inside enclosures (cubicles) must be ensured an air renewal rate in the order of one cubic meter per second for each 100 kW installed power or fraction of installed power. Totally Enclosed Air Over motors - TEAO (fan and exhaust / smoke extraction) are supplied without cooling fan and the manufacturer of the driven machine is responsible for sufficient motor cooling. If no minimum required air speed between motor fins is indicated on the motor nameplate, ensure the air speed indicated in the table 21 is provided. The values shown in Table 26 are valid for 60 Hz motors. To obtain the minimum air speed for 50 Hz motors, multiply the values in the table by 0.83.

Frame		Poles			
IEC	NEMA	2	4	6	8
56 to 90	143/5	13	7	5	4
100 to 132	182/4 to 213/5	18	12	8	6
160 to 200	254/6 to 324/6	20	15	10	7
225 to 280	364/5 to 444/5	22	20	15	12
315 to 450	445/7 to 7008/9	25	25	20	15

Table 26 - Minimum required air speed between motor fins (metres/second)

The voltage and frequency variations may affect the performance characteristics and the electromagnetic compatibility of the motor. The power supply variations should not exceed the values specified in the applicable standards. Examples:

- ABNT NBR 17094 - Parts 1 and 2. The motor has been designed to supply the rated torque for a combined variation in voltage and frequency:
  - Zone A: ±5% of the rated voltage and ±2% of the rated frequency;
  - Zone B: ±10% of the rated voltage and +3% -5% of the rated frequency.

When operated continuously in Zone A or B, the motor may show performance variations and the operating temperature may increase considerably. These performance variations will be higher in Zone B. Thus it is not recommended to operate the motor in Zone B during extended periods.

- IEC 60034-1. The motor has been designed to supply the rated torque for combined variation in voltage and frequency:
  - Zone A: ±5% of the rated voltage and ±2% of the rated frequency;
  - Zone B: ±10% of the rated voltage and +3% -5% of the rated frequency.

When operated continuously in Zone A or B, the motor may show performance variations and the operating temperature may increase considerably. These performance variations will be higher in Zone B. Thus it is not recommended to operate the motor in Zone B during extended periods. For multivoltage motors (example 380-415/660 V), a ±5% voltage variation from the rated voltage is allowed.

- NEMA MG 1 Part 12. The motor has been designed to be operated in one of the following variations:
  - ±10% of the rated voltage, with rated frequency;
  - ±5% of the rated frequency, with rated voltage;
  - A combined variation in voltage and frequency of ±10%, provided the frequency variation does not exceed ±5%.

If the motor is cooled by ambient air, clean the air inlet and outlet openings and cooling fins at regular intervals to ensure a free airflow over the frame surface. The hot air should never be returned to the motor. The cooling air must be at room temperature limited to the temperature range indicated on the motor nameplate (if no room temperature is specified, please consider a temperature range between -20 °C and +40 °C).

Table 22 shows the minimum required water flow for water cooled motors considering the different frame sizes and the maximum allowed temperature rise of the cooling water after circulating through the motor. The inlet water temperature should not exceed 40 °C.

Frame size		Flow rate (litres/minute)	Maximum allowed water temperature rise (°C)
IEC	NEMA		
180	284/6	12	5
200	324/6	12	5
225	364/5	12	5
250	404/5	12	5
280	444/5 445/7 447/9	15	6
315	504/5	16	6
355	586/7 588/9	25	6

Table 27 - Minimum required water flow and the maximum allowed temperature rise of the cooling water after circulating through the motor

For W60 motors, please see the nameplate at heat-exchanger.
Motors fitted with oil mist lubrication systems can be operated continuously for a maximum of one hour after the failure of the oil pumping system.

Considering the sun's heat increases the operating temperature, externally mounted motors must always be protected from direct sunlight exposure.

Each and every deviation from the normal operating condition (tripping of the thermal protection, noise and vibration level increase, temperature and current rise) should be investigated and corrected by WEG Authorized Service Centers.

Failure to observe the criteria and recommendations set out in this manual may result in the cancellation of the product warranty.

7.2.1 Limits of vibration

The vibration severity is the maximum vibration value measured at all positions and in all directions as recommended in the standard IEC 60034-14. Table 28 specifies the limits of the maximum vibrations magnitudes according to standard IEC 60034-14 for shaft heights IEC 56 to 400, for vibrations grades A and B. The vibration severity limits in Table 28 are given as RMS values (Root Mean Square values or effective values) of the vibration speed in mm/s measured in free suspension condition.

Shaft height [mm]	56 ≤ H ≤ 132	H ≥ 132
Vibration grade	Vibration severity on elastic base [mm/s RMS]	
A	2.8	2.8
B	1.1	1.8

Table 28 - Recommended limits for the vibration severity according to standard IEC 60034-14

Notes:
1 - The values in valid for measurements carried out with decoupled machines (without load) operated at rated voltage and frequency.
2 - The values in valid regardless of the direction of rotation of the machine.
3 - The values in not applicable to single-phase motors, three-phase motors powered by a single-phase system or to machines mounted in situ or coupled with inertia flywheels or to loads.

According to NEMA MG 1, the allowed vibration limit for standard motors is 0.15 in/s (peak vibration in in/s).

Note:
For the load operation condition, the use of the standard ISO 10816-3 is recommended for evaluating the motor vibration limits. In the load condition the motor vibration will be influenced by several factors, such as, type of the coupled load, condition of the motor fixation, alignment condition under load, structure or base vibration due to other equipments, etc..

ENGLISH

8. MAINTENANCE

The purpose of the maintenance is to extend the useful life of the equipment. The non-compliance with one of these previous items can cause unexpected machine failures.
If motors with cylindrical roller or angular contact bearings are to be transported during the maintenance procedures, the shaft locking device must always be fitted. All HGF, W50, W51 HD and W60 motors, regardless of the bearing type, must always be transported with the shaft locking device fitted.
All repairs, disassembly and assembly related services must be carried out only by qualified and well-trained personnel by using proper tools and techniques. Make sure that the machine has stopped and it is disconnected from the power supply, including the accessory devices (space heater, brake, etc.), before any servicing is undertaken.
The company does not assume any responsibility or liability for repair services or maintenance operations executed by non-authorized Service Centers or by non qualified service personnel. The company shall have no obligation or liability whatsoever to the buyer for any indirect, special, consequential or incidental loss or damage caused or arising from the company's proven negligence.

Pacemaker users and unqualified personnel shall not open WMagnet and WQuattro motors, because high energy magnets are used.

8.1 GENERAL INSPECTION

The inspection intervals depend on the motor type, application and installation conditions. Proceed as follows during inspection:

- Visually inspect the motor and coupling. Check if abnormal noises, vibrations, excessive heating, wear signs, misalignment or damaged parts are noticed. Replace the damaged parts as required;
- Measure the insulation resistance according to the item 5.4;
- Clean the motor enclosure. Remove oil spills and dust accumulation from the motor frame surface to ensure a better heat transfer to the surrounding ambient;
- Check cooling fan condition and clean the air inlet & outlet openings to ensure a free air flow over the motor;
- Investigate the actual condition of the seals and replace them, if required;
- Drain the condensed water from inside the motor. After draining, reinstall the drain plugs to ensure the degree of protection as indicated on the motor nameplate. The motor must always be positioned so the drain hole is at the lowest position (see item 6);
- Check the connections of the power supply cables, ensuring the correct clearance distance between live and grounded parts, as specified in Figure 31.

- Check if the tightening torque of the bolted connections and mounting bolts meets the tightening torque specified in Table 44;
- Check the status of the cable passages, the cable gland seals and the seals inside the terminal box and replace them, if required;
- Check the bearing operating conditions. Check for the presence of any abnormal noise, vibration or other abnormal operating conditions, like motor temperature rise. Check the oil level, the lube oil condition and compare the workings hours with the informed life time;
- Record and file all changes performed on the motor.

Do not reuse damaged or worn parts. Damaged or worn parts must be replaced by parts supplied by the manufacturer and must be installed as if they were the original parts.

8.2 LUBRICATION

Proper lubrication plays a vital role in the motor performance. Only use the grease or oil types, amounts and lubrication intervals recommended for the bearings. This information is available on the motor nameplate and the lubrication procedures must be carried out according to the type of lubricant (oil or grease).
When the motor is fitted with thermal protection devices for bearing temperature control, consider the operating temperature limits shown in Table 12.
The maximum operating temperature of motors used in special applications may differ from those shown in Table 31. The grease and oil disposal should be made in compliance with applicable laws in each country.

Please contact WEG when motors are to be installed in special environments or used for special applications.

8.2.1 Grease lubricated rolling bearings

Excess grease causes bearing overheating, resulting in bearing failure.

The lubrication intervals specified in Table 29, Table 30, Table 31, Table 32, Tabla 34, Table 34 Table 35, Table 36 and Table 37, Table 38, andTable 39 consider an absolute temperature on the bearing of 70 °C (up to frame size IEC 200 / NEMA 324/6) and 85 °C (for frame size IEC 225 / NEMA 364/5 and above), the motor running at rated speed, a motor mounted in horizontal position and greased with Mobil Polyrex EM grease. Any variation of the parameters listed above must be evaluated.

Table 39 - Lubrification interval for roller bearings - W51 HD line

WGOST motors use Mobiltemp SHC 32 grease as standard, suitable for operation at low temperatures, with the ambient temperature ranging from -45°C to +40°C. Table 40 indicates the lubrication intervals for these motors.

Table 41 - Lubrication interval for ball bearings - WEG General Purpose and WIN lines

The WEG General Purpose and WIN motor lines with relubrication system (grease fitting and open bearings) in frame sizes 225S/M, 250S/M and W280S/M is provided with a grease storage chamber inside the motor and do not have an opening for its exit. The internal volume destined to store the old grease has the capacity to reach to 7 (seven) relubrications, limited to 5 years of operation, being necessary the grease removal after this period. For each increment of 15 ºC above the bearing temperature, the relubrication intervals given in the Table must be halved. The relubrication interval of motors designed by the manufacturer for mounting in horizontal position, but installed in vertical position (with WEG authorization), must be halved.

For special applications, such as: high and low temperatures, aggressive environments, driven by frequency inverter (VFD - frequency inverter), etc., please contact WEG about the required amount of grease and the relubrication intervals.

8.2.1.1 Motor without grease fitting

Motors without grease fittings must be lubricated in accordance with the existing Maintenance Plan. Motor disassembly must be carried out as specified in Item 8.3. If motors are fitted with shielded bearings (for example, ZZ, DDU, 2RS, VV), these bearings must be replaced at the end of the grease service life.

8.2.1.2 Motor with grease fitting

To lubricate the bearings with the motor stopped, proceed as follows:
- Before lubricating, clean the grease nipple and immediate vicinity thoroughly;
- Lift grease inlet protection;
- Remove the grease outlet plug (not required for motors with automatic grease relief fittings, such as IEEE Std 841);
- Pump in approximately half of the total grease indicated on the motor nameplate and run the motor for about 1 (one) minute at rated speed;
- Switch-off the motor and pump in the remaining grease;
- Lower again the grease inlet protection and reinstall the grease outlet plug.

To grease the motor while running, proceed as follows:
- Before lubricating, clean the grease nipple and immediate vicinity thoroughly;
- Lift grease inlet protection;
- If safe and possible, remove the grease outlet plug;
- Pump the total grease indicated on the motor nameplate;
- Lower again the grease inlet protection and reinstall the grease outlet plug (if removed).

For lubrication, use only manual grease gun.

Due to internal clearances in the motor, it is possible that, in the first re-lubrication of the bearings, the grease will not come out of the grease outlet. Therefore, do not apply excess grease expecting for it to come out.

If Motors are provided with a spring device for grease removal, the grease excess must be removed by pulling the rod and cleaning the spring until the spring does not remove more grease.

8.2.1.3 Compatibility of the Mobil Polyrex EM grease with other greases

The Mobil Polyrex EM grease has a polyurea thickener and a mineral oil and it is not compatible with other greases.
If you need another type of grease, contact WEG.
It is not recommended to mix different types of greases. In such a case, clean the bearings and lubrication channels before applying new grease.
The used grease must have in its formulation corrosion and oxidation inhibitors.

8.2.1.4 Oil lubricated bearings

To change the oil of oil lubricated motor proceed as follows:
- Switch-off the motor;
- Remove threaded oil drain plug;
- Open the valve and drain the oil;
- Close the drain valve again;
- Reinstall the threaded oil drain plug;
- Fill-up with the type and amount of oil as specified on the nameplate;
- Check oil level. The oil level is OK when the lubricant can be viewed approximately in the center of the sight glass;
- Reinstall oil inlet plug;
- Check for oil leaks and ensure that all not used threaded plugs are closed with plugs.

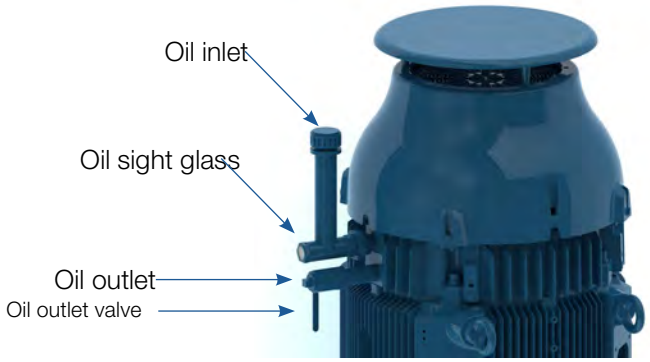

Figure 51 - Oil lubricated bearing - vertical mounting

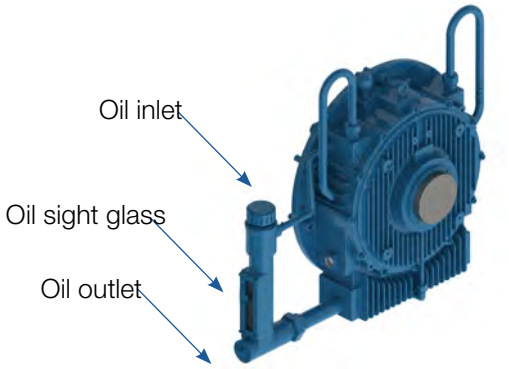

Figure 52 - Oil lubricated bearing - horizontal mounting

The bearing lubricating oil must be replaced as specified on the nameplate or whenever changes in the oil properties are noticed. The oil viscosity and pH must be checked periodically. The oil level must be checked every day and must be kept in the center of the sight glass.
Please contact WEG, when oils with different viscosities should be used.
Note:
The HGF vertical mounted motors with high axial thrust are supplied with grease lubricated DE-bearings and with oil lubricated NDE-bearings. The DE-bearings must be lubricated according to recommendations in item 8.2.1. Table 8.10 specifies the oil type and the amount of oil required for this motor lubrication.

Mounting - high axial thrust	Frame		Poles	Bearing designation	Oil (liters)	Interval (h)	Lubricant	Lubricant specification
	IEC	NEMA						
	315L/A/B and 315C/D/E	5006/7/8T and 5009/10/11T	4 - 8	29320	20	8000	FUCHS Renolin DTA 40 / Mobil SHC 629	ISO VG150 mineral oil with antifoam and antioxidant additives
	355L/A/B and 355C/D/E	5807/8/9T and 5810/11/12T			26			
	400L/A/B and 400C/D/E	6806/7/8T and 6809/10/11T			37			
	450	7006/10			45			

Table 42 - Oil properties for HGF vertical mounted motors with high axial thrust and Vertical High Thrust

8.2.1.5 Oil mist lubricated bearings

Check the service conditions of the seals and if replacement is required use only original components. Clean the seal components before assembly (bearing caps, end shields, etc.).
Apply joint sealant between the bearing caps and end shields. The joint sealant must be compatible with the used lubricating oil. Connect the oil lubricant tubes (oil inlet and oil outlet tubes and motor drain tube), as shown in Figure 40

8.2.1.6 Sleeve bearings

The lubricating oil of sleeve bearings must be changed at the intervals specified in Table 43 To replace the oil, proceed as follows:

- NDE-bearing: remove the protection plate from the fan cover;
- Drain the oil through the drain hole located at the bottom of the bearing (see Figure 53);
- Close the oil drain hole;
- Remove the oil inlet plug;
- Fill the sleeve bearing with the specified oil and with the amount of oil specified in the Table 43;
- Check the oil level and ensure it is kept close to the center of the sight glass;
- Install the oil inlet plug;
- Check for oil leaks.

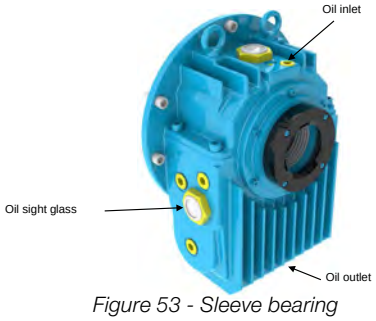

Figure 53 - Sleeve bearing

Frame		Poles	Bearing designation	Oil (liters)	Interval (h)	Lubricant	Lubricant specification
IEC	NEMA						
315	5000	2	9-80	3.6	8000	FUCHS Renolin DTA 10	ISO VG32 mineral oil with antifoam and antioxidant additives
355	5800

400	6800		11-110	4.7			
450	7000		11-125				
500	8000						

Table 43 - Oil properties for sleeve bearings

The lubricating oil must be replaced as specified on the nameplate or whenever changes on the oil properties are noticed. The oil viscosity and pH must be checked periodically. The oil level must be checked every day and kept in the center of the sight glass.
Please contact WEG, when oils with different viscosities are to be used.

8.3 MOTOR ASSEMBLY AND DISASSEMBLY

All repair services on motors should be always performed by qualified personnel and in accordance with the applicable laws and regulations in each country. Always use proper tools and devices for motor disassembly and assembly.

Disassembly and assembly services can be carried out only after the motor has been disconnected from the power supply and is completely stopped.
Dangerous voltages may be present at the motor terminals inside the terminal box since capacitors can retain electrical charge for long periods of time even when they are not connected directly to a power source or when space heaters are connected to the motor or when the motor windings are used as space heaters.
Dangerous voltages may be present at the motor terminals when they are driven by frequency inverter even when they are completely stopped.

Record the installation conditions such as terminal connection diagram, alignment / leveling conditions before starting the disassembly procedures. These records should be considered for later assembly.
Disassemble the motor carefully without causing scratches on machined surfaces or damaging the threads.
Assemble the motor on a flat surface ensuring a good support base. Footless motors must be fixed/locked on the base to prevent accidents.
Handle the motor carefully to not damage the insulated components such as windings, insulated rolling bearings, power cables etc..
Seal elements, such as joint seals and bearing seals should always be replaced when wear or damage is noticed.
Motors with degree of protection higher than IP55 are supplied with joint and screw seal Loctite 5923 (Henkel)
Clean the components and apply a new coat of Loctite 5923 on the surfaces before assembly.

For motors with permanent magnet rotor (WQuattro and WMagnet motors), the motor assembly and disassembly require the use of proper devices due to the attracting or repelling forces that occur between metallic parts. This work must only be performed by a WEG Authorized service center specifically trained for such an operation. People with pacemakers cannot handle these motors.
The permanent magnets can also cause disturbances or damages to other electric equipment and components during maintenance.

For the W40, W50, W51 HD and HGF motor lines provided with axial fans, the motor and the axial fan have different markings for indicating the direction of rotation for prevent incorrect assembly.
The axial fan must be assembled so that the indicative arrow for direction of rotation is always visible, viewing the non-drive end side. The marking indicated on the axial fan blade, CW for clockwise direction of rotation or CCW for counterclockwise direction of rotation, indicates the direction of rotation of the motor viewing the drive end side.

For motors with encoder, it is necessary to check the radial run out of the encoder seat. The runout should not exceed the limit specified by the encoder manufacturer.

For motors with polymeric fan cover assembled by snap fit, to remove the polymeric fan cover use two screwdrivers or similar tool positioned near the snap fit region and remove one side by lifting carefully, repeat for the other sides until the complete removal of the fan cover.
When assembling polymeric components, the tightening torques specified in Table 28 must be respected.

Engines with fans fixed only by interference on the shaft, if disassembled, the component must be replaced with a new one. For engines that have aluminum injected covers without machining, it is necessary to heat the covers for assembly and disassembly.

8.3.1.1 Terminal box

Proceed as follows to remove the terminal box cover and to disconnect/connect the power supply cables and the cables of the accessory devices:

- Ensure that during the screw removal the terminal box cover does not damage the components installed inside the terminal box;
- If the terminal box cover is fitted with lifting eyebolt, lift the terminal box cover always by its lift eyebolt;
- If motors are supplied with terminal blocks, ensure the correct tightening torque on the motor terminals as specified in Table 44;

For flying leads motors, do not push the overlength of leads into the motor in order to prevent that they touch the rotor.

  - Ensure that the cables do not contact sharp edges;
- Ensure that the original IP degree of protection is not changed and is maintained as indicate on the motor nameplate. The power supply cables and the control cables must always be fitted with components (cable glands, conduits) that meet the applicable standards and regulations of each country;
- Ensure that the pressure relief device is in perfect operating condition, if provided. The seals in the terminal box must be in perfect condition for reuse and must be reinstalled correctly to ensure the specified degree of protection;
- Ensure the correct tightening torque for the securing bolts of the terminal box cover as specified in Table 44.

Screw type and seal	M4	M5	M6	M8	M10	M12	M14	M16	M20
Hex bolt/hex socket bolt (rigid joint)	-	3,5 to 5	6 to 9	14 to 20	28 to 40	45 to 70	75 to 110	115 to 170	230 to 330
Combined slotted screw (rigid joint)	1,5 to 3	3 to 5	5 to 10	10 to 18	-	-	-	-	-
Hex bolt/hex socket bolt (flexible joint)	-	3 to 5	4 to 8	8 to 15	18 to 30	25 to 40	30 to 45	35 to 50	-
Combined slotted screw (flexible joint)	-	3 to 5	4 to 8	8 to 15	-	-	-	-	-
Terminal blocks	1 to 1,5	2 to 4 1)	4 to 6,5	6,5 to 9	10 to 18	15,5 to 30	-	30 to 50	50 to 75
Grounding terminals	1,5 to 3	3 to 5	5 to 10	10 to 18	28 to 40	45 to 70	-	115 to 170	-

Table 44 - Tightening torque for the securing bolts [Nm]

Note: 1) For 12-pin terminal block, apply the minimum torque of 1.5 Nm and maximum torque of 2.5 Nm.

8.4 DRYING THE STATOR WINDING INSULATION

Dismantle the motor completely. Remove the end shields, the rotor with the shaft, the fan cover, the fan and the terminal box before the wound stator with the frame is transferred to the oven for the drying process. Place the wound stator in the oven heated to max. 120 °C for two hours. For larger motors a longer drying time may be required. After the drying process has been concluded, allow the stator to cool to room temperature. Measure the insulation resistance again as described in item 5.4. Repeat the stator drying process if the required insulation resistance does not meet the values specified in Table 3. If the insulation resistance does not improve despite several drying processes, evaluate the causes of the insulation resistance drop carefully and an eventual replacement of the motor winding may be required. If in doubt contact WEG.

To prevent electrical shock, discharge the motor terminals immediately before, and after each measurement. If the motor is equipped with capacitors, these must be discharged before beginning any repair.

Pacemaker users and unqualified personnel shall not open WMagnet and WQuattro motors, because high energy magnets are used.

8.5 SPARE PARTS

When ordering spare parts, always provide complete motor designation, indicating the motor type, the code number and the serial number, which are stated on the motor nameplate.
Spare parts must always be purchased from WEG authorized Service Centers. The use of non-original spare parts can cause motor failure, performance drop and void the product warranty.
The spare parts must be stored in a clean, dry and properly ventilated room, with relative air humidity not exceeding 60%, with ambient temperature between 5 °C and 40 °C, free of dust, vibrations, gases, corrosive smokes and at constant temperature. The spare parts must be stored in their normal mounting position without placing other components onto them.

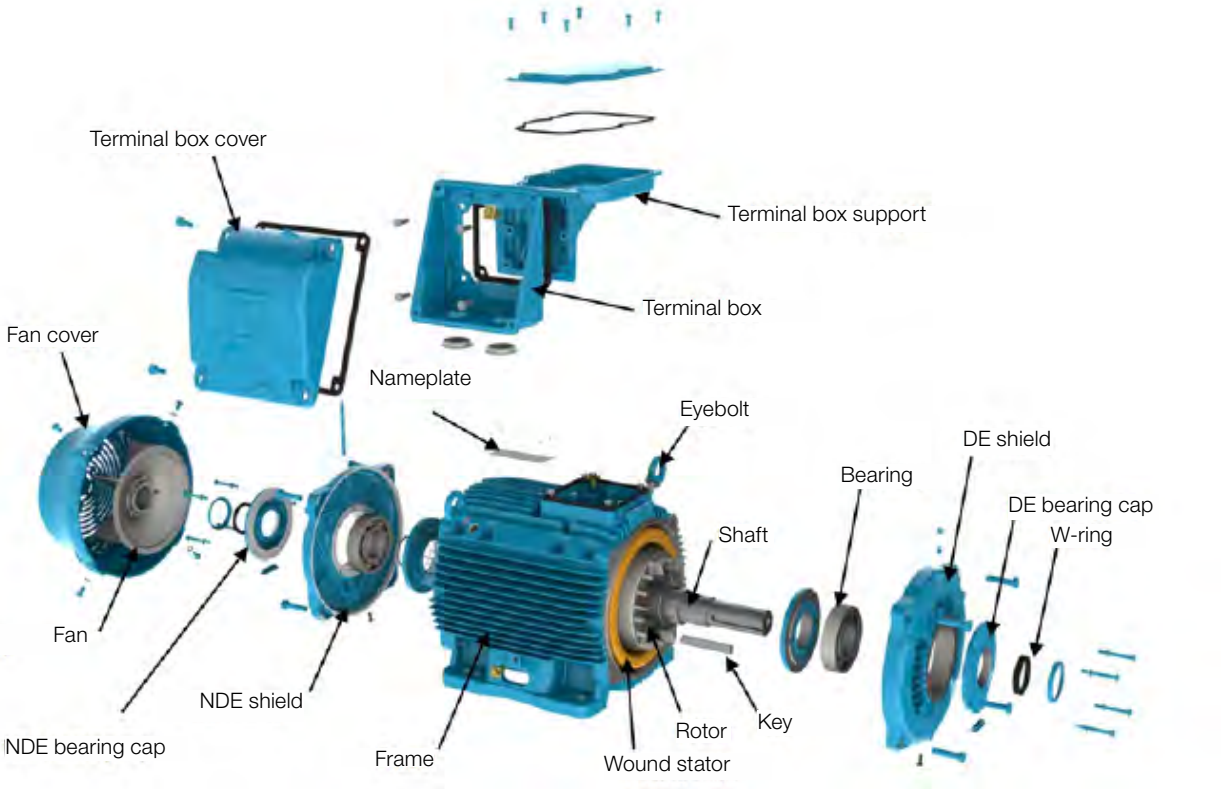

Figure 54 - Exploded view of the components of a W22 motor

9. ENVIRONMENTAL INFORMATION

9.1 PACKAGING

WEG electric motors are supplied in cardboard, plastic or wooden packaging. These materials can be recycled and must be disposed according to the applicable laws and regulations in each country. All wood used in the packaging of WEG motors come from the company reforestation program and is not submitted to any chemical conservation treatment.

9.2 PRODUCT

Electric motors consist mainly of ferrous metals (steel plates and cast iron), non ferrous metals (copper and aluminum) and plastic materials.
In general, electric motors have relatively long service live. However when they must be discarded, WEG recommends to dismantle the motor, sort the different materials and send them for recycling.
No-recyclable materials should be disposed of at industrial landfills according to the applicable environmental laws and regulations in each country, or co-processed in cement kilns or incinerated.
The recycling service providers, the disposal in industrial landfills, the waste co-processing or the incineration process must be properly authorized by the state environment agency to carry out these activities.

10. TROUBLESHOOTING CHART X SOLUTIONS

This troubleshooting chart provides a basic list of problems that may occur during motor operation, possible causes and recommended corrective actions. In case of doubts, please contact WEG Service Center.

Problem	Possible cause	Corrective action
Motor does not start, neither coupled nor decoupled	Power cables are interrupted	Check the control panel and the motor power supply cables
	Blown fuses	Replace blown fuses
	Wrong motor connection	Correct the motor connection according to connection diagram
	Locked rotor	Check motor shaft to ensure that it rotates freely
The motor starts at no-load, but fails when load is applied. It starts very slowly and does not reach the rated speed	Load toque is too high during start-up	Do not start the motor on load
	Too high voltage drop in the power cables	Check the installation dimensioning (transformer, cable cross section, relays, circuit breakers, etc.)
Abnormal/excessive noise	Defective transmission component or defective driven machine	Check the transmission force, the coupling and the alignment
	Misaligned / unleveled base	Align / level the motor with the driven machine
	Unbalanced components or unbalanced driven machine	Balance the machine set again
	Different balancing methods used for motor and coupling balancing (halve key, full key)	Balance the motor again
	Wrong motor direction of rotation	Reverse the direction of rotation
	Loose bolts	Retighten the bolts
	Foundation resonance	Check the foundation design
	Damaged bearings	Replace the bearings
Motor overheating	Insufficient cooling	Clean air inlet and outlet and cooling fins
		Check the minimum required distance between the fan cover and nearest walls. See item 7
		Check air temperature at inlet
	Overload	Measure motor current, evaluate motor application and if required, reduce the load
	Number of starts per hour is too high or the load inertia moment is too high	Reduce the number of starts per hour
	Power supply voltage too high	Check the motor power supply voltage. Power supply voltage must not exceed the tolerance specified in item 7.2
	Power supply voltage too low	Check the motor power supply voltage and the voltage drop. Power supply voltage must not exceed the tolerance specified in item 7.2
	Interrupted power supply	Check the connection of the power cables
	Voltage unbalance at the motor terminals	Check for blown fuses, wrong commands, voltage unbalance in the power line, phase fault or interrupted power cables
	Direction of rotation is not compatible with the unidirectional fan	Check if the direction of rotation matches the rotation arrow indicated on end shield
Bearing overheating	Excessive grease/oil	Clean the bearing and lubricate it according to the provided recommendations
	Grease/oil aging	
	The used grease/oil does not matches the specified one	
	Lack of grease/oil	Lubricate the bearing according to the provided recommendations
	Excessive axial or radial forces due to the belt tension	Reduce the belt tension
		Reduce the load applied to the motor

MANUAL GENERAL DE INSTALACIÓN, OPERACIÓN Y MANTENIMIENTO DE MOTORES ELÉCTRICOS

Este manual presenta información de a los motores eléctricos WEG de inducción con rotor de jaula, con rotor de imanes permanentes o híbridos, de baja y alta tensión, en las carcasas IEC 56 a 630 y NEMA 42 a 9606/10.
A continuación se relacionan manuales específicos donde encontrar información adicional:

- Motores para extracción de humo *(Smoke Extraction Motor)*;
- Motores con freno electromagnético;
- Motores para Áreas Clasificadas.

Estos productos están de acuerdo con las siguientes normas, cuando son aplicables:

- NBR 17094-1: Máquinas Eléctricas Giratorias - Motores de Inducción - Parte 1: trifásicos.
- NBR 17094-2: Máquinas Eléctricas Giratorias - Motores de Inducción - Parte 2: monofásicos.
- IEC 60034-1: Máquinas Eléctricas Giratorias - Parte 1: Clasificación y Rendimiento
- NEMA MG 1: Motores y Generadores
- CSA C 22.2 N°100: Motores y Generadores
- UL 1004-1: Máquinas Eléctricas Giratorias - Requisitos Generales

En caso de dudas sobre la aplicabilidad de este material, póngase en contacto con WEG.

1. DEFINICIONES

Equilibrado: procedimiento por el cual la distribución de masa de un cuerpo es verificada y, si es necesario, ajustada para garantizar que el desequilibrio residual o las vibraciones y fuerzas en los cojinetes en la frecuencia de rotación mecánica estén dentro de los límites especificados en las normas internacionales.

Grado de balanceo: indica la amplitud de pico de la velocidad de vibración, expresada en mm/s, de un rotor girando libre en el espacio y es producto de un desequilibrio específico y la velocidad angular del rotor a la velocidad máxima de operación.

Parte puesta a tierra: partes metálicas eléctricamente conectadas al sistema de puesta a tierra.

Parte viva: conductor o parte conductora destinada a ser energizada en condiciones normales de uso, incluyendo el conductor neutro.

Personal autorizado: trabajador que tiene autorización formal de la empresa.

Personal capacitado: trabajador que cumpla las siguientes condiciones:

- Reciba capacitación bajo orientación y responsabilidad de profesional habilitado y autorizado;
- Bajo responsabilidad de profesional habilitado y autorizado.

Nota: *La capacitación sólo es válida para la empresa que lo capacitó y en las condiciones establecidas por el profesional habilitado y autorizado responsable por la capacitación.*

Personal habilitado: trabajador previamente cualificado y con registro en el consejo de clase competente.

Personal cualificado: trabajador que compruebe conclusión de curso específico en el área eléctrica por el sistema oficial de enseñanza.

2. RECOMENDACIONES INICIALES

Los motores eléctricos poseen circuitos energizados, componentes giratorios y superficies calientes, durante su operación normal, que pueden causar daños personales. Por ello, todas las actividades relacionadas con su transporte, almacenamiento, instalación, operación y mantenimiento deben ser realizadas por personal capacitado.
Deben ser observadas las normas y procedimientos vigentes en el país de instalación.
La no observación de las instrucciones indicadas en este manual y demás referencias en el sitio web: www.weg.net puede resultar en graves lesiones y daños materiales y anular la garantía del producto.

En este manual no se presentan todas las informaciones detalladas sobre posibles variantes constructivas se consideran todos los casos de montaje, operación o mantenimiento. Este documento contiene informaciones necesarias para que las personas capacitadas puedan ejecutar el servicio. Las imágenes presentadas son meramente ilustrativas.
Para aplicaciones y condiciones especiales de trabajo (manual 50026367 para motores de extracción de humos, manual 50021973 para Motofrenos, manual 50078700 para Motores Controlados Electrónicamente, manual 14629920 para motores Roller Table, manual 50106963 para motores WEG Lift Gearless) se debe consultar el manual o entrar en contacto con WEG.
Para los motores suministrados con el sensor WEG Motor Scan, consulte las guías de instalación a través del Manual de Descripción General de la Recepción a la Operación (10008475131) disponible en www.weg.net.
Para informaciones sobre cargas radiales y axiales admisibles en el eje consultar el catálogo técnico del producto.

La correcta definición de las características del entorno y de la aplicación es de responsabilidad del usuario.

Durante el período de garantía del motor, los servicios de reparación, revisión y recuperación deben ser realizadas por Asistentes Técnicos autorizados WEG para que la garantía siga vigente.

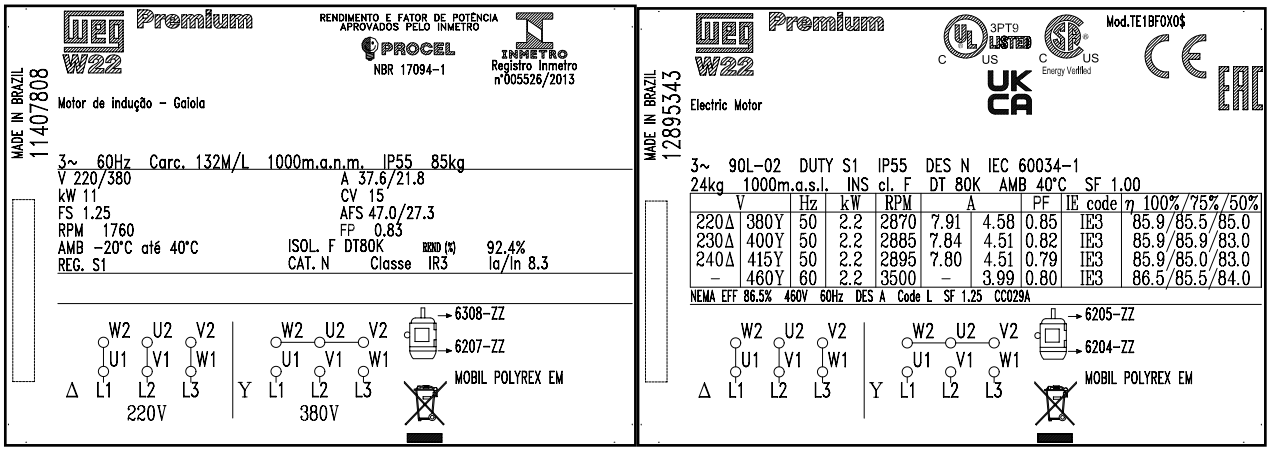
2.1 SEÑALES DE ADVERTENCIA

Advertencia sobre seguridad y garantía.

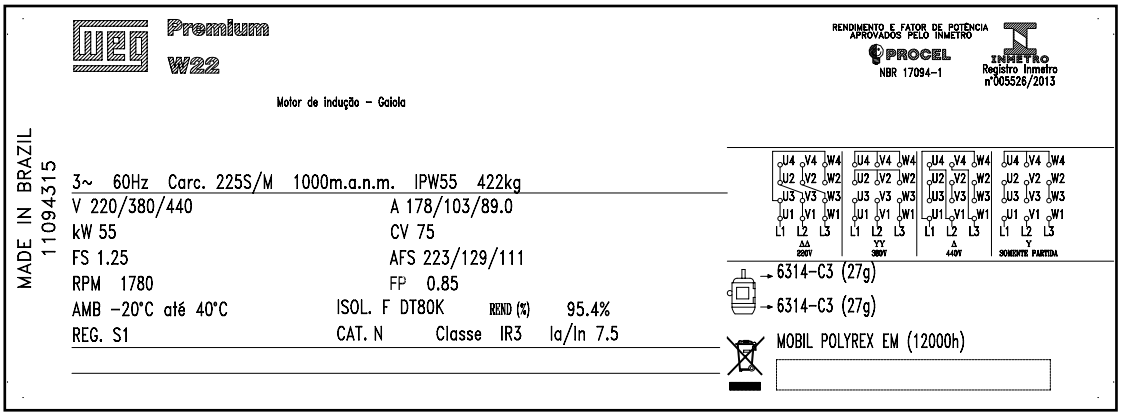
2.2 VERIFICACION A LA RECEPCION

Todos los motores son testeados durante el proceso de fabricación.
A la recepción del motor, verifique si ocurrieron daños durante el transporte. Ante la ocurrencia de cualquier daño, regístrelo por escrito junto al transportista, y comuníquelo inmediatamente a la compañía aseguradora y a WEG. La no comunicación puede resultar en la cancelación de la garantía.
Se debe realizar una inspección completa en el producto:

- Verifique si los datos contenidos en la placa de características están de acuerdo con el pedido de compra;
- Remueva los dispositivos de trabado del eje (en caso que existan) y gire manualmente el eje para verificar si el mismo gira libremente. En los motores WMagnet y WQuattro, el eje no gira libremente debido al par de alineación de los imanes. Puede que sea necesario utilizar una palanca para girar el eje



Al girar el eje de un motor WMagnet o WQuattro, se debe garantizar el aislamiento de los terminales de la máquina, debido al riesgo de descarga eléctrica provocada por la tensión inducida durante el procedimiento.



- Asegúrese que el motor no haya sido expuesto a polvareda y humedad excesiva durante el transporte.

No remueva la grasa de protección de la punta del eje, ni los tapones que cierran los agujeros de la caja de conexión, si existen. Estos ítems de protección deben ser mantenidos hasta que la instalación completa sea concluída

2.3 PLACAS DE CARACTERÍSTICAS

La placa de características contiene las informaciones que describen las características constructivas y el rendimiento del motor. En la Figura 1, Figura 2 y Figura 3 son presentados ejemplos de diseños de placas de características.

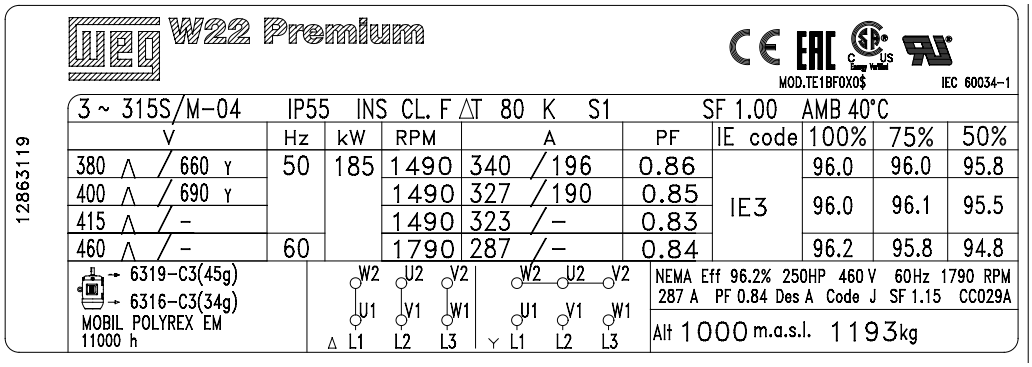


Figura 1 - Placa de características de motores IEC

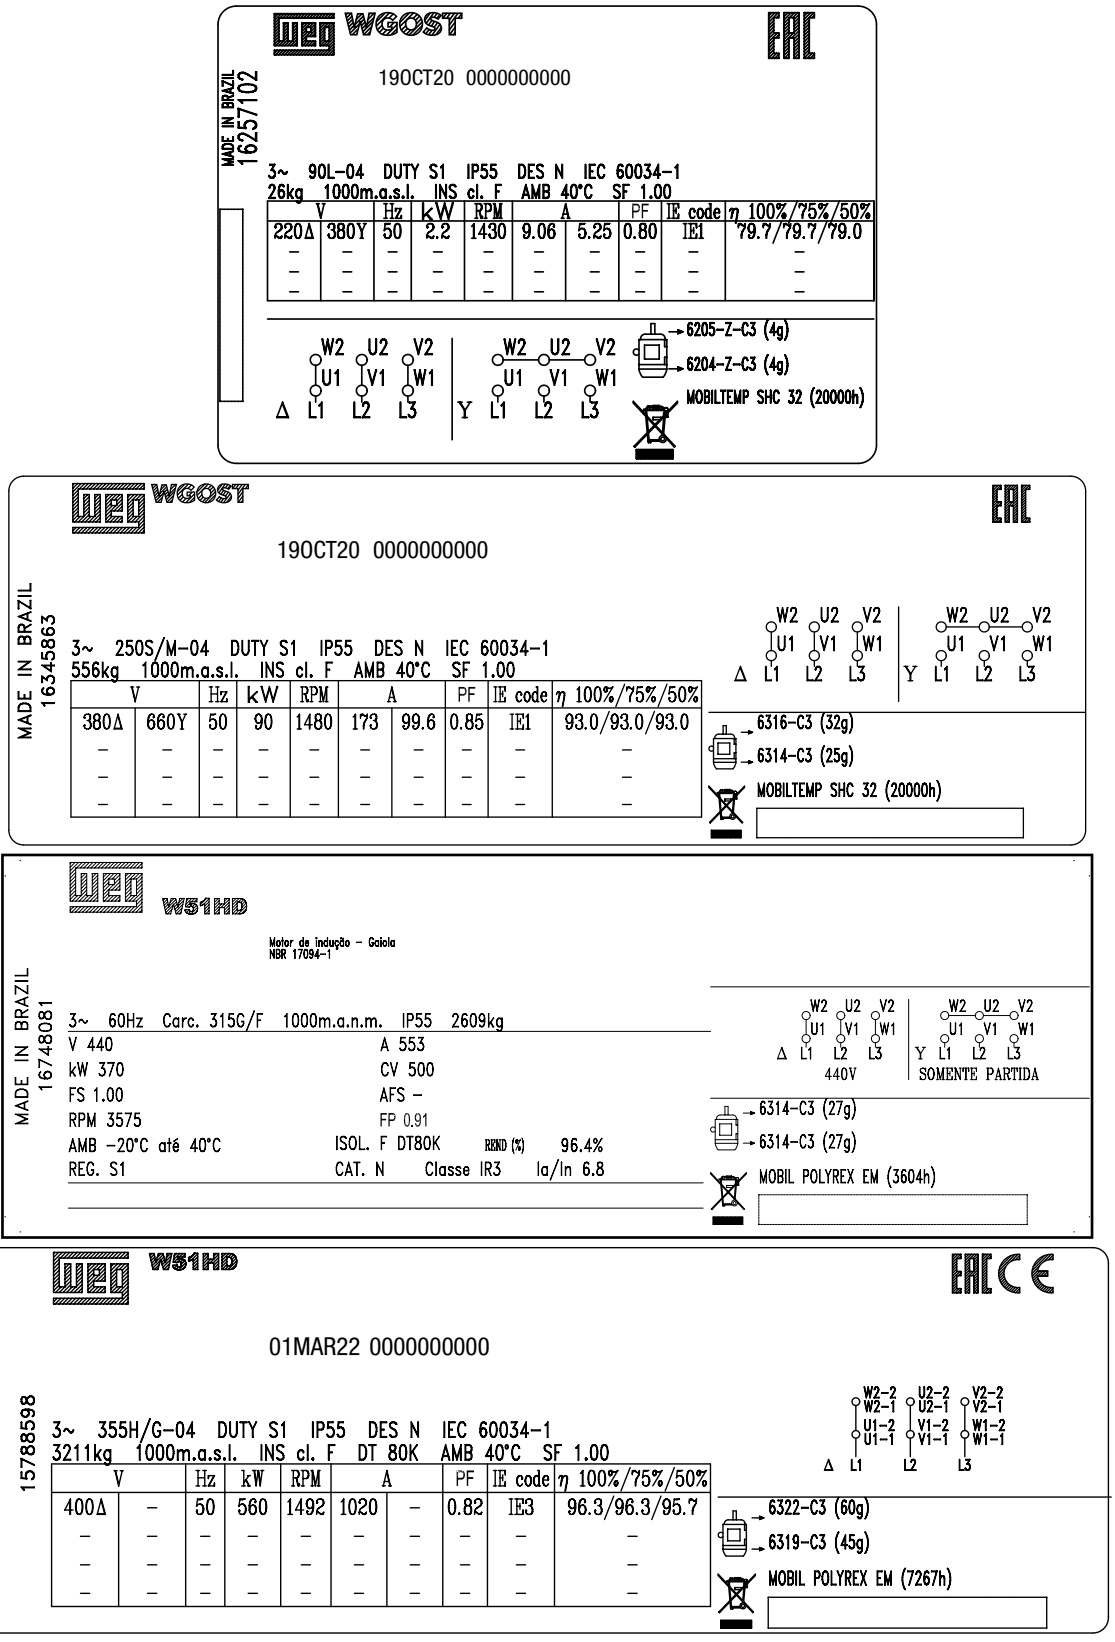

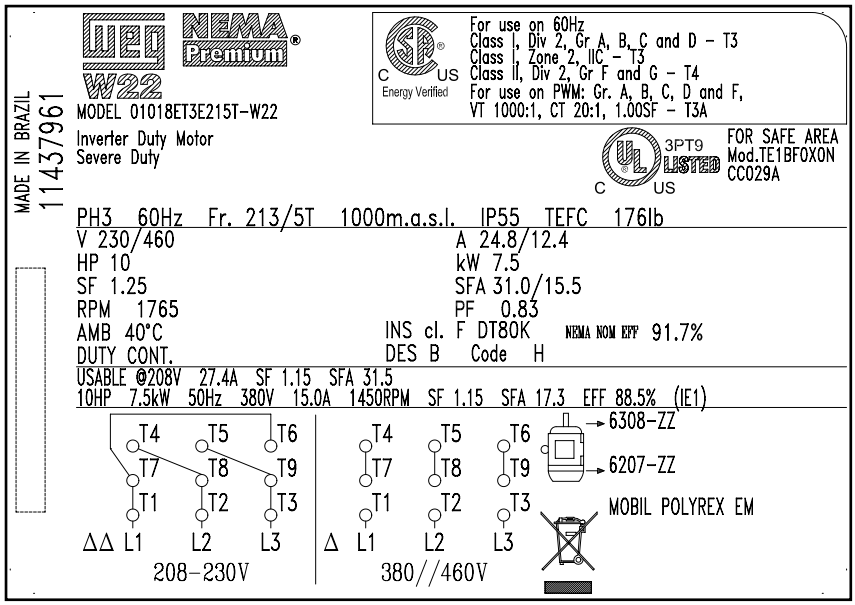

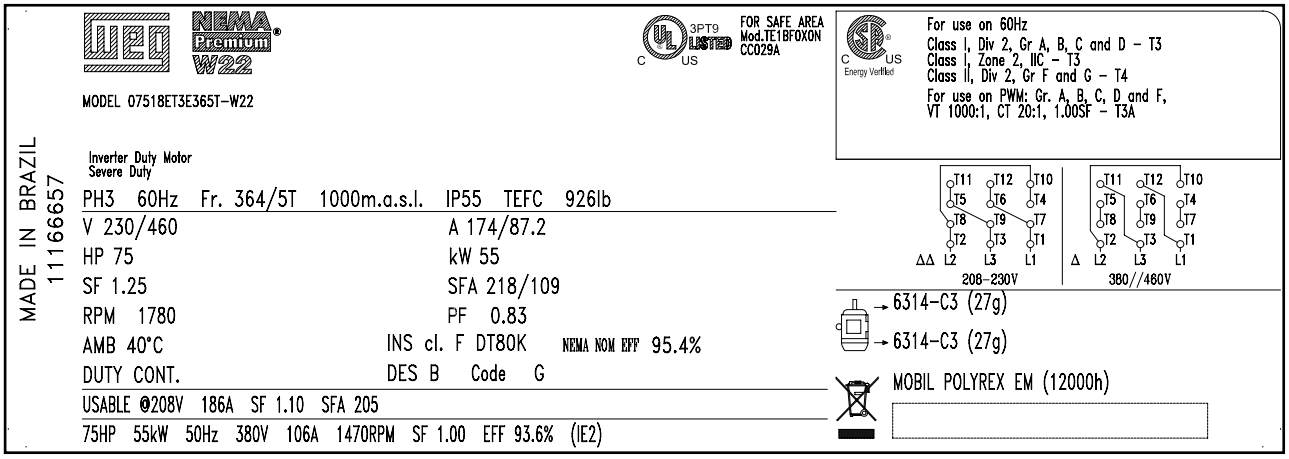

Figura 2 - Placa de características de motores IEC

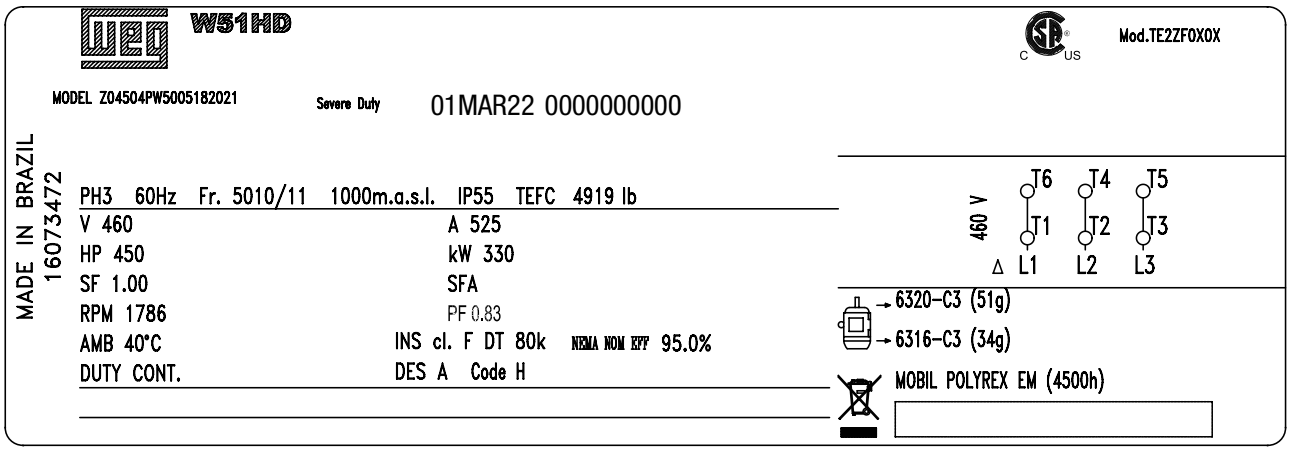

Figura 3 - Placa de características de motores NEMA

3. SEGURIDAD

Durante la instalación y mantenimiento, los motores deben estar desconectados de la red, completamente parados y deben ser tomados cuidados adicionales para evitar arranques accidentales.

Los profesionales que trabajan en instalaciones eléctricas, sea en el montaje, en la operación o en el mantenimiento, deben utilizar herramientas apropiadas y ser instruidos sobre la aplicación de las normas y prescripciones de seguridad, inclusive sobre el uso de Equipamientos de Protección Individual (EPI), los que deben ser cuidadosamente observados.

Los motores eléctricos poseen circuitos energizados, componentes giratorios y superficies calientes, durante su operación normal, que pueden causar lesiones. De esta forma, todas las actividades relacionadas a su transporte, almacenamiento, instalación, operación y mantenimiento deben ser realizadas por personal capacitado.

Los usuarios de marcapasos y el personal no calificado no deben abrir los motores WMagnet y WQuattro, ya que se utilizan imanes de alta energía.

Deben ser seguidas las instrucciones sobre seguridad, instalación, mantenimiento e inspección de acuerdo con las normas vigentes en cada país.

4. MANIPULACIÓN Y TRANSPORTE

Los motores embalados individualmente no deben ser izados por el eje o por el embalaje, sino por el(los) cáncamos de elevación (cuando existan) y con dispositivos adecuados. Los cáncamos de elevación están dimensionados para soportar tan solo la masa del motor indicada en la placa de características. Los motores suministrados en palés deben ser izados por la base de palé.
El embalaje no debe ser tumbado bajo ninguna circunstancia.

No utilice los cáncamos de elevación para suspender el motor en conjunto con otros equipamientos, como por ejemplo: bases, poleas, ventiladores, bombas, reductores, etc..

No deben ser utilizados cáncamos dañados, por ejemplo, con rajaduras, deformaciones, etc. Verificar sus condiciones antes de utilizarlos.

Los cáncamos de elevación en componentes como tapas, kit de ventilación forzada, entre otros, deben ser utilizados solamente para el elevación de estos componentes de manera aislada, nunca del motor completo.

Todo el movimiento debe ser realizado de forma suave, sin impactos, en caso contrario los rodamientos pueden ser dañados, así como los cáncamos ser expuestos a esfuerzos excesivos, pudiendo provocar la rotura de los mismos.

Nunca manipule los motores por los componentes poliméricos: tapa deflectora, sombrerete, caja de conexión y / o tapa de la caja de conexión.

Los dispositivos de trabado del eje (utilizados para protección durante el transporte), en motores con rodamientos de rodillos o contacto angular, deben ser utilizados para todo y cualquier transporte del motor, aunque eso requiera el desplazamiento de la máquina accionada.
Todos los motores HGF, W50, W51 HD y W60 independientemente del tipo de cojinete, deben tener su rotor trabado para transporte. Motores verticales con rodamientos lubricados por aceite deben ser transportados en posición vertical. En caso de necesidad de transporte en posición horizontal, utilice el dispositivo de trabado del eje en ambos lados (delantero / trasero) del motor.

4.1 ELEVACIÓN

Antes de iniciar cualquier proceso de elevación, asegúrese de que los cáncamos estén adecuadamente fijados, totalmente atornillados y con su base en contacto con la superficie a ser izada, conforme Figura 4. La Figura 5 ejemplifica el uso incorrecto.
Asegúrese de que el equipamiento utilizado en el elevación y sus dimensiones sean adecuados al tamaño del cáncamo y de la masa del motor.

Figura 4 - Manera correcta de fijación del cáncamo de elevación

Figura 5 - Manera incorrecta de fijación del cáncamo de elevación

El centro de gravedad de los motores varía en función de la potencia y los accesorios instalados. Respete los ángulos máximos, durante la elevación, informados en los subtemas a seguir.

4.1.1 Motores horizontales con un cáncamo de elevación

Para motores con un cáncamo de elevación, el ángulo máximo resultante durante el proceso de elevación no podrá exceder 30° en relación al eje vertical, conforme Figura 6.

Figura 6 - Ángulo máximo resultante para motores con un cáncamo de elevación

4.1.2 Motores horizontales con dos o más cáncamos de elevación

Para motores que poseen dos o más cáncamos para el elevación, todos los cáncamos suministrados deben ser utilizados simultáneamente para el elevación.

Existen dos disposiciones de cáncamos posibles (verticales e inclinados), conforme son presentadas a seguir:

- Motores con cáncamos verticales, conforme Figura 7, el ángulo máximo resultante debe ser de 45° en relación al eje vertical. Se recomienda la utilización de una barra separadora, para mantener el elemento de elevación (corriente o cable) en el eje vertical y evitar daños a la superficie del motor.

Figura 7 - Ángulo máximo resultante para motores con dos o más cáncamos de elevación

Para motores HGF, W51 HD, W40 y W50 conforme Figura 8, el ángulo máximo resultante debe ser de 30° en relación al eje vertical;

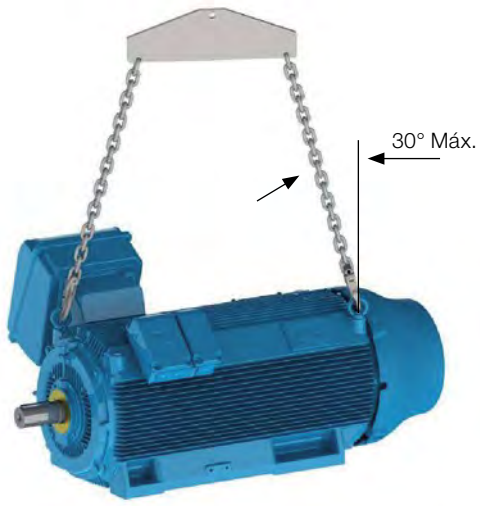

Figura 8 - Ángulo máximo resultante para motores HGF, W51 HD, W40 y W50 horizontales

Para motores W60, conforme Figura 9, es necesaria la utilización de una barra separadora, para mantener el elemento de elevación (corriente, cable, etc.) en el eje vertical y así también evitar daños a la superficie del motor.

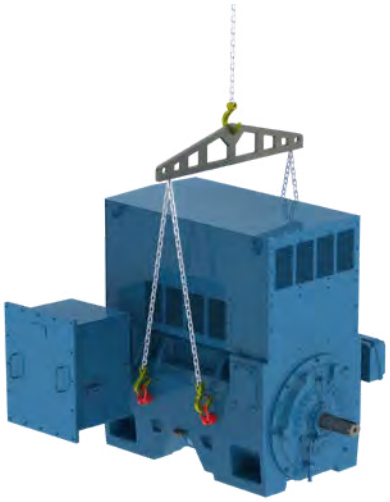

Figura 9 - Uso de barra separadora en la elevación de motores W60

- Motores con cáncamos inclinados, conforme Figura 10, es necesaria la utilización de una barra separadora, para mantener el elemento de elevación (corriente, cable, etc.) en el eje vertical y así también evitar daños a la superficie del motor.

Figura 10 - Uso de barra separadora en la elevación

4.1.3 Motores verticales

Para motores verticales, conforme Figura 11, es necesaria la utilización de una barra separadora, para mantener el elemento de elevación (corriente, cable) en el eje vertical y así también evitar daños a la superficie del motor.

Figura 11 - Elevación de motores verticales

Utilice siempre los cáncamos que están dispuestos en la parte superior del motor en relación a la posición de montaje y diametralmente opuestos. Ver Figura 12.

Figura 12 - Elevación de motores HGF, W51 HD y W50

4.1.3.1. Procedimiento para colocación de motores W22/WEG General Purpose/WIN en posición vertical

De forma general, por cuestiones de seguridad durante el transporte, los motores verticales son embalados y suministrados en la posición horizontal.

Para la colocación de motores W22/WEG General Purpose/WIN con cáncamos inclinados (ver Figura 10) en la vertical, deben ser seguidos los pasos abajo descritos:

1. Asegúrese de que los cáncamos están adecuadamente fijos, conforme Figura 4;

2. Remover el motor del embalaje, utilizando los cáncamos superiores, conforme Figura 13;

Figura 13 - Retirada del motor del embalaje

3. Instalar el segundo par de cáncamos, conforme Figura 14;

*Figura 14 - Instalación del segundo par de cáncamos*4.

Reducir la carga sobre el primer par de cáncamos para iniciar a rotación del motor, conforme Figura 15. Este procedimiento debe ser realizado de forma lenta y cuidadosa.

Figura 15 - Resultado final: motor posicionado de forma vertical

Para los motores de la carcasa IEC 112 a 200 (NEMA equivalente), WEG posee un kit de dispositivos para facilitar el vuelco del motor a la posición vertical, siendo de punta hacia arriba o hacia abajo (conforme las Figuras 16 y 17).

Figura 16 - - Ojal para vuelco en la punta de eje, vertical punta hacia arriba (V6/V36)

Figura 17 - Ojales con prolongador fijo en la tapa trasera, vertical punta hacia abajo (V5/V35)

4.1.3.2. Procedimiento para colocación de motores HGF, W51 HD y W50 en posición vertical

Los motores verticales HGF son suministrados con ocho puntos de elevación, cuatro en la parte delantera y cuatro en la parte trasera. Los motores verticales W50 y W51 HD son suministrados con nueve puntos de elevación, cuatro en la parte delantera, uno en la parte central y cuatro en la parte trasera. Ambos son generalmente transportados en la posición horizontal, no obstante, para la instalación precisan ser colocados en la posición vertical.
Para la colocación de motores en posición vertical, deben ser seguidos los pasos de abajo:

1. Levante el motor a través de los cuatro cáncamos laterales, utilizando dos grúas, ver Figura 18;

Figura 18 - Elevación del motor HGF, W51 HD y W50 utilizando dos grúas

2. Baje la grúa que está sujeta a la parte delantera del motor y al mismo tempo levante la grúa que está sujeta al lado trasero del motor hasta que el motor se equilibre, ver Figura 19;

Figura 19 - Colocación de motor HGF, W51 HD y W50 en posición vertical

3. Suelte la grúa sujeta a la parte delantera del motor y gire el motor 180° para posibilitar la fijación de la grúa suelta en los otros dos cáncamos de la parte trasera del motor, ver Figura 20;

Figura 20 - Suspensión de motor HGF, W51 HD y W50 por los cáncamos traseros

4. Fije la grúa suelta a los otros dos cáncamos de la parte trasera del motor y levántela hasta que el motor quede en la posición vertical, ver Figura 21.

Figura 21 - Motor HGF, W51 HD y W50 en posición vertical

Estos procedimientos sirven para movimientos de motores construidos con montaje en posición vertical. Estos mismos procedimientos pueden ser utilizados para la colocación del motor de posición horizontal a posición vertical y viceversa.

4.2 PROCEDIMIENTO PARA VIRADA DE MOTORES W22/WEG GENERAL PURPOSE/WIN VERTICALES

Para realizar la virada de motores W22/WEG General Purpose/WIN originalmente en la posición vertical, siga los pasos mostrados abajo:

1. Asegúrese que los cáncamos estén fijados adecuadamente, conforme ítem 4.1;
2. Instale el primer par de cáncamos y suspenda el motor, ver Figura 22;

Figura 22 - Instalación del primer par de cáncamos

3. Instalar el segundo par de cáncamos, ver Figura 23;

*Figura 23 - Instalación del segundo par de cáncamos*4.

4. Reduzca la carga sobre el primer par de cáncamos para iniciar la rotación del motor, conforme Figura 24. Este procedimiento debe ser realizado de forma lenta y cuidadosa;

Figura 24 - Motor está siendo rotado para hacia la posición horizontal

5. Remueva el primer par de cáncamos, ver Figura 25.

Figura 25 - Resultado final: motor posicionado de forma horizontal

5. ALMACENAMIENTO

Si los motores no fueran instalados de inmediato, se recomienda almacenarlos en local seco con humedad relativa del aire de hasta 60%, con temperatura ambiente por encima de 5 °C y por debajo de 40 °C, libre de polvo, vibraciones, gases, agentes corrosivos, con temperatura uniforme, en posición normal y sin apoyar otros objetos sobre los mismos. Quite las poleas, en caso que existan, de la punta del eje, la cual debe ser mantenida libre y con grasa protectora para evitar corrosión.

En caso que el motor posea resistencia de calentamiento, ésta deberá ser energizada siempre que el motor no esté en operación. Esto se aplica también a los casos en que el motor está instalado, pero fuera de uso por un largo período. En estas situaciones, dependiendo de las condiciones del ambiente, podrá ocurrir condensación de agua en el interior del motor, provocando una caída en la resistencia de aislamiento. Los motores deben ser almacenamientos de tal modo que el drenaje de agua condensada sea facilitado (informaciones adicionales están disponibles en el ítem 6).

Las resistencias de calentamiento nunca deben estar energizadas mientras el motor esté operando.

5.1 SUPERFICIES MECANIZADAS EXPUESTAS

Todas las superficies mecanizadas expuestas (por ejemplo, punta de eje y brida) son protegidas en la fábrica por un inhibidor de oxidación temporario. Esta película protectora debe ser reaplicada periódicamente durante el período de almacenamiento (por lo menos a cada seis meses) o cuando fuera retirada o estuviera deteriorada.

5.2 APILAMIENTO

El apilamiento de embalajes durante el almacenamiento no debe sobrepasar los 5 metros de altura, obedeciendo los criterios de la Tabla 1:

Tipo de embalaje	Carcasas	Cantidad máxima de apilamiento
Caja de cartón	IEC 56 a 132 NEMA 143 a 215	Indicada en la pestaña superior de la caja de cartón
Jaula de madera	IEC 56 a 315 NEMA 48 a 504/5	06
	IEC 355 NEMA 586/7 y 588/9	03
	W40 / W50 / W51 HD / W60 / HGF IEC 315 a 630 W40 / W50 / W51 HD / HGF NEMA 5000 a 9600	Indicado en el propio embalaje

Tabla 1 - Apilamiento máximo recomendado

Notas:

1) No apile embalajes mayores sobre menores;

2) Posicione correctamente un embalaje sobre el otro (ver Figura 26 y Figura 27);

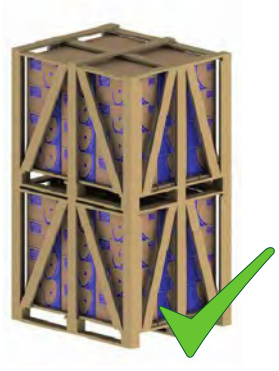

Figura 26 - Apilamiento adecuado

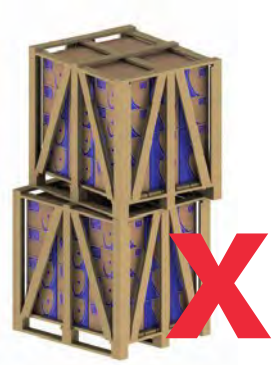

Figura 27 - Apilamiento inadecuado

3) Las patas de los embalajes superiores deben estar apoyadas sobre calces de madera (Figura 28) no sobre cintas de acero ni *pueden permanecer sin apoyo (Figura 29);*

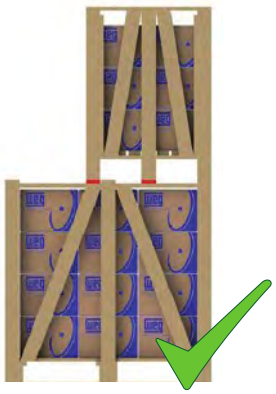

Figura 28 - Apilamiento adecuado

Figura 29 - Apilamiento inadecuado

4) Para el apilamiento de un volumen menor sobre un volumen mayor, agregue varas transversales entre los mismos cuando el mayor no ofrezca resistencia al peso del menor (ver Figura 30). Esta situación normalmente ocurre con los volúmenes de los motores de carcasa por encima de la IEC 225S/M (NEMA 364/5T).

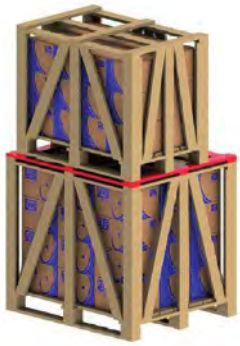

Figura 30 - Utilización de varas adicionales para apilamiento

5.3 COJINETES

5.3.3.1. Cojinetes de rodamiento lubricados con grasa

Se recomienda girar el eje del motor por lo menos una vez al mes (manualmente, al menos cinco vueltas, dejando el eje en posición diferente de la original). En los motores WMagnet y WQuattro, el eje no gira libremente debido al par de alineación de los imanes. Puede que sea necesario utilizar una palanca para girar el eje.

Al girar el eje de un motor WMagnet o WQuattro, se debe garantizar el aislamiento de los terminales de la máquina, debido al riesgo de descarga eléctrica provocada por la tensión inducida durante el procedimiento.

Obs.: en caso que el motor posea dispositivo de trabado del eje, el mismo debe ser retirado antes de girar el eje y ser colocado de nuevo antes de levantar el motor.
Los motores verticales pueden ser almacenamientos en posición vertical o en posición horizontal.
Para motores con rodamiento abierto almacenamientos por más de seis meses, los rodamientos deben ser relubricados, conforme el ítem 8.2, antes de la entrada en operación.
En caso que el motor permanezca almacenamiento por un período superior a dos años, se recomienda sustituir los rodamientos, o de otra forma, deben ser retirados, lavados, inspeccionados y relubricados conforme el ítem 8.2.

5.3.1 Cojinetes de rodamiento con lubricación por aceite

El motor debe ser almacenamiento en su posición original de funcionamiento, y con aceite en los cojinetes. El nivel de aceite debe ser respetado, permaneciendo en la mitad del visor de nivel.
Durante el período de almacenamiento, se debe retirar el dispositivo de trabado del eje y, mensualmente, girar el eje manualmente cinco vueltas, para hacer circular el aceite y conservar el cojinete en buenas condiciones. Siendo necesario mover el motor, el dispositivo de trabado del eje debe ser reinstalado.
Para los motores almacenamientos durante un periodo igual o mayor que el intervalo de cambio de aceite, el aceite deberá ser cambiado, conforme el ítem 8.2, antes de la puesta en funcionamiento.
En caso que el motor permanezca almacenamiento por un período superior a dos años, se recomienda sustituir los rodamientos o entonces retirarlos, lavarlos, inspeccionarlos y relubricarlos conforme el ítem 8.2.
El aceite de los cojinetes de los motores verticales, es retirado para evitar derramamiento durante el transporte. Tras la recepción, sus cojinetes deben ser lubricados.

5.3.1.1. Cojinetes de rodamiento con lubricación de tipo de neblina de aceite

El motor debe ser almacenamiento en posición horizontal. Rellene los cojinetes con aceite mineral ISO VG 68 con la cantidad de aceite indicada en la Tabla 2 (también válida para rodamientos con dimensiones equivalentes). Tras a colocación de aceite en los cojinetes, gire el eje (como mínimo cinco vueltas).
Durante el período de almacenamiento, se debe retirar el dispositivo de trabado del eje (cuando es suministrado) y semanalmente girar el eje manualmente 5 vueltas, dejando el mismo en posición diferente de la original. Siendo necesario mover el motor, el dispositivo de trabado del eje debe ser reinstalado.
En caso que el motor permanezca almacenamiento por un período superior a dos años, se recomienda sustituir los rodamientos o entonces retirarlos, lavarlos, inspeccionarlos y relubricarlos conforme el ítem 8.2.

Tamaño de rodamiento	Cantidad de aceite (ml)	Tamaño de rodamiento	Cantidad de aceite (ml)
6201	15	6309	65
6202	15	6311	90
6203	15	6312	105
6204	25	6314	150
6205	25	6315	200
6206	35	6316	250
6207	35	6317	300
6208	40	6319	350
6209	40	6320	400
6211	45	6322	550
6212	50	6324	600
6307	45	6326	650
6308	55	6328	700

Tabla 2 - Cantidad de aceite por rodamiento

Durante cualquier manipulación del motor, los cojinetes deben estar sin aceite. De esa forma, antes de la entrada en operación, todo el aceite de los cojinetes debe ser drenado. Después de la instalación, en caso que el sistema de neblina no esté en operación, el aceite debe ser recolocado para garantizar la conservación del cojinete. En este caso, se debe también proceder con el giro semanal del eje.

5.3.2 Cojinetes de deslelevación

El motor debe ser almacenamiento en su posición original de funcionamiento, y con aceite en los cojinetes. El nivel de aceite debe ser respetado, permaneciendo en la mitad del visor de nivel.
Durante el período de almacenamiento, se debe, retirar el dispositivo de trabado del eje y, mensualmente, girar el eje manualmente 5 vueltas (y a 30 rpm), para hacer circular el aceite y conservar el cojinete en buenas condiciones. En caso que sea necesario mover el motor, el dispositivo de trabado del eje debe ser reinstalado.
Para los motores almacenamientos durante un periodo igual o mayor que el intervalo de cambio de aceite, el aceite deberá ser cambiado, conforme el ítem 8.2, antes de la puesta en funcionamiento.
En caso que el motor permanezca almacenamiento por un período mayor que el intervalo de cambio de aceite, o no sea posible girar el eje del motor, el aceite debe ser drenado y debe ser aplicada una protección anticorrosiva y deshumidificadores.

5.3.3 Procedimiento para medición de la resistencia de aislamiento

La medición de la resistencia de aislamiento debe ser realizada en área segura.

La resistencia de aislamiento debe ser medida con un megóhmetro y con el motor parado, frío y completamente desconectado de la red eléctrica.

Para evitar el riesgo de shock eléctrico, descargue los terminales inmediatamente antes y después de cada medición. En caso que el motor posea capacitores, éstos deben ser descargados.

Es recomendable que cada fase sea aislada y testeada separadamente, permitiendo que sea hecha una comparación entre la resistencia de aislamiento entre cada fase. Para testear una de las fases, las demás fases deben estar puestas a tierra.
El test de todas las fases simultáneamente evalúa solamente la resistencia de aislamiento contra tierra. En este caso no es evaluada la resistencia de aislamiento entre las fases.
Los cables de alimentación, llaves, condensadores y otros equipamientos externos conectados al motor pueden influenciar considerablemente la medición de la resistencia de aislamiento. Al realizar estas mediciones, todos los equipamientos externos deben estar desconectados y puestos a tierra.
La lectura de la resistencia de aislamiento debe ser realizada después de ser aplicada la tensión durante un período de un minuto (1 min). La tensión a ser aplicada debe obedecer la Tabla 3.

Tensión nominal del motor (V)	Tensión aplicada para la medición de la resistencia de aislamiento (V)
< 1.000	500
1.000 - 2.500	500 - 1.000
2.501 - 5.000	1.000 - 2.500
5.001 - 1.2000	2.500 - 5.000
> 1.2000	5.000 - 1.0000

Tabla 3 - Tensión para medición de la resistencia de aislamiento

La medición de la resistencia de aislamiento debe ser corregida para la temperatura de 40 °C conforme Tabla 4.

Temperatura de medición de la resistencia de aislamiento (°C)	Factor de corrección de la resistencia de aislamiento para 40 °C
10	0,125
11	0,134
12	0,144
13	0,154
14	0,165
15	0,177
16	0,189
17	0,203
18	0,218
19	0,233
20	0,250
21	0,268
22	0,287
23	0,308
24	0,330
25	0,354
26	0,379
27	0,406
28	0,435
29	0,467
30	0,500

Temperatura de medición de la resistencia de aislamiento (°C)	Factor de corrección de la resistencia de aislamiento para 40 °C
30	0,500
31	0,536
32	0,574
33	0,616
34	0,660
35	0,707
36	0,758
37	0,812
38	0,871
39	0,933
40	1,000
41	1,072
42	1,149
43	1,231
44	1,320
45	1,414
46	1,516
47	1,625
48	1,741
49	1,866
50	2,000

Tabla 4 - Factor de Corrección de la Resistencia de Aislamiento para 40 °C

La condición del aislamiento del motor deberá ser evaluada comparándose el valor medido con los valores de la Tabla 5 (referenciados a 40 °C):

Valor límite para tensión nominal hasta 1,1 kV (MΩ)	Valor límite para tensión nominal por encima de 1,1 kV (MΩ)	Situación
Hasta 5	Hasta 100	Peligroso, el motor no debe operar en esa condición
Entre 5 y 100	Entre 100 y 500	Regular
Entre 100 y 500	Por encima de 500	Bueno
Por encima de 500	Por encima de 1.000	Excelente

Tabla 5 - Avaliação do sistema de isolamento

Los datos indicados de la tabla sirven simplemente como valores de referencia. Se sugiere mantener el histórico de la resistencia de aislamiento del motor durante toda su vida.

Si la resistencia de aislamiento estuviera baja, el estator del motor puede estar húmedo. En ese caso, se recomienda llevarlo a un Asistente Técnico Autorizado WEG para que sean realizadas la evaluación y la reparación adecuadas. Este servicio no está cubierto por el Término de Garantía.
Para procedimiento de adecuación de la resistencia de aislamiento, ver ítem 8.4.

6. INSTALACIÓN

La instalación de motores debe ser hecha por profesionales capacitados con conocimientos sobre las normas y las prescripciones de seguridad.

Antes de continuar con el procedimiento de instalación deben ser evaluados algunos puntos:

1. Resistencia de aislamiento: debe estar dentro de los valores aceptables. Ver ítem 5.4.
2. Cojinetes:
   Si el motor está instalado y no entra en funcionamiento inmediatamente, proceder con elas instrucciones del ítem 5.3
3. Condición de los condensadores de arranque: para motores monofásicos almacenamientos por un período mayor a dos años, se recomienda que sus condensadores de arranque sean sustituidos.
4. Caja de conexión:
   a. Deben estar limpias y secas en su interior;
   b. Los elementos de contacto deben estar libres de oxidación y correctamente conectados. Ver ítems 6.9 y 6.10;
   c. Las entradas de cables no utilizadas deben estar correctamente selladas, la tapa de la caja de conexión debe ser cerrada y los sellados deben estar en condiciones apropiadas para atender el grado de protección del motor.
5. Ventilación: las aletas, la entrada y la salida de aire deben estar limpias y desobstruidas. La distancia de instalación recomendada entre las entradas de aire del motor y la pared no debe ser inferior a ¼ (un cuarto) del diámetro de la entrada de aire. Se debe asegurar espacio suficiente para la realización de servicios de limpieza. Ver ítem 7.
6. Acoplamiento: retirar el dispositivo de trabado del eje (si existe) y la grasa de protección contra corrosión de la punta del eje, incluyendo el área del cepillo de tierra, y de la brida inmediatamente antes de instalar el motor. Ver ítem 6.4.
7. Drenaje: siempre deben estar posicionados de forma que el drenaje sea facilitado (en el punto más bajo del motor. En caso que exista una flecha indicadora en el cuerpo del drenaje, el drenaje debe ser montado para que la misma apunte hacia abajo).
   Motores con drenaje de goma, drenaje roscada y además drenajes abierto/cerrado salen de la fábrica en la posición y deben ser abiertos periódicamente para permitir la salida del agua condensado. Para ambientes con elevada condensación del agua y motores con grado de protección IP55, los drenajes pueden ser armados en posición abierta (ver Figura 31).
   Para motores con grado de protección IP56, IP65 o IP66, los drenajes deben permanecer en posición cerrada (ver Figura 6.1), siendo abiertos solamente durante el mantenimiento del motor.
   Los motores con lubricación de tipo neblina de aceite deben tener sus drenajes conectados a un sistema de recogida específico (ver Figura 31).

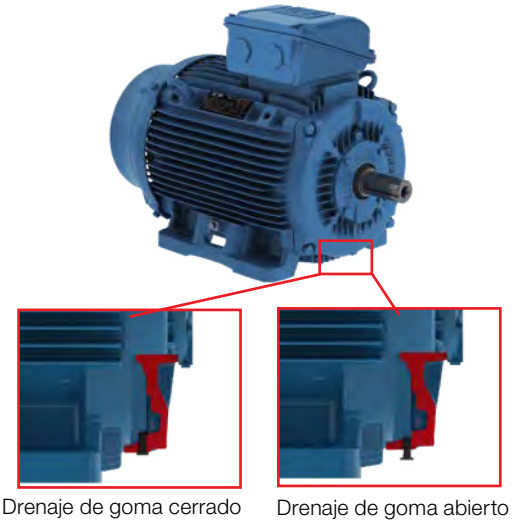

Figura 31 - Detalle del drenaje de goma montado en posición cerrada y abierta

8. Recomendaciones adicionales
   a. Verifique el sentido de rotación del motor, encendiéndolo a vacío antes de acoplarlo a la carga;
   b. Para motores montados a posición vertical con la punta de eje hacia abajo, se recomienda el uso de sombrerete para evitar a penetración de cuerpos extraños en el interior del motor;
   c. Para motores montados en la posición vertical con la punta de eje hacia arriba, se recomienda el uso de un deflector de agua (water slinger ring) para evitar la penetración de agua por el eje.
   d. Los elementos de fijación montados en agujeros roscados pasantes del involucro del motor (por ejemplo, en la brida) deben ser sellados para asegurar el grado de protección indicado en la placa de identificación del motor.

Retire o fije completamente la chaveta antes de encender el motor.

Cualquier modificación de las características constructivas del motor, como la instalación de accesorio de engrases prolongadas o modificación del sistema de lubricación, instalación de accesorios en puntos alternativos, etc., sólo puede ser realizada con aprobación previa por escrito de WEG.

6.1 CIMIENTOS PARA EL MOTOR

El cimiento es el elemento estructural, base natural o preparada, destinada a soportar los esfuerzos producidos por los equipamientos instalados, permitiendo la operación de éstos con estabilidad, buen rendimiento y seguridad.
El proyecto de cimientos debe considerar las estructuras adyacentes para evitar influencia de un equipamiento sobre el otro, a fin de que no ocurra propagación de vibraciones.
Los cimientos deben ser planos y su elección, detallado y ejecución, exige las características:
a) De la construcción del propio equipamiento, implicando no solamente los valores y forma de actuación de las cargas, sino que también su finalidad y los límites máximos de las deformaciones y vibraciones compatibles en cada caso (ejemplo, motores con valores reducidos de: nivel de vibración, planicidad de las patas, concentricidad de la brida, pulso de la brida, etc.);
b) De las construcciones vecinas, comprendiendo el estado de conservación, estimación de las cargas máximas aplicadas, tipo de cimiento y fijación empleadas, así como los niveles de vibración transmitidos por estas construcciones.
Cuando el motor sea suministrado con tornillo de alineamiento/nivelación, deberá ser prevista en la base una superficie que permita el alineamiento/nivelación.

Los esfuerzos generados durante la operación, por la carga accionada, deben ser considerados como parte del dimensionamiento de los cimientos.
El usuario es totalmente responsable del proyecto, preparación y ejecución de los cimientos.

Los esfuerzos sobre los cimientos pueden ser calculados por las ecuaciones:

$$F_1 = 0{,}5 * g * m - (4 * T_b / A)$$
$$F_2 = 0{,}5 * g * m + (4 * T_b / A)$$

Donde:
F_1 y F_2 = esfuerzos en un lado del motor (N)
g = aceleración de la gravedad (9,8 m/s^2)
m = peso del motor (kg)
T_b = par máximo del motor (Nm)
A = distancia entre los agujeros de montaje de las patas del motor (vista frontal) (m)
Los motores pueden ser montados sobre:
- Bases de concreto: más recomendadas y usuales para los motores de gran porte (ver Figura 32)
- Bases metálicas: más comunes para motores de pequeño tamaño (ver Figura 33)

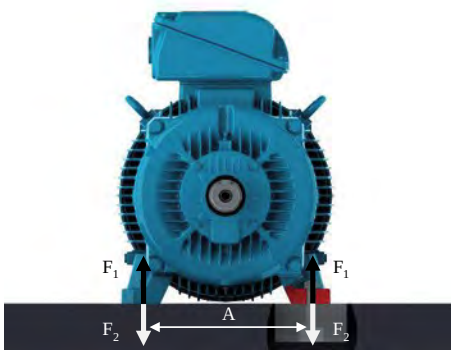

Figura 32 - Motor instalado sobre base de concreto

Figura 33 - Motor instalado sobre base metálica

En las bases metálicas y de hormigón puede existir un sistema de deslelevación. Normalmente son utilizados en aplicaciones en que el accionamiento ocurre por poleas y correas. Son más flexibles permitiendo montajes y desmontajes más rápidas, además de permitir ajustes en la tensión de la correa. Otro aspecto importante es la posición de los tornillos de trabado de la base, que deben ser opuestos y en posición diagonal. El riel más cercano a la polea motora es colocado de forma que el tornillo de posicionamiento permanezca entre el motor y la máquina accionada. El otro riel debe ser colocado con el tornillo en posición opuesta (diagonal), como es presentado en la Figura 34.

Para facilitar el montaje, las bases pueden poseer características como:
- Resaltes y/o huecos
- Tornillos de anclaje con placas sueltas
- Tornillos fundidos en el hormigón
- Tornillos de nivelación
- Tornillos de posicionamiento
- Bloques de hierro o de acero, placas con superficies planas

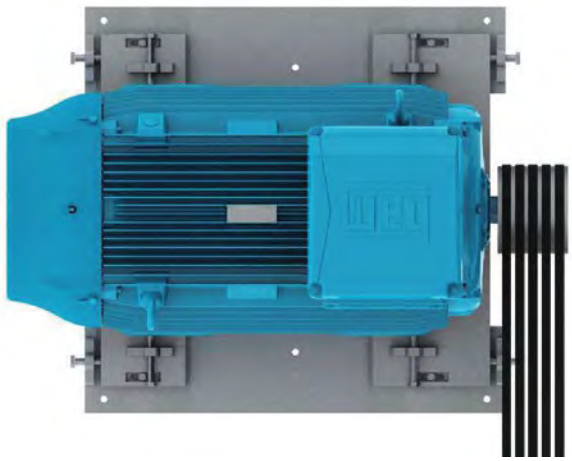

Figura 34 - Motor instalado sobre base deslizante

También se recomienda que después de la instalación del motor, las partes metálicas expuestas sean protegidas contra oxidación.

6.2 FIJACIÓN DEL MOTOR

Motores sin patas suministrados con dispositivos de transporte, de acuerdo con la Figura 35, deben tener sus dispositivos retirados antes de iniciar la instalación del motor.

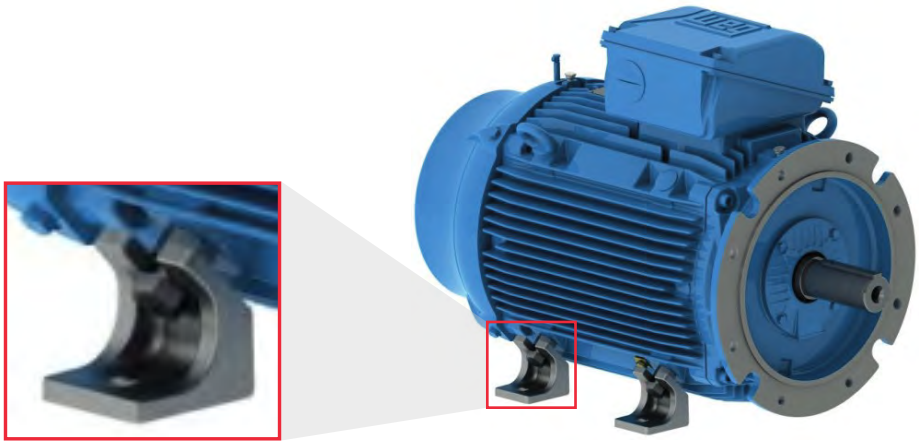

Figura 35 - Dispositivo de transporte para motores sin patas

6.2.1 Fijación por las patas

El dimensionamiento de la perforación de las patas, basado en las normas IEC o NEMA, es informado en el catálogo técnico del producto.
El motor debe ser apoyado sobre la base, alineado y nivelado a fin de que no provoque vibraciones ni esfuerzos excesivos en el eje o en los cojinetes. Para más detalles, consulte el ítem 6.3 y 6.6.
Se recomienda que el tornillo de fijación tenga longitud roscada libre de 1,5 veces el diámetro del tornillo. En aplicaciones de alto rendimiento, puede ser necesaria la utilización de una longitud roscada libre mayor. La Figura 36 representa la fijación del motor con patas indicando la longitud libre mínima del tornillo.

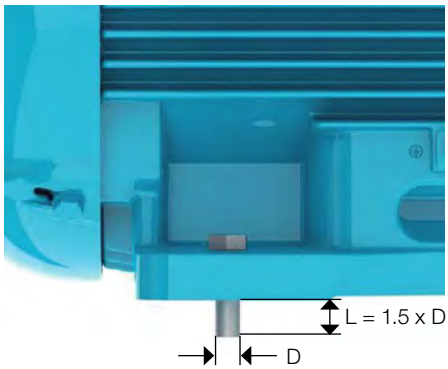

Figura 36 - Representación de la fijación del motor por patas

6.2.1.1. Fijación por brida

El dimensional de la brida, basado en las normas IEC o NEMA, es informado en el catálogo electrónico o en el catálogo técnico del producto.
La brida del motor debe ser apoyada en la base, que debe poseer un dimensionamiento de encaje adecuado para el tamaño de la brida del motor y así asegurar la concentricidad del conjunto.
Dependiendo del tipo de brida, la fijación puede ser realizada desde el motor hacia la base (brida FF e (IEC) o D (NEMA)) o desde la base hacia el motor (brida C (DIN o NEMA)).
Para fijación desde la base hacia el motor, la determinación de la longitud del tornillo debe tomar en consideración el grosor de la base del usuario y la profundidad de la rosca de la brida del motor.

En los casos en que se utilicen bridas de polímero con tuerca incorporada o brida de aluminio con orificio hexagonal, la longitud del tornillo de fijación del motor no debe exceder la longitud del orificio, evitando así la desalineación y holgura del acoplamiento.

En los casos que el agujero de la brida sea pasante, la longitud del tornillo de fijación del motor no debe exceder la longitud roscada de la brida para evitar contacto con la bobina del motor.

Los motores con carcasa y/o brida en aluminio pueden ser suministrados con agujeros hexagonales para fijación de la brida, estos agujeros pueden recibir tornillos cilíndricos compatibles con las dimensiones de acoplamiento estandarizadas, importante tener atención a la clase de resistencia mínima del tornillo, de acuerdo con el catálogo del producto.
Para fijación del motor a la base, se recomienda que el tornillo de fijación tenga longitud roscada libre de 1,5 veces el diámetro del tornillo. En aplicaciones severas, puede ser necesaria la utilización de una longitud roscada libre mayor.
Para fijación de motores de gran porte y/o en aplicaciones de alto rendimiento, se recomienda que, además de la fijación por brida, el motor sea apoyado (por patas o *pad*). El motor nunca puede ser apoyado sobre sus aletas. Ver Figura 37.

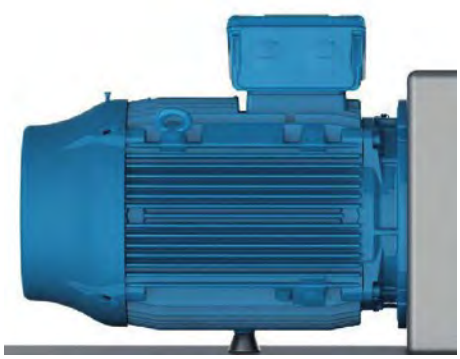

Figura 37 - Representación de la fijación del motor con brida y apoyo en la base de la carcasa

Para aplicación de motores con la presencia de líquidos en el interior de la brida (ej.: aceite), el sellado del motor debe ser adecuado para impedir la penetración de líquidos en el interior del motor.
Se debe respetar el par de apriete indicado en la Tabla 6 al fijar:
- la pata y / o brida de polímero al equipo;
- al instalar tapas deflectoras de polímero de motores WEG General Purpose y WIN y/o cambio/rotación de la caja de conexiones de motores W12/WEG General Purpose.
Para la instalación de motores W12 / WEG General Purpose en las carcasas IEC56, W63 y W71 en la posición vertical del eje hacia arriba, la pata debe bloquearse axialmente mediante la fijación de un tornillo de cabeza plana como se indica en la Tabla 6.
El agujero hexagonal en las bridas C-DIN de los motores W12/WEG General Purpose en las carcasas IEC56 / W63 / W71 son adecuados para los tornillos indicados en la Tabla 6.

Carcasa	Componente	Especificación del tornillo (calibre x largo)	Torque (Nm)
IEC56	Pata Polímero	M5x12	8
W63/W71		M5x16	8
IEC56/W63/ W71	Brida Polímero	-	8
	C-80	M5	5
	C-105	M6	6
160/180/200/W225/225/250/W280	Tapa deflectora	M8 / M10	6 a 8
IEC 56/W63/W71	Caja de conexión /Puesta a tierra	M5	1,8 a 2,4
71/W80/90/W100/112/132	Caja de conexión /Puesta a tierra	M5	5

Tabla 6 - Torque de apriete y tornillo a ser utilizados en motores W12/WEG General Purpose

Para motores de la línea WFL, la brida tiene orificios hexagonales, aptos para tornillos M6 (torque máximo 8Nm), los tornillos deben tener por lo menos clase de resistencia de 5,6. El largo de los tornillos que serán utilizados en la aplicación, para fijar el motor en el equipo, no debe sobrepasar el espesor de las paredes de la tapa donde éstos serán fijados, con riesgo de dañar la cabeza de la bobina del motor, así como de shock eléctrico. El tornillo de la aplicación debe ser engastado en la tapa con profundidad mínima de 7mm y máxima de 9mm (Figura 38).

Figura 38 - Límite de profundidad del engaste

6.2.2 Fijación por pad

Este tipo de fijación es normalmente utilizado en conductos de ventilación. La fijación del motor se hace a través de perforaciones roscadas en la estructura del motor, cuyas medidas se informan en el catálogo electrónico o en el catálogo técnico del producto.
El dimensionamiento de la varilla de fijación/tornillo del motor debe tomar en consideración las medidas del conducto de ventilación o base de instalación y la profundidad de la rosca en el motor. Las varillas de fijación y la pared del ducto deben tener rigidez suficiente para evitar la vibración excesiva del conjunto (motor y ventilador).
La Figura 39 representa la fijación por *pads*.

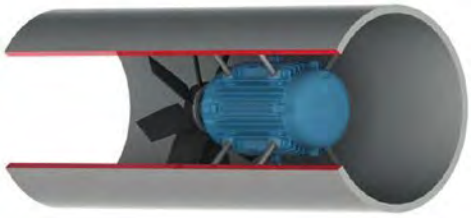

Figura 39 - Representación de la fijación del motor en el interior de un conducto de ventilación

6.3 . EQUILIBRADO

Los equipos desequilibrados generan vibraciones que pueden causar daños al motor. Los motores WEG están equilibrados dinámicamente con "media chaveta" en vacío (desacoplados). Deben ser solicitados equilibrados especiales en el momento de la compra.

Los elementos de transmisión tales como poleas, acoplamientos, etc., deben ser equilibrados antes de ser instalados en los ejes de los motores.

El grado de calidad de equilibrado del motor sigue las normas vigentes para cada línea de producto.
Se recomienda que los desvíos máximos de equilibrado sean registrados en el informe de instalación.

6.4 ACOPLAMIENTOS

Los acoplamientos son utilizados para la transmisión del par del motor hacia la máquina accionada. Al utilizar un acoplamiento, deben ser observados los aspectos siguientes:

- Utilice herramientas apropiadas para el montaje y desmontaje de los acoplamientos y así evitar daños al motor;
- Se recomienda la utilización de acoplamientos flexibles, capaces de absorber pequeños desalineamientos durante la funcionamiento del equipo
- Las cargas máximas y límites de velocidad informados en los catálogos de los fabricantes de los acoplamientos y del motor no deben ser excedidos;
- Realice la nivelación y el alineamiento del motor conforme ítems 6.5 y 6.6, respectivamente.

Los motores accionados sin elementos de transmisión acoplados deben tener su chaveta firmemente fijada o retirada, para prevenir accidentes.

6.4.1 Acoplamiento directo

Cuando el eje del motor está acoplado directamente al eje de la carga accionada, sin el uso de elementos de transmisión, presenta acoplamiento directo. El acoplamiento directo ofrece menor costo, mayor seguridad contra accidentes y ocupa menos espacio.

En aplicaciones con acoplamiento directo, se recomienda el uso de rodamientos de bolas.

6.4.2 Acoplamiento por engranaje

El acoplamiento por engranajes es utilizado cuando existe la necesidad de una reducción de velocidad.
Es imprescindible que los ejes estén perfectamente alineados, rigurosamente paralelos (en caso de engranajes rectos) y en el ángulo de engranaje (en caso de engranajes cónicos o helicoidales).

6.4.3 Acoplamiento por poleasy

Es un tipo de transmisión utilizado cuando existe la necesidad de una relación de velocidades entre el motor y la carga accionada.

Una tensión excesiva en las correas perjudica los rodamientos y puede provocar la ruptura del eje del motor.

6.4.4 Acoplamiento de motores equipados con cojinetes de deslelevación

Los motores equipados con cojinetes de deslelevación deben estar acoplados directamente a la máquina accionada o por medio de un reductor. Los cojinetes de deslelevación no permiten el acoplamiento a través de poleas y correas.

Los motores equipados con cojinetes de deslelevación poseen 3 marcas en la punta del eje, donde la marca central es la indicación del centro magnético y las otras 2 marcas externas indican los límites de movimiento axial permitidos para el rotor, conforme Figura 40.
El motor debe ser acoplado de manera que la flecha fijada en la carcasa del cojinete quede posicionada sobre la marca central, cuando el motor esté en operación. Durante la puesta en marcha, o incluso en operación, el rotor puede moverse libremente entre las dos ranuras externas, en caso que la máquina accionada ejerza algún esfuerzo axial sobre el eje del motor. No obstante, el motor no puede operar de manera constante con esfuerzo axial sobre el cojinete, bajo ningún concepto.

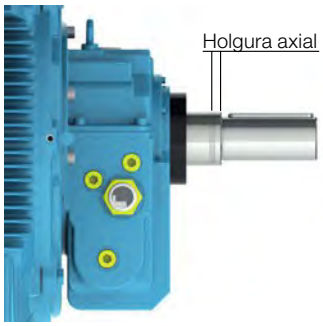

Figura 40 - Holgura axial en motor equipado con cojinete de deslelevación

Al evaluar el acoplamiento, se debe considerar la holgura axial máxima del cojinete conforme la Tabla 7. Las holguras axiales de la máquina accionada y del acoplamiento influyen en la holgura máxima del cojinete.

Tamaño del cojinete	Holgura axial total (mm)
9*	3 + 3 = 6
11*	4 + 4 = 8
14*	5 + 5 =10
18	7,5 + 7,5 = 15

Tabla 7 - Holguras utilizadas en cojinetes de deslelevación

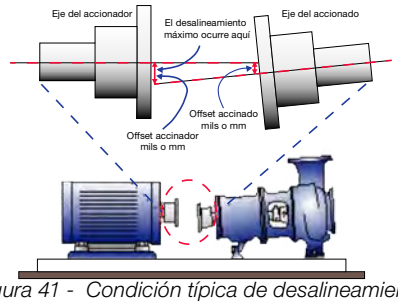
Los cojinetes de deslelevación utilizados por WEG no fueron proyectados para soportar un esfuerzo axial continuo. La operación continua de la máquina, en sus límites de holgura axial, no es recomendada.

6.5 NIVELACIÓN

La nivelación del motor debe ser realizada para corregir eventuales desvíos de planicidad, que puedan existir provenientes de otros procesos y acomodaciones de los materiales. La nivelación puede ser realizada por medio de un tornillo de nivelación fijado a la pata o brida del motor, o por medio de finas chapas de compensación. Tras la nivelación, la diferencia de altura entre la base de fijación del motor y el motor no debe exceder 0,1 mm.
En caso que sea utilizada una base metálica para ajustar la altura de la punta de eje del motor con la punta de eje de la máquina accionada, ésta debe ser nivelada en la base de cemento.
Se recomienda que los desvíos máximos de nivelación sean registrados y almacenamientos en el informe de instalación.

6.6 ALINEAMIENTO

El alineamiento entre la máquina motriz y la accionada es una de las variables que más contribuyen para prolongar la vida del motor. El desalineamiento entre los acoplamientos genera elevadas cargas que reducen la vida útil de los cojinetes, provocan vibraciones y, en casos extremos, pueden causar la ruptura del eje. La Figura 41 ilustra el desalineamiento entre el motor y el equipamiento accionado.



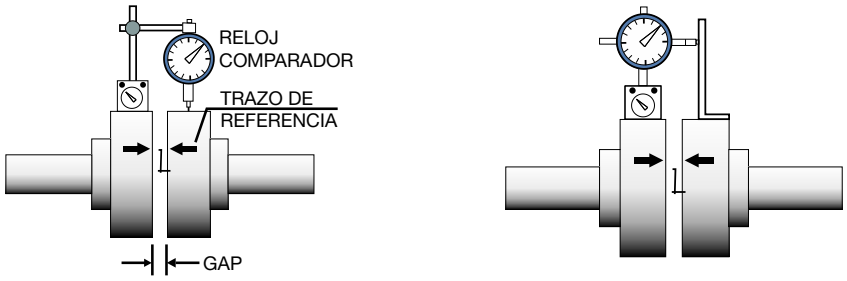


Figura 41 - Condición típica de desalineamiento

Para efectuar un buen alineamiento del motor, se deben utilizar herramientas y dispositivos adecuados, tales como reloj comparador, instrumento de alineamiento láser, entre otros. El eje debe ser alineado axialmente y radialmente con el eje de la máquina accionada.

El valor leído en relojes comparadores para el alineamiento, de acuerdo con la Figura 42, no debe exceder 0,03 mm, considerando un giro completo del eje. Debe existir una holgura entre los acoplamientos, para compensar la dilatación térmica de los ejes, conforme especificación del fabricante del acoplamiento.

Alineamiento paralelo *Alineamiento angular*

Figura 42 - Alineamiento con reloj comparador

En caso que el alineamiento sea realizado a través de un instrumento láser, deben ser seguidas las instrucciones y recomendaciones suministradas por el fabricante del instrumento.
La verificación del alineamiento debe ser realizada a temperatura ambiente y a la temperatura de trabajo de los equipamientos.

Es recomendable que el alineamiento de los acoplamientos sea verificado periódicamente.

Para acoplamiento por poleas y correas, el alineamiento debe ser realizado de tal modo que el centro de la polea motora esté en el mismo plano del centro de la polea movida y los ejes del motor y de la máquina estén perfectamente paralelos.
Después de la realización de los procedimientos descritos anteriormente, se debe certificar que los dispositivos de montaje del motor no permitan alteraciones en el alineamiento y en la nivelación y no causen daños al equipamiento.
Se recomienda que los desvíos máximos de alineamiento sean registrados y almacenamientos en el informe de instalación.

6.7 CONEXIÓN DE MOTORES LUBRICADOS POR ACEITE O DE TIPO NEBLINA DE ACEITE

En motores con lubricación a aceite o de tipo *oil mist*, se debe conectar los tubos de lubricación existentes (entrada, salida del cojinete y drenaje del motor), conforme se indica en la Figura 43.
El sistema de lubricación debe garantizar lubricación continua del cojinete, de acuerdo con las especificaciones del fabricante de este sistema.

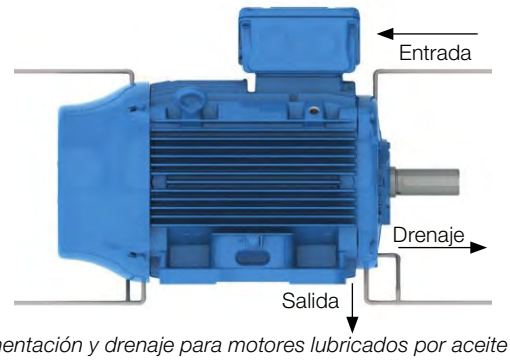

Figura 43 - Sistema de alimentación y drenaje para motores lubricados por aceite o de tipo Neblina de aceite

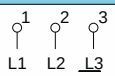
6.8 CONEXIÓN DEL SISTEMA DE REFRIGERACION POR AGUA

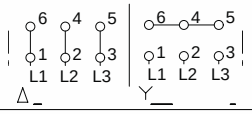
En motores con refrigeración a agua, debe ser prevista la instalación de conductos en la entrada y salida de agua del motor para garantizar su refrigeración. Se debe observar, conforme el ítem 7.2, el flujo mínimo y la temperatura del agua en la instalación.

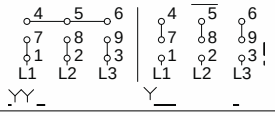
6.9 CONEXIÓN ELECTRICA

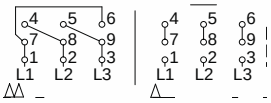
Para el dimensionamiento de los cables de alimentación y dispositivos de maniobra y protección deben ser considerados: corriente nominal del motor, factor de servicio, corriente de arranque, condiciones del ambiente y de la instalación, la máxima caída de tensión, etc. conforme las normas vigentes.
Todos los motores deben ser instalados con sistemas de protección contra sobrecarga. Para motores trifásicos se recomienda la instalación de sistemas de protección contra falta de fase.

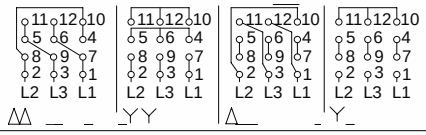
Antes de conectar el motor, verifique si la tensión y la frecuencia de la red son las mismas marcadas en la placa de características del motor. Siga el diagrama de conexión indicado en la placa de características del motor. Como referencia, pueden ser seguidas los diagramas de conexión presentados en la Tabla 8.
Para evitar accidentes, verifique si la puesta a tierra fue realizada conforme las normas vigentes.

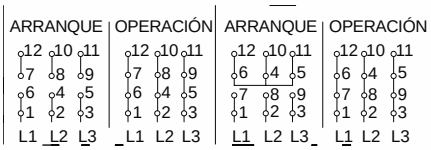


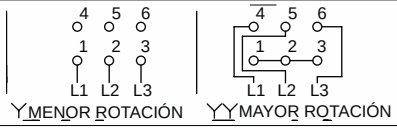


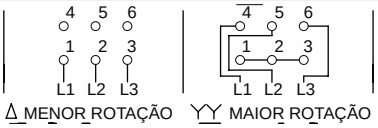


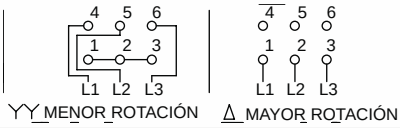


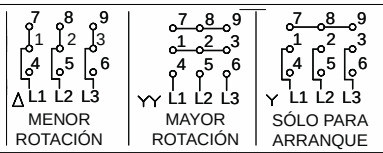


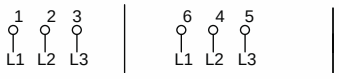












Configuración	Cantidad de cables	Tipo de conexión	Diagrama de conexión
Velocidad Única	3	-	
	6	Δ - Y	
	9	YY - Y	
		ΔΔ - Δ	
		ΔΔ - YY - Δ - Y	
	12	Δ - PWS Partida Devanado parcial	
Dos velocidades Dahlander	6	YY - Y Par Variable	
		Δ - YY Par Constante	
		YY - Δ Potencia Constante	
	9	Δ - Y - YY	
Dos velocidades Doble devanado	6	-	

Tabla 8 - Diagrama de conexión usuales para motores trifásicos

Características del cable en el diagrama de conexión		1	2	3	4	5	6	7	8	9	10	11	12

		Con Termostato	Split Phase (sin condensador)	
			Condensador de arranque / Condensador permanente Dos valores	

Tabla 10 - Diagramas de ligação usuais para motores monofásicos

Los motores W12 y WEG General Purpose con la tapa de la caja de conexión polimérica tienen el diagrama de conexión impreso en su interior. Para conectar los cables, verifique en la placa de identificación el código del diagrama que debe usarse.

Para abrir la tapa de la caja de conexión use un destornillador de hendidura o alguna herramienta similar, posicionando en la región del encaje, como palanca y levante el encaje con cuidado, uno a la vez, hasta que la tapa sea removida.
Asegurarse de que el motor esté conectado correctamente a la red de alimentación eléctrica, a través de contactos seguros y permanentes.

AVISO – Las normas locales tienen prioridad en la definición de los estándares de conexión.

Las conexiones presentadas abajo son una referencia para la conexión de los cables de alimentación del cliente, en motores de baja tensión con placas de bornes. Las placas de bornes presentadas abajo son el estándar de cada línea, no obstante, pueden ocurrir variaciones.
Se recomienda siempre el uso de terminales en cobre electrolítico o latón, similares a los terminales utilizados en los cables de los motores.

Placa de bornes K1M

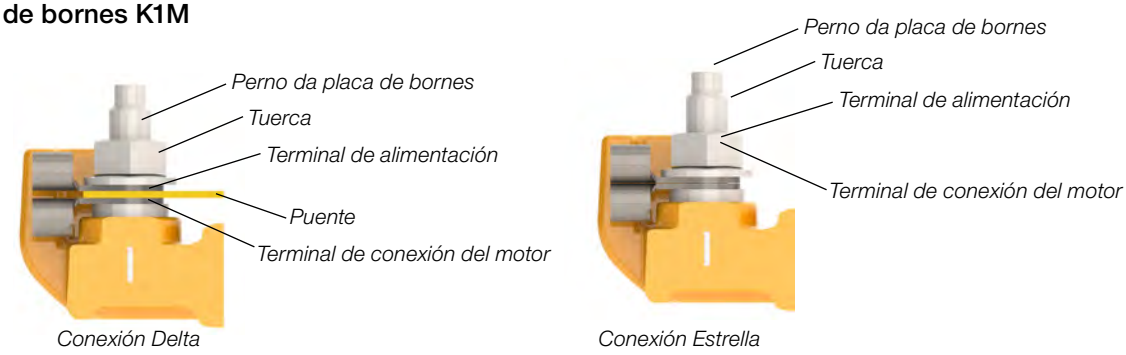

Figura 44 - Conexión para los motorescon placa de bornes K1M.*

Placa de bornes KWLV y KWMV

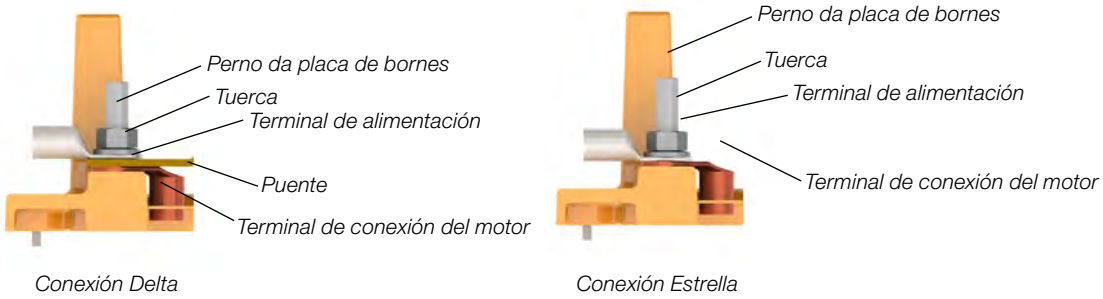

Figura 45 - Conexión para los motores con placa de bornes KWLV y KWMV.

Asegúrese de que el motor esté conectado correctamente a la red de alimentación eléctrica a través de contactos seguros y permanentes.
Para motores sin placa de bornes, aísle los cables terminales del motor, utilizando materiales aislantes compatibles con la tensión de alimentación y con la clase de aislamiento informada en la placa de características.
Para la conexión del cable de alimentación y del sistema de puesta a tierra deben ser respetados los pares de apriete indicados en la Tabla 43.
La distancia de aislamiento (ver Figura 46) entre partes vivas no aisladas entre sí y entre partes vivas y partes puestas a tierra debe respetar los valores indicados en la Tabla 11.

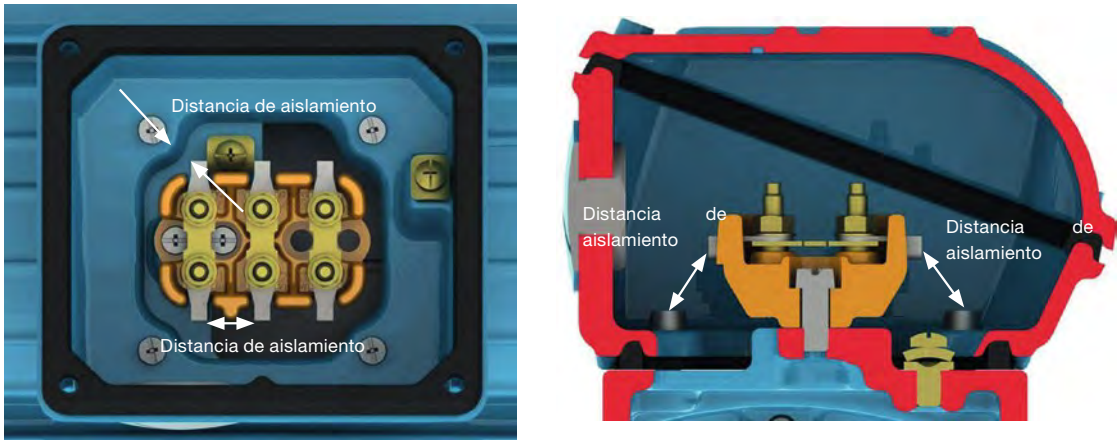

Figura 46 - Representación de la distancia de aislamiento

Tensión	Distancia mínima de aislamiento (mm)
U ≤ 440 V	4
440 < U ≤ 690 V	5.5
690 < U ≤ 1.000 V	8
1.000 < U ≤ 6.900 V	45
6.900 < U ≤ 1.1000 V	70
1.1000 < U ≤ 16.500 V	105

Tabla 11 - Distancia mínima de aislamiento (mm) x tensión de alimentación

Aunque el motor esté apagado, puede existir energía eléctrica en el interior de la caja de conexión utilizada para la alimentación de las resistencias de calentamiento o inclusive para energizar el devanado, cuando éste esté siendo utilizado como elemento de calentamiento.
Los condensadores de motores pueden retener energía eléctrica, incluso con el motor apagado. No toque los condensadores ni los terminales del motor sin antes verificar la existencia de tensión en los mismos. Para los motores WMagnet y WQuattro, incluso con la máquina desconectada de la energía, puede haber voltaje en los terminales de la máquina si el rotor se mueve.

Después de efectuar la conexión del motor, asegúrese de que ningún cuerpo extraño haya permanecido en el interior de la caja de conexión.

Tomar las medidas necesarias para asegurar el grado de protección indicado en la placa de identificación del motor:
- En las entradas de cables no utilizadas de la caja de conexiones, las cuales deben ser debidamente cerradas con tapón;
- En componentes suministrados de forma independiente (por ejemplo cajas de conexiones montadas por separado).
Las entradas de cables utilizadas para alimentación y control deben emplear componentes (como, por ejemplo, prensacables y conductos eléctricos) que cumplan las normas y reglamentaciones vigentes en cada país.

En caso que existan accesorios, como freno y ventilación forzada, los mismos deben ser conectados a la red de alimentación, siguiendo las informaciones de sus placas de características y los cuidados indicados anteriormente.

En motores con caja de conexión polimérica y / o su tapa, asegúrese de que los accesorios y bloqueos de estos componentes estén correctamente ensamblados después de realizar la conexión del cable.

En los motores que tienen tapas ciegas en la caja de terminales, para quitar las tapas ciegas de aluminio, use un destornillador o una herramienta similar y un martillo para separar la tapa ciega, golpeando con la llave varias veces hasta que se quite. Retire primero la interna y luego, si es necesario, la externa según el tamaño del prensaestopas utilizado. Para las cajas de conexiones de polímero, puede ser necesario utilizar una cuchilla o un taladro para evitar dañar la caja. Tenga cuidado, no golpee el interior de la caja de conexiones y elimine los residuos del troquelado desprendidos en el interior de la caja.
Todas las protecciones, inclusive las contra sobretensión, deben ser ajustadas tomando como base las condiciones nominales de la máquina. Esta protección también tendrá que proteger el motor en caso de cortocircuito, falta de fase, o rotor bloqueado.

Los ajustes de los dispositivos de seguridad de los motores deben ser hechos según las normas vigentes.
Verifique el sentido de rotación del motor. En caso que no haya ninguna limitación debido a la utilización de ventiladores unidireccionales, es posible cambiar el sentido de giro de motores trifásicos, invirtiendo dos fases de alimentación. Para motores monofásicos, verifique el esquema de conexión en la placa de características.

6.10 CONEXIÓN DE LOS DISPOSITIVOS DE PROTECCIÓN TERMICA

Cuando es suministrado con dispositivos de protección o de monitoreo de temperatura, como: protector térmico bimetálico (termostatos), termistores, protectores térmicos del tipo Automático, Pt-100 (RTD), etc., sus terminales deben ser conectados a los dispositivos de control correspondientes, de acuerdo con las placas de características de los accesorios. La no observación de este procedimiento puede resultar en la cancelación de la garantía y riesgo para la instalación.

No aplique tensión de test superior a 2,5 V para termistores y corriente superior a 1 mA para RTDs (Pt-100) de acuerdo con la norma IEC 60751.

El esquema de conexión de los protectores térmicos bimetálicos (termostatos) y termistores se muestra en la Figura 47 y Figura 48, respectivamente.

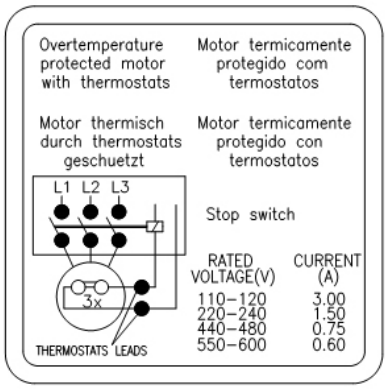

Figura 47 - Conexión de los protectores térmicos bimetálicos (termostatos)

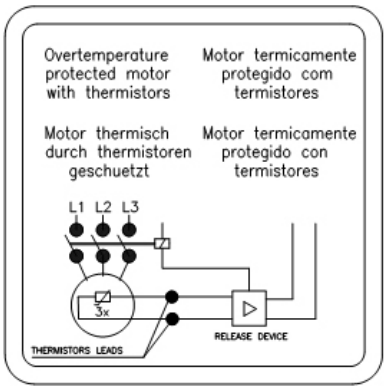

Figura 48 - Conexión de los termistores

Los límites de temperatura de alarma y desconexión de las protecciones térmicas pueden ser definidos de acuerdo con la aplicación, no obstante, no deben sobrepasar los valores indicados en la Tabla 12.

Componente	Clase de aislamiento	Temperatura máxima de operación (°C)	
		Alarma	Desconexión
Devanado	B	-	130
	F	130	155
	H	155	180
Cojinete	Todas	110	120

Tabla 12 - Temperatura máxima de actuación de las protecciones térmicas

Notas:

1) La cantidad y el tipo de protección térmica instalados en el motor son informados en las placas de características de los accesorios del mismo.

2) En el caso de protección térmica con resistencia calibrada (por ejemplo, Pt-100), el sistema de protección debe ser ajustado a la temperatura de operación indicada en la Tabla 12..

6.11 TERMORESISTORES (PT-100)

Son elementos cuya operación está basada en la característica de variación de la resistencia con la temperatura, intrínseca en algunos materiales (generalmente platina, níquel o cobre).
Poseen resistencia calibrada, que varía linealmente con la temperatura, posibilitando un acompañamiento continuo del proceso de calentamiento del motor por el display del controlador, con alto grado de precisión y sensibilidad de respuesta. Su aplicación es amplia en los diversos sectores de técnicas de medición y automatización de temperatura de las industrias. Generalmente, se aplica en instalaciones de gran responsabilidad como, por ejemplo, en régimen intermitente muy irregular. El mismo detector puede servir tanto para alarma como para apagado.

La equivalencia entre la resistencia del Pt-100 y la temperatura se presenta en la Tabla 13 y Figura 50. En la Figura 49 se presenta la conexión de Pt-100 de los bobinados.

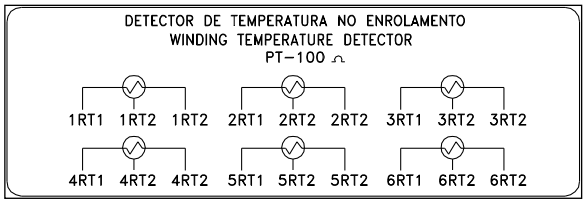

Figura 49 - Conexión de Pt-100 de los bobinados

Tabla 13 - Equivalencia entre la resistencia del Pt-100 y la temperatura

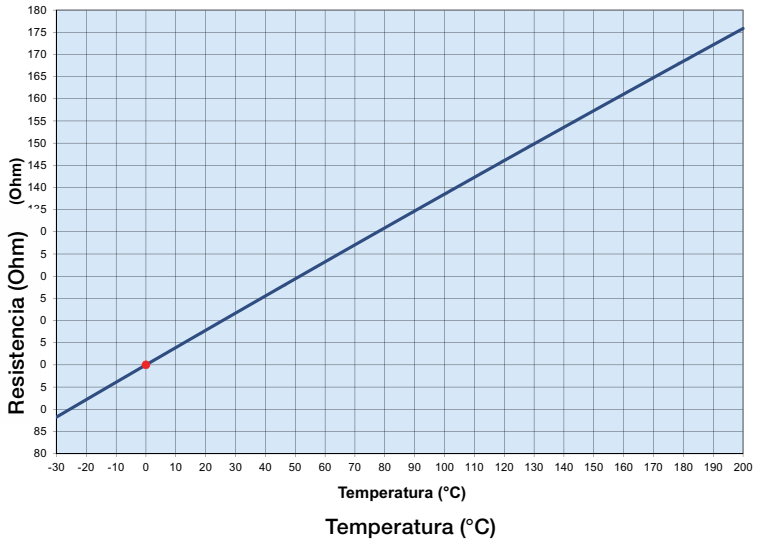

Figura 50 - - Resistencia óhmica del Pt-100 x temperatura

6.12 CONEXIÓN DE LAS RESISTENCIAS DE CALDEO

Antes de encender las resistencias de caldeo, verifique si sus conexiones fueron realizadas de acuerdo con el diagrama indicado en la placa de características de las resistencias de caldeo. Para motores suministrados con resistencias de caldeo de doble tensión (110-127/220-240 V), ver Figura 51.

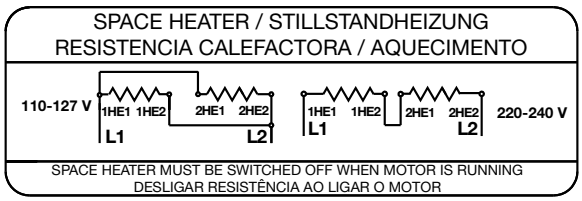

Figura 51 - - Conexión de las resistencias de caldeo de doble tensión

Las resistencias de caldeo nunca deben estar energizadas mientras el motor esté operando.

6.13 METODOS DE ARRANQUE

Siempre que sea posible, el arranque del motor debe ser directo (en plena tensión). Es el método más simple, sin embargo, solamente es viable cuando la corriente de arranque no afecta la red de alimentación. Es importante seguir las reglas vigentes de la concesionaria de energía eléctrica.

En los casos en que la corriente de arranque del motor es alta, pueden ocurrir las siguientes consecuencias:

a) Elevada caída de tensión en el sistema de alimentación de la red, provocando interferencia en los equipamientos instalados en este sistema;

b) El superdimensionamiento del sistema de protección (cables, contactores), lo que eleva los costos de la instalación.

En caso que la arranque directa no sea posible debido a los problemas citados arriba, se puede usar el método el arranque indirecto compatible con la carga y la tensión del motor, para reducir la corriente de arranque.

Cuando es utilizado un método de arranque con tensión reducida, el par de arranque del motor también será reducido.

La Tabla 14 indica los métodos de arranque indirecta posibles de ser utilizados, de acuerdo con la cantidad de cables del motor.

Cantidad de cables	Métodos de arranques posibles
3 cables	Llave Compensadora Soft-starter
6 cables	Llave Estrella - Triángulo Llave Compensadora Soft-starter
9 cables	Llave Serie - Paralela Llave Compensadora Soft-starter
12 cables	Llave Estrella - Triángulo Llave Serie - Paralela Llave Compensadora Soft-starter

Tabla 14 - Métodos de arranque - cantidad de cables

La Tabla 15 indica ejemplos de métodos de arranque indirecto que se pueden utilizar, de acuerdo con la tensión indicada en la placa de características del motor y la tensión de la red eléctrica.

Tensión de la placa de características	Tensión de la red	Arranque con llave Estrella - Triángulo	Arranque con llave compensadora	Arranque con llave Serie - Paralela	Arranque con Soft-starter
220/380 V	220 V 380 V	SÍ NO	SÍ SÍ	NO NO	SÍ SÍ
220/440 V	220 V 440 V	NO NO	SÍ SÍ	SÍ NO	SÍ SÍ
230/460 V	230 V 460 V	NO NO	SÍ SÍ	SÍ NO	SÍ SÍ
380/660 V	380 V	SÍ	SÍ	NO	SÍ
220/380/440 V	220 V 380 V 440 V	SÍ NO SÍ	SÍ SÍ SÍ	SÍ SÍ NO	SÍ SÍ SÍ

Tabla 15 - Métodos de arranque x tensión

Otro método de arranque posible que no sobrecargue la red de alimentación es la utilización de un convertidor de frecuencia. Para más informaciones sobre motores alimentados con convertidor de frecuencia ver ítem 6.14.

6.14 MOTORES ALIMENTADOS POR CONVERTIDOR DE FRECUENCIA

La operación con convertidor de frecuencia debe ser informada en el momento de la compra debido a posibles diferencias constructivas necesarias para ese tipo de accionamiento.

Los motores WMagnet deben ser accionados solamente por convertidor de frecuencia. Los motores WQuattro deben ser accionados directamente a partir de la red o por convertidor de frecuencia en modo escalar.

El convertidor utilizado para accionar motores con tensión de alimentación hasta 690 V debe poseer modulación PWM con control vectorial.

Cuando un motor opera con convertidor de frecuencia por debajo de la frecuencia nominal, es necesario reducir el torque suministrado por el motor, a fin de evitar sobrecalentamiento. Los valores de reducción de torque *(derating torque)* pueden ser encontrados en el ítem 6.4 de la "Guía Técnica Motores de Inducción Alimentados por Convertidores de Frecuencia PWM" disponible en www.weg.net.

Para operación por encima de la frecuencia nominal se debe observar:
- Operación con potencia constante;
- El motor puede suministrar como máximo 95% de la potencia nominal;
- Respetar la rotación máxima, considerando los siguientes criterios:
  - Máxima frecuencia de operación informada en la placa adicional;
  - Límite de rotación mecánica del motor.

Para los motores WMagnet accionados por inversores que no son WEG, además del límite de velocidad indicado en la hoja de datos del motor, se debe verificar el límite de velocidad máxima permitida para evitar quemar el inversor en caso de un corte de energía. Debe considerarse de acuerdo con la siguiente ecuación:

$$RPM_{máx} = 0.9 * V_{rmsMáx} * 1000$$
$$ke$$

Ser,
$RPM_{máx}$ – Velocidad máxima permitida para evitar quemar el inversor en caso de un corte de energía en [RPM].
$V_{rmsMáx}$ – Voltaje rms máximo de entrada del inversor, según lo informado por el fabricante del inversor en [V].
ke – Parámetro informado en la placa de características y en la hoja de datos del motor en [V / kRPM].

Los recomendaciones para los cables de conexión entre motor y convertidor son indicadas en el ítem 6.8 de la "Guía Técnica de Motores de Inducción alimentados por Convertidores de Frecuencia PWM" disponible en www.weg.net.

6.14.1 Uso de filtros (dV/dt)

6.14.1.1. Motor con alambre circular esmaltado

Los motores con tensión nominal de hasta 690 V, cuando son alimentados por convertidores de frecuencia, no requieren filtros, si son observados los criterios de la Tabla 16.

Tensión de operación del motor[1]	Tensión de pico en el motor (máx.)	dV/dt en la salida del convertidor (máx.)	Rise time[2] del convertidor (mín.)	MTBP[2] tiempo entre pulsos (min)
Vnom < 460 V	≤ 1.600 V	≤ 5200 V/µs	≥ 0,1 µs	≥ 6 µs
460 ≤ Vnom < 575 V	≤ 2.000 V	≤ 6500 V/µs		
575 ≤ Vnom ≤ 1000 V	≤ 2.400 V	≤ 7800 V/µs		

Tabla 16 - Criterios para utilización de motores de alambre circular esmaltado alimentados por convertidor de frecuencia

1. Para motores con doble tensión, ejemplo 380/660 V, deben ser observados los criterios de la tensión menor (380 V).
2. Informaciones suministradas por el fabricante del convertidor.

6.14.1.2. Motor con bobina preformada

Los motores con bobina preformada (media y alta tensión, independientemente del tamaño de la carcasa y baja tensión a partir de la carcasa IEC 500 / NEMA 80) especificados para utilización con convertidor de frecuencia no requieren filtros, si son observados los criterios de la Tabla 17.

Tensión de operación del motor	Tipo de modulación	Aislamiento de la espira (fase-fase)		Aislamiento principal (fase-tierra)	
		Tensión de pico en los terminales del motor	dV/dt en los terminales del motor	Tensión de pico en los terminales del motor	dV/dt en los terminales del motor
690 < Vnom ≤ 4160 V	Senoidal	≤ 5.900 V	≤ 500 V/µs	≤ 3.400 V	≤ 500 V/µs
	PWM	≤ 9.300 V	≤ 2700 V/µs	≤ 5.400 V	≤ 2.700 V/µs
4160 < Vnom ≤ 6600 V	Senoidal	≤ 9.300 V	≤ 500 V/µs	≤ 5.400 V	≤ 500 V/µs
	PWM	≤ 14.000 V	≤ 1.500 V/µs	≤ 8.000 V	≤ 1.500 V/µs

Tabla 17 - Criterios para utilización de motores con bobina preformada alimentados con convertidor de frecuencia

6.14.2 Aislamiento de los cojinetes

Se recomienda aislar los cojinetes para operación con convertidor de frecuencia de acuerdo con la Tabla 18.

Carcasa	Recomendación
IEC 315 e 355 NEMA 445/7 a L5810/11	Un cojinete aislado Puesta a tierra entre eje y carcasa por medio de escobilla
IEC 400 y superior NEMA 6800 y superior	Cojinete trasero aislado Puesta a tierra entre eje y carcasa por medio de escobilla

Tabla 18 - Recomendación sobre el aislamiento de los cojinetes para motores accionados por convertidor de frecuencia

Para motores suministrados con sistema de puesta a tierra del eje, debe ser observado constantemente el estado de conservación de la escobilla y, al llegar al fin de su vida útil, la misma debe ser sustituida por otra de su misma especificación.

Si un motor se suministra con una escobilla de puesta a tierra interna, indicada por una etiqueta en el producto, se debe verificar que cada vez se le dé mantenimiento a los cojinetes o cualquier parte interna del motor.

Los motores de carcasa IEC 315, NEMA 445/7 y superiores, cuando se alimentan por inversor, deben estar equipados con juegos de puesta a tierra del eje.

Para motores de área segura y para fines de pruebas de verificación, pueden ser instalados pernos terminales de contacto, de los dos lados del aislamiento del cojinete, de modo de permitir la realización de mediciones de la tensión sobre el cojinete, o, en caso de que los pernos terminales sean conectados por un cable o cable trenzado metálico (cortocircuitando el aislamiento del cojinete), de la corriente por el cojinete. Se debe observar, sin embargo, que durante la operación normal del motor, el aislamiento del cojinete no debe estar cortocircuitado figura 52.

Figura 52 - Alambre trenzado

6.14.3 Frecuencia de conmutación

La frecuencia mínima de conmutación del convertidor deberá ser de 2 kHz.
Se recomienda que la frecuencia máxima de conmutación del convertidor sea de 5 kHz.

La no observación de los criterios y recomendaciones expuestos en este manual puede resultar en la anulación de la garantía del producto.

6.14.4 Límite de la rotación mecánica

La Tabla below muestra las rotaciones máximas permitidas para motores accionados por convertidor de frecuencia.

Carcasa		Polaridad	Rotación máxima para motores estándar

Tabla 22 - Rotación máxima de los motores W22 (en RPM)

Tabla 23 - Rotación máxima de los motores W40 (en RPM)

Notas:

1. *Cuando el motor tenga sellados del tipo retén o Inproseal, entre en contacto con WEG.*
2. *Para rotaciones superiores a la nominal, medir la vibración y la temperatura del cojinete, si la temperatura y los niveles de vibración sobrepasaran los límites especificados, contacte a WEG.*
3. *Verificar el modelo del rodamiento delantero en la placa del motor.*

Por condiciones diferentes de las descritas en las tablas 18 a 22, consultar a WEG.

Para más informaciones sobre el uso de convertidor de frecuencia, o acerca de cómo dimensionarlo correctamente para su aplicación, contacte a WEG o consulte la “Guía Técnica de Motores de Inducción Alimentados por Convertidores de Frecuencia PWM” disponible en www.weg.net.

7. OPERACIÓN

7.1 ARRANQUE DEL MOTOR

Después de ejecutar los procedimientos de instalación, algunos aspectos deben ser verificados antes de la arranque inicial del motor, principalmente si el motor no fue colocado inmediatamente en operación tras su instalación. Aquí deben ser verificados los siguientes ítems:

- Si los datos que constan en la placa de características (tensión, corriente, esquema de conexión, grado de protección, refrigeración, factor de servicio, entre otras) están de acuerdo con la aplicación;
- El correcto montaje y alineamiento del conjunto (motor + máquina accionada);
- El sistema de accionamiento del motor, considerando que la rotación del motor no sobrepase la velocidad máxima establecida en la Tabla 18, 19, 20, 21 y 22;

- La resistencia de aislamiento del motor, conforme ítem 5.4;
- El sentido de rotación del motor;
- La integridad de la caja de conexión, que debe estar limpia y seca, sus elementos de contacto libres de oxidación, sus sellados en condiciones apropiadas de uso y sus entradas de cables correctamente cerradas/protegidas de acuerdo con el grado de protección.
- Las conexiones del motor, verificando si fueron correctamente realizadas, inclusive puesta a tierra y cables auxiliares, conforme recomendaciones del ítem 6.9;
- El correcto funcionamiento de los accesorios (freno, encoder, protección térmica, ventilación forzada, etc.) instalados en el motor;
- La condición de los rodamientos. Para los motores almacenados y/o instalados hace más de dos años sin funcionamento, se recomienda cambiar los rodamientos, o como alternativa, desmontarlos, lavarlos, revisarlos y lubricarlos nuevamente antes de hacer trabajar el motor. Si el almacenamiento y/o instalación se realizó de acuerdo con las recomendaciones del ítem 5.3, realice el procedimiento de relubricación como se describe en el ítem 8.2. Para una evaluación de los cojinetes se pueden utilizar técnicas de análisis de vibración: análisis de envolvente o demodulación.
- En motores con cojinetes de rodillos y lubricación por aceite debe ser verificado:
  - El nivel correcto de aceite del cojinete. El mismo debe estar en la mitad del visor (ver Figura 54 y 55);
  - Que cuando el motor sea almacenamiento por un período igual o mayor al intervalo de cambio de aceite, el aceite deberá ser cambiado antes de la puesta en funcionamiento.
- En motores con cojinetes de deslelevación debe ser verificado:
  - El nivel correcto de aceite del cojinete. El mismo debe estar en la mitad del visor (ver Figura 56);
  - Que el motor no arranque ni opere con cargas radiales o axiales;
  - Que cuando el motor sea almacenamiento por un período igual o mayor al intervalo de cambio de aceite, el aceite deberá ser cambiado antes de la puesta en funcionamiento.
- El análisis de la condición de los condensadores, si existen. Para motores instalados por un período superior a dos años, pero que no entraron en operación, se recomienda la sustitución de sus condensadores de arranque de motores monofásicos;
- Que entradas y salidas de aire estén completamente desobstruidas. El mínimo espacio libre hasta la pared más próxima (L) debe ser ¼ del diámetro de la entrada de aire de la deflectora (D), ver Figura 53. El aire en la entrada del motor debe estar a temperatura ambiente.

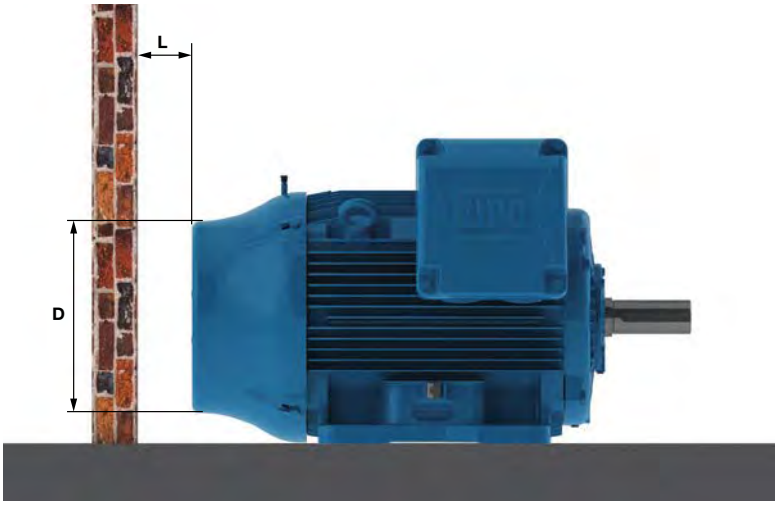

Figura 53 - - Distancia mínima del motor hasta la pared

Como referencia, pueden ser seguidas las distancias mínimas presentadas en la Tabla 24.

Carcasa		**Distancia entre la tapa deflectora y la pared (L)**	
IEC	NEMA	mm	pulgadas
63	-	25	0,96

400	6806/7/8 6809/10/11	147	5,79
450	7006/10	159	6,26
500	8006/10	171	6,73
560	8806/10	185	7,28
630	9606/10	200	7,87

Tabla 24 - Distancia mínima entre la tapa deflectora y la pared

- Que los flujos y las temperaturas del agua estén correctas, cuando es utilizada en la refrigeración del motor. Ver ítem 7.2;
- Que todas las partes giratorias, como poleas, acoplamientos, ventiladores externos, eje, etc., estén protegidas contra toques accidentales.

Otros ensayos y verificaciones que no constan en esta relación pueden hacerse necesarios, en función de las características específicas de la instalación, aplicación y/o del motor.

Despuésde haber sido realizadas todas las verificaciones, siga el procedimiento de abajo para efectuar el arranque de motor:

- Encienda la máquina sin ninguna carga (cuando sea posible), accionando la llave de arranque como si fuese un pulso, verificando el sentido de rotación, la presencia de ruido, vibración u otra condición anormal de operación;
- Encienda nuevamente el motor, debiendo arrancar y funcionar de manera suave. En caso que eso no ocurra, apáguelo y verifique nuevamente el sistema de montaje y las conexiones antes de arrancarlo de nuevo;
- En caso de vibraciones excesivas, verifique si los tornillos de fijación están adecuadamente apretados o si la vibración es proveniente de máquinas adyacentes. Verifique periódicamente la vibración, respetando los límites presentados en el ítem 7.2.1;
- Opere el motor bajo carga nominal por un pequeño período de tiempo y compare la corriente de operación con la corriente indicada en la placa de características;
- Se recomienda que algunas variables del motor sean acompañadas hasta su equilibrio térmico: corriente, tensión, temperatura en los cojinetes y en la superficie externa de la carcasa, vibración y ruido;
- Se recomienda que los valores de corriente y tensión sean registrados en el informe de instalación.

Debido al valor elevado de la corriente de arranque de los motores de inducción, el tiempo gastado en la aceleración en las cargas de inercia apreciable resulta en la elevación rápida de la temperatura del motor. Si el intervalo entre arranques sucesivos es muy reducido, resultará en un aumento de la temperatura en los devanados, deteriorándolos o reduciendo su vida útil. En caso que no sea especificado régimen de servicio diferente a S1 / CONT. en la placa de características del motor, los motores son aptos para:

- Dos arranques sucesivos, siendo el primero realizado con el motor frío, es decir, con sus devanados a temperatura ambiente y un segundo arranque a seguir, no obstante, después de que el motor haya sido desacelerado hasta alcanzar su reposo;
- Un arranque con el motor a caliente, o sea, con los devanados a la temperatura de régimen.

El ítem 10 relaciona algunos problemas de mal funcionamiento del motor, con sus posibles causas.

7.2 CONDICIONES DE OPERACIÓN

En caso que ninguna otra condición sea informada en el momento de la compra, los motores eléctricos son proyectados para operar a una altitud limitada a 1000 m sobre el nivel del mar y en temperatura ambiente entre -20 °C y + 40 °C. Cualquier variación de las condiciones del entorno donde vaya a funcionar el moto, debe estar indicada en la placa de características del motor.

Algunos componentes se deben sustituir cuando la temperatura ambiente es diferente de la indicada arriba. Favor contactar a WEG para verificar las características especiales.

Para temperaturas y altitudes diferentes de las indicadas arriba, utilizar la Tabla 24 para encontrar el factor de corrección que deberá ser utilizado para definir la potencia útil disponible (Pmax = Pnom x Factor de corrección).

T (°C)	Altitud (m)								
	1000	1500	2000	2500	3000	3500	4000	4500	5000

75	0,70	0,68	0,66	0,64	0,62	0,60	0,58	0,53	0,49
80	0,65	0,64	0,62	0,60	0,58	0,56	0,55	0,48	0,44

Tabla 25 - Factores de corrección considerando la altitud y la temperatura ambiente

El ambiente en el local de instalación deberá tener condiciones de renovación de aire del orden de 1 m³ por segundo para cada 100 kW o fracción de potencia del motor. Para motores ventilados, que no poseen ventilador propio, la ventilación adecuada del motor es de responsabilidad del fabricante del equipamiento. En caso que no haya especificación de la velocidad de aire mínima entre las aletas del motor en una placa de características, deben ser seguidos los valores indicados en la Tabla 25. Los valores presentados en la Tabla 26 son válidos para motores aleteados alimentados en la frecuencia de 60 Hz. Para obtención de las velocidades mínimas de aire en 50 Hz se deben multiplicar los valores de la tabla por 0,83.

Tabla 26 - Velocidad mínima de aire entre las aletas del motor (m/s)

Las variaciones de la tensión y frecuencia de alimentación pueden afectar las características derendimiento y la compatibilidad electromagnética del motor. Estas variaciones de alimentación deben seguir los valores establecidos en las normas vigentes. Ejemplos:

- ABNT NBR 17094 - Partes 1 y 2. El motor está apto para proveer torque nominal, bajo las siguientes zonas de variación de tensión y frecuencia:
  - Zona A: ±5% de tensión y ±2% de frecuencia;
  - Zona B: ±10% de tensión y +3% -5% de frecuencia.

Cuando es operado en la Zona A o B, el motor puede presentar variaciones de rendimiento y alcanzar temperaturas más elevadas. Estas variaciones son mayores para la operación en la zona B. No es recomendada una operación prolongada del motor en la zona B.

- IEC 60034-1. El motor es apto para suministrar el par nominal bajo las siguientes zonas de variación de tensión y frecuencia:
  - Zona A: ±5% de tensión y ±2% de frecuencia;
  - Zona B: ±10% de tensión y +3% -5% de frecuencia.

Cuando es operado en la Zona A o B, el motor puede presentar variaciones de rendimiento y alcanzar temperaturas más elevadas. Estas variaciones son mayores para la operación en la zona B. No es recomendada la operación prolongada del motor en la zona B. Para motores multitensión (ejemplo 380-415/660 V) se permite una variación de tensión de ±5%.

- NEMA MG 1 Parte 12. El motor es apto para operar en una de las siguientes variaciones:
  - ±10% de tensión, con frecuencia nominal
  - ±5 de frecuencia, con tensión nominal
  - Una combinación de variación de tensión y frecuencia de ±10%, siempre que la variación de frecuencia no sea superior a ±5%.

Para motores que son enfriados a través del aire ambiente, las entradas y salidas de aire deben ser limpiadas en intervalos regulares para garantizar una libre circulación del aire. El aire caliente no debe retornar hacia el motor. El aire utilizado para refrigeración del motor debe estar a temperatura ambiente, limitada a la franja de temperatura indicada en la placa de características del motor (cuando no sea indicado, considere una franja de temperatura entre -20 °C y +40 °C).

Para motores refrigerados a agua, los valores del flujo de agua para cada tamaño de carcasa, así como la máxima elevación de temperatura del agua después de circular por el motor, son mostrados en la Tabla 27. La temperatura del agua en la entrada no debe exceder 40 °C.

Carcasa		Flujo (litros/minuto)	Máxima elevación de temperatura del agua (°C)
IEC	NEMA		
180	284/6	12	5
200	324/6	12	5
225	364/5	12	5
250	404/5	12	5
280	444/5 445/7 447/9	15	6
315	504/5	16	6
355	586/7 588/9	25	6

Tabla 27 - Flujo y máxima elevación de temperatura del agua

Para motores W60, consulte la placa de identificación en el intercambiador de calor.
Para motores con lubricación de tipo *Oil Mist*, en caso de fallo del sistema de bombeo de aceite, está permitida una operación en régimen continuo con el tiempo máximo de una hora de operación.
Considerando que el calor del sol causa aumento de la temperatura de operación, los motores instalados externamente deben siempre estar protegidos contra la incidencia directa de los rayos solares.
Posibles desvíos en relación a la operación normal (actuación de protecciones térmicas, aumento del nivel de ruido, vibración, temperatura y corriente) deben ser examinados y eliminados por personal capacitado. En caso de dudas, apague el motor inmediatamente y contacte a un Asistente Técnico Autorizado WEG.

El incumplimiento de los criterios y recomendaciones establecidos en este manual puede resultar en anulación de la garantía del producto.

7.3 LÍMITES DE LA GRAVEDAD DE LA VIBRACIÓN

La gravedad de la vibración es el máximo valor de vibración encontrada entre todos los puntos y direcciones recomendados.
La Tabla 28 indica los valores admisibles de la gravedad de la recomendados en la norma IEC 60034-14 para las carcasas IEC 56 a 400, para los grados de vibración A y B.
Los límites de gravedad de la Tabla 27 son presentados en términos del valor medio cuadrático (= valor RMS o valor eficaz) de la velocidad de vibración en mm/s medidos en condición de suspensión libre (base elástica).

Altura del eje [mm]	56 ≤ H ≤ 132	H ≥ 132
Grado de vibración	gravedad de la vibración en base elástica [mm/s RMS]	
A	2.8	2.8
B	1.1	1.1

Tabla 28 - Limites recomendados para la severidad de vibración de acuerdo con la norma IEC 60034-14

Notas:
1 - Los valores de la Tabla 7.5 son válidos para mediciones realizadas con la máquina desacoplada y sin carga, operando en la frecuencia y tensión nominales.
2 - Los valores de la Tabla 7.5 son válidos independientemente del sentido de giro de la máquina.
3 - La Tabla 7.5 no se aplica para motores trifásicos con conmutador, motores monofásicos, motores trifásicos con alimentación monofásica o para máquinas fijadas en el local de instalación, acopladas en sus cargas de accionamiento o cargas accionadas.

Para motor estándar, de acuerdo con la norma NEMA MG 1, el límite de vibración es de 0,15 pulg/s, en la misma condición de suspensión libre y desacoplado.

Nota:
Para condición de operación en carga se recomienda el uso de la norma ISO 10816-3 para evaluación de los limites de vibración del motor. En la condición en carga, la vibración del motor resultará influida por varios factores, entre ellos, tipo de carga acoplada, condición de fijación del motor, condición de alineamiento con la carga, vibración de la estructura o base debido a otros equipamientos, etc..

8. MANTENIMIENTO

La finalidad del mantenimiento es prolongar lo máximo posible la vida útil del equipo. La no observancia de uno de los ítems relacionados a seguir puede llevar a paradas no deseadas del equipo.
En caso que, durante el mantenimiento, hubiera necesidad de transporte de los motores con rodamientos de rodillos o contacto angular, deben ser utilizados los dispositivos de trabado del eje suministrados con el motor. Todos los motores HGF, W50, W51 HD y W60 independientemente del tipo de cojinete, deben tener su eje trabado durante el transporte.
Cualquier servicio en máquinas eléctricas debe ser realizado solamente por personal capacitado, utilizando sólo herramientas y métodos adecuados. Antes de iniciar cualquier servicio, las máquinas deben estar completamente paradas y desconectadas de la red de alimentación, inclusive los accesorios (resistencia de calentamiento, freno, etc.).
Asistentes técnicos o personal no capacitado, sin autorización para hacer mantenimiento y/o reparar motores, son totalmente responsables por el trabajo ejecutado y por los eventuales daños que puedan ocurrir durante su funcionamiento.

8.1 INSPECCIÓN GENERAL

La frecuencia con que deben ser realizadas las inspecciones depende del tipo de motor, de la aplicación y de las condiciones del local de la instalación. Durante la inspección, se recomienda:

- Hacer una inspección visual del motor y del acoplamiento, observando los niveles de ruido, de la vibración, alineamiento, señales de desgastes, oxidación y piezas deterioradas. Sustituir las piezas, cuando fuera necesario;
- Medir la resistencia de aislamiento conforme se describe en el ítem 5.4;
- Mantener la carcasa limpia, eliminando toda acumulación de aceite o de polvo en la parte externa del motor para de esta forma facilitar el intercambio de calor con el medio ambiente;
- Verificar la condición del ventilador y de las entradas y salidas de aire, asegurando un libre flujo del aire;
- Verificar el estado de los sellados y efectuar el cambio, si fuera necesario;
- Drenar el motor. Tras el drenaje, recolocar los drenajes para garantizar nuevamente el grado de protección del motor. Los drenajes deben estar siempre posicionados de tal forma que se facilite el drenaje (ver ítem 6);
- Verificar la conexión de los cables de alimentación, respetando las distancias de aislamiento entre partes vivas no aisladas entre sí y entre partes vivas y partes puestas a tierra de acuerdo con la Tabla 10;
- Verificar si el apriete de los tornillos de conexión, sustentación y fijación está de acuerdo con lo indicado en la Tabla 44;
- Verificar el estado del pasaje de los cables en la caja de conexión, los sellados de los prensacables y los sellados en las cajas de conexión y efectuar el cambio, se fuera necesario;
- Verificar el estado de los cojinetes, observando la aparición de ruidos y niveles de vibración no habituales, verificando la temperatura de los cojinetes, el nivel del aceite, la condición del lubricante y el monitoreo de las horas de operación en comparación con la vida útil informada;
- Registrar y archivar todas las modificaciones realizadas en el motor.

No reutilice piezas dañadas o desgastadas. Sustitúyalas por nuevas originales de fábrica.

8.2 LUBRICACIÓN

La correcta lubricación es de vital importancia para el buen funcionamiento del motor.
Utilice el tipo y cantidad de grasa o aceite especificados y siga los intervalos de relubricación recomendados para los cojinetes. Estas informaciones pueden ser encontradas en la placa de características y este procedimiento debe ser realizado conforme el tipo de lubrificante (aceite o grasa).
Cuando el motor utilice protección térmica en el cojinete, deben ser respetados los límites de temperatura de operación indicados en la Tabla 12.
Los motores para aplicaciones especiales pueden presentar temperaturas máximas de operación diferentes a las indicadas en la tabla.
El descarte de la grasa y/o aceite debe seguir las recomendaciones vigentes de cada país.

La utilización de motor en ambientes y/o aplicaciones especiales siempre requiere una consulta previa a WEG.

8.2.1 Cojinetes de rodamiento lubricados con grasa

Grasa en exceso provoca calentamiento del cojinete y su consecuente falla.

Los intervalos de lubricación especificados en la Tabla 28, Tabla 29, Tabla 30, Tabla 31, Tabla 32, Tabla 33, Tabla 34, Tabla 35 y Tabla 36 consideran una temperatura absoluta del cojinete de 70 °C (hasta carcasa IEC 200 / NEMA 324/6) y 85 °C (a partir de la carcasa IEC 225 / NEMA 364/5), rotación nominal del motor, instalación horizontal y grasa Mobil Polyrex EM. Cualquier variación de los parámetros indicados debe ser evaluada puntualmente.

Tabla 41 - Intervalo de lubrificación para rodamiento de esferas - líneas WEG General Purpose y WIN

Las líneas de motores WEG General Purpose y WIN con sistema de relubricación (con acessório de engrase y cojinetes abiertos) en los tamaños de carcasa 225S/M, 250S/M y W280S/M tienen una cámara de almacenamiento de grasa dentro del motor y no tienen una abertura para su salida. El volumen interno destinado a almacenar la grasa vieja tiene la capacidad de cumplir hasta 7 (siete) relubricaciones, limitado a 5 anõs de operación, siendo necesaria la remoción de grasa después de este período.
Para cada incremento de 15 °C en la temperatura del cojinete, el intervalo de relubricación deberá ser reducido a la mitad.
Para aplicaciones especiales, tales como: altas y bajas temperaturas, ambientes agresivos, variación de velocidad (accionamiento por convertidor de frecuencia), etc., entre en contacto con WEG para obtener informaciones referentes al tipo de grasa e intervalos de lubricación a ser utilizados.

8.2.1.1. Motores sin accesorio de engrase

En motores sin accesorio de engrase, la lubricación debe ser efectuada conforme el plano de mantenimiento preventivo existente. El desmontaje y montaje del motor deben ser hechos conforme el ítem 8.3.
En motores con rodamientos blindados (por ejemplo, ZZ, DDU, 2RS, VV), los rodamientos deben ser substituidos al final de la vida útil de la grasa.

8.2.1.2. Motores con accesorio de engrase

Para relubricación de los rodamientos con el motor parado, proceder de la siguiente manera:
- Limpie las proximidades del orificio de entrada de grasa;
- Abrir la protección de entrada de grasa;
- Retirar la tapa de salida de grasa (la eliminación no es necesaria en el caso de sistema de relubricación automática, como los motores IEEE Std 841);
- Coloque aproximadamente mitad de la grasa total recomendada en la placa de características del motor y gire el motor durante aproximadamente 1 minuto en la rotación nominal;
- Apague el motor y coloque el resto de la grasa;
- Recoloque la protección de entrada de grasa y la tapa de salida de grasa.

Para relubricación de los rodamientos con el motor en funcionamiento, proceder de la siguiente manera:
- Limpie las proximidades del orificio de entrada de grasa;
- Abrir la protección de entrada de grasa;
- Si es posible y seguro, retirar la tapa de salida de grasa;
- Coloque la cantidad de grasa total recomendada en la placa de características del motor;
- Recoloque la protección de entrada de grasa y la tapa de salida de grasa (si ha sido eliminado).

Para lubricación, es indicado el uso de lubricador manual.

Debido a los espacios internos presentes en el motor, es posible que, en los primeros reengrases de los cojinetes, la grasa no va a salir de la salida de grasa. Por lo tanto, no aplique exceso de grasa esperando que salga.

En motores suministrados con dispositivo de resorte, el exceso de grasa debe ser retirado extrayendo la varilla del resorte y limpiándola hasta que no presente más grasa.

8.2.1.3. Compatibilidad de la grasa Mobil Polyrex EM con otras grasas

La grasa Mobil Polyrex EM posee espesante de poliurea y aceite mineral, no siendo compatible con otras grasas. En caso que necesite de otro tipo de grasa, contacte a WEG.
No es recomendada la mezcla de grasas. En tal caso, limpiar los cojinetes y los canales de lubricación antes de aplicar grasa nueva.
La grasa aplicada debe poseer, en su formulación, aditivos inhibidores de corrosión y oxidación.

8.2.2 Cojinetes de rodamiento lubricados por aceite

En motores con rodamientos lubricados por aceite, el cambio de aceite debe ser hecho con el motor parado, siguiendo los procedimientos siguientes:
- Abra la respiración de entrada de aceite;
- Retire el tapón de salida de aceite;
- Abra la válvula y drene todo el aceite;
- Cierre la válvula;
- Recoloque el tapón;
- Abastezca con la cantidad y especificación de aceite indicadas en la placa de características;
- verifique si el nivel del aceite está en la mitad del visor;
- cierre la respiración de la entrada de aceite;
- asegúrese de que no hay pérdida y que todos los orificios roscados no utilizados estén cerrados.

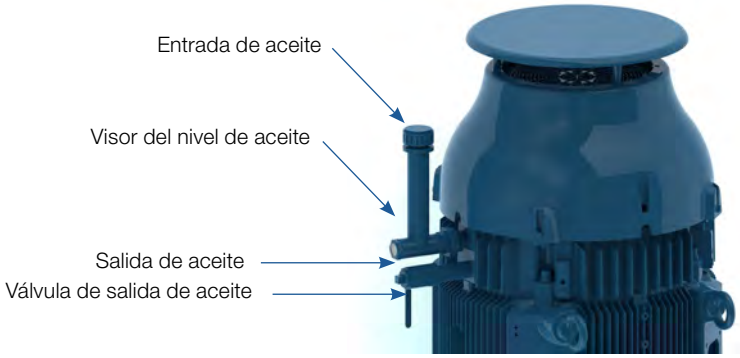

Figura 54 - Cojinete vertical de rodamiento lubrificado por aceite.

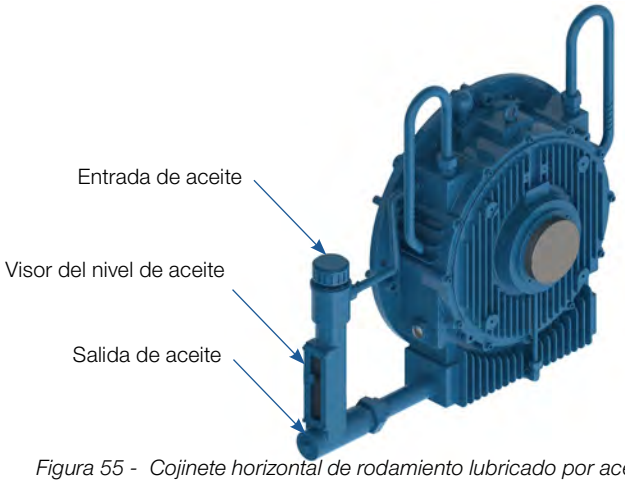

Figura 55 - Cojinete horizontal de rodamiento lubricado por aceite.

El cambio de aceite de los cojinetes debe ser realizado en el intervalo indicado en la placa de características o siempre que el lubrificante presente alteraciones en sus características (viscosidad, pH, etc.).
El nivel de aceite debe ser mantenido en la mitad del visor de aceite y comprobado diariamente.
El uso de lubricantes con otras viscosidades requiere contacto previo con WEG.

Obs.: los motores HGF verticales para alto empuje son suministrados con cojinetes delanteros lubricados a grasa y con cojinetes traseros por aceite. Los cojinetes delanteros deben seguir las recomendaciones del ítem 8.2.1. La Tabla 41 presenta la cantidad y especificación de aceite para esa configuración.

	Carcasa		Polos	Rodamiento	Aceite (l)	Intervalo (h)	Lubricante	Especificación lubricante
	IEC	NEMA						
Montaje alto empuje	315L/A/B y 315C/D/E	5006/7/8T y 5009/10/11T	4 - 8	29320	20	8000	FUCHS Renolin DTA 40 / Mobil SHC 629	Aceite mineral ISO VG150 con aditivos antiespuma y antioxidantes
	355L/A/B y 355C/D/E	5807/8/9T y 5810/11/12T	4 - 8	29320	26			
	400L/A/B y 400C/D/E	6806/7/8T y 6809/10/11T	4 - 8	29320	37			
	450	7006/10	4 - 8	29320	45			

Tabla 42 - Características de lubricación para motores HGF vertical de alto empuje y Vertical High Thrust.

8.2.3 Cojinetes de rodamiento con lubricación de tipo Neblina de aceite

Verifique el estado de los sellados y, siempre que fuera necesario algún cambio, use solamente piezas originales.
Realice la limpieza de los componentes antes del montaje (anillos de fijación, tapas, etc.).
Aplique sellajuntas resistente al aceite lubricante utilizado, entre los anillos de fijación y las tapas.
A conexión de los sistemas de entrada, salida y drenaje de aceite deben ser realizados conforme la Figura 43.

8.2.4 Cojinetes de deslelevación

Para los cojinetes de deslelevación, el cambio de aceite debe ser hecho en los intervalos indicados en la Tabla 8.11 y debe ser realizado, adoptando los siguientes procedimientos:

- Para el cojinete trasero, retire la tapa de inspección de la deflectora;
- Drene el aceite a través del drenaje localizado en la parte inferior de la carcasa del cojinete (ver Figura 56;
- Cierre la salida de aceite;
- Retire el tapón de la entrada de aceite;
- Abastezca con el aceite especificado y con la cantidad indicada en la Tabla 41;
- Verifique si el nivel del aceite está en la mitad del visor;
- Cierre la entrada de aceite;
- Asegúrese de que no existe pérdida.

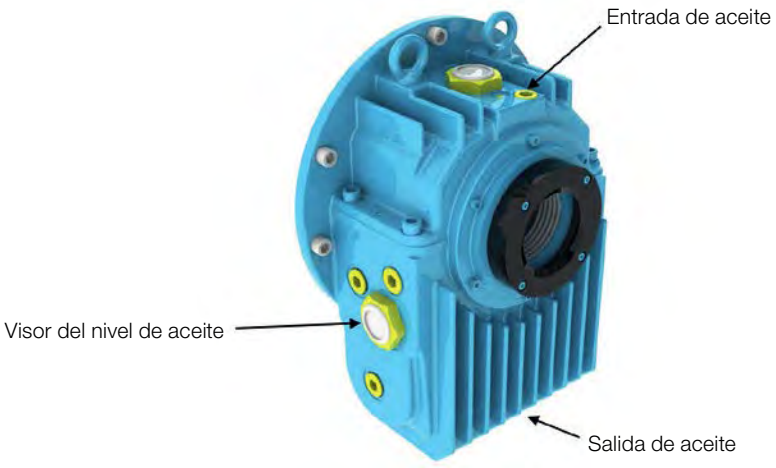

Figura 56 - Cojinete de deslelevación.

Carcasa		Polos	Cojinete	Aceite (L)	Intervalo (h)	Lubricante	Especificación lubrificante
IEC	NEMA						
315	5000	2	9-80	3.6	8000	FUCHS Renolin DTA 10	Aceite mineral ISO VG32 con aditivos antiespuma y antioxidantes
355	5800						
400	6800						
450	7000						
315	5000	4 - 8	9-90		8000	FUCHS Renolin DTA 15	Aceite mineral ISO VG46 con aditivos antiespuma y antioxidantes
355	5800		9-100				
400	6800		11-110	4.7			
450	7000		11-125				
500	8000						

Tabla 43 - Características de lubricación para cojinetes de deslelevación

El cambio de aceite de los cojinetes debe ser realizado en el intervalo indicado en la placa de características o siempre que el lubricante presente alteraciones en sus características (viscosidad, pH, etc.).
El nivel de aceite debe ser mantenido en la mitad del visor y seguido diariamente.
No podrán ser usados lubrificantes con otras viscosidades sin antes consultar a WEG.

8.3 DESMONTAJE Y MONTAJE

Los servicios de reparación en motores deben ser efectuados solamente por personal capacitado siguiendo las normas vigentes del país. Sólo deben ser utilizadas herramientas y métodos adecuados.

Cualquier servicio de desmontaje y montaje debe ser realizado con el motor totalmente desenergizado y completamente parado.
El motor apagado también puede presentar energía eléctrica en el interior de la caja de conexión:, en las resistencias de calentamiento, en el devanado y en los capacitores.
Los motores accionados por convertidor de frecuencia pueden estar energizados incluso con el motor parado.

Antes de iniciar el procedimiento de desmontaje, registre las condiciones actuales de la instalación, tales como conexiones de los terminales de alimentación del motor y alineamiento / nivelación, los que deben ser considerados durante el montaje posterior.
Realice el desmontaje de manera cuidadosa, sin causar impactos contra las superficies mecanizadas y / o en las roscas.
Monte el motor en una superficie plana para garantizar una buena base de apoyo. Los motores sin patas deben ser calzados/trabados para evitar accidentes.
Deben ser tomados cuidados adicionales para no dañar las partes aisladas que operan bajo tensión eléctrica, como por ejemplo, devanados, cojinetes aislados, cables de alimentación, etc..
Los elementos de sellado, como por ejemplo, juntas y sellados de los cojinetes deben ser cambiados siempre que presenten desgaste o estén damnificados.
Los motores con grado de protección superior a IP55 son suministrados con producto sellante Loctite 5923 (Henkel) en las juntas y tornillos. Antes de montar los componentes, limpie las superficies y aplique una nueva camada de este producto.

En el caso de motores con rotor de imanes permanentes (motores WQuattro y WMagnet), el montaje y desmontaje del motor requiere de la utilización de dispositivos adecuados debido a las fuerzas de atracción o de repulsión entre piezas metálicas. Este servicio solamente debe llevarse a cabo por un Servicio Técnico Autorizado WEG con formación específica para dicha operación.
Las personas que utilicen marcapasos no pueden manipular estos motores. Los imanes permanentes también pueden causar perturbaciones o daños en otros equipamientos eléctricos y componentes durante el mantenimiento.

En los motores de las líneas W40, W50, W51 HD y HGF, suministrados con ventiladores axiales, el motor y el ventilador axial tienen indicación de sentido de rotación distintas, para prevenir un montaje erróneo. El ventilador debe ser montado de tal forma que la flecha indicativa del sentido de rotación este siempre visible, cuando observadas desde el lado externo del motor (en el lado no accionado). La marca indicada en las aspas del ventilador, CW para sentido de rotación horario o CCW para sentido de rotación anti-horario, indica el sentido de rotación del motor.

En motores que utilizan codificador, es necesario verificar la excentricidad de la región de asiento de este componente antes de su montaje. La excentricidad no debe superar el límite especificado por el fabricante del enconder.

En los motores que utilizan una tapa deflector de polímero, para retirarla, utilice dos destornilladores o una herramienta similar colocada cerca de los enganches y levante uno a la vez, repitiendo el procedimiento para cada lado hasta retirar completamente la tapa deflector.
Al ensamblar componentes poliméricos, se deben respetar los pares de apriete especificados en la Tabla 6.
Motores con un ventilador fijo únicamente por interferencia en el eje, si se desmontan, el componente debe ser reemplazado por uno nuevo. Para motores que tienen tapas inyectadas de aluminio sin mecanizado, es necesario calentar las tapas para el montaje y desmontaje.

8.3.1 Caja de conexión

Al retirar la tapa de la caja de conexión para la conexión/desconexión de los cables de alimentación y accesorios, deben ser adoptados los siguientes cuidados:
- Asegúrese que durante la remoción de los tornillos, la tapa de la caja no dañe los componentes instalados en su interior;

- En caso que la caja de conexión sea suministrada con cáncamo de suspensión, éste debe ser utilizado para mover la tapa de la caja de conexión;
- Para motores suministrados con placa de bornes, deben ser asegurados los torques de apriete especificados en la Tabla 44;

Para motores sin placa de bornes, no forzar los cables de alimentación para el interior para evitar contacto con el rotor.

- Verifique que los cables no entren en contacto con superficies con esquinas vivas.
- Adopte los debidos cuidados para garantizar que el grado de protección inicial, indicado en la placa de características del motor no sea alterado. Las entradas de cables para la alimentación y control deben utilizar siempre componentes (como, por ejemplo, prensacables y conductos eléctricos) que atiendan las normas y reglamentaciones vigentes de cada país;
- Asegúrese que la ventana de alivio de presión, cuando exista, no esté dañada. Las juntas de sellado de la caja de conexión deben estar en perfecto estado para reutilización y deben ser posicionadas correctamente para garantizar el grado de protección;
- Verifique los torques de apriete de los tornillos de fijación de la tapa de la caja conforme Tabla 44.

Tipo de tornillo y junta	M4	M5	M6	M8	M10	M12	M14	M16	M20
Tornillo sextavado externo/ interno (junta rígida)	-	3,5 hasta 5	6 hasta 9	14 hasta 20	28 hasta 40	45 hasta 70	75 hasta 110	115 hasta 170	230 hasta 330

Puesta a tierra	1,5 hasta 3	3 hasta 5	5 hasta 10	10 hasta 18	28 hasta 40	45 hasta 70	-	115 hasta 170	-

Tabla 44 - Torques de apriete para elementos de fijación [Nm]

Notas: *1) Para la placa de bornes 12 pines, aplicar el par mínimo de 1,5 Nm y máximo 2,5 Nm.*

8.4 PROCEDIMIENTO PARA ADECUACIÓN DE LA RESISTENCIA DE AISLAMIENTO

El motor debe ser desmontado y sus tapas, rotor completo (con eje), ventilador, deflectora y caja de conexión deben ser separados, de modo que apenas la carcasa con el estator pase por un proceso de secado en un horno apropiado, por un período de dos horas, a una temperatura no superior a 120 ºC. Para motores mayores, puede ser necesario aumentar el tiempo de secado. Luego de ese período de secado, deje el estator enfriar hasta que llegue a temperatura ambiente y repita la medición de la resistencia de aislamiento, conforme ítem 5.4. En caso necesario, se debe repetir el proceso de secado del estator.
Si, luego de repetidos los procesos de secado del estator, la resistencia de aislamiento no vuelve a los niveles aceptables, se recomienda hacer un análisis exhaustivo de las causas que llevaron a la caída del aislamiento del devanado y, eventualmente podrá culminar con el rebobinado del motor.

Para evitar el riesgo de shock eléctrico, descargue los terminales inmediatamente antes y después de cada medición. En caso que el motor posea condensadores, éstos deben ser descargados.

Los motores WMagnet y WQuattro tienen imanes de alta energía y no deben ser abiertos por personal no calificado y personas con marcapasos.

8.5 COMPONENTES Y PIEZAS

Al solicitar piezas para repuesto, informe la designación completa del motor, así como su código y número de serie, que pueden ser encontrados en la placa de características del motor.
Las partes y piezas deben ser adquiridas de la red de Asistencia Técnica Autorizada WEG. El uso de piezas no originales puede resultar en una disminución del rendimiento y causar fallos en el motor.
Las piezas sobresalientes deben ser almacenadas en un lugar seco con una humedad relativa del aire de hasta 60%, con temperatura ambiente mayor a 5 °C y menor a 40 °C, libre de polvo, vibraciones, gases, agentes corrosivos, sin variaciones bruscas de temperatura, en su posición normal y sin apoyar otros objetos sobre las mismas.

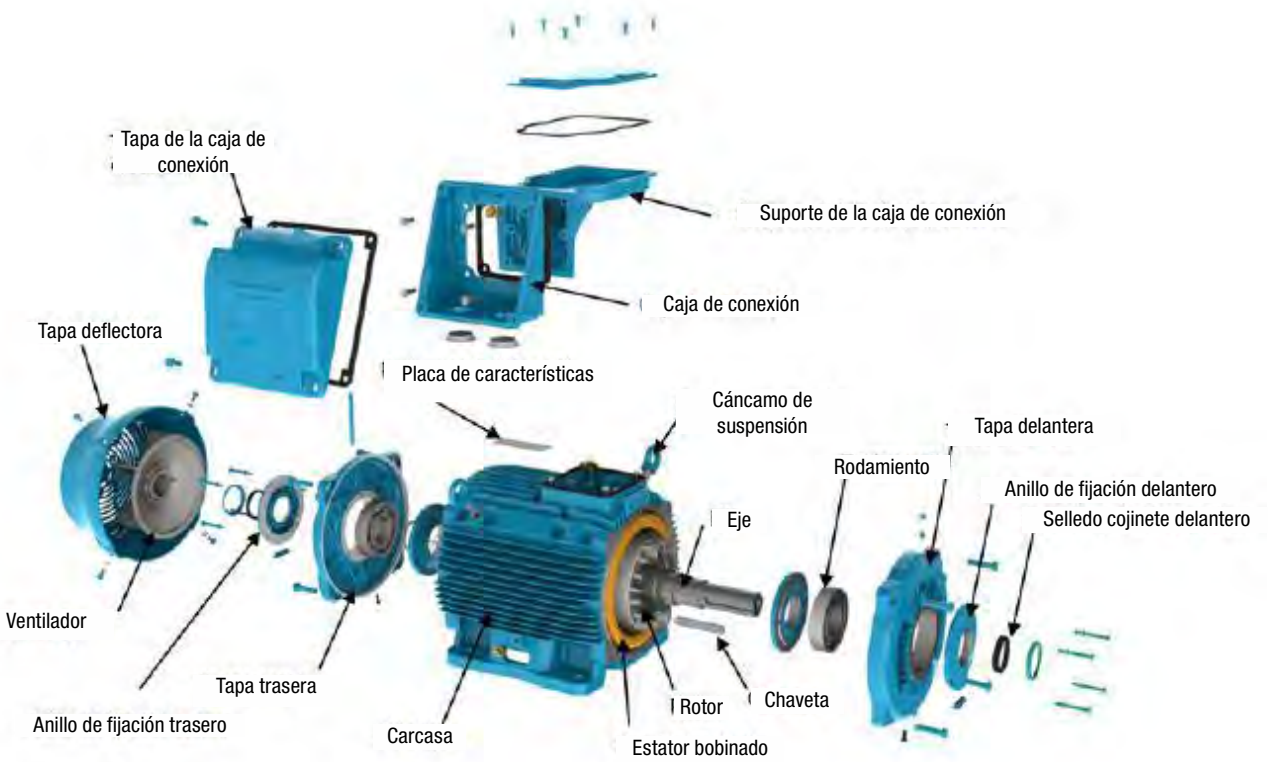

Figura 57 - Vista en despiece de los componentes de un motor W22

9. INFORMACIÓN MEDIO AMBIENTAL

9.1 EMBALAJE

Los motores eléctricos son suministrados en embalajes de cartón, plástico o madera. Estos materiales son reciclables o reutilizables y deben recibir el destino correcto, conforme las normas vigentes de cada país. Toda la madera utilizada en los embalajes de los motores WEG proviene de reforestación y no es sometida a ningún tratamiento químico para su conservación.

9.2 PRODUCTO

Los motores eléctricos, bajo el aspecto constructivo, son fabricados esencialmente con metales ferrosos (acero, hierro fundido), metales no ferrosos (cobre, aluminio) y plástico.

El motor eléctrico, de manera general, es un producto que posee una vida útil larga, no obstante en cuanto a su eliminación, WEG recomienda que los materiales del embalaje y del producto sean debidamente separados y enviados a reciclaje.

Los materiales no reciclables deben, como determina la legislación ambiental, ser dispuestos de forma adecuada, o sea, en vertederos industriales, coprocesados en hornos de cemento o incinerados. Los prestadores de servicios de reciclaje, disposición en vertederos industiales, coprocesamiento o incineración de residuos deben estar debidamente autorizados por el organismo responsable en materia medioambiental de cada país para realizar estas actividades.

10. PROBLEMAS Y SOLUCIONES

Las instrucciones siguientes presentan una relación de problemas comunes con posibles soluciones. En caso de duda, contacte al Asistente Técnico Autorizado, o a WEG.

Problema	Posibles Causas	Solución
El motor no arranca, ni acoplado ni desacoplado	Interrupción en la alimentación del motor	Verifique el circuito de comando y los cables de alimentación del motor.
	Fusibles quemados	Sustituya los fusibles.
	Error en la conexión del motor	Corrija las conexiones del motor conforme al diagrama de conexión.
	Cojinete trabado	Verifique si el cojinete gira libremente.
Cuando acoplado con carga, el motor no arranca o arranca muy lentamente y no alcanza la rotación nominal	Carga con torque muy elevado durante el arranque	No aplique carga en la máquina accionada durante la arranque.
	Caída de tensión muy alta en los cables de alimentación	Verifique el dimensionamiento de la instalación (transformador, sección de los cables, relés, disyuntores, etc.).
Ruido elevado/anormal	Defecto en los componentes de transmisión o en la máquina accionada	Verifique la transmisión de fuerza, el acoplamiento y el alineamiento.
	Base desalineada/desnivelada	Realinee/nivele el motor y la máquina accionada.
	Desequilibrio de los componentes o de la máquina accionada	Recupere el balanceo.
	Tipos diferentes de equilibrio entre motor y acoplamiento (media chaveta, chaveta entera)	Recupere el balanceo.
	Sentido de rotación del motor incorrecto	Invierta el sentido de rotación del motor.
	Tornillos de fijación sueltos	Reapriete los tornillos.
	Resonancia de los cimientos	Verifique el proyecto de los cimientos.
	Rodamientos deteriorados	Sustituya el rodamiento.
Calentamiento excesivo en el motor	Refrigeración insuficiente	Limpie las entradas y salidas de aire de la deflectora, y de la carcasa.
		Verifique las distancias mínimas entre la entrada de la deflectora de aire y las paredes cercanas. Ver ítem 7.
		Verifique la temperatura del aire en la entrada.
	Sobrecarga	Mida la corriente del motor, analizando su aplicación y, si fuera necesario, disminuya la carga.
	Excesivo número de arranques o momento de inercia de la carga muy elevado	Reduzca el número de arranques.
	Tensión muy alta	Verifique la tensión de alimentación del motor. No sobrepase la tolerancia conforme ítem 7.2.
	Tensión muy baja	Verifique la tensión de alimentación y la caída de tensión en el motor. No sobrepase la tolerancia conforme ítem 7.2.
	Interrupción de un cable de alimentación	Verifique la conexión de todos los cables de alimentación.
	Desequilibrio de tensión en los terminales de alimentación del motor	Verifique si hay fusibles quemados, comandos incorrectos, desequilibrio en las tensiones de la red de alimentación, falta de fase o en los cables de conexión.
	Sentido de rotación no compatible con el ventilador unidireccional	Verifique el sentido de rotación conforme la indicación del motor.
Calentamiento del cojinete	Grasa aceite en exceso	Realice la limpieza del cojinete y lubríquelo según las recomendaciones.
	Envejecimiento de la grasa/aceite	
	Utilización de grasa/aceite no especificados	
	Falta de grasa/aceite	Lubrique según las recomendaciones.
	Excesivo esfuerzo axial o radial	Reduzca la tensión en las correas.
		Redimensione la carga aplicada al motor.

Safety messages

NOTICE

Read this document before working with the product. For personal and system safety, and for optimum product performance, ensure you thoroughly understand the contents before installing, using, or maintaining this product. For technical assistance, contacts are listed below:

Customer Central

Technical support, quoting, and order-related questions.
United States - 1-800-999-9307 (7:00 am to 7:00 pm Central Time)
Asia Pacific- 65 777 8211
Europe/Middle East/Africa - 49 (8153) 9390

North American Response Center

Equipment service needs.
1-800-654-7768 (24 hours—includes Canada)
Outside of these areas, contact your local Emerson representative.

⚠ WARNING

Follow instruction

Failure to follow these installation guidelines could result in death or serious injury.

Ensure only qualified personnel perform the installation.

Explosion

Explosions could result in death or serious injury.

Do not remove the connection head cover in explosive atmospheres when the circuit is live.
Before connecting a handheld communicator in an explosive atmosphere, ensure that the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.
Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.
All connection head covers must be fully engaged to meet explosion-proof requirements.

Process leaks

Process leaks could result in death or serious injury.

Do not remove the thermowell while in operation.
Install and tighten thermowells and sensors before applying pressure.

Electric shock

Electrical shock could cause death or serious injury.

Use extreme caution when making contact with the leads and terminals.

The products described in this document are NOT designed for nuclear-qualified applications.

Using non-nuclear qualified products in applications that require nuclear-qualified hardware or products may cause inaccurate readings.

For information on Rosemount nuclear-qualified products, contact your local Emerson Sales Representative.

⚠ WARNING

Physical access

Unauthorized personnel may potentially cause significant damage to and/or misconfiguration of end users' equipment. This could be intentional or unintentional and needs to be protected against.

Physical security is an important part of any security program and fundamental to protecting your system. Restrict physical access by unauthorized personnel to protect end users' assets. This is true for all systems used within the facility.

1 Introduction

1.1 Using this manual

This manual is designed to assist in the installation, operation, and maintenance of Rosemount 644 Head Mount, Field Mount, and Rail Mount Transmitters with the HART® protocol.

Configuration provides instruction the commissioning and operating the Rosemount 644 HART Transmitter. The information explains how to configure software functions and many configuration parameters on an Asset Management System, a Field Communicator, and the Local Operator Interface display option.

Hardware Installation contains mechanical installation instructions for the transmitter.

Electrical Installation contains electrical installation instructions and considerations for the transmitter.

Operation and Maintenance contains common operation and maintenance techniques for the transmitter.

Troubleshooting provides troubleshooting techniques for the most common transmitter operating problems.

Safety Instrumented Systems (SIS) Certification provides identification, installation, configuration, operation and maintenance, and inspection information for Safety Instrumented Systems as it pertains to the Rosemount 644 Head Mount and Field Mount Temperature Transmitter.

Reference Data supplies procedure on how to get the specifications, ordering information, and product certification.

Field Communicator Menu Trees and Fast Keys contains Field Communicator menu trees and Field Communicator Fast Keys.

Local Operator Interface (LOI) contains instructions for number entry, text entry, as well as the LOI menu tree and LOI extended menu tree.

1.1.1 Transmitter overview

The Rosemount 644 Head Mount and Field Mount Temperature Transmitters support the following features:

- HART® configuration with Selectable HART revision capability (Revisions 5 or 7)
- Accepts either one or two inputs from a wide variety of sensor types (2-, 3-, and 4-wire RTD, thermocouple, mV and ohm)
- A compact transmitter size with electronics completely encapsulated in protective silicone and enclosed in a plastic housing ensuring long-term transmitter reliability
- Optional Safety Certification Option (IEC 61508 SIL 2)

- Optional enhanced accuracy and stability performance
- Optional LCD display with extended temperature ratings of -40 to 185 °F (-40 to 85 °C)
- Optional advanced LCD display with local operator interface (LOI)
- The Rosemount 644 Head Mount Transmitter is available in two housing materials (Aluminum and SST) and various housing options that allow for mounting flexibility in a variety of environmental conditions. The Rosemount 644 Field Mount is available in an aluminum housing.
- Special dual-sensor features include Hot Backup™, Sensor Drift Alert, first good, differential and average temperature measurements, and four simultaneous measurement variable outputs in addition to the analog output signal.
- Additional advanced features include: Thermocouple degradation diagnostic, which monitors thermocouple health, and process and transmitter minimum/maximum temperature tracking.

The Rosemount 644 Rail Mount Temperature Transmitter supports the following features:

- 4–20 mA/HART protocol (Revision 5)
- Accepts one sensor input from a wide variety of sensor types (2-, 3-, and 4-wire RTD, Thermocouple, mV and ohm)
- Completely encapsulated electronics to ensure long term transmitter reliability

Refer to the following literature for a full range of compatible connection heads, sensors, and thermowells provided by Emerson.

- Rosemount Volume 1 Temperature Sensors and Accessories (English) Product Data Sheet
- Rosemount DIN-Style Temperature Sensors and Thermowells (Metric) Product Data Sheet

Table 1-1 and Table 1-2 below summarize changes in the Rosemount 644 Head Mount and Rail Mount HART device revisions, respectively.

Table 1-1: Head Mount HART Revisions

Software release date	Identify device			Field device driver		Review instructions
	NAMUR software revision	NAMUR hardware revision(1)	HART software revision	HART universal revision(2)	Device revision	Manual document number
Jan-2023	1.1.3	1.0.2	5	7	9	00809-0200-4728
				5	8	
Feb-2020	1.1.2	1.0.1	4	7	9	00809-0200-4728
				5	8	

Table 1-1: Head Mount HART Revisions *(continued)*

Software release date	Identify device			Field device driver		Review instructions
	NAMUR software revision	NAMUR hardware revision(1)	HART software revision	HART universal revision(2)	Device revision	Manual document number
Aug-2012	1.1.1	1.0.0	3	7	9	00809-0200-4728

(1) NAMUR Software Revision is located in the hardware tag of the device. HART Software Revision can be read using a HART-capable configuration tool.

(2) Device Driver file names use Device and DD Revision (e.g. 10_07). HART Protocol is designed to enable legacy driver revisions to continue to communicate with new HART devices. To access this functionality, the new device driver must be downloaded. It is recommended to download the new device driver to ensure new functionality.

HART revision	5

2 Configuration

2.1 Overview

This section contains information on commissioning and tasks that should be performed on the bench prior to installation. Field Communicator, AMS Device Manager, and Local Operator Interface (LOI) instructions are given to perform configuration functions. For convenience, Field Communicator Fast Key sequences are labeled “Fast Keys,” and abbreviated LOI menus are provided for each function below. The LOI is only available on the Rosemount 644 Head Mount and Field Mount designs, and the configuration instructions referencing the interface will not apply to the rail mount form factor.

Full Field Communicator menu trees and Fast Key sequences are available in Field Communicator Menu Trees and Fast Keys. Local operator interface menu trees are available in Local Operator Interface (LOI).

2.2 Safety messages

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Refer to the following safety messages before performing an operation preceded by this symbol.

⚠ WARNING

Follow instruction

Failure to follow these installation guidelines could result in death or serious injury.

Ensure only qualified personnel perform the installation.

Explosion

Explosions could result in death or serious injury.

Do not remove the connection head cover in explosive atmospheres when the circuit is live.

Before connecting a handheld communicator in an explosive atmosphere, ensure that the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.

Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

All connection head covers must be fully engaged to meet explosion-proof requirements.

⚠ WARNING

Process leaks

Process leaks could result in death or serious injury.

Do not remove the thermowell while in operation.
Install and tighten thermowells and sensors before applying pressure.

Electric shock

Electrical shock could cause death or serious injury.

Use extreme caution when making contact with the leads and terminals.

Physical access

Unauthorized personnel may potentially cause significant damage to and/or misconfiguration of end users' equipment. This could be intentional or unintentional and needs to be protected against.

Physical security is an important part of any security program and fundamental to protecting your system. Restrict physical access by unauthorized personnel to protect end users' assets. This is true for all systems used within the facility.

2.3 System readiness

2.3.1 Confirm HART revision capability

If using HART®-based control or asset management systems, confirm the HART capability of those systems prior to transmitter installation. Not all systems are capable of communicating with HART Revision 7 protocol. This transmitter can be configured for either HART Revision 5 or 7.

For instructions on how to change the HART revision of your transmitter, see Switching HART Revision.

2.3.2 Confirm correct device driver

- Verify the latest Device Driver files are loaded on your systems to ensure proper communications.
- Download the latest Device Driver at Emerson.com/Rosemount or Fieldcomm.org.

Table 2-1: Rosemount 644 Device Revisions and Files

Software date	Identify device		Find device driver files		Review instructions	Review functionality
Date	NAMUR software revision	HART® software revision	HART Universal revision(1)	Device revision(2)	Document	Changes to software(3)
June 2012	1.1.1	01	5	8	Rosemount 644 Temperature Transmitter Reference Manual	See (3) for list of changes
			7	9		

(1) NAMUR Software Revision is located on the hardware tag of the device. HART Software Revision can be read using a HART Communication tool.

(2) Device Driver file names use Device and DD Revision (e.g. 10_01). HART Protocol is designed to enable legacy device driver revisions to continue to communicate with new HART devices. To access new functionality, the new Device Driver must be downloaded. It is recommended to download the new Device Driver files to ensure full functionality.

(3) HART Revision 5 and 7 Selectable. Dual Sensor support, Safety Certified, Advanced Diagnostics (if ordered), Enhanced Accuracy, and Stability (if ordered).

2.3.3 Surges/transients

The transmitter will withstand electrical transients of the energy level encountered in static discharges or induced switching transients. However, high-energy transients, such as those induced in wiring from nearby lightning strikes, welding, heavy electrical equipment, or switching gears, can damage both the transmitter and the sensor. To protect against high-energy transients, install the transmitter into a suitable connection head with the integral transient protector, option T1. Refer to the Rosemount 644 Product Data Sheet for more information.

2.4 Configuration methods

⚠ CAUTION

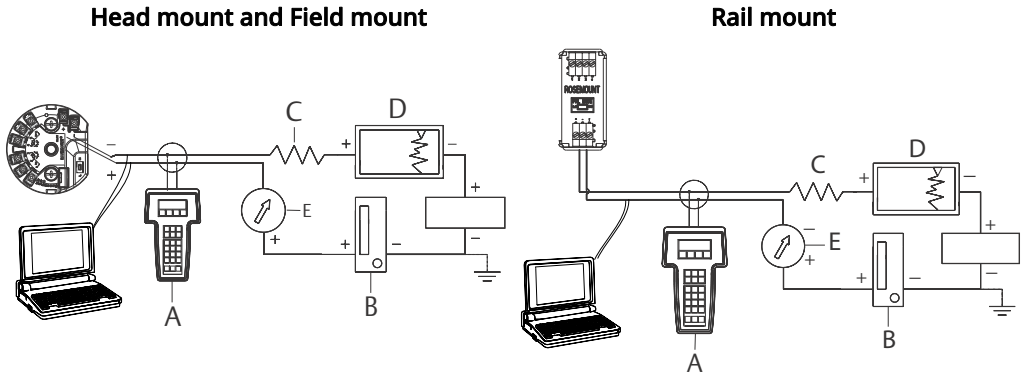
Commisioning

Set all transmitter hardware adjustments during commissioning to avoid exposing the transmitter electronics to the plant environment after installation.

The transmitter can be configured either before or after installation. Configuring the transmitter on the bench using either a Field Communicator, AMS Device

Manager, or LOI ensures all transmitter components are in working order prior to installation.

The transmitter can be configured either on-line or off-line using a Field Communicator, AMS Device Manager, or the optional LOI (head-mount and field-mount). During on-line configuration, the transmitter is connected to a Field communicator. Data is entered in the working register of the communicator and sent directly to the transmitter.



Off-line configuration consists of storing configuration data in a Field Communicator while it is not connected to a transmitter. Data is stored in nonvolatile memory and can be downloaded to the transmitter at a later time.

2.4.1 Configuring on the bench

To configure on the bench, required equipment includes a power supply, a digital multimeter (DMM), and Field Communicator, AMS Device Manager, or a LOI – option M4.

Connect the equipment as shown in Figure 2-1. Connect HART® Communication leads at any termination point in the signal loop. To ensure successful HART Communication, a resistance of at least 250 ohms must be present between the transmitter and the power supply. Connect the Field Communicator leads to the clips behind the power (+,–) terminals on the top of the device. Avoid exposing the transmitter electronics to the plant environment after installation by setting all transmitter jumpers during the commissioning stage on the bench.

Figure 2-1: Powering the Transmitter for Bench Configuration

A. Field communicator
B. Power supply
C. 248 Ω ≤ RL ≤ 1100 Ω
D. Recorder (optional)
E. Ammeter (optional)

Note

- Signal loop may be grounded at any point or left ungrounded.

- A Field Communicator may be connected at any termination point in the signal loop. The signal loop must have between 250 and 1100 ohms load for communications.
- Max torque is 6 in-lb (0.7 N-m).

2.4.2 Selecting a configuration tool

Field Communicator

The Field Communicator is a handheld device that exchanges information with the transmitter from the control room, the instrument site, or any wiring termination point in the loop. To facilitate communication, connect the Field Communicator, shown in this manual, in parallel with the transmitter (see Figure 2-1). Use the loop connection ports on the rear panel of the Field Communicator. The connections are non-polarized. Do not make connections to the serial port or the nickel cadmium (NiCd) recharger jack in explosive atmospheres. Before connecting the Field Communicator in an explosive atmosphere make sure the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.

There are two interfaces available with the Field Communicator: Traditional and Dashboard interfaces. All steps using a Field Communicator will be using Dashboard interfaces. Figure 2-2 shows the Device Dashboard interface. As stated in System readiness, it is critical that the latest DD's are loaded into the Field Communicator for optimal transmitter performance.

Visit Emerson.com/Rosemount to download latest DD library.

Turn on the Field Communicator by pressing the ON/OFF key. The Field Communicator will search for a HART®-compatible device and indicate when the connection is made. If the Field Communicator fails to connect, it indicates that no device was found. If this occurs, refer to Troubleshooting.

Figure 2-2: Field Communicator Device Dashboard Interface

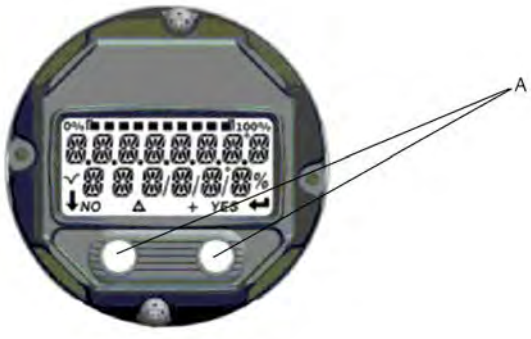
Field Communicator menu trees and Fast Keys are available in Field Communicator Menu Trees and Fast Keys.

AMS Device Manager

With an AMS Device Manager software package, you can commission and configure instruments, monitor status and alerts, troubleshoot from the control room, perform advanced diagnostics, manage calibration, and automatically document activities with a single application.

Full configuration capability with AMS Device Manager requires loading the most current Device Descriptor (DD) for this device. Download the latest DD at Emerson.com/Rosemount or Fieldcomm.org.

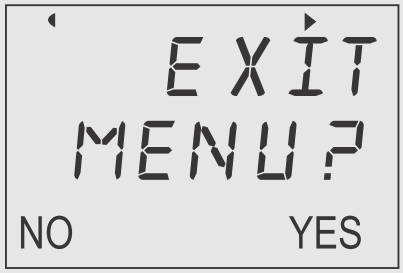
Note
All steps listed in this product manual using AMS Device Manager assume the use of Version 11.5.

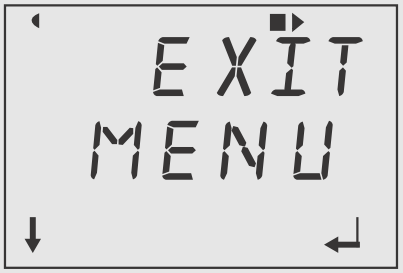


Local Operator Interface (LOI)

- The LOI requires option code M4 to be ordered.
- To activate the LOI, push either configuration button. Configuration buttons are located on the LCD display (remove the housing cover to access the interface. See Table 2-2 for configuration button functionality and Figure 2-3 for configuration button location).

When using the LOI for configuration, several features require multiple screens for a successful configuration. Data entered will be saved on a screen-by-screen basis; the LOI will indicate this by flashing SAVED on the LCD display each time.





Note
Entering into the LOI menu effectively disables the ability to write to the device by any other host or configuration tool. Ensure this is communicated to necessary personnel before using the LOI for device configuration.

Figure 2-3: LOI Configuration Buttons

A. Configuration buttons

Table 2-2: LOI Button Operation

Button		
Left	No	SCROLL
Right	Yes	ENTER

LOI password

An LOI password can be entered and enabled to prevent review and modification of device configuration via the LOI. This does not prevent configuration from HART® or through the control system. The LOI password is a four-digit code that is to be set by the user. If the password is lost or forgotten the master password is “9307”. The LOI password can be configured and enabled/disabled by HART communication via a Field Communicator, AMS Device Manager, or the LOI.

2.4.3 Setting the loop to manual

When sending or requesting data that would disrupt the loop or change the output of the transmitter, set the process application loop to manual. The Field Communicator, AMS Device Manager, or LOI will prompt you to set the loop to manual when necessary. Acknowledging this prompt does not set the loop to manual. The prompt is only a reminder; set the loop to manual as a separate operation.

2.4.4 Failure mode

As part of normal operation, each transmitter continuously monitors its own performance. This automatic diagnostics routine is a timed series of checks repeated continuously. If diagnostics detect an input sensor failure or a failure in the transmitter electronics, the transmitter drives its output to low or high depending on the position of the failure mode switch. If the sensor temperature is outside the range limits, the transmitter saturates its output to 3.9 mA for standard configuration on the low end (3.8 mA if configured for NAMUR-compliant operation) and 20.5 mA on the high end (or NAMUR-compliant). These values are also custom configurable by the factory or using the Field Communicator. The values to which the transmitter drives its output in failure mode depend on whether it is configured to standard, NAMUR-compliant, or custom operation. See Rosemount 644 Temperature Transmitter Product Data Sheet for standard and NAMUR-compliant operation parameters.

2.4.5 HART software lock

The HART® software lock prevents changes to the transmitter configuration from all sources; all changes requested via HART by the Field Communicator, AMS Device manager or the LOI will be rejected. The HART Lock can only be set via HART Communication, and is only available in HART Revision 7 mode. The HART Lock can be enabled or disabled with a Field Communicator or AMS Device Manager.

Lock HART software using the Field Communicator

From the ***HOME*** screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	3, 2, 1

Lock HART software using the AMS Device Manager

Procedure

1. Right click on the device and select **Configure**.
2. Under Manual Setup select the **Security** tab.
3. Select the **Lock/Unlock** button under HART Lock (Software) and follow the screen prompts.

2.5 Verify configuration

It is recommended that various configuration parameters are verified prior to installation into the process. The various parameters are detailed out for each configuration tool. Depending on what configuration tool(s) are available, follow the steps listed relevant to each tool.

2.5.1 Verify configuration using the Field Communicator

Configuration parameters listed in Table 2-3 below are the basic parameters that should be reviewed prior to transmitter installation. A full list of configuration parameters that can be reviewed and configured using a Field Communicator are located in Field Communicator Menu Trees and Fast Keys. A Rosemount 644 Device Descriptor (DD) must be installed on the Field Communicator to verify configuration.

Verify device configuration using Fast Key sequences in Table 2-3.

From the ***HOME*** screen, enter the Fast Key sequences listed in Table 2-3.

Table 2-3: Device Dashboard Fast Key Sequences

Function	HART 5	HART 7
Alarm Values	2, 2, 5, 6	2, 2, 5, 6
Damping Values	2, 2, 1, 5	2, 2, 1, 6
Lower Range Value (LRV)	2, 2, 5, 5, 3	2, 2, 5, 5, 3

Table 2-3: Device Dashboard Fast Key Sequences *(continued)*

Function	HART 5	HART 7
Upper Range Value (URV)	2, 2, 5, 5, 2	2, 2, 5, 5, 2
Primary Variable	2, 2, 5, 5, 1	2, 2, 5, 5, 1
Sensor 1 Configuration	2, 1, 1	2, 1, 1
Sensor 2 Configuration (1)	2, 1, 1	2, 1, 1
Tag	2, 2, 7, 1, 1	2, 2, 7, 1, 1
Units	2, 2, 1, 5	2, 2, 1, 4

(1) Available only if option code (S) or (D) is ordered.

2.5.2 Verify configuration using the AMS Device Manager

Procedure

1. Right click on the device and select **Configuration Properties** from the menu.
2. Navigate the tabs to review the transmitter configuration data.

2.5.3 Verify configuration using the LOI

Procedure

1. Press any configuration button to activate the LOI.
2. Select **VIEW CONFIG** to review the below parameters.
3. Use the configuration buttons to navigate through the menu.

   The parameters to be reviewed prior to installation include:

   - Tag
   - Sensor configuration
   - Units
   - Alarm and saturation levels
   - Primary variable
   - Range values
   - Damping

2.5.4 Checking transmitter output

Before performing other transmitter on-line operations, review the transmitter digital output parameters to ensure that the transmitter is operating properly and is configured to the appropriate process variables.

Checking or setting process variables

The “Process Variables” menu displays process variables, including sensor temperature, percent of range, analog output, and terminal temperature. These process variables are continuously updated. The default primary variable is Sensor 1. The secondary variable is the transmitter terminal temperature by default.

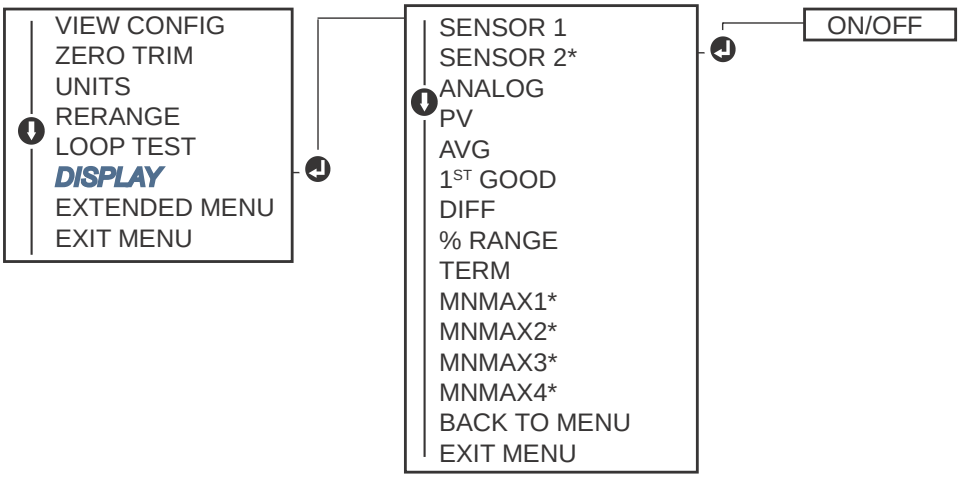
Check or set process variables using the Field Communicator

From the ***HOME*** screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	3, 2, 1

Check or set process variables using the AMS Device Manager

Procedure



- Right click on the device and select **Service Tools** from the menu.
  The ***Variables*** tab displays the following process variables:
  - Primary, second, third, and fourth variables, as well as the analog output.

Check or set process variables using LOI

Procedure

1. To check the process variables from the LOI, the user must first configure the display to show the desired variables (see Configuring the LCD display).
2. Once the desired device variables are chosen, simply exit the LOI menu and view the alternating values on the display screen.

Figure 2-4: Check or set process variables using LOI

2.6 Basic configuration of the transmitter

The transmitter must be configured for certain basic variables in order to be operational. In many cases, all of these variables are pre-configured at the factory. Configuration may be required if the transmitter is not configured or if the configuration variables need revision.

2.6.1 Mapping the HART variables

Mapping HART variables using the Field Communicator

The “Variable Mapping” menu displays the sequence of the process variables. Select the sequence below to change this configuration. The transmitter single sensor input configuration screens allow selection of the primary variable (PV) and the secondary variable (SV). When the *Select PV screen* appears, **Snsr 1** must be selected.

The transmitter dual-sensor option configuration screens allow selection of the Primary Variable (PV), Secondary Variable (SV), Tertiary Variable (TV), and Quaternary Variable (QV). Variable choices are Sensor 1, Sensor 2, Differential Temperature, Average Temperature, Terminal Temperature, and Not Used. The 4–20 mA analog signal represents the Primary Variable.

From the ***HOME*** screen, enter the Fast Key sequence.

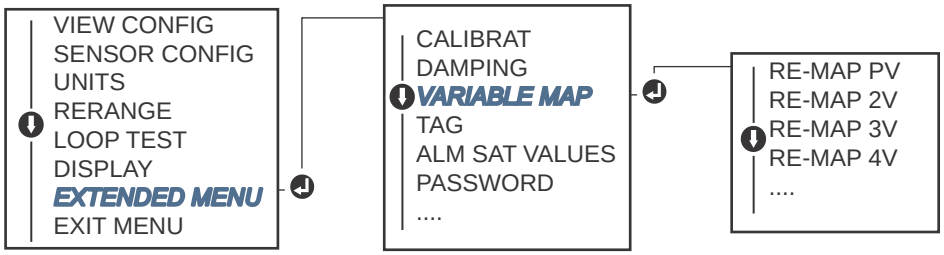
Device Dashboard Fast Keys	2, 2, 8, 6

Mapping HART variables using the AMS Device Manager

Procedure

1. Right click on the device and select the **Configure** menu.
2. In the left navigation pane, select **Manual Setup** then on the HART tab.
3. Map each variable individually or use the Re-map Variables method to guide you through the re-mapping process.
4. Select **Apply** when complete.

Mapping HART variables using LOI



Follow flow chart to select the desired mapped variables.

Procedure

1. Use the **SCROLL** and **ENTER** buttons to select each variable.
2. Save by selecting **SAVE** as indicated on the LCD screen when prompted.

   See Figure 2-5 for an example of a mapped variable with the LOI.

Figure 2-5: Mapping Variables with LOI

2.6.2 Configuring the sensor(s)

Sensor configuration includes setting the information for:

- Sensor type
- Connection type
- Units
- Damping values
- Sensor serial number
- RTD 2-wire offset

Configure the sensors using a Field Communicator

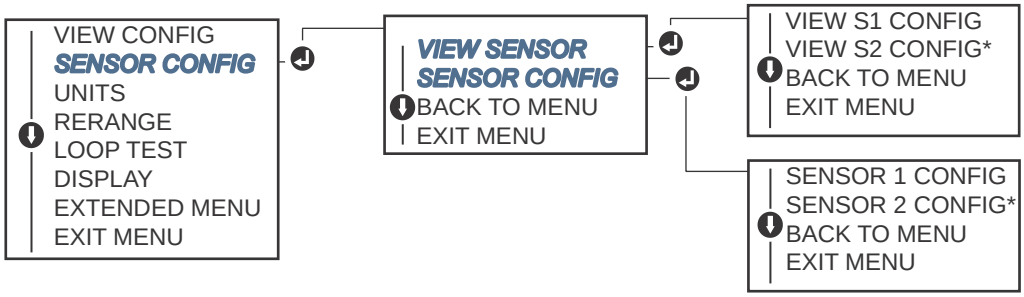
The configure sensors method will guide you through the configuration of all necessary settings associated with configuring a sensor including:

For a full list of Sensor Types available with the Rosemount 644 Transmitter and their associated levels of accuracy.

From the ***HOME*** screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	2, 1, 1

Configure the sensors using AMS Device Manager



Procedure

1. Right click on the device and select **Configure**.
2. In the left navigation pane select **Manual Setup** and select the **Sensor 1** or **Sensor 2** tab depending on the need.
3. Individually select the sensor type, connection, units and other sensor related information as desired from the drop down menus on the screen.
4. Select **Apply** when complete.

Configure sensors using LOI

Reference Figure 2-6 for guidance on where to find Sensor Configuration in the LOI menu.

Figure 2-6: Configuring Sensors with LOI

Note
Sensor 2 configuration is available only if option code (S) or (D) is ordered.

Contact an Emerson representative for information on the temperature sensors, thermowells, and accessory mounting hardware that is available through Emerson.

2.6.3 2-wire RTD offset

The 2-wire offset feature allows the measured lead wire resistance to be input and corrected for, which results in the transmitter adjusting its temperature measurement for the error caused by this added resistance. Because of a lack of lead wire compensation within the RTD, temperature measurements made with a 2-wire RTD are often inaccurate.

This feature can be configured as a subset of the sensor configuration process in the Field Communicator, AMS Device Manager, and the LOI.

To utilize this feature properly perform the following steps:

Procedure

1. Measure the lead wire resistance of both RTD leads after installing the 2-wire RTD and transmitter.
2. Navigate to the 2-wire RTD offset parameter.
3. Enter the total measured resistance of the two RTD leads at the 2-wire offset prompt to ensure proper adjustment. The transmitter will adjust its temperature measurement to correct the error caused by lead wire resistance.

Set 2-wire RTD offset using the Field Communicator

From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	2, 1, 1

Set 2-wire RTD offset using the AMS Device Manager

Procedure

1. Right click on the device and select **Configure**.
2. In the left navigation pane select **Manual Setup** and select the **Sensor 1** or **Sensor 2** tab depending on the need. Find the 2-wire offset text field and enter the value.
3. Select **Apply** when complete.

2.6.4 Setting output units

The Units can be configured for a number of different parameters in the Rosemount 644 Transmitter. Individual Units can be configured for:

- Sensor 1
- Sensor 2
- Terminal temperature
- Differential temperature
- Average temperature
- First good temperature

Each of the base parameters and calculated outputs from those values can have a unit of measure associated with it. Set the transmitter output to one of the following engineering units:

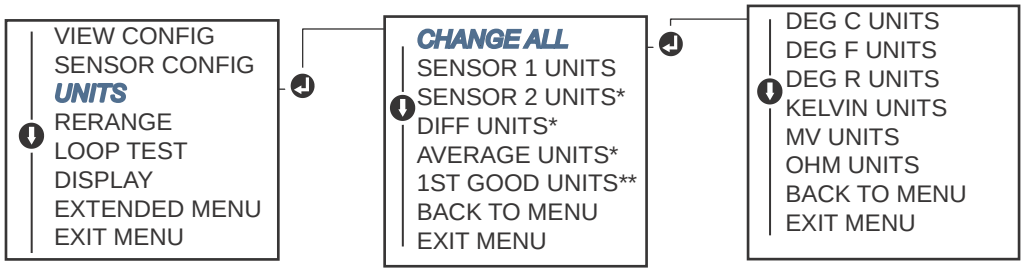
- Celsius
- Fahrenheit
- Rankine
- Kelvin
- Ohms
- Millivolts

Set output limits using Field Communicator

From the *HOME* screen, enter the Fast Key sequence.

	HART 5	HART 7
Device Dashboard Fast Keys	2, 2, 1, 4	2, 2, 1, 5

Set output limits using AMS Device Manager



Procedure

1. Right click on the device and select **Configure**.
2. In the left navigation pane select **Manual Setup**. The unit fields for various variables are spread over the Manual Setup tabs, click through the tabs and change the desired units.
3. Select **Apply** when complete.

Set output limits using LOI

Reference the below image for where to find the Units configuration in the LOI menu.

Figure 2-7: Configuring Units with LOI

* Available only if option code (S) or (D) is ordered.

** Available only if option codes (S) and (DC) are both ordered, or if option codes (D) and (DC) are both ordered.

Note
The list of choices available for Units after the primary menu is dependent on your Sensor configuration settings.

2.7 Configure dual sensor options

Dual-sensor configuration deals with the functions that can be used with a transmitter ordered with Dual Sensor inputs. In the Rosemount 644 Transmitter these functions include:

- Differential temperature
- Average temperature
- Hot Backup™ and sensor drift alert diagnostics (requires option code DC)
  - First good temperature (requires options S and DC, or options D and DC)

2.7.1 Differential temperature configuration

The Rosemount 644 Transmitter ordered and configured for dual-sensors can accept any two inputs then display the differential temperature between them. Use the following procedures to configure the transmitter to measure differential temperature.

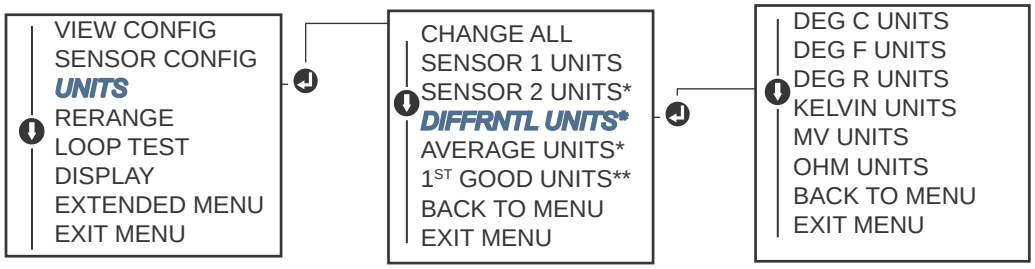
Note
This procedure assumes the differential temperature is a calculated output of the device but does not re-assign it as the primary variable. If it desired for Differential to be the transmitter's primary variable see Mapping the HART variables to set it to PV.

Configure differential temperature configuration using Field Communicator

From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	2, 2, 3, 1

Configure differential temperature configuration using AMS Device Manager



Procedure

1. Right click on the device and select **Configure**.
2. In the left navigation pane choose **Manual Setup**.
3. On the **Calculated Output** Tab find the **Differential Temperature** group box.
4. Select Units and Damping settings then select **Apply** when complete.

Configure differential temperature configuration using LOI

To configure the Differential Temperature on the LOI, the Units and Damping values must be set separately. Reference figures below for where to find these in the menu.

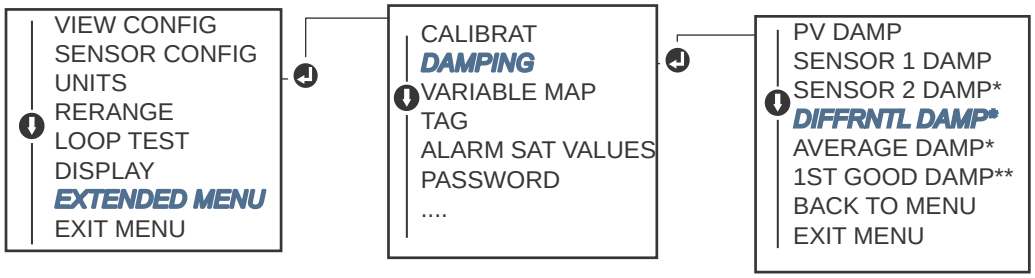


Figure 2-8: Configuring Differential Units with LOI

* Available only if option code (S) or (D) is ordered.

** Available only if option codes (S) and (DC) are both ordered, or if option codes (D) and (DC) are both ordered.

Figure 2-9: Configuring Differential Damping with LOI

* Available only if option code (S) or (D) is ordered.

** Available only if option codes (S) and (DC) are both ordered, or if option codes (D) and (DC) are both ordered.

2.7.2 Average temperature configuration

The Rosemount 644 Transmitter ordered and configured for dual-sensors can output and display the average temperature of any two inputs. Use the following procedures to configure the transmitter to measure the average temperature:

Note
This procedure assumes the average temperature is a calculated output of the device but does not reassign it as the primary variable. If it is desired for average to be the transmitter's primary variable see Mapping the HART variables to set it to PV.

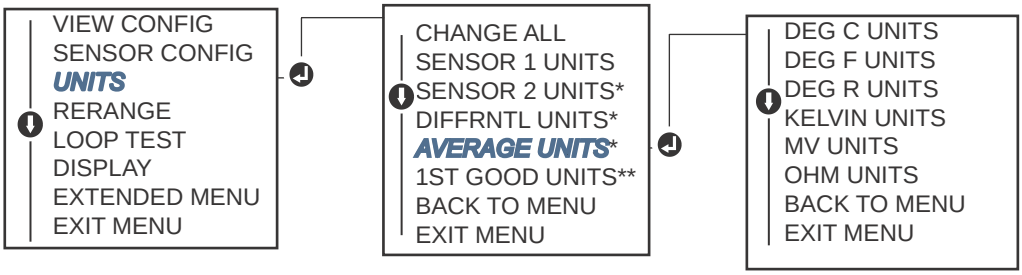
Configure average temperature using Field Communicator

From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	2, 2, 3, 3

Configure average temperature using AMS Device Manager

Procedure



1. Right click on the device and select **Configure**.
2. In the left navigation pane select **Manual Setup**.
3. On the **Calculated Output** Tab find the Average Temperature group box.
4. Select Units and Damping settings then select **Apply** when complete.

Configure average temperature using LOI

Procedure

- To configure average temperature on the LOI, the units and damping values must be set separately. Reference Figure 2-10 and Figure 2-11 below for where to find these in the menu.

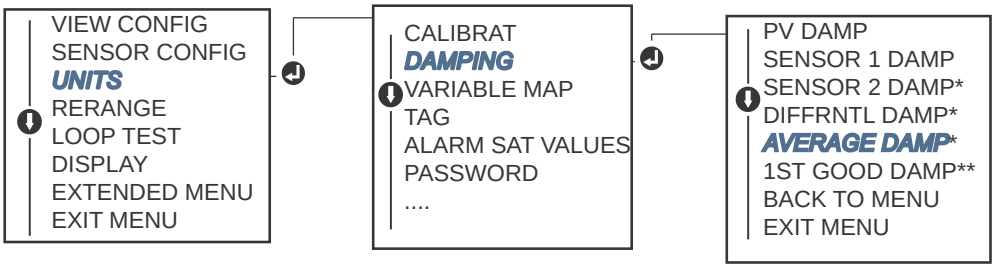


Figure 2-10: Configuring Average Units with LOI

* Available only if option code (S) or (D) is ordered.

** Available only if option codes (S) and (DC) are both ordered, or if option codes (D) and (DC) are both ordered.

Figure 2-11: Configuring Average Damping with LOI

* Available only if option code (S) or (D) is ordered.

** Available only if option codes (S) and (DC) are both ordered, or if option codes (D) and (DC) are both ordered.

Note

If Sensor 1 and/or Sensor 2 should fail while PV is configured for average temperature and Hot Backup™ is not enabled, the transmitter will go into alarm. For this reason, it is recommended when PV is Sensor Average, that Hot Backup be enabled when dual-element sensors are used, or when two temperature measurements are taken from the same point in the process. If a sensor failure occurs when Hot Backup is enabled, while PV is Sensor Average, three scenarios could result:

— If Sensor 1 fails, the average will only be reading from Sensor 2, the working sensor

— If Sensor 2 fails, the average will only be reading from Sensor 1, the working sensor

— If both sensors fail simultaneously, the transmitter will go into alarm and the status available (via HART®) states that both Sensor 1 and Sensor 2 have failed

In the first two scenarios, the 4–20 mA signal is not disrupted and the status available to the control system (via HART) specifies which sensor has failed.

2.7.3 Hot Backup configuration

The Hot Backup™ feature configures the transmitter to automatically use Sensor 2 as the primary sensor if Sensor 1 fails. With Hot Backup enabled, the primary variable (PV) must either be first good or average. See the Note for details on using Hot Backup when the PV is set to Sensor Average.

Sensors 1 or 2 can be mapped as the secondary variable (SV), tertiary variable (TV), or quaternary variable (QV). In the event of a primary variable (Sensor 1) failure, the transmitter enters Hot Backup mode and Sensor 2 becomes the PV. The 4–20 mA signal is not disrupted, and a status is available to the control system through HART® that Sensor 1 has failed. An LCD display, if attached, displays the failed sensor status.

While configured to Hot Backup, if Sensor 2 fails but Sensor 1 is still operating properly, the transmitter continues to report the PV 4–20 mA analog output signal, while a status is available to the control system through HART that Sensor 2 has failed.

Resetting Hot Backup

In Hot Backup™ mode, if Sensor 1 does fail and Hot Backup is initiated, the transmitter will not revert back to Sensor 1 to control the 4–20 mA analog output until the Hot Backup mode is reset by re-enabling through HART®, re-setting it through the LOI or by briefly powering down the transmitter.

Configure Hot Backup using Field Communicator

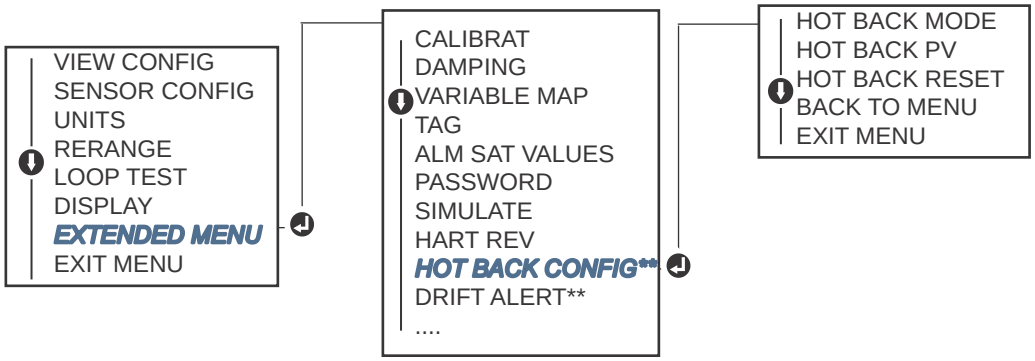
The Field Communicator will walk you through a method to correctly configure the necessary elements of the Hot Backup feature.

From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	2, 1, 5

Configure Hot Backup using AMS Device Manager

Procedure



1. Right click on the device and select **Configure**.
2. In the left navigation pane select **Manual Setup**.
3. On the Diagnostics Tab find the **Hot Backup** group box.

4. Choose the button **Configure Hot Backup** or **Reset Hot Backup** depending on the desired function and walk through the guided steps.
5. Select **Apply** when complete.

Configure Hot Backup using LOI

To configure Hot Backup™ on the LOI, enable the mode and set the PV values. Reference Figure 2-12 for where to find these in the menu.

Figure 2-12: Configuring Hot Backup with LOI

* Available only if option code (S) or (D) is ordered.

** Available only if option codes (S) and (DC) are both ordered, or if option codes (D) and (DC) are both ordered.

For information on using Hot Backup with HART Tri-Loop™ see Using the transmitter with the HART Tri-Loop.

2.7.4 Sensor drift alert configuration

The sensor drift alert command allows the transmitter to set a warning flag (through HART), or go into analog alarm when the temperature difference between Sensor 1 and Sensor 2 exceeds a user-defined limit.

This feature is useful when measuring the same process temperature with two sensors, ideally when using a dual-element sensor. When sensor drift alert mode is enabled, the user sets the maximum allowable difference, in engineering units, between sensor 1 and sensor 2. If this maximum difference is exceeded, a sensor drift alert warning flag will be set.

Though it defaults to WARNING, when configuring the transmitter for sensor drift alert, the user also has the option of specifying the analog output of the transmitter go into ALARM when sensor drifting is detected.

Note
Using dual sensor configuration in the Rosemount 644 Transmitter, the transmitter supports the configuration and simultaneous use of Hot Backup and sensor drift alert. If one sensor fails, the transmitter switches output to use the remaining good sensor. Should the difference between the two sensor readings exceed the configured threshold, the AO will go to alarm indicating the sensor

drift condition. The combination of sensor drift alert and Hot Backup improves sensor diagnostic coverage while maintaining a high level of availability. Refer to the Rosemount 644 FMEDA report for the impact on safety.

Configure sensor drift alert using Field Communicator

The Field Communicator will guide you through a method to correctly configure the necessary elements of a sensor drift alert feature.

From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	2, 1, 6

Configure sensor drift alert using AMS Device Manager

Procedure

1. Right click on the device and select **Configure**.
2. On the **Diagnostics** Tab find the **Sensor Drift Alert** group box.
3. Select to **Enable** the **Mode** and fill in the **Units**, **Threshold** and **Damping** values from the drop downs provided or select the **Configure Sensor Drift Alert** button and walk through the guided steps.
4. Select **Apply** when complete.

Configure sensor drift alert using LOI

To configure sensor drift alert on the LOI, enable the mode, then set the PV, drift limit, and value for drift alert damping all separately. Reference figure below for where to find these in the menu.

Figure 2-13: Configuring Sensor Drift Alert with LOI

* Available only if option code (S) or (D) is ordered.

** Available only if option codes (S) and (DC) are both ordered, or if option codes (D) and (DC) are both ordered.

Note
Enabling the drift alert option to WARNING will set a flag (through the HART communications) whenever the maximum acceptable difference between Sensor 1 and Sensor 2 has been exceeded. For the transmitter's analog signal to go into ALARM when drift alert is detected, select alarm during the configuration process.

2.8 Configure device outputs

2.8.1 Re-range the transmitter

Re-ranging the transmitter sets the measurement range to the limits of the expected readings for a certain application. Setting the measurement range to the limits of expected readings maximizes transmitter performance; the transmitter is most accurate when operated within the expected temperature range for the application.

The range of expected readings is defined by the Lower Range Value (LRV) and Upper Range Value (URV). The transmitter range values can be reset as often as necessary to reflect changing process conditions. For a complete listing of Range and Sensor limits.

Note
The re-range functions should not be confused with the trim functions. Although the re-range function matches a sensor input to a 4–20 mA output, as in conventional calibration, it does not affect the transmitter's interpretation of the input.

Select from one of three methods to re-range the transmitter.

Re-range the transmitter using Field Communicator

From the *HOME* screen, enter the Fast Key sequence.

	Lower range value	Upper range value
Device Dashboard Fast Keys	2, 2, 5, 5, 3	2, 2, 5, 5, 2

Re-range the transmitter using AMS Device Manager

Procedure

1. Right click on the device and select **Configure**.
2. In the left navigation pane select **Manual Setup**.
3. On the **Analog Output** Tab find the Primary Variable Configuration group box.
4. Change the **Upper Range Value** and **Lower Range Value** to their desired settings.
5. Select **Apply** when complete.

Re-range the transmitter using LOI

Reference the image below to find the range value configuration path on the LOI.

Figure 2-14: Re-ranging the Transmitter with LOI

2.8.2 Damping

The damping function changes the response time of the transmitter to smooth variations in output readings caused by rapid changes in input. Determine the appropriate damping setting based on the necessary response time, signal stability, and other requirements of the loop dynamics of the system. The default damping value is 5.0 seconds and can be reset to any value between 1 and 32 seconds.

The value chosen for damping affects the response time of the transmitter. When set to zero (disabled), the damping function is off and the transmitter output reacts to changes in input as quickly as the intermittent sensor algorithm allows. Increasing the damping value increases transmitter response time.

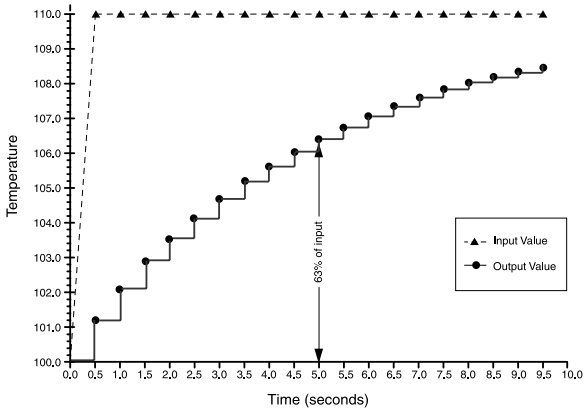
With damping enabled, if the temperature change is within 0.2 percent of the sensor limits, the transmitter measures the change in input every 500 milliseconds (for a single sensor device) and outputs values according to the following relationship:

$$Damped\ value\ =\ (N-P)x\left(\frac{2T-U}{2T+U}\right)+P$$

P = previous damped value

N = new sensor value

T = damping time constant



U = update rate

At the value to which the damping time constant is set, the transmitter output is at 63 percent of the input change and it continues to approach the input according to the damping equation above.

For example, as illustrated in Figure 2-15, if the temperature undergoes a step change—within 0.2 percent of the sensor limits—from 100 to 110 degrees, and the damping is set to 5.0 seconds, the transmitter calculates and reports a new reading every 500 milliseconds using the damping equation. At 5.0 seconds, the transmitter outputs 106.3 degrees, or 63 percent of the input change, and the output continues to approach the input curve according to the equation above.

For information regarding the damping function when the input change is greater than 0.2 percent of the sensor limits, refer to Intermittent sensor detection.

Figure 2-15: Change in Input vs. Change in Output with Damping Set to Five Seconds

Damping can be applied to a number of parameters in the Rosemount 644 Transmitter. Variables that can be damped are:

- Primary Variable (PV)
- Sensor 1
- Sensor 2
- Differential temperature
- Average temperature
- First good temperature

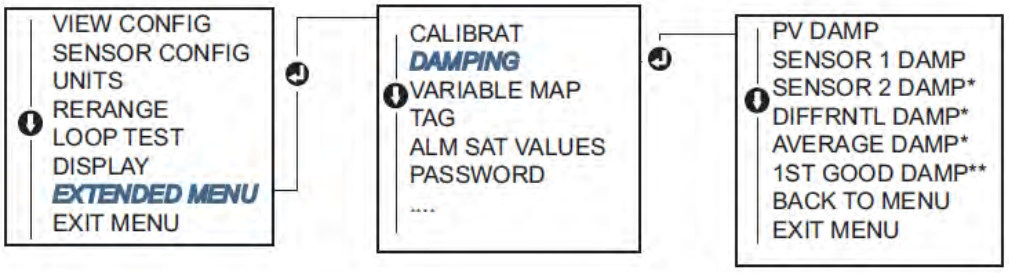
Note
The instructions below only refer to the damping of the Primary Variable (PV).

Set damping value using Field Communicator

From the *HOME* screen, enter the Fast Key sequence.

	HART 5	HART 7
Device Dashboard Fast Keys	2, 2, 1, 5	2, 2, 1, 6

Set damping value using AMS Device Manager



Procedure

1. Right click on the device and select **Configure**.
2. In the left navigation pane select **Manual Setup**.
3. On the **Sensor 1** Tab find the Setup group box.
4. Change the **Damping Value** to the desired setting.
5. Select **Apply** when complete.

Set damping value using LOI

Reference the figure below to find the damping configuration path on the LOI.

Figure 2-16: Set damping value using LOI

2.8.3 Configure alarm and saturation levels

In normal operation, the transmitter will drive the output in response to measurements between the lower to upper saturation points. If the temperature goes outside the sensor limits, or if the output would be beyond the saturation points, the output will be limited to the associated saturation point.

The transmitter automatically and continuously performs self-diagnostic routines. If the self-diagnostic routines detect a failure, the transmitter drives the output to configured alarm value based on the position of the alarm switch. The Alarm and Saturation settings allow the alarm settings (Hi or Low) and saturation values to be viewed and changed.

Failure mode alarm and saturation levels can be configured using a Field Communicator, AMS Device Manager, and the LOI. The following limitations exist for custom levels:

- The low alarm value must be less than the Low Saturation level.
- The high alarm value must be higher than the High Saturation level.
- Alarm and Saturation levels must be separated by at least 0.1 mA

The configuration tool will provide an error message if the configuration rule is violated.

See table below for the common alarm and saturation levels.

Table 2-4: Rosemount Alarm and Saturation Values

Units - mA	Min	Max	Rosemount	NAMUR
High alarm	21	23	21.75	21.0
Low alarm(1)	3.5	3.75	3.75	3.6
High saturation	20.5	20.9(2)	20.5	20.5
Low saturation(1)	3.7(3)	3.9	3.9	3.8

(1) Requires 0.1 mA gap between low alarm and low saturation values.

(2) Rail mount transmitters have a high saturation max of 0.1 mA less than the high alarm setting, with a max value of 0.1 mA less than the high alarm max.
(3) Rail mount transmitters have a low saturation min of 0.1 mA greater than the low alarm setting, with a minimum of 0.1 mA greater than the low alarm min.

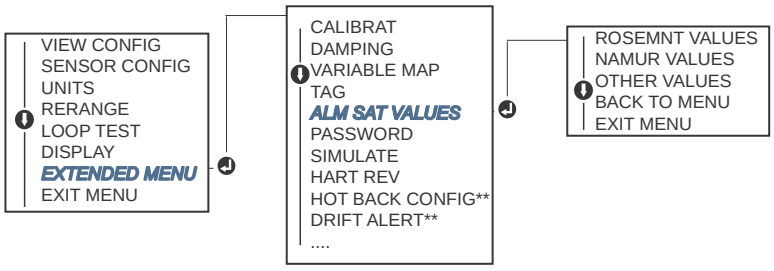
Note
Transmitters set to HART multidrop mode send all saturation and alarm information digitally; saturation and alarm conditions will not affect the analog output.

Configure alarm and saturation levels using Field Communicator

From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	2, 2, 5, 6

Configure alarm and saturation levels using AMS Device Manager



Procedure

1. Right click on the device and select **Configure**.
2. In the left navigation pane select **Manual Setup**.
3. On the **Analog Output** Tab find the Alarm and Saturation Levels group box.
4. Enter the High Alarm, High Saturation, Low Saturation and Low Alarm levels to the desired vales.
5. Select **Apply** when complete.

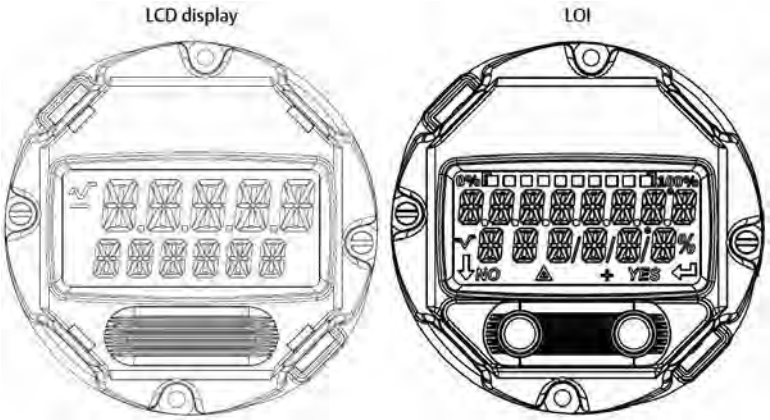
Configure alarm and saturation levels using LOI

Reference the Figure 2-17 below to find the alarm and saturation value configuration path on the LOI.

Figure 2-17: Configuring Alarm and Saturation Values with LOI

* Available only if option code (S) or (D) is ordered.

** Available only if option codes (S) and (DC) are both ordered, or if option codes (D) and (DC) are both ordered.



2.8.4 Configuring the LCD display

The LCD display configuration command allows customization of the LCD display to suit application requirements. The LCD display will alternate between the selected items with each item displaying for a three seconds interval.

- Sensor 1
- Sensor 2
- Analog output
- Primary variable
- Average temperature
- First good temperature
- Differential temperature
- Percent of range
- Terminal temperature
- Min and max 1
- Min and max 2
- Min and max 3
- Min and max 4

Reference Figure 2-18 to view the differences between the LCD display and LOI options available with the transmitter.

Figure 2-18: LOI and LCD Display

Configure the LCD display using Field Communicator

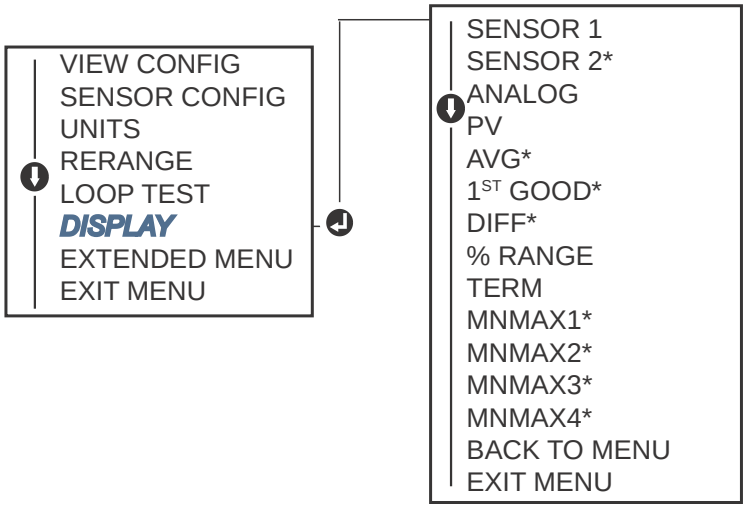
From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	2, 1, 4

Configure the LCD display using AMS Device Manager

Procedure

1. Right click on the device and select **Configure**.
2. In the left navigation pane select **Manual Setup**.



Note
On the **Display** tab there will be a group box with all available variables that can be displayed.

3. Check and uncheck the desired display variables, with a checked box indicating that the variable will be displayed.
4. Select **Apply** when complete.

Configure the LCD display using LOI

Reference Figure 2-19 to find the LCD display value configuration path on the LOI.

Figure 2-19: Configuring the LCD Display using LOI

*Available only if option code (S) or (D) is ordered.

2.9 Inputting device information

Access the transmitter information variables online using the Field Communicator or other suitable communications device. The following is a list of transmitter information variables, including device identifiers, factory-set configuration variables, and other information.

2.9.1 Tag, Date, Descriptor, and Message

The Tag, Date, Descriptor, and Message are parameters that provide transmitter identification in large installations.

The **Tag** variable is the easiest way to identify and distinguish between different transmitters in multi-transmitter environments. It is used to label transmitters electronically according to the requirements of the application. The defined Tag is automatically displayed when a HART®-based communicator establishes contact with the transmitter at power-up. The Tag is up to eight characters and the Long Tag (a parameter introduced with the HART 6 and 7 protocol) was extended to 32 characters long. Neither parameter has any impact on the primary variable readings of the transmitter, it is only for information.

The **Date** is a user-defined variable that provides a place to save the date of the last revision of configuration information. It has no impact on the operation of the transmitter or the HART-based communicator.

The **Descriptor** variable provides a longer user-defined electronic label to assist with more specific transmitter identification than is available with tag. The Descriptor may be up to 16 characters long and has no impact on the operation of the transmitter or the HART-based communicator.

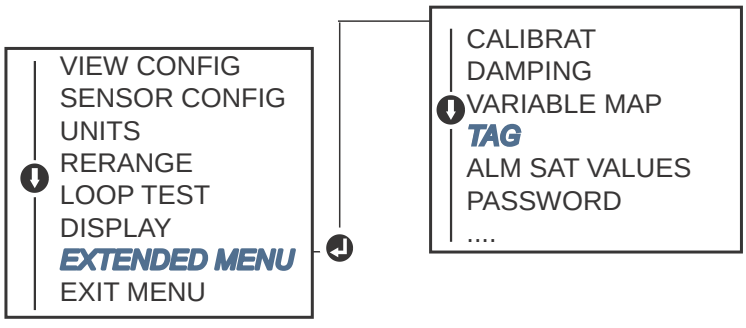
The **Message** variable provides the most specific user-defined means for identifying individual transmitters in multi-transmitter environments. It allows for 32 characters of information and is stored with the other configuration data. The Message variable has no impact on the operation of the transmitter or the HART-based communicator.

Input device information using Field Communicator

From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	1, 8

Input device information using AMS Device Manager



Procedure

1. Right click on the device and select **Configure**.
2. In the left navigation pane select **Manual Setup**.
3. On the **Device** Tab there will be a group box called identification. Enter the desired characters in the **Tag**, **Date**, **Descriptor**, and **Message** fields
4. Select **Apply** when complete.

Input device information using LOI

Reference Figure 2-20 to find the tag configuration path in the LOI.

Figure 2-20: Configuring the Tag with LOI

2.10 Configure measurement filtering

2.10.1 50/60 Hz filter

The 50/60 Hz Filter (also known as Line Voltage Filter or AC Power Filter) function sets the transmitter electronic filter to reject the frequency of the AC power supply in the plant. The 60 or 50 Hz mode can be chosen. The factory default for this setting is 50 Hz.

Configure measurement filtering using Field Communicator

From the ***HOME*** screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	2, 2, 7, 4, 1

Configure measurement filtering using AMS Device Manager

Procedure

1. Right click on the device and select **Configure**.
2. In the left navigation pane select **Manual Setup**.
3. On the **Device** Tab there will be a group box called **Noise Rejection**. In the **AC Power Filter** box, select from the drop down menu.
4. Select **Apply** when complete.

2.10.2 Resetting the device

Processor Reset function resets the electronics without actually powering down the unit. It does not return the transmitter to the original factory configuration.

Reset the device using a Field Communicator

From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	3, 4, 6, 1

Reset the device using AMS Device Manager

Procedure

1. Right click on the device and select **Service Tools**.
2. In the left navigation pane select **Maintenance**.
3. On the ***Reset/Restore*** tab select the **Processor Reset** button.
4. Select **Apply** when complete.

2.10.3 Intermittent sensor detection

The intermittent sensor detection feature (also known as the transient filter) is designed to guard against erratic process temperature readings caused by intermittent open sensor conditions. An intermittent sensor condition is an open sensor condition that lasts less than one update. By default, the transmitter is shipped with the intermittent sensor detection feature switched ON and the threshold value set at 0.2 percent of sensor limits. The intermittent sensor detect feature can be switched ON or OFF and the threshold value can be changed to any value between 0 and 100 percent of the sensor limits with a Field Communicator.

When the intermittent sensor detection feature is switched ON, the transmitter can eliminate the output pulse caused by intermittent open sensor conditions. Process temperature changes (T) within the threshold value will be tracked normally by the transmitter's output. A (T) greater than the threshold value will activate the intermittent sensor algorithm. True open sensor conditions will cause the transmitter to go into alarm.

The threshold value of the transmitter should be set at a level that allows the normal range of process temperature fluctuations; too high and the algorithm will not be able to filter out intermittent conditions; too low and the algorithm will be activated unnecessarily. The default threshold value is 0.2 percent of the sensor limits.

When the intermittent sensor detection feature is switched OFF, the transmitter tracks all process temperature changes, even from an intermittent sensor. (The transmitter behaves as though the threshold value had been set at 100 percent.) The output delay due to the intermittent sensor algorithm will be eliminated.

Configure intermittent sensor detect using a Field Communicator

The following steps indicate how to turn the intermittent sensor detect (or transient filter) feature ON or OFF. When the transmitter is connected to a Field Communicator, use the Fast Key sequence and choose ON (normal setting) or OFF.

From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	2, 2, 7, 4, 2

The threshold value can be changed from the default value of 0.2 percent. Turning the Intermittent Sensor Detect feature OFF or leaving it ON and increasing the threshold value above the default does not affect the time needed for the transmitter to output the correct alarm signal after detecting a true open sensor condition. However, the transmitter may briefly output a false temperature reading for up to one update in either direction up to the threshold value (100 percent of sensor limits if Intermittent Sensor Detect is OFF). Unless a rapid response rate is necessary, the suggested setting is ON with 0.2 percent threshold.

Configure intermittent sensor detect using AMS Device Manager

Procedure

1. Right click on the device and select **Configure**.
2. In the left navigation pane select **Manual Setup**.

   Note
   On the **Device** Tab there will be a group box called Noise Rejection, in the box **Transient Filter Threshold**, enter the desired percent.

3. Select **Apply** when complete.

2.10.4 Open sensor hold off

The open sensor hold off option, at the normal setting, enables the Rosemount 644 Transmitter to be more robust under heavy EMI conditions. This is accomplished by the software having the transmitter perform additional verification of the open sensor status prior to activating the transmitter alarm. If the additional verification shows that the open sensor condition is not valid, the transmitter will not go into alarm.

For users of the Rosemount 644 Transmitter that desire a more vigorous open sensor detection, the open sensor hold off option can be changed to a fast setting where the transmitter will report an open sensor condition without additional verification of whether or not the open condition is valid.

Note
In high noise environments, normal mode is recommended.

Configure open sensor hold off using a Field Communicator

From the ***HOME*** screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	2, 2, 7, 3

Configure open sensor hold off using AMS Device Manager

Procedure

1. Right click on the device and select **Configure**.
2. In the left navigation pane select **Manual Setup**.
3. On the **Device** Tab there will be a group box called Open Sensor Hold Off. Change the Mode to either **Normal** or **Fast**.
4. Select **Apply** when complete.

2.11 Diagnostics and service

2.11.1 Perform a loop test

The analog loop test verifies the output of the transmitter, the integrity of the loop, and the operations of any recorders or similar devices installed in the loop. To initiate a loop test, follow the steps below.

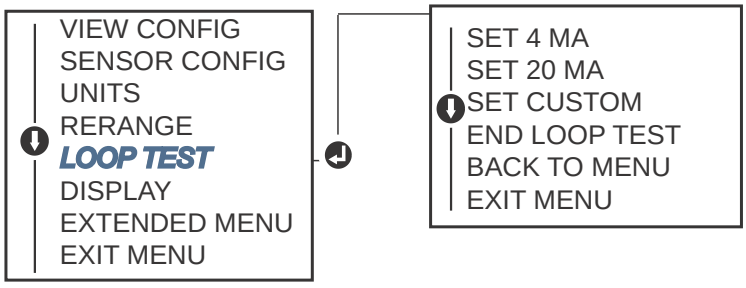
The host system may provide a current measurement for the 4–20 mA HART® output. If not, connect a reference meter to the transmitter by either connecting the meter to the test terminals on the terminal block, or shunting transmitter power through the meter at some point in the loop.

Perform a loop test using a Field Communicator

From the ***HOME*** screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	3, 5, 1

Perform a loop test using AMS Device Manager



Procedure

1. Right click on the device and select **Service Tools**.
2. In the left navigation pane select **Simulate**.
3. On the **Simulate** Tab find the Perform Loop Test button in the **Analog Output Verification** group box.
4. Follow the guided instructions and select **Apply** when complete.

Perform a loop test using LOI

Reference the Figure 2-21 to find the path to the loop test in the LOI menu.

Figure 2-21: Performing a Loop Test with the LOI

2.11.2 Simulate digital signal (digital loop test)

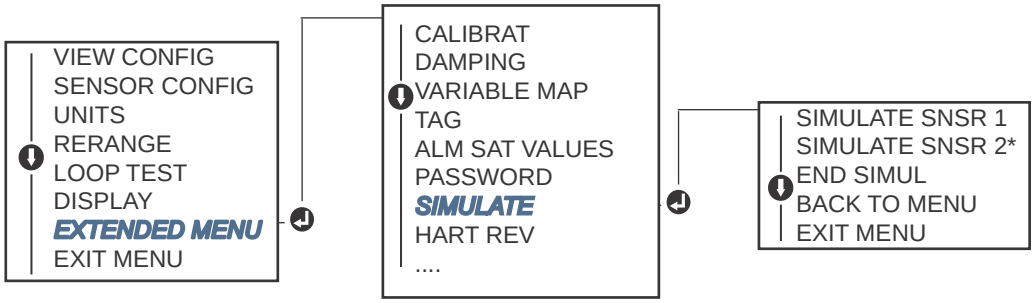
The simulate digital signal function adds to the analog loop test by confirming the HART output values are outputting correctly. Digital loop test is only available in HART Revision 7 mode.

Simulate a digital signal using a Field Communicator

From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	3, 5, 2

Simulate a digital signal using AMS Device Manager



Procedure

1. Right click on the device and select **Service Tools**.
2. In the left navigation window select **Simulate**.
3. In the group box labeled **Device Variables** select the variable to simulate.
   a) Sensor 1 Temperature
   b) Sensor 2 Temperature (only available with option S or D)
4. Follow the screen prompts to simulate selected digital value.

Simulate a digital signal using LOI

Reference the Figure 2-22 to find the path to the simulate digital signal in the LOI menu.

Figure 2-22: Simulating the Digital Signal with LOI

*Available only if option code (S) or (D) is ordered.

2.11.3 Thermocouple degradation diagnostic

Thermocouple degradation diagnostic acts as a gauge of the general health of the thermocouple and is indicative of any major changes in the status of the thermocouple or the thermocouple loop. The transmitter monitors the resistance of the thermocouple loop to detect drift conditions or wiring condition changes. The transmitter uses a baseline and threshold Trigger value and reports the suspected status of the thermocouple based off the difference between these values. This feature is not intended to be a precise measurement of thermocouple status, but is a general indicator of thermocouple and thermocouple loop health.

Thermocouple diagnostic must be Enabled as well as connected and configured to read a thermocouple type sensor. Once the diagnostic has been activated, a baseline resistance value is calculated. Then a Trigger threshold must be selected,

which can be two, three, or four times the baseline resistance, or the default of 5000 ohms. If the thermocouple loop resistance reaches the Trigger Level, a maintenance alert is generated.

⚠ CAUTION

The thermocouple degradation diagnostic monitors the health of the entire thermocouple loop, including wiring, terminations, junctions, and the sensor itself. Therefore, it is imperative that the diagnostic baseline resistance be measured with the sensor fully installed and wired in the process, and not on the bench.

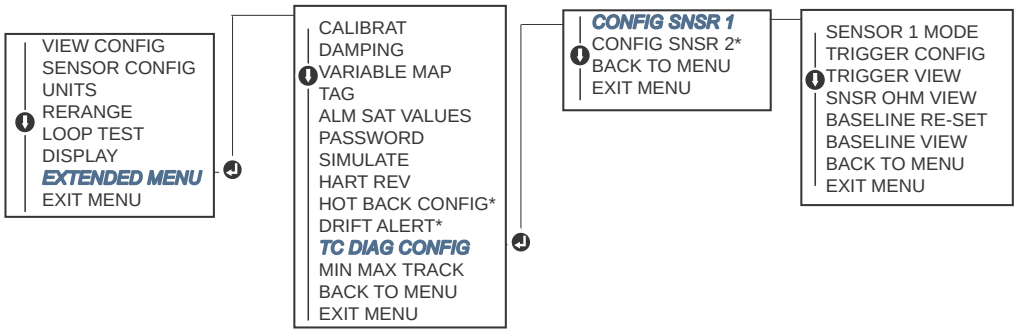
Note
The thermocouple resistance algorithm does not calculate resistance values while the active calibrator mode is enabled.

Perform thermocouple degradation diagnostic using a Field Communicator

From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	2, 2, 4, 3, 4

Perform thermocouple degradation diagnostic using AMS Device Manager



Procedure

1. Right click on the device and select **Configure**.
2. In the left navigation window select **Manual Setup**.
3. On the Diagnostics tab, there is a group box labeled **Sensor and Process Diagnostics**; select the button for **Configure Thermocouple Diagnostic**.
4. Follow the screen prompts to Enable and set the values for the diagnostic. See AMS terms.

Perform thermocouple degradation diagnostic using LOI

Reference the Figure 2-23 to find the path to the thermocouple diagnostic in the LOI menu.

Figure 2-23: Configuring T/C Diagnostic with LOI

* Available only if option code (S) or (D) is ordered.

2.11.4 Minimum/maximum tracking diagnostic

Minimum and maximum temperature tracking (min/max tracking) when enabled records minimum and maximum temperatures with date and time stamps on Rosemount 644 HART Head Mount and Field Mount Temperature Transmitters. This feature records values for Sensor 1, Sensor 2, Differential, Average, First Good, and Terminal temperatures. Min/Max Tracking only records temperature maximum and minimum obtained since the last reset, and is not a logging function.

To track maximum and minimum temperatures, Min/Max Tracking must be enabled using a Field Communicator, AMS Device Manager, LOI, or other communicator. While enabled, this feature allows for a reset of information at any time, and all variables can be reset simultaneously. Additionally, each of the individual parameter's minimum and maximum values may be reset individually. Once a particular field has been reset, the previous values are overwritten.

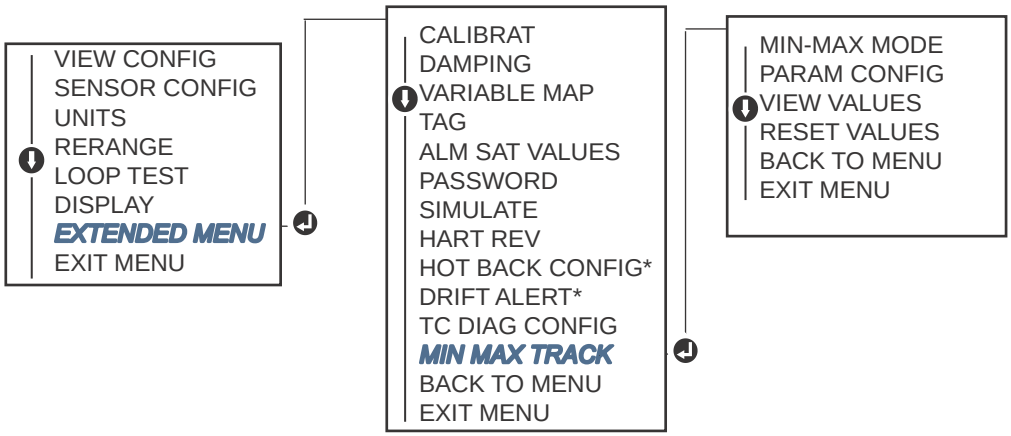
Track minimum and maximum temperatures using a Field Communicator

From the ***HOME*** screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	2, 2, 4, 3, 5

Track minimum and maximum temperatures using AMS Device Manager

Procedure



1. Right click on the device and select **Configure**.

2. In the left navigation window select **Manual Setup**.
3. On the Diagnostics tab, there is a group box labeled **Sensor and Process Diagnostics**; select the button for **Configure Min/Max Tracking**.
4. Follow the screen prompts to Enable and configure the settings for the diagnostic.

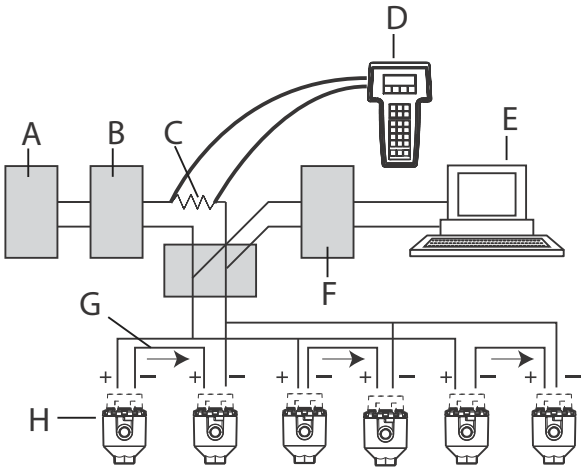
Track minimum and maximum temperatures using LOI

Reference the Figure 2-24 to find the path to configure min/max in the LOI menu

Figure 2-24: Configuring Min/Max Tracking with LOI

* Available only if option code (S) or (D) is ordered.

2.12 Establishing multi-drop communication



Multi-dropping refers to the connection of several transmitters to a single communications transmission line. Communication between the host and the transmitters takes place digitally with the analog output of the transmitters deactivated.

Many Rosemount transmitters can be multi-dropped. With the Field Communications protocol, up to 15 transmitters can be connected on a single twisted pair of wires or over leased phone lines.

A Field Communicator can test, configure, and format a multi-dropped Transmitter in the same way as in a standard point-to-point installation. The application of a multidrop installation requires consideration of the update rate necessary from each transmitter, the combination of transmitter models, and the length of the transmission line. Each transmitter is identified by a unique address (1–15) and responds to the commands defined in the HART protocol. A Field Communicator can test, configure, and format a multidropped transmitter the same as in a standard point-to-point installation.

Note
Multi-drop is not suitable for safety-certified applications and installations.

Figure 2-25: Typical Multi-dropped Network

A. Power supply
B. Power supply impedance
C. 250 Ω
D. Field Communicator
E. Computer or DCS
F. HART interface
G. 4–20 mA
H. Transmitter

Note
Rosemount 644 Transmitters are set to address 0 at the factory, allowing them to operate in the standard point-to-point manner with a 4–20 mA output signal. To activate multidrop communication, the transmitter address must be changed to a number between 1 and 15. This change deactivates the 4–20 mA analog output, sending it to 4 mA. The failure mode current also is disabled.

2.12.1 Changing a transmitter address

To activate multi-drop communication, the transmitter poll address must be assigned a number from 1–15 for HART Revision 5, and 1–63 for HART Revision 7. Each transmitter in a multi dropped loop must have a unique poll address.

Change transmitter address using a Field Communicator

From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	1, 2, 1

Change transmitter address using AMS Device Manager

Procedure

1. Right click on the device and select **Configuration Properties** from the menu.
2. In HART Revision 5 mode:
   a) In the HART tab, enter poll address into the **Polling Address** box, select **Apply**.
3. In HART Revision 7 mode:
   a) In the HART tab, select the **Change Polling Address** button.

2.13 Using the transmitter with the HART Tri-Loop

To prepare the transmitter with dual-sensor option for use with a Rosemount 333 HART® Tri-Loop, the transmitter must be configured to Burst Mode and the process variable output order must be set. In Burst Mode, the transmitter provides digital information for the four process variables to the HART Tri-Loop. The HART Tri-Loop divides the signal into separate 4–20 mA loops for up to three of the following choices:

- Primary Variable (PV)
- Secondary Variable (SV)
- Tertiary Variable (TV)
- Quaternary Variable (QV)

When using the transmitter with dual-sensor option in conjunction with the HART Tri-Loop, consider the configuration of the differential, average, first good temperatures, Sensor Drift Alert, and Hot Backup features (if applicable).

Note
The procedures are to be used when the sensors and transmitters are connected, powered, and functioning properly. Also, Field Communicator must be connected and communicating to the transmitter control loop. For communicator usage instructions, see Verify configuration using the Field Communicator.

2.13.1 Set the transmitter to burst mode

To set the transmitter to burst mode, follow the steps below with the Fast Key sequence.

Set the transmitter to burst mode using a Field Communicator

From the *HOME* screen, enter the Fast Key sequence.

	HART 5	HART 7
Device Dashboard Fast Keys	2, 2, 8, 4	2, 2, 8, 5

Set the transmitter to burst mode using AMS Device Manager

Procedure

1. Right click on the device and select **Configure**.
2. In the left navigation window select **Manual Setup**.
3. On the **HART** tab find the Burst Mode Configuration group box and fill in the necessary content.
4. Select **Apply** when complete.

2.13.2 Set process variable output order

To set the process variable output order, follow the steps in one of the methods outlined in Mapping the HART variables.

Note
Take careful note of the process variable output order. The HART® Tri-Loop must be configured to read the variables in the same order.

Special considerations

To initiate operation between a transmitter with dual-sensor option and the HART® Tri-Loop, consider the configuration of both the differential, average and first good temperatures, sensor drift alert, and Hot Backup features (if applicable).

Differential temperature measurement

To enable the differential temperature measurement feature of a dual-sensor operating in conjunction with the HART® Tri-Loop, adjust the range end points of the corresponding channel on the HART Tri-Loop to include zero. For example, if the secondary variable is to report the differential temperature, configure the transmitter accordingly (see Mapping the HART variables) and adjust the corresponding channel of the HART Tri-Loop so one range end point is negative and the other is positive.

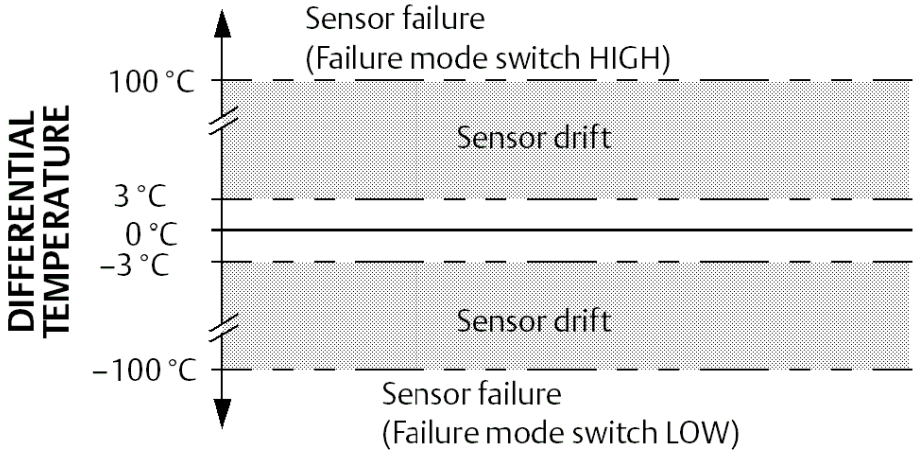
Hot Backup

To enable the Hot Backup feature of a transmitter with dual-sensor option operating in conjunction with the HART Tri-Loop, ensure that the output units of the sensors are the same as the units of the HART Tri-Loop. Use any combination of RTDs or thermocouples as long as the units of both match the units of the HART Tri-Loop.

Using the Tri-Loop to detect sensor drift alert

The dual-sensor transmitter sets a failure flag (through HART) whenever a sensor failure occurs. If an analog warning is required, the HART Tri-Loop can be configured to produce an analog signal that can be interpreted by the control system as a sensor failure.

Use these steps to set up the HART Tri-Loop to transmit sensor failure alerts.



Procedure

1. Configure the dual-sensor transmitter variable map as shown:

Variable	Mapping
PV	Sensor 1 or sensor average
SV	Sensor 2
TV	Differential temperature
QV	As desired

2. Configure Channel 1 of the HART Tri-Loop as TV (differential temperature). If either sensor should fail, the differential temperature output will be +9999 or –9999 (high or low saturation), depending on the position of the Failure Mode Switch (see Setting the alarm switch).
3. Select temperature units for Channel 1 that match the differential temperature units of the transmitter.
4. Specify a range for the TV such as -148 to 212 °F (-100 to 100 °C). If the range is large, then a sensor drift of a few degrees will represent only a small percent of range. If Sensor 1 or Sensor 2 fails, the TV will be +9999 (high saturation) or –9999 (low saturation). In this example, zero is the midpoint of the TV range. If a ΔT of zero is set as the lower range limit (4 mA), then the output could saturate low if the reading from Sensor 2 exceeds the reading from Sensor 1. By placing a zero in the middle of the range, the output will normally stay near 12 mA, and the problem will be avoided.
5. Configure the DCS so that TV << –148 °F (–100 °C) or TV >> 212 °F (100 °C) indicates a sensor failure and, for example, TV ≤ 26.6 °F (–3 °C) or TV ≥ 37.4 °F (3 °C) indicates a drift alert. See Figure 2-26.

Figure 2-26: Tracking Sensor Drift and Sensor Failure with Differential Temperature

2.14 Transmitter security

2.14.1 Available security options

There are three security methods to utilize with the transmitter.

- Software security switch (write protect)
- HART lock
- LOI password

The write protect feature allows you to protect the transmitter data from accidental or unwarranted configuration changes. To enable the write protect feature, perform the following procedures.

Configure transmitter security using a Field Communicator

From the *HOME* screen, enter the Fast Key sequence.

Write Protect	2, 2, 9, 1
HART Lock	2, 2, 9, 2
LOI Password	2, 2, 9, 3

Configure transmitter security using AMS Device Manager

Procedure

1. Right click on the device and select the **Configure** menu.
2. In the left navigation pane select **Manual Setup** then select the **Security** tab.
   - All three parameters can be configured from this screen.
3. Select **Apply** when complete.

3 Hardware Installation

Note
Each transmitter is marked with a tag indicating the approvals. Install the transmitter according to all applicable installation codes, and approval and installation drawings (see Product Data Sheet). Verify the operating atmosphere of the transmitter is consistent with the hazardous location certifications. Once a device labeled with multiple approval types is installed, it should not be reinstalled using any of the other labeled approval types. To ensure this, the approval label should be permanently marked to distinguish the approval type(s) used.

3.1 Overview

The information in this section covers installation considerations for the Rosemount 644 Temperature Transmitter with HART® Protocol. A Quick Start Guide is shipped with every transmitter to describe recommended mounting and wiring procedures for initial installation. Dimensional drawings for transmitter mounting configurations are included in the Product Data Sheet.

3.2 Safety messages

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Refer to the following safety messages before performing an operation preceded by this symbol.

⚠ WARNING

Follow instruction

Failure to follow these installation guidelines could result in death or serious injury.

Ensure only qualified personnel perform the installation.

Explosion

Explosions could result in death or serious injury.

Do not remove the connection head cover in explosive atmospheres when the circuit is live.

Before connecting a handheld communicator in an explosive atmosphere, ensure that the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.

Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

All connection head covers must be fully engaged to meet explosion-proof requirements.

⚠ WARNING

Process leaks

Process leaks could result in death or serious injury.

Do not remove the thermowell while in operation.
Install and tighten thermowells and sensors before applying pressure.

Electric shock

Electrical shock could cause death or serious injury.

Use extreme caution when making contact with the leads and terminals.

Physical access

Unauthorized personnel may potentially cause significant damage to and/or misconfiguration of end users' equipment. This could be intentional or unintentional and needs to be protected against.

Physical security is an important part of any security program and fundamental to protecting your system. Restrict physical access by unauthorized personnel to protect end users' assets. This is true for all systems used within the facility.

3.3 Considerations

3.3.1 General

Electrical temperature sensors such as RTDs and thermocouples produce low-level signals proportional to their sensed temperature. The transmitter converts the low-level sensor signal to a standard 4–20 mA dc or digital HART® signal that is relatively insensitive to lead length and electrical noise. This signal is then transmitted to the control room via two wires.

3.3.2 Commissioning

The transmitter can be commissioned before or after installation. It may be useful to commission it on the bench, before installation, to ensure proper operation and to become familiar with its functionality. Ensure the instruments in the loop are installed in accordance with intrinsically safe, or non-incendive field wiring practices.

3.3.3 Installation

Measurement accuracy depends upon proper installation of the transmitter. Mount the transmitter close to the process and use minimum wiring to achieve best accuracy. Keep in mind the need for easy access, personnel safety, practical field calibration, and a suitable transmitter environment. Install the transmitter to minimize vibration, shock, and temperature fluctuation.

3.3.4 Mechanical

Location

When choosing an installation location and position, take into account the need for access to the transmitter.

Special mounting

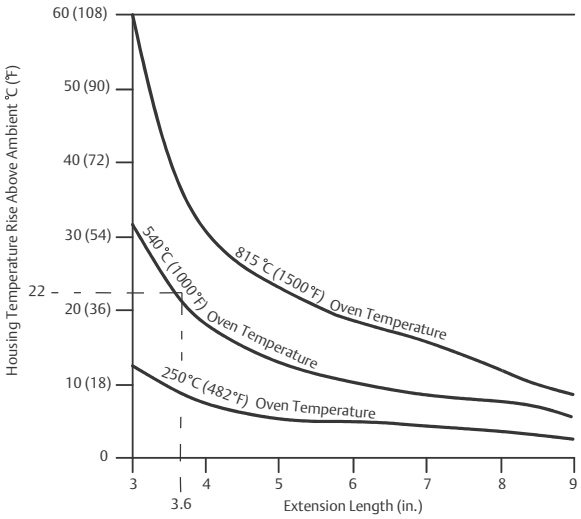
Special mounting hardware is available for mounting a Rosemount 644 Head Mount Transmitter to a DIN rail or assembling a new Rosemount 644 Head Mount to an existing threaded sensor connection head (former option code L1).

3.3.5 Electrical

Proper electrical installation is necessary to prevent errors due to sensor lead resistance and electrical noise. For best results, shielded cable should be used in electrically noisy environments.

Make wiring connections through the cable entry in the side of the housing. Provide adequate clearance for cover removal.

3.3.6 Environmental



The transmitter electronics module is permanently sealed within a plastic enclosure, resisting moisture and corrosive damage. Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

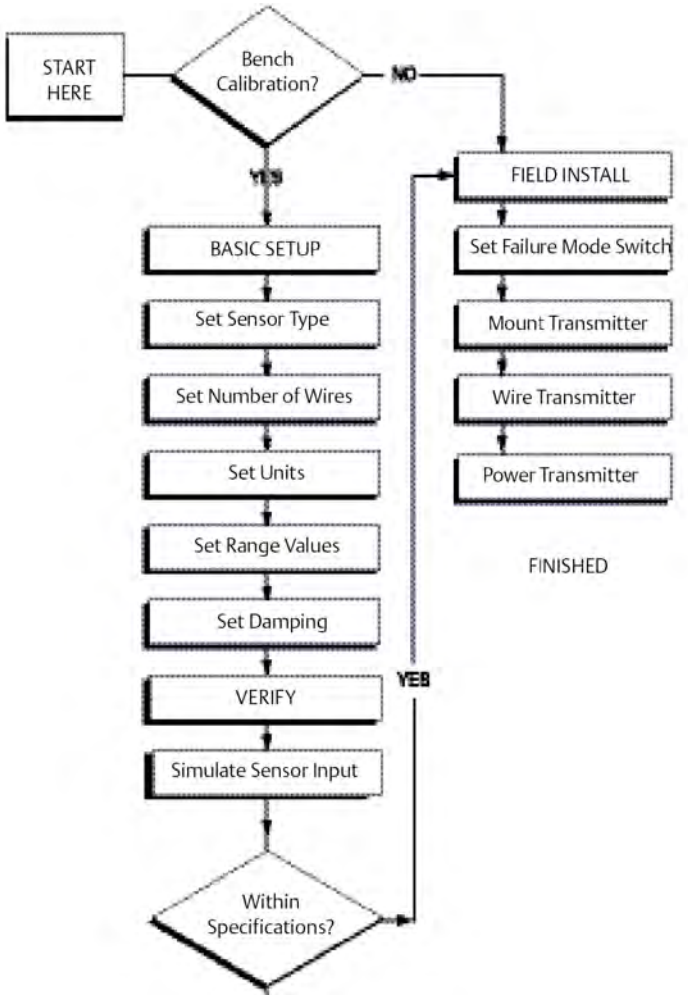
Temperature effects

The transmitter will operate within specifications for ambient temperatures between –40 and 185 °F (–40 °C and 85 °C). Heat from the process is transferred from the thermowell to the transmitter housing. If the expected process temperature is near or beyond specification limits, consider the use of additional thermowell lagging, an extension nipple, or a remote mounting configuration to isolate the transmitter from the process.

Figure 3-1 provides an example of the relationship between transmitter housing temperature rise and extension length.

Figure 3-1: Head Mount Transmitter Connection Head Temperature Rise vs. Extension Length

Example



The maximum permissible housing temperature rise (T) can be calculated by subtracting the maximum ambient temperature (A) from the transmitter's ambient temperature specification limit (S). For instance, if A = 40 °C.

T = S - A T = 85 °C – 40 °C T = 45 °C

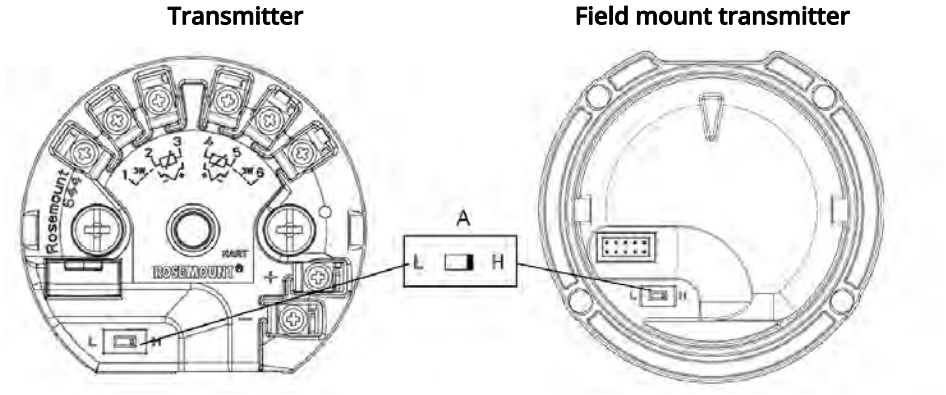
For a process temperature of 540 °C (1004 °F), an extension length of 3.6-in. (91.4 mm) yields a housing temperature rise (R) of 22 °C (72 °F), providing a safety margin of 23 °C (73 °F). A 6.0-in. (152.4 mm) extension length (R = 10 °C [50 °F]) offers a higher safety margin (35 °C [95 °F]) and reduces temperature-effect errors but would probably require extra transmitter support. Gauge the requirements for individual applications along this scale. If a thermowell with lagging is used, the extension length may be reduced by the length of the lagging.

3.4 Installation procedures

Figure 3-2: Installation Flowchart

3.4.1 Setting the alarm switch

Verify the alarm switch is set to the desired position before putting the device into operation to ensure correct function in the instance of a failure.



Setting the alarm switch without an LCD display

Procedure

1. Set the loop to manual (if applicable) and disconnect the power.
2. Remove the housing cover.
3. Set the physical hardware alarm switch to the desired position. H indicates High, L indicates Low. Then reattach the housing cover. See Figure 3-3 for alarm switch location.

4. Apply power and set the loop to automatic control.

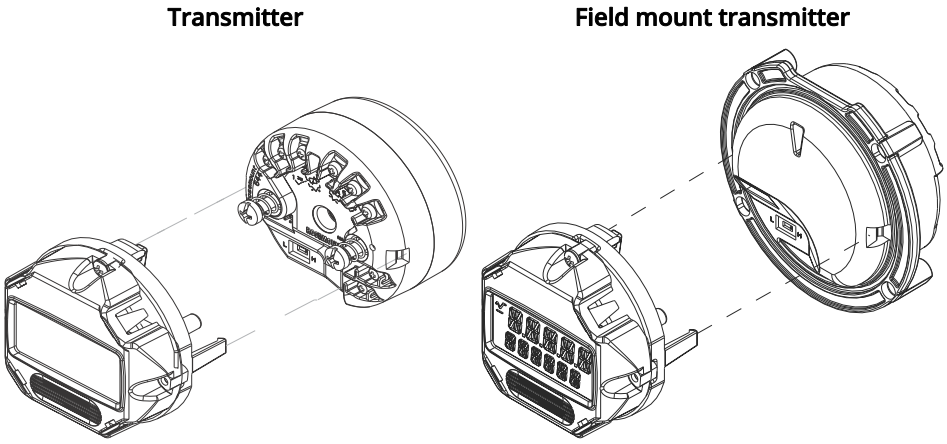


Figure 3-3: Failure Switch Location

A. Alarm switch

Note
If using an LCD Display or LOI, first remove the display by detaching it from the top of the device, set the switch to the desired position and reattach the display. See Figure 3-4 for proper display orientation.

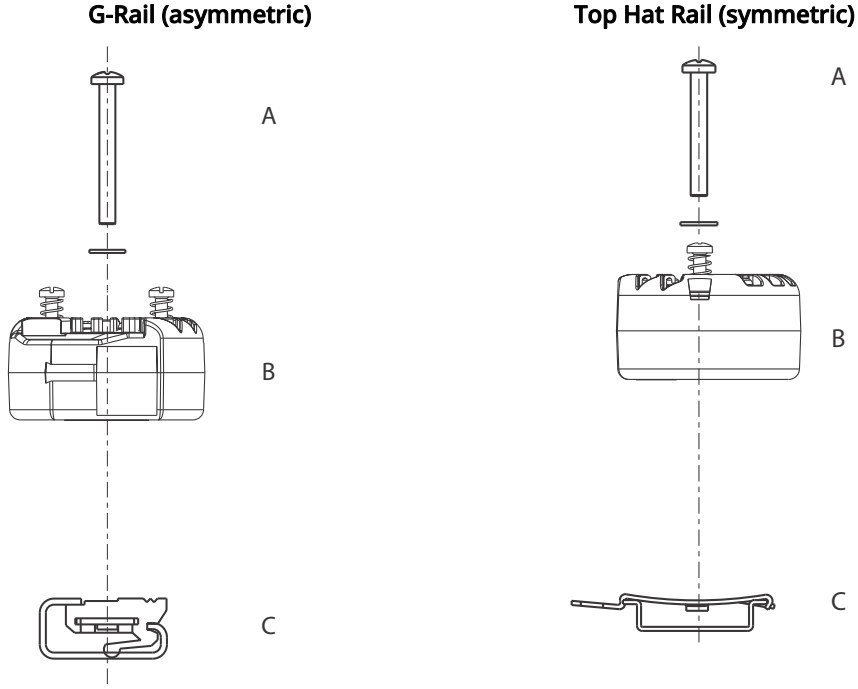
Figure 3-4: Display Connection

3.4.2 Mount the transmitter

Mount the transmitter at a high point in the conduit run to prevent moisture from draining into the transmitter housing.

The Rosemount 644 Head Mount installs:

- In a connection head or universal head mounted directly on a sensor assembly.
- Apart from a sensor assembly using a universal head.
- To a DIN rail using an optional mounting clip.



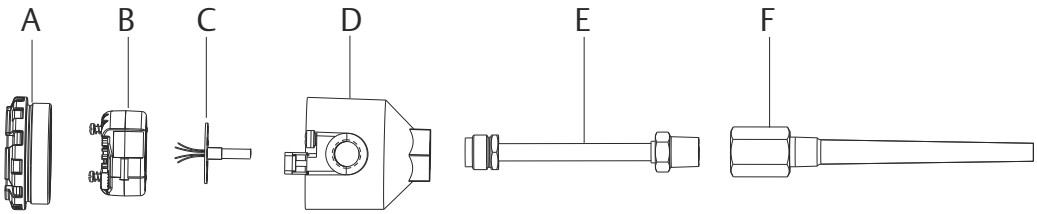
The Rosemount 644 Field Mount installs in a field mount housing, directly mounted on a sensor or apart from a sensor assembly using an optional bracket.

The Rosemount 644 Rail Mount attaches directly to a wall or to a DIN rail.

Mounting a Rosemount 644 Head Mount to a DIN rail

To attach a head mount transmitter to a DIN rail, assemble the appropriate rail mounting kit (part number 00644-5301-0010) to the transmitter as shown in Figure 3-5. Follow the procedure under Field mount transmitter with threaded sensor installation.

Figure 3-5: Assembling Rail Clip Hardware to a Rosemount 644 Transmitter



A. Mounting hardware
B. Transmitter
C. Rail clip

Note
Kit (part number 00644-5301-0010) includes mounting hardware and both types of rail kits.

3.4.3 Install the device

Head mount transmitter with DIN plate style sensor installation

A. Connection head cover

B. Transmitter mounting screws

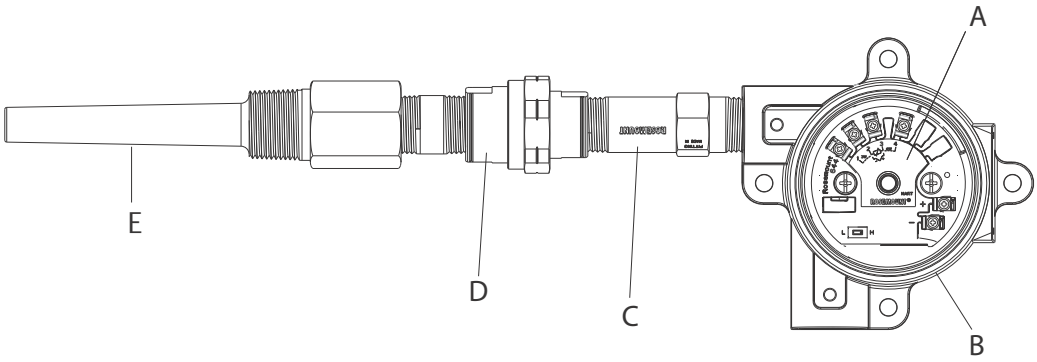
C. Integral mount sensor with flying leads

D. Connection head

E. Extension

F. Thermowell

Procedure



1. Attach the thermowell to the pipe or process container wall. Install and tighten the thermowell before applying process pressure.
2. Verify the transmitter failure mode switch position.
3. Assemble the transmitter to the sensor. Push the transmitter mounting screws through the sensor mounting plate.

   Note
   If using a threaded type sensor with a connection head, reference steps 1-6 below in Head mount transmitter with threaded sensor installation.

4. Wire the sensor to the transmitter (see Wiring and powering the transmitter).
5. Insert the transmitter-sensor assembly into the connection head. Thread the transmitter mounting screw into the connection head mounting holes. Assemble the extension to the connection head by tightening the threaded connections of the extension to the housing. Insert the assembly into the thermowell and tighten the threaded connections.
6. If using a cable gland for power wiring, properly attach the cable gland to a housing conduit entry.
7. Insert the shielded cable leads into the connection head through the conduit entry.

8. Connect the shielded power cable leads to the transmitter power terminals. Avoid contact with sensor leads and sensor connections. Connect and tighten the cable gland.
9. Install and tighten the connection head cover. Enclosure covers must be fully engaged to meet explosion-proof requirements.

Head mount transmitter with threaded sensor installation

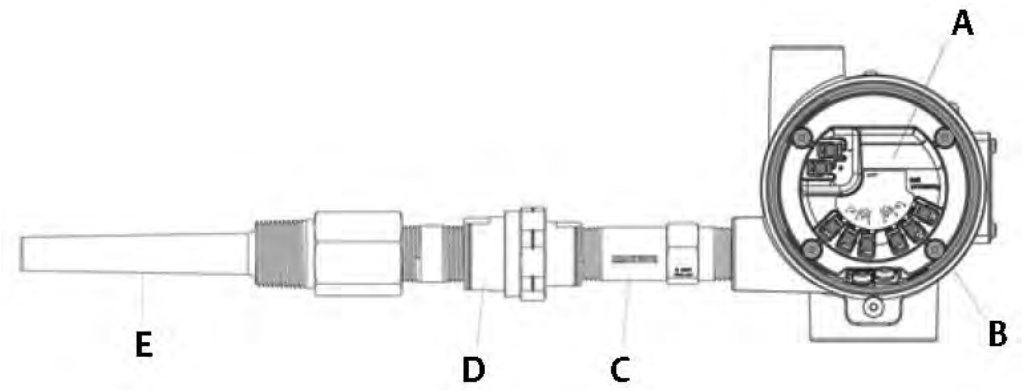
A. Rosemount 644 Transmitter

B. Universal junction box

C. Threaded style sensor

D. Extension

E. Threaded thermowell



Procedure

1. Attach the thermowell to the pipe or process container wall. Install and tighten thermowells before applying process pressure.
2. Attach necessary extension nipples and adapters to the thermowell. Seal the nipple and adapter threads with silicone tape.
3. Screw the sensor into the thermowell. Install drain seals if required for severe environments or to satisfy code requirements.
4. Verify the transmitter failure mode switch is in the desired position.
5. To verify the correct installation of Integral Transient Protection (option code T1) on the device, confirm the following steps have been completed:
   a) Ensure the transient protector unit is firmly connected to the transmitter puck assembly.
   b) Ensure the transient protector power leads are adequately secured under the transmitter power terminal screws.
   c) Verify the transient protector's ground wire is secured to the internal ground screw found within the universal head.

Note
The transient protector requires the use of an enclosure of at least 3.5-in. (89 mm) in diameter.

6. Pull the sensor wiring leads through the universal head and transmitter. Mount the transmitter in the universal head by threading the transmitter mounting screws into the universal head mounting holes.
7. Seal adapter threads with thread sealant.
8. Pull the field wiring leads through the conduit into the universal head. Wire the sensor and power leads to the transmitter (see Wiring and powering the transmitter). Avoid contact with other terminals.
9. Install and tighten the universal head cover. Enclosure covers must be fully engaged to meet explosion-proof requirements.

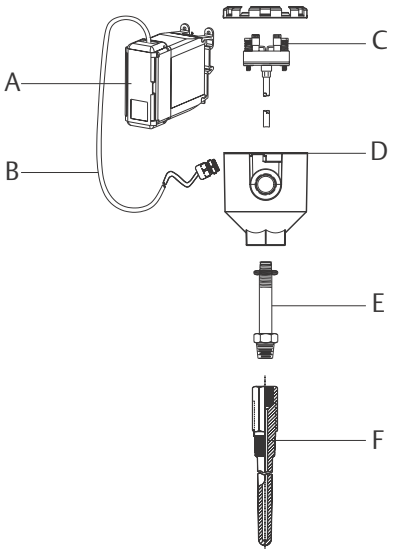
Field mount transmitter with threaded sensor installation

A. Rosemount 644 Field Mount

B. Field mount housing

C. Threaded style sensor

D. Extension



E. Threaded thermowell

Procedure

1. Attach the thermowell to the pipe or process container wall. Install and tighten thermowells before applying process pressure.
2. Attach necessary extension nipples and adapters to the thermowell.
3. Seal the nipple and adapter threads with silicone tape.
4. Screw the sensor into the thermowell. Install drain seals if required for severe environments or to satisfy code requirements.
5. Verify the transmitter failure mode switch is in the desired position.
6. Mount the transmitter-sensor assembly into the thermowell, or remote mount if desired.
7. Seal adapter threads with silicone tape.
8. Pull the field wiring leads through the conduit into the field mount housing. Wire the sensor and power leads to the transmitter. Avoid contact with other terminals.

9. Install and tighten the covers of two compartments. Enclosure covers must be fully engaged to meet explosion-proof requirements.

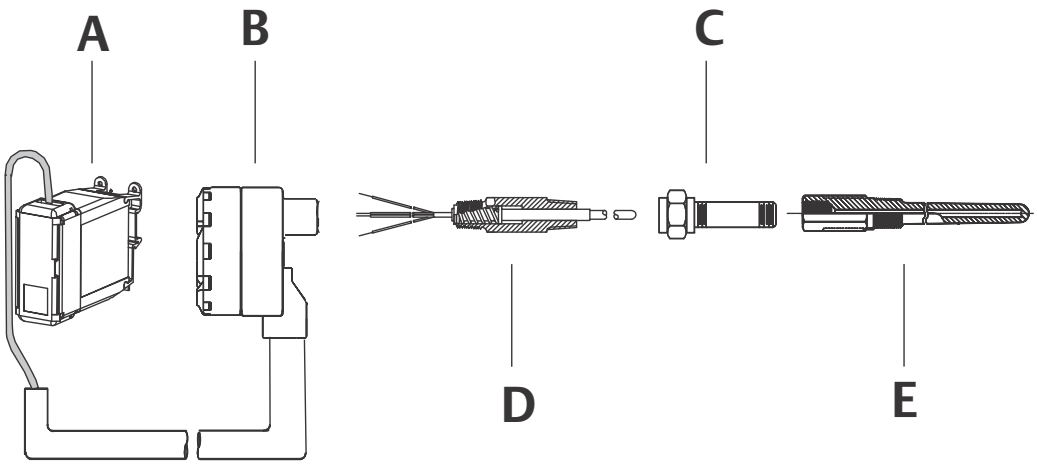
Rail mount transmitter and sensor

A. Rail mount transmitter

B. Sensor leads with cable glands

C. Integral mount sensor with terminal block

D. Connection head



E. Standard extension

F. Threaded thermowell

Procedure

1. Attach the transmitter to a suitable rail or panel.
2. Attach the thermowell to the pipe or process container wall. Install and tighten the thermowell, according to plant standards, before applying pressure.
3. Attach the sensor to the connection head and mount the entire assembly to the thermowell.
4. Attach and connect sufficient lengths of sensor lead wire from the connection head to the sensor terminal block.
5. Tighten the connection head cover. Enclosure covers must be fully engaged to meet explosion-proof requirements.
6. Run sensor lead wires from the sensor assembly to the transmitter.
7. Verify the transmitter failure mode switch.
8. Attach the sensor wires to the transmitter.

Rail mount transmitter with threaded sensor

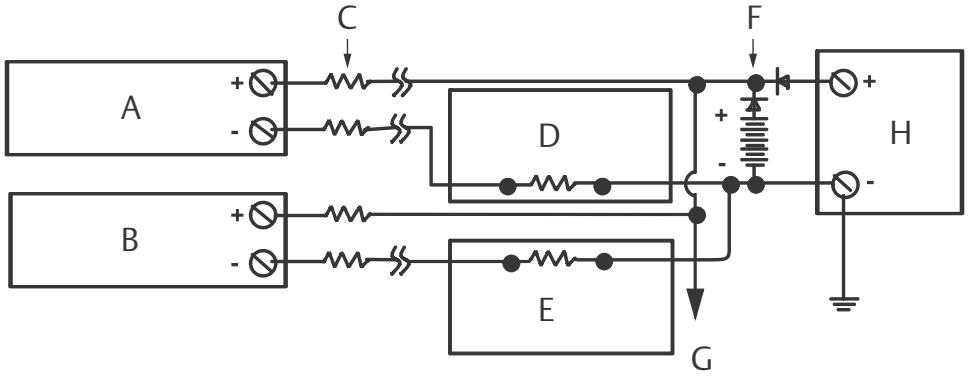
A. Rail mount transmitter

B. Threaded sensor connection head

C. Standard extension

D. Threaded style sensor

E. Threaded thermowell



Procedure

1. Attach the transmitter to a suitable rail or panel.
2. Attach the thermowell to the pipe or process container wall. Install and tighten the thermowell before applying pressure.
3. Attach necessary extension nipples and adapters. Seal the nipple and adapter threads with thread sealant.
4. Screw the sensor into the thermowell. Install drain seals if required for severe environments or to satisfy code requirements.
5. Screw the connection head to the sensor.
6. Attach the sensor lead wires to the connection head terminals.
7. Attach additional sensor lead wires from the connection head to the transmitter.
8. Attach and tighten the connection head cover. Enclosure covers must be fully engaged to meet explosion-proof requirements.
9. Set the transmitter failure mode switch.
10. Attach the sensor wires to the transmitter.

3.4.4 Multichannel installations

In a HART® installation, several transmitters can be connected to a single master power supply, as shown in Figure 3-6. In this case, the system may be grounded only at the negative power supply terminal. In multichannel installations where several transmitters depend on one power supply and the loss of all transmitters would cause operational problems, consider an uninterrupted power supply or a back-up battery. The diodes shown in Figure 3-6 prevent unwanted charging or discharging of the back-up battery.

Figure 3-6: Multichannel Installations

Between 250 Ω and 1100 Ω if no load resistor.

A. *Transmitter no. 1*

3.4.5 LCD display installation

The LCD display provides local indication of the transmitter output and abbreviated diagnostic messages governing transmitter operation. Transmitters ordered with the LCD display are shipped with the meter installed. After-market installation of the meter can be performed. After-market installation requires the meter kit, which includes:

- LCD display assembly (includes LCD display, meter spacer, and two screws)
- Meter cover with O-ring in place

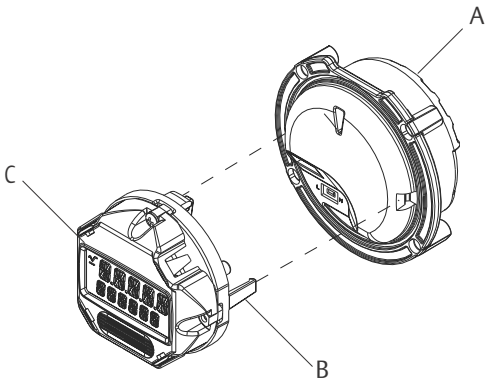

Figure 3-7: Display Connection

Transmitter

A. Rosemount 644 Transmitter
B. Mounting screw and springs
C. LCD display
D. LCD rotation screws

Field mount transmitter

A. Rosemount 644 Field Mount
B. LCD rotation screws
C. LCD display

Procedure

1. If the transmitter is installed in a loop, secure the loop and disconnect the power. If the transmitter is installed in an enclosure, remove the cover from the enclosure.
2. Decide meter orientation (the meter can be rotated in 90-degree increments). To change meter orientation, remove the screws located above and below the display screen. Lift the meter off the meter spacer. Rotate the display top and re-insert it in the location that will result in the desired viewing orientation.
3. Reattach the meter to the meter spacer using the screws. If the meter was rotated 90 degrees from its original position, it will be necessary to remove the screws from their original holes and re-insert them in the adjacent screws holes.
4. Line up the connector with the pin socket and push the meter into the transmitter until it snaps into place.

5. Attach the meter cover. The cover must be fully engaged to meet explosion-proof requirements.
6. Use a Field Communicator, AMS Device Manager software tool to configure the meter to the desired display.

Note

Observe the following LCD display temperature limits:

- Operating: –40 to 175 °F (–40 to 80 °C)
- Storage: –50 to 185 °F (–45 to 85 °C)

4 Electrical Installation

4.1 Overview

The information in this section covers installation considerations for the Rosemount 644 Temperature Transmitter. A Quick Start Guide is shipped with every transmitter to describe mounting, wiring, and basic hardware installation procedures for initial installation.

4.2 Safety messages

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Refer to the following safety messages before performing an operation preceded by this symbol.

⚠ WARNING

Follow instruction

Failure to follow these installation guidelines could result in death or serious injury.

Ensure only qualified personnel perform the installation.

Explosion

Explosions could result in death or serious injury.

Do not remove the connection head cover in explosive atmospheres when the circuit is live.

Before connecting a handheld communicator in an explosive atmosphere, ensure that the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.

Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

All connection head covers must be fully engaged to meet explosion-proof requirements.

Process leaks

Process leaks could result in death or serious injury.

Do not remove the thermowell while in operation.

Install and tighten thermowells and sensors before applying pressure.

Electric shock

Electrical shock could cause death or serious injury.

Use extreme caution when making contact with the leads and terminals.

⚠ WARNING

Physical access

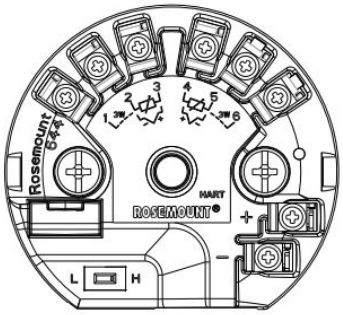
Unauthorized personnel may potentially cause significant damage to and/or misconfiguration of end users' equipment. This could be intentional or unintentional and needs to be protected against.

Physical security is an important part of any security program and fundamental to protecting your system. Restrict physical access by unauthorized personnel to protect end users' assets. This is true for all systems used within the facility.

4.3 Wiring and powering the transmitter

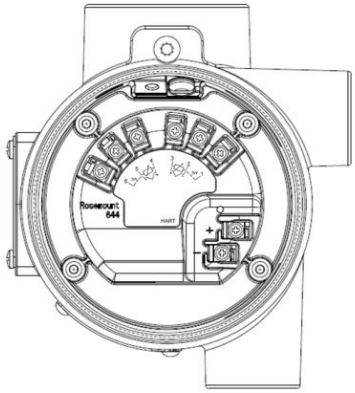
All power to the transmitter is supplied over the signal wiring. Use ordinary copper wire of sufficient size to ensure the voltage across the transmitter power terminals does not drop below 12.0 Vdc.

If the sensor is installed in a high-voltage environment and a fault condition or installation error occurs, the sensor leads and transmitter terminals could carry lethal voltages. Use extreme caution when making contact with the leads and terminals.



Note
Do not apply high voltage (e.g., ac line voltage) to the transmitter terminals. Abnormally high voltage can damage the unit. (Sensor and transmitter power terminals are rated to 42.4 Vdc. A constant 42.4 volts across the sensor terminals may damage the unit.)

For multichannel HART installations, the transmitters will accept inputs from a variety of RTD and thermocouple types. Refer to Figure 2-7 when making sensor connections.



The sensor wiring diagram is located on the device's top label below the terminal screws. See Figure 4-1 and Sensor wiring for where to find and how to correctly wire all sensor types to the transmitter.

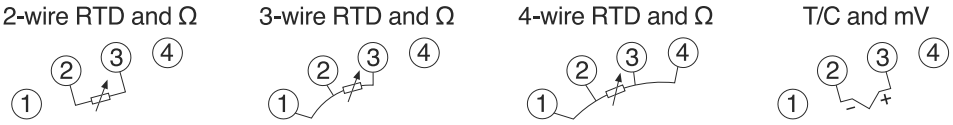
Figure 4-1: Wiring Diagram Location

Head mount transmitter

Field mount transmitter

4.3.1 Sensor connections

The transmitter is compatible with a number of RTD and thermocouple sensor types. Sensor wiring shows the correct input connections to the sensor terminals on the transmitter. To ensure a proper sensor connection, anchor the sensor lead wires into the appropriate captive terminals and tighten the screws.



Sensor wiring

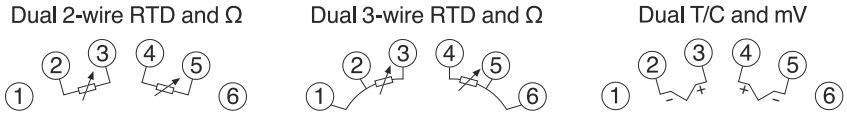
Emerson provides a 4-wire sensors for all single element RTDs.

You can use these RTDs in 3-wire configurations by leaving the unneeded leads disconnected and insulated with electrical tape.

Figure 4-2: HART Head Mount and Field Mount

Single input wiring

Dual input wiring



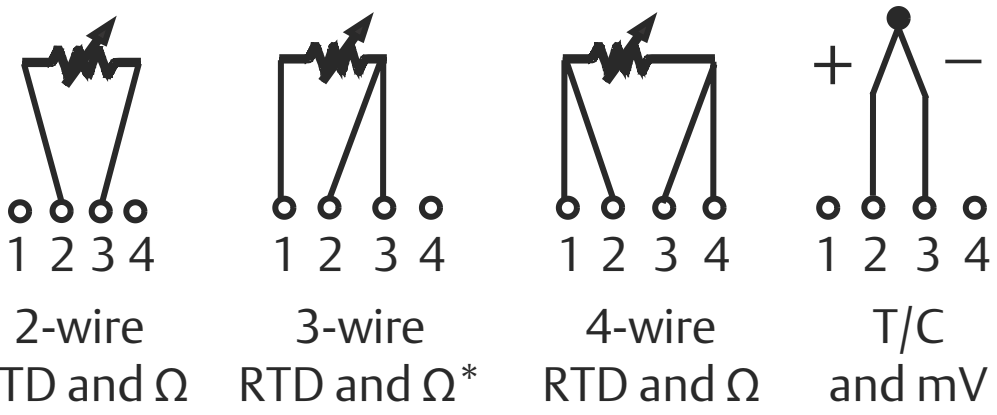


Figure 4-3: HART Rail Mount and FOUNDATION Fieldbus/PROFIBUS

Thermocouple or millivolt inputs

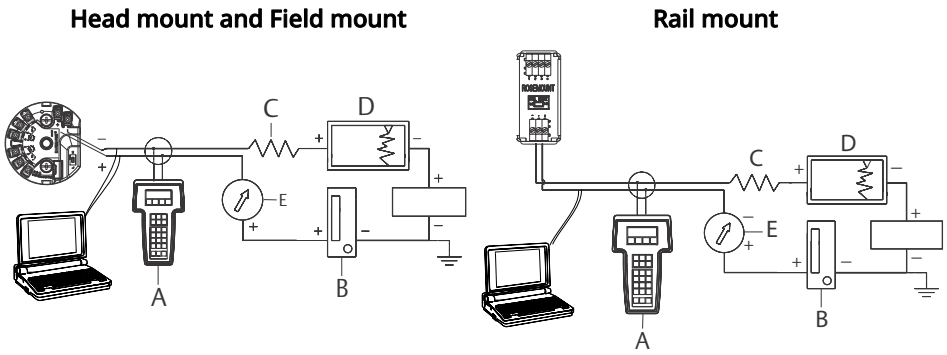
The thermocouple can be connected directly to the transmitter. Use appropriate thermocouple extension wire if mounting the transmitter remotely from the sensor. Make millivolt inputs connections with copper wire. Use shielding for long runs of wire.

RTD or Ohm inputs

The transmitters will accept a variety of RTD configurations, including 2-, 3- or 4-wire. If the transmitter is mounted remotely from a 3- or 4-wire RTD, it will operate within specifications, without recalibration, for lead wire resistances of up to 60 ohms per lead (equivalent to 6,000 feet of 20 AWG wire). In this case, the leads between the RTD and transmitter should be shielded. If using only two leads, both RTD leads are in series with the sensor element, so significant errors can occur if the lead lengths exceed three feet of 20 AWG wire (approximately 0.05 °C/ft). For longer runs, attach a third or fourth lead as described above.

Sensor lead wire resistance effect– RTD input

When using a 4-wire RTD, the effect of lead resistance is eliminated and has no impact on accuracy. However, a 3-wire sensor will not fully cancel lead resistance error because it cannot compensate for imbalances in resistance between the lead wires. Using the same type of wire on all three lead wires will make a 3-wire RTD installation as accurate as possible. A 2-wire sensor will produce the largest error because it directly adds the lead wire resistance to the sensor resistance. For 2- and 3-wire RTDs, an additional lead wire resistance error is induced with ambient temperature variations. The table and the examples shown below help quantify these errors.



Note
For HART transmitters, the use of two grounded thermocouples with a dual option transmitter is not recommended. For applications in which the use of two thermocouples is desired, connect either two ungrounded thermocouples, one grounded and one ungrounded thermocouple, or one dual element thermocouple.

4.3.2 Power the transmitter

Procedure

1. An external power supply is required to operate the transmitter.
2. Remove the housing cover (if applicable).
3. Connect the positive power lead to the "+" terminal. Connect the negative power lead to the "–" terminal.
   - If a transient protector is being used, the power leads will now be connected to the top of the transient protector unit. See the transient label for indication of "+" and "-" terminal connections.
4. Tighten the terminal screws. When tightening the sensor and power wires, the maximum torque is 6.5 in-lb (0.73 N-m).
5. Reattach and tighten the cover (if applicable).
6. Apply power (12–42 Vdc).

Figure 4-4: Powering the Transmitter for Bench Configuration

A. Field communicator
B. Power supply
C. 248 Ω ≤ RL ≤ 1100 Ω
D. Recorder (optional)
E. Ammeter (optional)

Note

- Signal loop may be grounded at any point or left ungrounded.
- A Field Communicator may be connected at any termination point in the signal loop. The signal loop must have between 250 and 1100 ohms load for communications.
- Max torque is 6 in-lb (0/7 N-m).

Load limitation

The power required across the transmitter power terminals is 12 to 42.4 Vdc (the power terminals are rated to 42.4 Vdc). To prevent damaging the transmitter, do not allow terminal voltage to drop below 12.0 Vdc when changing the configuration parameters.

4.3.3 Ground the transmitter

Sensor shielding

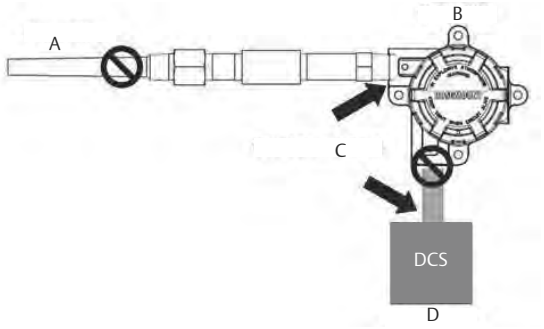
The currents in the leads induced by electromagnetic interference can be reduced by shielding. Shielding carries the current to ground and away from the leads and electronics. If the ends of the shields are adequately grounded, only a small amount of current will actually enter the transmitter. If the ends of the shield are left ungrounded, voltage is created between the shield and the transmitter housing and also between the shield and earth at the element end. The transmitter may not be able to compensate for this voltage, causing it to lose communication and/or go into alarm. Instead of the shield carrying the currents away from the transmitter, the currents will now flow through the sensor leads into the transmitter circuitry where it will interfere with the circuit operation.

Shielding recommendations

The following are recommended practices from API Standard 552 (Transmission Standard) section 20.7, and from field and laboratory testing. If more than one recommendation is given for a sensor type, start with the first technique shown or the technique that is recommended for the facility by its installation drawings. If the technique does not eliminate the transmitter alarms, try another technique. If all of the techniques do not eliminate or prevent the transmitter alarms because of high EMI, contact an Emerson representative.

To ensure proper grounding, it is important that the instrument cable shield be:

- Trimmed close and insulated from touching the transmitter housing
- Connected to the next shield if cable is routed through a junction box
- Connected to a good earth ground at the power supply end



Ungrounded thermocouple, mV, and RTD/Ohm inputs

Each process installation has different requirements for grounding. Use the grounding options recommended by the facility for the specific sensor type, or begin with grounding option 1 (the most common).

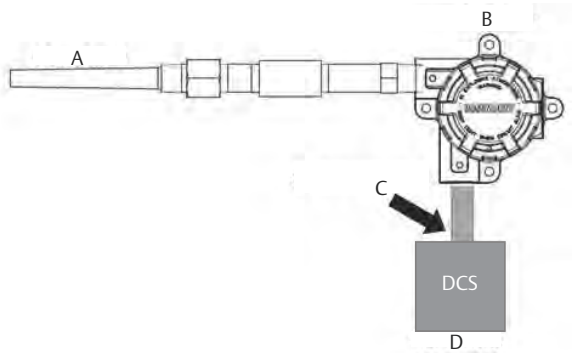
Ground the transmitter: option 1

Procedure

1. Connect sensor wiring shield to the transmitter housing.
2. Ensure the sensor shield is electrically isolated from surrounding fixtures that may be grounded.
3. Ground signal wiring shield at the power supply end.

A. Sensor wires

B. Transmitter



C. Shield ground point

D. 4-20 mA loop

Ground the transmitter: option 2

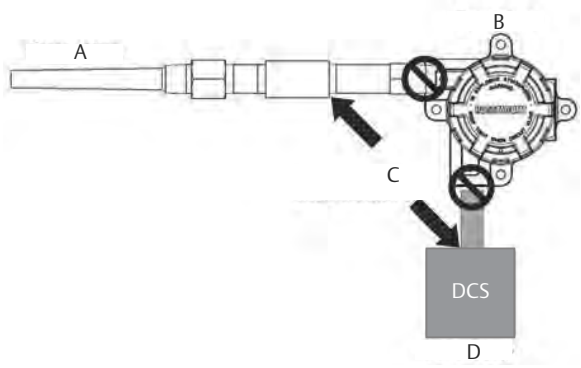
Procedure

1. Connect signal wiring shield to the sensor wiring shield.
2. Ensure the two shields are tied together and electrically isolated from the transmitter housing.
3. Ground shield at the power supply end only.
4. Ensure the sensor shield is electrically isolated from the surrounding grounded fixtures.

A. Sensor wires

B. Transmitter

C. Shield ground point



D. 4-20 mA loop

Note
Connect shields together, electrically isolated from the transmitter.

Ground the transmitter: option 3

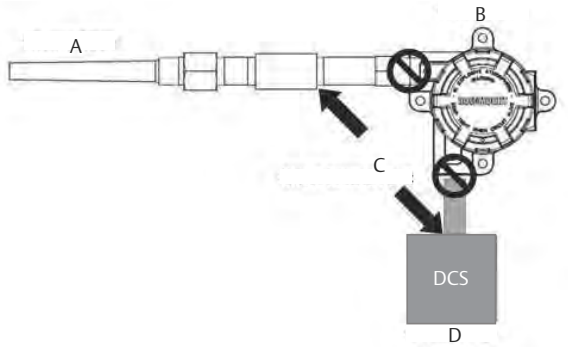
Procedure

1. Ground sensor wiring shield at the sensor if possible.
2. Ensure the sensor wiring and signal wiring shields are electrically isolated from the transmitter housing.
3. Do not connect the signal wiring shield to the sensor wiring shield.
4. Ground the signal wiring shield at the power supply end.

A. Sensor wires

B. Transmitter

C. Shield ground point



D. 4-20 mA loop

Grounded thermocouple inputs

Ground the transmitter: option 4

Procedure

1. Ground sensor wiring shield at the sensor.
2. Ensure the sensor wiring and signal wiring shields are electrically isolated from the transmitter housing.
3. Do not connect the signal wiring shield to the sensor wiring shield.
4. Ground signal wiring shield at the power supply end.

A. Sensor wires

B. Transmitter

C. Shield ground point

D. 4–20 mA loop

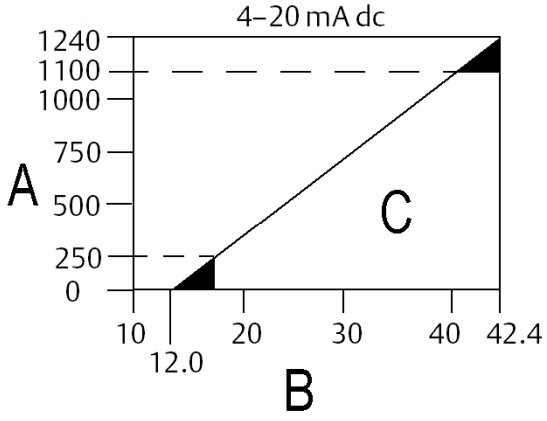
4.3.4 Wiring with a Rosemount 333 HART Tri-Loop (HART/4–20 mA only)

Use the dual-sensor option transmitter that is operating with two sensors in conjunction with a Rosemount 333 HART® Tri-Loop HART-to-Analog Signal Converter to acquire an independent 4–20 mA analog output signal for each sensor input. The transmitter can be configured to output four of the six following digital process variables:

- Sensor 1
- Sensor 2
- Differential temperature
- Average temperature
- First good temperature
- Transmitter terminal temperature

The HART Tri-Loop reads the digital signal and outputs any or all of these variables into as many as three separate 4–20 mA analog channels. Refer to Figure 2-7 for basic installation information. Refer to the Rosemount 333 HART Tri-Loop HART-to-Analog Signal Converter Reference Manual for complete installation information.

Power supply



An external power supply is required to operate the transmitter and is not included. The input voltage range of the transmitter is 12–42.4 Vdc. This is the power required across the transmitter power terminals. The power terminals are rated to 42.4 Vdc. With 250 ohms of resistance in the loop, the transmitter requires a minimum of 18.1 Vdc for communication.

The power supplied to the transmitter is determined by the total loop resistance and should not drop below the lift-off voltage. The lift-off voltage is the minimum supply voltage required for any given total loop resistance. If the power drops below the lift-off voltage while the transmitter is being configured, the transmitter may output incorrect information.

The DC power supply should provide power with less than two percent ripple. The total resistance load is the sum of the resistance of the signal leads and the load resistance of any controller, indicator, or related piece of equipment in the loop. Note that the resistance of intrinsic safety barriers, if used, must be included.

Note
Permanent damage to the transmitter could result if the voltage drops below 12.0 Vdc at the power terminals, when changing transmitter configuration parameters.

Figure 4-5: Load Limits

Maximum Load = 40.8 × (Supply voltage - 12.0)

5 Operation and Maintenance

5.1 Overview

This section contains information on calibrating Rosemount 644 Temperature Transmitter. Field Communicator, AMS Device Manager, and Local Operator Interface (LOI) instructions are given to perform all functions.

5.2 Safety messages

Read this manual before working with the product. For personal and system safety, and for optimum product performance, ensure you thoroughly understand the contents before installing, using, or maintaining this product.

⚠ WARNING

Follow instructions

Failure to follow these installation guidelines could result in death or serious injury.

Ensure only qualified personnel perform the installation.

Explosions

Explosions could result in death or serious injury.

Installation of the transmitters in a hazardous environment must be in accordance with the appropriate local, national, and international standards, codes, and practices. Please review the Product Certifications section for any restrictions associated with a safe installation.

Do not remove the connection head cover in explosive atmospheres when the circuit is live.

Before connecting a handheld communicator in an explosive atmosphere, ensure the instruments are installed in accordance with intrinsically safe or non-incendive field wiring practices.Verify the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

All connection head covers must be fully engaged to meet explosion-proof requirements.

Process leaks

Process leaks could result in death or serious injury.

Do not remove the thermowell while in operation.

Install and tighten thermowells and sensors before applying pressure.

⚠ WARNING

Electrical shock

Electrical shock could cause death or serious injury.

Avoid contact with the leads and terminals. High voltage that may be present on leads can cause electrical shock.

The products described in this document are NOT designed for nuclear-qualified applications.

Using non-nuclear qualified products in applications that require nuclear-qualified hardware or products may cause inaccurate readings.

For information on Rosemount nuclear-qualified products, contact your local Emerson Sales Representative.

Physical access

Unauthorized personnel may potentially cause significant damage to and/or misconfiguration of end users' equipment. This could be intentional or unintentional and needs to be protected against.

Physical security is an important part of any security program and fundamental to protecting your system. Restrict physical access by unauthorized personnel to protect end users' assets. This is true for all systems used within the facility.

⚠ CAUTION

Conduit/cable entries

The conduit/cable entries in the transmitter housing use a ½–14 NPT thread form.

When installing in a hazardous location, use only appropriately listed or Ex certified plugs, glands, or adapters in cable/conduit entries.

Unless otherwise marked, the conduit/cable entries in the housing enclosure use a ½–14 NPT form. Only use plugs, adapters, glands, or conduit with a compatible thread form when closing these entries.

Unless marked, the conduit/cable entries in the transmitter housing use a ½–14 NPT thread form. Entries marked "M20" are M20 × 1.5 thread form. On devices with multiple conduit entries, all entries will have the same thread form. Only use plugs, adapters, glands, or conduit with a compatible thread form when closing these entries.

Only use plugs, adapters, glands, or conduit with a compatible thread form when closing these entries.

5.3 Calibration overview

Calibrating the transmitter increases the measurement precision by allowing corrections to be made to the factory-stored characterization curve by digitally altering the transmitter's interpretation of the sensor input.

To understand calibration, it is necessary to understand that smart transmitters operate differently from analog transmitters. An important difference is that smart transmitters are factory-characterized, meaning that they are shipped with a standard sensor curve stored in the transmitter firmware. In operation, the transmitter uses this information to produce a process variable output, in engineering units, dependent on the sensor input.

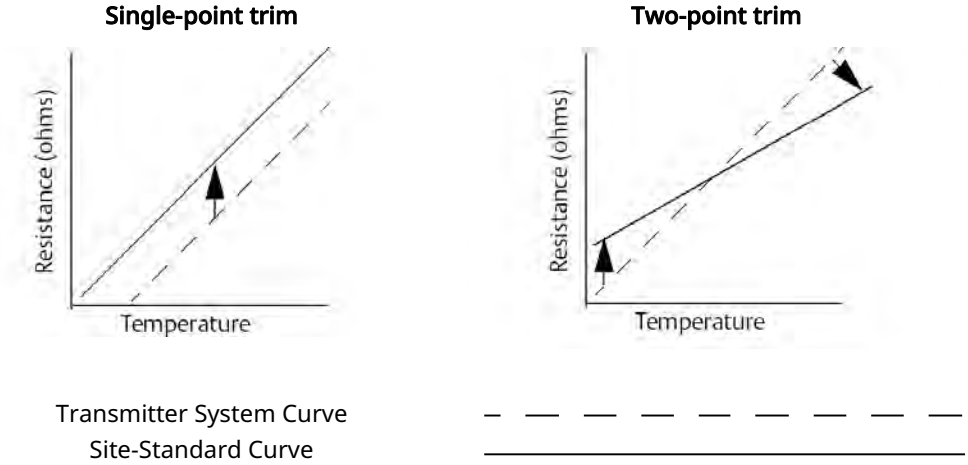
Calibration of the transmitter may include the following procedures:

- Sensor Input Trim: digitally alter the transmitter's interpretation of the input signal.
- Transmitter-Sensor Matching: generates a special custom curve to match that specific sensor curve, as derived from the Callendar-Van Dusen constants.
- Output Trim: calibrates the transmitter to a 4–20 mA reference scale.
- Scaled Output Trim: calibrates the transmitter to a user-selectable reference scale.

5.3.1 Trimming

The trim functions should not be confused with the rerange functions. Although the re-range command matches a sensor input to a 4–20 mA output—as in conventional calibration—it does not affect the transmitter's interpretation of the input.

One or more of the trim functions may be used when calibrating. The trim functions are as follows:



- Sensor input trim
- Transmitter-sensor matching
- Output trim
- Output scaled trim

5.4 Sensor input trim

The sensor trim command allows for alteration of the transmitter's interpretation of the input signal. The sensor trim command trims, in engineering (°F, °C, °R, K) or raw (ohms, mV) units, the combined sensor and transmitter system to a site standard using a known temperature source. Sensor trim is suitable for validation procedures or for applications that require profiling the sensor and transmitter together.

Perform a sensor trim if the transmitter's digital value for the primary variable does not match the plant's standard calibration equipment. The sensor trim function calibrates the sensor to the transmitter in temperature units or raw units. Unless the site-standard input source is NIST-traceable, the trim functions will not maintain the NIST-traceability of your system.

Figure 5-1: Trim

5.4.1 Application: Linear offset (single-point trim solution)

Procedure

1. Connect sensor to transmitter. Place sensor in bath between range points.
2. Enter known bath temperature using the Field Communicator.

5.4.2 Application: Linear offset and slope correction (two-point trim)

Procedure

1. Connect sensor to transmitter. Place sensor in bath at low range point.

2. Enter known bath temperature using the Field Communicator.
3. Repeat at high range point.

Perform a sensor trim using a Field Communicator

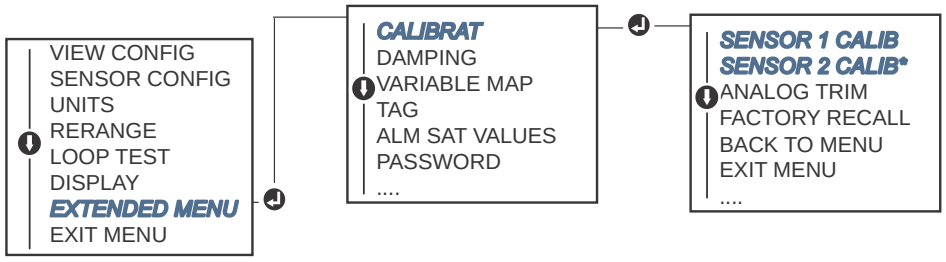
Procedure

1. Connect the calibration device or sensor to the transmitter. (If using an active calibrator, see Active calibrator and EMF compensation).
2. Connect the communicator to the transmitter loop.
3. From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	3, 4, 4, 1

   The communicator will display “Are you using an active calibrator?”
4. Select **No** if a sensor is connected to the transmitter
5. Select **Yes** if using a calibration device. By selecting Yes, the transmitter will switch into active calibration mode (see Active calibrator and EMF compensation). This is critical if the calibrator requires constant sensor current for calibration. If using a calibration device that can accept pulsed current, select **No**.

Perform a sensor trim using AMS Device Manager



Procedure

1. Right click on the device and select **Overview**.
2. On the main Overview tab, select the **Calibrate Sensor(s)** button near the bottom of the window.
3. Follow the screen prompts through the Sensor Trimming process.

Perform a sensor trim using LOI

Reference the below image for guidance on where to find Sensor Calibration in the LOI menu.

Figure 5-2: Trimming the Sensor with the LOI

5.4.3 Recall factory trim—sensor trim

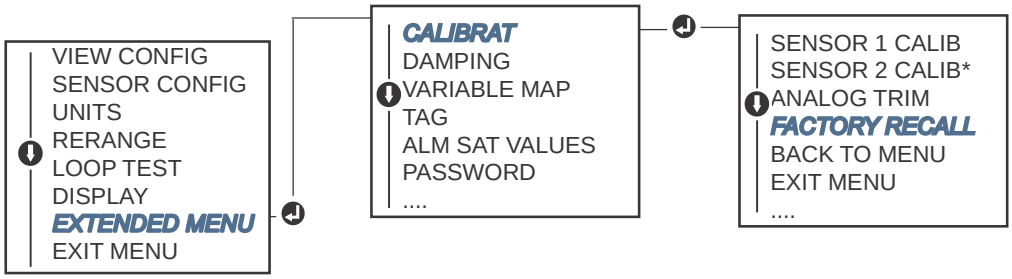
The recall factory trim—sensor trim feature allows the restoration of the as-shipped factory settings of the analog output trim. This command can be useful for recovering from an inadvertent trim, incorrect Plant Standard or faulty meter.

Recall factory trim using a Field Communicator

From the *HOME* screen, enter the Fast Key sequence and follow the steps within the Field Communicator to complete the sensor trim.

Device Dashboard Fast Keys	3, 4, 4, 2

Recall factory trim using AMS Device Manager



Procedure

1. Right click on the device and select **Service Tools**.
2. On the Sensor Calibration tab, select the **Restore Factory Calibration**.
3. Follow the screen prompts through the restoring of the calibration settings.

Recall factory trim using LOI

Reference Figure 5-3 for where to find recall sensor trim in the LOI menu.

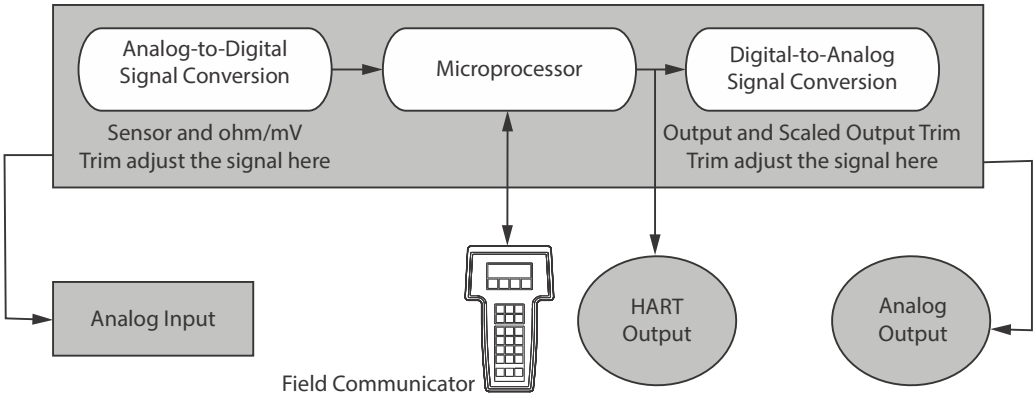
Figure 5-3: Recalling the Sensor Trim with the LOI

5.4.4 Active calibrator and EMF compensation

The transmitter operates with a pulsating sensor current to allow EMF compensation and detection of open sensor conditions. Because some calibration equipment requires a steady sensor current to function properly, the “Active Calibrator Mode” feature should be used when an Active Calibrator is connected. Enabling this mode temporarily sets the transmitter to provide steady sensor current unless two sensor inputs are configured.

Disable this mode before putting the transmitter back into the process to set the transmitter back to pulsating current. “Active Calibrator Mode” is volatile and will automatically be disabled when a master reset is performed (through HART) or when the power is cycled.

EMF compensation allows the transmitter to provide sensor measurements that are unaffected by unwanted voltages, typically due to thermal EMFs in the equipment connected to the transmitter, or by some types of calibration equipment. If this equipment also requires steady sensor current, the transmitter must be set to “Active Calibrator Mode.” However, the steady current does not allow the transmitter to perform EMF compensation and as a result, a difference in readings between the Active Calibrator and actual sensor may exist.



If a reading difference is experienced and is greater than the plant’s accuracy specification allows, perform a sensor trim with “Active Calibrator Mode” disabled. In this case, an active calibrator capable of tolerating pulsating sensor current must be used or the actual sensors must be connected to the transmitter. When the Field Communicator, AMS Device Manager, or the LOI asks if an Active Calibrator is being used when the sensor trim routine is entered, select No to leave the “Active Calibrator Mode” disabled.

5.5 Trim the analog output

5.5.1 Analog output trim or scaled analog output trim

Perform an output trim or a scaled output trim if the digital value for the primary variable matches the plant’s standards but the transmitter’s analog output does not match the reading on the output device. The output trim function calibrates the transmitter to a 4–20 mA reference scale; the scaled output trim function calibrates to a user-selectable reference scale. To determine the need for an output trim or a scaled output trim, perform a loop test (Perform a loop test).

Figure 5-4: Measurement Dynamics of Temperature Transmitter

5.5.2 Analog output trim

The analog output trim allows the transmitter’s conversion of the input signal to a 4–20 mA output to be altered (Figure 5-4). Adjust the analog output signal at regular intervals to maintain measurement precision.

Perform analog output trim using a Field Communicator

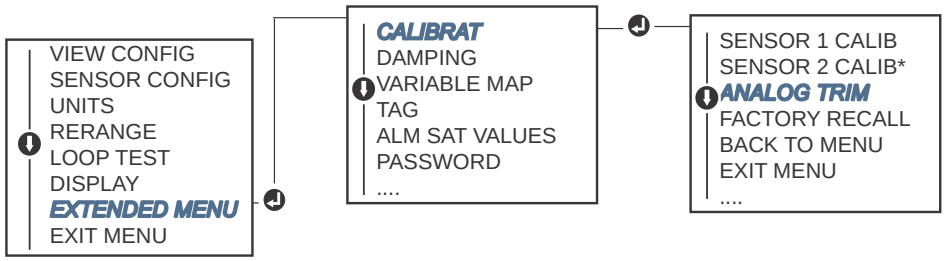
To perform a digital-to-analog trim, perform the following procedure with Traditional Fast Key sequence:

Procedure

1. Connect an accurate reference meter to the transmitter at the **CONNECT REFERENCE METER** prompt by shunting the power to the transmitter through the reference meter at some point in the loop.
2. From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	3, 4, 5, 1

Perform analog output trim using AMS Device Manager



Procedure

1. Right click on the device and select **Service Tools**.
2. In the left navigation pane select **Maintenance**.
3. Find the **Analog Calibration** tab and click on the **Analog Trim** button.
4. Follow the screen prompts through the Analog Trimming process.

Perform analog output trim using LOI

Reference Figure 5-5 for guidance on where to find analog trim in the LOI menu.

Figure 5-5: Trimming the Analog Output with the LOI

5.5.3 Performing a scaled output trim

The scaled output trim matches the 4 and 20mA points to a user-selectable reference scale other than 4 and 20 mA (2–10 volts, for example). To perform a scaled D/A trim, connect an accurate reference meter to the transmitter and trim the output signal to scale as outlined in the Trim the analog output procedure.

Perform a scaled output trim using a Field Communicator

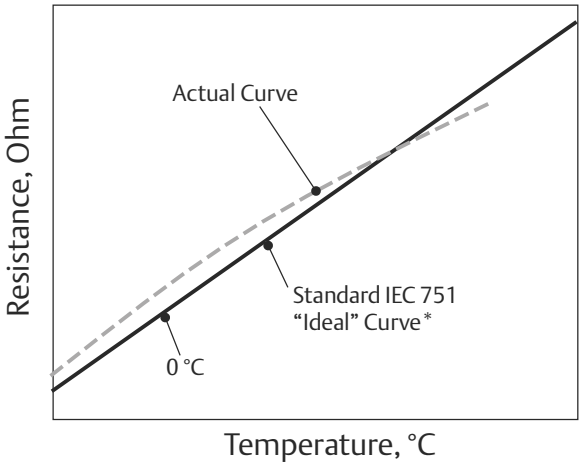
Procedure

1. Connect an accurate reference meter to the transmitter at the **CONNECT REFERENCE METER** prompt by shunting the power to the transmitter through the reference meter at some point in the loop.
2. From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	3, 4, 5, 2

Perform a scaled output trim using AMS Device Manager

Procedure



1. Right click on the device and select **Service Tools**.
2. In the left navigation pane select **Maintenance**.
3. Find the **Analog Calibration** tab and select the **Scaled Trim** button.
4. Follow the screen prompts through the Analog Trimming process.

5.6 Transmitter-sensor matching

Use Transmitter-Sensor Matching to enhance the temperature measurement accuracy of the system and if you have a sensor with Callendar-Van Dusen constants. When ordered from Emerson, sensors with Callendar-Van Dusen constants are NIST-traceable.

The transmitter accepts Callendar-Van Dusen constants from a calibrated RTD schedule and generates a special custom curve to match that specific sensor Resistance vs. Temperature performance. Figure 5-6.

Figure 5-6: Standard vs. Actual Sensor Curve

*The Actual Curve is identified from the Callendar-Van Dusen equation.

Matching the specific sensor curve with the transmitter significantly enhances the temperature measurement accuracy. See the comparison below in Table 5-1.

Table 5-1: Standard RTD vs. RTD with Matched CVD Constants with Standard Transmitter Accuracy

System accuracy comparison at 150 °C using a PT 100 (α=0.00385) RTD with a span of 0 to 200 °C			
Standard RTD		Matched RTD	
Rosemount 644	±0.15 °C	Rosemount 644	±0.15 °C
Standard RTD	±1.05 °C	Matched RTD	±0.18 °C
Total System(1)	±1.06 °C	Total System(1)	±0.23 °C

(1) Calculated using root-summed-squared (RSS) statistical method.

$$\text{TotalSystemAccuracy} = \sqrt{(\text{TransmitterAccuracy})^2 + (\text{SensorAccuracy})^2}$$

Table 5-2: Standard RTD vs. RTD with Matched CVD Constants with Enhanced Transmitter Accuracy Option P8

System Accuracy Comparison at 150 °C Using a PT 100 (α=0.00385) RTD with a Span of 0 to 200 °C			
Standard RTD		Matched RTD	
Rosemount 644	±0.10 °C	Rosemount 644	±0.10 °C
Standard RTD	±1.05 °C	Matched RTD	±0.18 °C
Total System(1)	±1.05 °C	Total System(1)	±0.21 °C

(1) Calculated using root-summed-squared (RSS) statistical method

$$\text{TotalSystemAccuracy} = \sqrt{(\text{TransmitterAccuracy})^2 + (\text{SensorAccuracy})^2}$$

Callendar-Van Dusen equation:

The following input variables, included with specially-ordered Rosemount temperature sensors, are required:

$R_t = R_o + R_o a [t – d(0.01t-1)(0.01t) – b(0.01t – 1)(0.01t)^3]$

- R_0 = Resistance at ice point
- Alpha = Sensor specific constant
- Beta = Sensor specific constant
- Delta = Sensor specific constant

To input Callendar-Van Dusen constants, perform one the following procedures:

5.6.1 Perform transmitter-sensor matching using a Field Communicator

From the *HOME* screen, enter the Fast Key sequence.

Device Dashboard Fast Keys	2, 2, 1, 9

5.6.2 Perform transmitter-sensor matching using AMS Device Manager

Procedure

1. Right click on the device and select **Configure**.
2. In the left navigation pane choose **Manual Setup** and choose the **Sensor 1** or **Sensor 2** tab depending on the need.
3. Find the **Transmitter Sensor Matching (CVD)** group box and enter in the required CVD constants. Or select “Set CVD Coefficients” button to be guided through steps. You may also select “Show CVD Coefficients” button to see the current coefficients loaded into the device.
4. Select **Apply** when complete.

Note
When the transmitter-senor matching is disabled, the transmitter reverts to either user or factory trim, whichever was used previously. Make certain the transmitter engineering units default correctly before placing the transmitter into service.

5.7 Switching HART Revision

Some systems are not capable of communicating with HART Revision 7 devices. The following procedures list how to change HART revisions between HART Revision 7 and HART Revision 5.

5.7.1 Switch HART revision using a generic menu

If the HART configuration tool is not capable of communicating with a HART Revision 7 device, it should load a Generic Menu with limited capability. The following procedures allow for switching between HART Revision 7 and HART Revision 5 from a generic menu in any HART compliant configuration tool.

Procedure

Locate “Message” field.

a) To change to HART Revision 5, Enter: **HART5** in the message field.

b) To change to HART Revision 7, Enter: **HART7** in the message field.

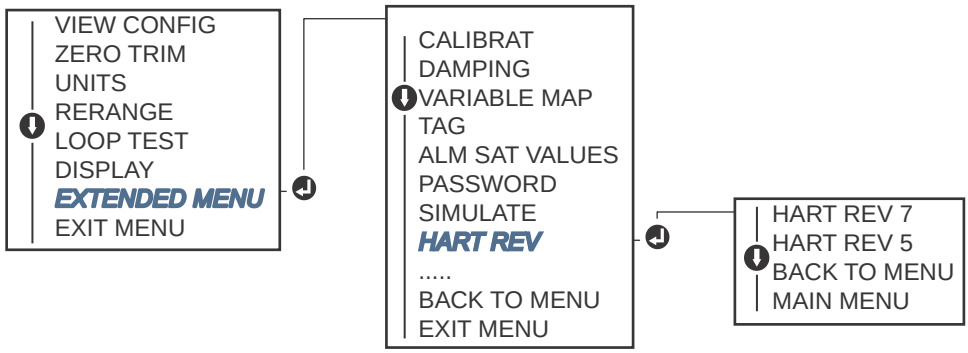
5.7.2 Switch HART revision using a Field Communicator

From the ***HOME*** screen, enter the Fast Key sequence and follow steps within the Field Communicator to complete the HART revision change.

Device Dashboard Fast Keys	2, 2, 8, 3

5.7.3 Switch HART revision using AMS Device Manager

Procedure



1. Right click on the device and select **Configure**.
2. In the left navigation pane choose **Manual Setup** and click on the **HART** tab.
3. Select the **Change HART Revision** button and follow the prompts.

Note
HART Revision 7 is only compatible with AMS Device Manager 10.5, and greater. AMS Device Manager version 10.5 requires a software patch to be compatible.

5.7.4 Switch HART revision using LOI

Reference Figure 5-7 for where to find HART Rev in the LOI menu.

Figure 5-7: Switching the HART Revision with the LOI

6 Troubleshooting

6.1 Overview

4–20 mA/HART output provides summarized maintenance and troubleshooting suggestions for the most common operating problems.

If you suspect malfunction despite the absence of any diagnostic messages on the Field Communicator display, follow the procedures described in 4–20 mA/HART output to verify that transmitter hardware and process connections are in good working order. Under each of four major symptoms, specific suggestions are offered for solving problems. Always deal with the most likely and easiest-to-check conditions first.

6.2 Safety messages

Read this manual before working with the product. For personal and system safety, and for optimum product performance, ensure you thoroughly understand the contents before installing, using, or maintaining this product.

⚠ WARNING

Follow instructions

Failure to follow these installation guidelines could result in death or serious injury.

Ensure only qualified personnel perform the installation.

Explosions

Explosions could result in death or serious injury.

Installation of the transmitters in a hazardous environment must be in accordance with the appropriate local, national, and international standards, codes, and practices. Please review the Product Certifications section for any restrictions associated with a safe installation.

Do not remove the connection head cover in explosive atmospheres when the circuit is live.

Before connecting a handheld communicator in an explosive atmosphere, ensure the instruments are installed in accordance with intrinsically safe or non-incendive field wiring practices.Verify the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

All connection head covers must be fully engaged to meet explosion-proof requirements.

⚠ WARNING

Process leaks

Process leaks could result in death or serious injury.

Do not remove the thermowell while in operation.
Install and tighten thermowells and sensors before applying pressure.

Electrical shock

Electrical shock could cause death or serious injury.

Avoid contact with the leads and terminals. High voltage that may be present on leads can cause electrical shock.

The products described in this document are NOT designed for nuclear-qualified applications.

Using non-nuclear qualified products in applications that require nuclear-qualified hardware or products may cause inaccurate readings.

For information on Rosemount nuclear-qualified products, contact your local Emerson Sales Representative.

Physical access

Unauthorized personnel may potentially cause significant damage to and/or misconfiguration of end users' equipment. This could be intentional or unintentional and needs to be protected against.

Physical security is an important part of any security program and fundamental to protecting your system. Restrict physical access by unauthorized personnel to protect end users' assets. This is true for all systems used within the facility.

⚠ CAUTION

Conduit/cable entries

The conduit/cable entries in the transmitter housing use a ½–14 NPT thread form.
When installing in a hazardous location, use only appropriately listed or Ex certified plugs, glands, or adapters in cable/conduit entries.
Unless otherwise marked, the conduit/cable entries in the housing enclosure use a ½–14 NPT form. Only use plugs, adapters, glands, or conduit with a compatible thread form when closing these entries.
Unless marked, the conduit/cable entries in the transmitter housing use a ½–14 NPT thread form. Entries marked "M20" are M20 × 1.5 thread form. On devices with multiple conduit entries, all entries will have the same thread form. Only use plugs, adapters, glands, or conduit with a compatible thread form when closing these entries.
Only use plugs, adapters, glands, or conduit with a compatible thread form when closing these entries.

6.3 4–20 mA/HART output

6.3.1 Transmitter communication

Transmitter does not communicate with Field Communicator

Potential cause

Loop wiring

Recommended actions

1. Check the revision level of the transmitter device descriptors (DDs) stored in your communicator. The communicator should report Dev v4, DD v1 (improved), or reference Field Communicator for previous versions. Contact Emerson Customer Central for assistance.
2. Check for a minimum of 250 ohms resistance between the power supply and Field Communicator connection.
3. Check for adequate voltage to the transmitter. If a Field Communicator is connected and 250 ohms resistance is properly in the loop, then the transmitter requires a minimum of 12.0 V at the terminals to operate (over entire 3.5–23.0 mA operating range), and 12.5 V minimum to communicate digitally.
4. Check for intermittent shorts, open circuits, and multiple grounds.

6.3.2 High output

Potential cause

Sensor input failure or connection

Recommended actions

1. Connect a Field Communicator and enter the transmitter test mode to check for a sensor failure.
2. Check for a sensor open or short circuit.
3. Check the process variable to see if it is out of range.

Potential cause

Loop wiring

Recommended actions

Check for dirty or defective terminals, interconnecting pins, or receptacles.

Potential cause

Power supply

Recommended actions

Check the output voltage of the power supply at the transmitter terminals. It should be 12.0–42.4 Vdc (over entire 3.75–23 mA operating range).

Potential cause

Electronics

Recommended actions

1. Connect a Field Communicator and enter the transmitter status mode to isolate module failure.
2. Connect a Field Communicator and check the sensor limits to ensure calibration adjustments are within the sensor range.

6.3.3 Erratic output

Potential cause

Loop wiring

Recommended actions

1. Check for adequate voltage to the transmitter. It should be 12.0–42.4 Vdc at the transmitter terminals (over entire 3.75–23 mA operating range).
2. Check for intermittent shorts, open circuits, and multiple grounds.
3. Connect a Field Communicator and enter the Loop test mode to generate signals of 4 mA, 20 mA, and user-selected values.

Potential cause

Electronics

Recommended actions

Connect a Field Communicator and enter the transmitter test mode to isolate module failure.

6.3.4 Low or no output

Potential cause

Sensor element

Recommended actions

1. Connect a Field Communicator and enter the transmitter test mode to isolate a sensor failure.
2. Check the process variable to see if it is out of range.

Potential cause

Loop wiring

Recommended actions

1. Check for adequate voltage to the transmitter. It should be 12.0–42.4 Vdc (over entire 3.75–23 mA operating range).
2. Check for shorts and multiple grounds.
3. Check for proper polarity at the signal terminal.
4. Check the loop impedance.
5. Connect a Field Communicator and enter the Loop test mode.
6. Check wire insulation to detect possible shorts to ground.

Potential cause

Electronics

Recommended actions

Connect a Field Communicator and check the sensor limits to ensure calibration adjustments are within the sensor range.

6.4 Diagnostic messages

Listed in the below sections are detailed tables of the possible messages that will appear on either the LCD/LOI Display, a Field Communicator, or an AMS Device Manager system. Use the tables below to diagnose particular status messages.

- Failed
- Maintenance
- Advisory

6.4.1 Failed status

Electronics failure

ALARM DEVICE ALARM FAIL

Potential cause

Essential electronics in the device have failed. The transmitter may have experienced an electronics failure while attempting to store information.

Recommended actions

1. Restart the transmitter.
2. If condition persists, replace the transmitter. Contact the nearest Emerson Field Service Center if necessary.

Sensor open

Sensor 1 is used here as an example. If Dual Sensors are ordered this alert can apply to either sensor.

ALARM SNSR 1 ALARM FAIL

Potential cause

The transmitter has detected an open sensor condition. The sensor may be disconnected, connected improperly, or malfunctioning.

Recommended actions

1. Verify the sensor connection and wiring. Refer to the wiring diagrams found on the transmitter label to ensure proper wiring.
2. Verify the integrity of the sensor and sensor lead wires. If the sensor is faulty, repair or replace the sensor.

Sensor short

Sensor 1 is used here as an example. If Dual Sensors are ordered this alert can apply to either sensor.

ALARM SNSR 1 ALARM FAIL

Potential cause

The transmitter has detected a shorted sensor condition. The sensor may be disconnected, connected improperly, or malfunctioning.

Recommended actions

1. Verify the process temperature is within the specified sensor's range. Use the Sensor Information button to compare with the process temperature.
2. Verify the sensor is properly wired and connected to the terminals.
3. Verify the integrity of the sensor and sensor lead wires. If the sensor is faulty, repair or replace the sensor.

Terminal temperature failure

ALARM TERM ALARM FAIL

Potential cause

The terminal temperature is outside the internal RTD’s specified operating range.

Recommended actions

Verify the ambient temperature is within the device specified operating range using the terminal temperature information button.

Invalid configuration

CONFG SNSR 1 WARN ERROR

Potential cause

The sensor configuration (type and/or connection) does not match the sensor output and is invalid.

Recommended actions

1. Verify sensor type and number of wires matched the sensor configuration of the device.
2. Reset the device.
3. If error persists, download the transmitter configuration.
4. If error still present, replace the transmitter.

Field device malfunction

ALARM DEVICE ALARM FAIL

Potential cause

The device has malfunctioned or needs immediate attention.

Recommended actions

1. Perform a processor reset.
2. View other alerts to see if the transmitter indicates a specific problem.
3. If the condition persists, replace the device.

6.4.2 Warning status

Hot Backup™ active

HOT BU SNSR 1 HOT BU FAIL

Potential cause

Sensor 1 has failed (open or shorted) and Sensor 2 is now the primary process variable output.

Recommended actions

1. Replace Sensor 1 at you earliest convenience.
2. Reset Hot Backup feature in the device software.

Sensor drift alert active

Sensor 1 is used here as an example. If Dual Sensors are ordered this alert can apply to either sensor.

WARN DRIFT WARN ALERT

Potential cause

The difference between Sensor 1 and 2 has gone beyond the user-configured Drift Alert Threshold.

Recommended actions

1. Verify sensor connections are valid on the transmitter.
2. If necessary, check calibration of each sensor.
3. Verify process conditions match sensor outputs.
4. If calibration fails, one of the sensors has failed. Replace it at your earliest convenience.

Sensor degraded

Sensor 1 is used here as an example. If Dual Sensors are ordered this alert can apply to either sensor.

WARN SNSR 1 DEGRA SNSR 1

Potential cause

The resistance of the thermocouple loop has exceeded the configured threshold. This could be caused by excess EMF.

Recommended actions

1. Check terminal connections on the terminal screws for corrosion.
2. Check the thermocouple loop for any signs of corrosion in terminal blocks, wire thinning, wire breaks, or faulty connections.
3. Verify the integrity of the sensor itself. Harsh process conditions may cause long-term sensor failures.

Calibration error

Potential cause

The value entered for the user trim point was not acceptable.

Recommended actions

Re-trim the device, ensure the user entered calibration points are close to the applied calibration temperature.

Sensor out of operating limits

Sensor 1 is used here as an example. If Dual Sensors are ordered this alert can apply to either sensor.

SAT SNSR 1 XX.XXX°C

Potential cause

Sensor readings are outside the sensor's specified range.

Recommended actions

1. Verify the process temperature is within the specified sensor's range. Use the Sensor Information button to compare with the process temperature.
2. Verify the sensor is properly wired and connected to the terminals.
3. Verify the integrity of the sensor and sensor lead wires. If the sensor is faulty, repair or replace the sensor.

Terminal temperature out of operating limits

SAT TERM DEGRA WARN

Potential cause

The terminal temperature is outside the on-board RTD specified operating range

Recommended actions

Verify the ambient temperature is within the device specified operating range using the Terminal Temperature Information Button.

6.4.3 Other LCD display messages

LCD is not displaying correctly or at all

Rosemount 644 HART 7 on screen

Potential cause

The display may not be functioning or it may be stuck on Home screen.

Recommended actions

If the meter does not appear to function, ensure the transmitter is configured for the meter option you desire. The meter will not function if the LCD Display option is set to Not Used.

Analog output fixed

WARN LOOP WARN FIXED

Potential cause

The analog output is set to a fixed value and is not currently tracking the HART Primary Variable.

Recommended actions

1. Verify that it was intended for the transmitter to be operating in “Fixed Current Mode.”
2. Disable “Fixed Current Mode” in Service Tools to have the analog output operate normally.

Simulation active

Potential cause

The device is in simulation mode and may not be reporting actual information.

Recommended actions

1. Verify simulation is no longer required.
2. Disable simulation mode in service tools.
3. Perform a device reset.

6.5 Return of materials

To expedite the return process in North America, call the Emerson National Response Center toll-free at 800-654-7768. This center, available 24 hours a day, will assist you with any needed information or materials.

The center will ask for the following information:

- Product model
- Serial numbers
- The last process material to which the product was exposed

The center will provide:

- A Return Material Authorization (RMA) number
- Instructions and procedures that are necessary to return goods that were exposed to hazardous substances.

For other locations, contact an Emerson sales representative.

Note
If a hazardous substance is identified, a Safety Data Sheet (SDS), required by law to be available to people exposed to specific hazardous substances, must be included with the returned materials.

7 Safety Instrumented Systems (SIS) Certification

7.1 SIS certification

The safety-critical output of the Rosemount 644P Temperature Transmitter is provided through a 2-wire, 4–20 mA signal representing temperature. The transmitter can be equipped with or without a display. The Rosemount 644P Safety Certified Safety Transmitter is certified to: Low demand; Type B.

- SIL 2 for random integrity at HFT=0
- SIL 3 for random integrity at HFT=1
- SIL 3 for systematic integrity

7.2 Safety certified identification

All Rosemount 644 HART Head Mount and Field Mount Transmitters must be identified as safety certified before installing into a SIS.

To identify a safety-certified transmitter, ensure the device satisfies the requirements below:

Procedure

1. Verify the transmitter was ordered with output option code “A” and option code “QT”. This signifies that it is a 4–20 mA/HART safety certified device.
   a) For example: MODEL 644HA.....QT.....
2. See a Yellow Tag affixed to the top of the transmitter face or a Yellow Tag affixed to the outside of the enclosure if pre-assembled.
3. Check the Namur Software Revision located on the adhesive transmitter tag. “SW _._._”.

   If the Device label software revision is 1.1.1 or higher, the device is safety certified.

7.3 Installation

Installations are to be performed by qualified personnel. No special installation is required in addition to the standard installation practices outlined in this document. Always ensure a proper seal by installing the electronics housing cover(s) so that metal contacts metal.

The loop should be designed so the terminal voltage does not drop below 12 Vdc when the transmitter output is 24.5 mA.

Environmental limits are available in the Rosemount 644 Temperature Transmitter product page.

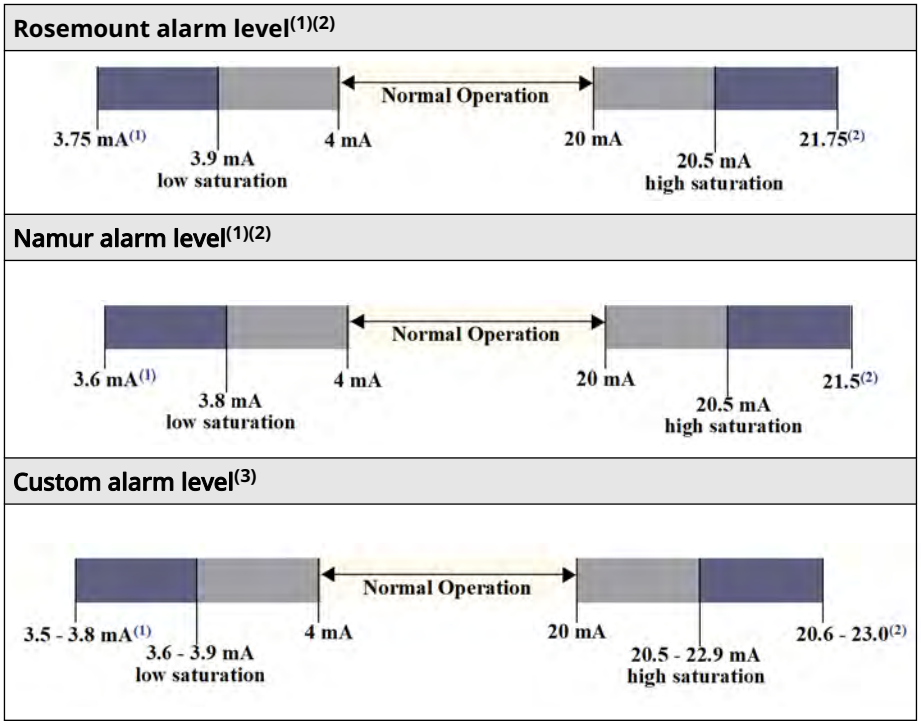
7.4 Configuration

Use any HART-capable configuration tool or the optional Local Operator Interface (LOI) to communicate with and verify the initial configuration or any configuration changes made to the transmitter prior to operating in Safety Mode. All configuration methods outlined in Configuration are the same for the safety-certified transmitter with any differences noted.

Software lock must be used in order to prevent unwanted changes to the transmitter configuration.

Note
Transmitter output is not safety-rated during the following: Configuration changes, Multidrop operation, Simulation, Active calibrator mode, and loop tests. Alternative means should be used to ensure process safety during transmitter configuration and maintenance activities.

7.4.1 Damping



User-adjustable damping affects the transmitter's ability to respond to changes in the applied process. The damping value + response time should not exceed the loop requirements.

If using a thermowell assembly, ensure to also take into account the added response time due to thermowell material.

7.4.2 Alarm and saturation levels

DCS or safety logic solver should be configured to match transmitter configuration. Figure 7-1 identifies the three alarm levels available and their operations values.

Figure 7-1: Alarm Levels

(1) Transmitter Failure, hardware or software alarm in LO position.
(2) Transmitter Failure, hardware or software alarm in HI position.
(3) Low alarm must be at least 0.1 mA lower than the low saturation value.

7.5 Operation and maintenance

7.5.1 Proof test

The following proof tests are recommended. In the event that an error is found in the safety functionality, proof test results and corrective actions taken must be documented at Emerson.com/Rosemount/Safety.

All proof test procedures must be carried out by qualified personnel.

7.5.2 Partial proof test 1

The partial proof test 1 consists of a power cycle plus reasonability checks of the transmitter output. Reference the FMEDA Report for percent of possible DU failures in the device.

FMEDA report can be found at Rosemount 644 Temperature Transmitter product page.

Required tools: Field Communicator, mA meter

Procedure

1. Bypass the safety PLC or take other appropriate action to avoid a false trip.
2. Send a HART command to the transmitter to go to high alarm current output and verify that the analog current reaches that value. This tests for compliance voltage problems such as low loop power supply voltage or increased wiring resistance. This also tests for other possible failures.
3. Send a HART command to the transmitter to go to the low alarm current output and verify that the analog current reaches that value. This tests for possible quiescent current related failures.
4. Use the HART communicator to view detailed device status to ensure no alarms or warnings are present in the transmitter.
5. Perform reasonability check on the sensor value(s) versus an independent estimate (i.e. from direct monitoring of BPCS value) to show current reading is good.
6. Restore the loop to full operation.
7. Remove the bypass from the safety PLC or otherwise restore to normal operation.

7.5.3 Comprehensive proof test 2

The comprehensive proof test 2 consists of performing the same steps as the partial proof test but with a two-point calibration of the temperature sensor in place of the reasonability check. Reference the FMEDA report for percent of possible DU failures in the device.

Required tools: Field Communicator, temperature calibration equipment

Procedure

1. Bypass the safety PLC or take other appropriate action to avoid a false trip.
2. Perform partial proof test 1.
3. Verify the measurement for two temperature points for Sensor 1. Verify the measurement for two temperature points for Sensor 2, if second sensor is present.
4. Perform reasonability check of the housing temperature.
5. Restore the loop to full operation.
6. Remove the bypass from the safety PLC or otherwise restore to normal operation.

7.5.4 Comprehensive proof test 3

The comprehensive proof test 3 includes a comprehensive proof test along with a simple sensor proof test. Reference the FMEDA report for percent of possible DU failures in the device.

Procedure

1. Bypass the safety PLC or take other appropriate action to avoid a false trip.

2. Perform simple proof test 1.
3. Connect calibrated sensor simulator in place of sensor 1.
4. Verify safety accuracy of two temperature points inputs to transmitter.
5. If sensor 2 is used, repeat Step 3 and Step 4.
6. Restore sensor connections to transmitter.
7. Perform reasonability check of transmitter housing temperature.
8. Perform reasonability check on the sensor(s) values versus an independent estimate (i.e. from direct monitoring of BPCS value) to show current reading is acceptable.
9. Restore loop to full operation.
10. Remove the bypass from the safety PLC or otherwise restore to normal operation.

7.5.5 Inspection

Visual inspection	Not required.
Special tools	Not required.
Product repair	The Rosemount 644 is repairable by replacement only.

All failures detected by the transmitter diagnostics or by the proof-test must be reported. Feedback can be submitted electronically at Emerson.com/Rosemount/Contact-Us.

7.6 Specifications

The Rosemount 644 Transmitter must be operated in accordance to the functional and performance specifications provided in the Product Data Sheet.

7.6.1 Failure rate data

The report is available at the Rosemount 644 Temperature Transmitter product page.

7.6.2 Failure values

Safety Deviation (defines what is dangerous in a FMEDA):

- Span ≥ 100 °C ± 2% of process variable span
- Span << 100 °C ± 2 °C

Safety response time: five seconds

7.6.3 Product life

50 years - based on worst case component wear-out mechanisms — not based on wear-out of process sensors.

Report any safety related product information at Emerson.com/Rosemount/Contact-Us.

A Reference Data

A.1 Product certifications

To view current Rosemount 644 Temperature Transmitter product certification, follow these steps:

Procedure

1. Go to Emerson.com/Rosemount/Rosemount-644.
2. Scroll as needed to the green menu bar and click **Documents & Drawings**.
3. Click **Manuals & Guides**.
4. Select the appropriate Quick Start Guide.

A.2 Ordering information, specifications, and drawings

To view current Rosemount 644 Temperature Transmitter ordering information, specifications, and drawings, follow these steps:

Procedure

1. Go to Emerson.com/Rosemount/Rosemount-644.
2. Scroll as needed to the green menu bar and click **Documents & Drawings**.
3. For installation drawings, click **Drawings & Schematics**.
4. Select the appropriate Product Data Sheet.
5. For ordering information, specifications, and dimensional drawings, click **Data Sheets & Bulletins**.
6. Select the appropriate Product Data Sheet.

A.3 AMS terms

Resistance:	This is the existing resistance reading of the thermocouple loop.
Resistance threshold exceeded:	The check box indicates if the sensor resistance has passed the Trigger Level.
Trigger level:	Threshold resistance value for the thermocouple loop. The trigger level may be set for 2, 3, or 4 × Baseline or the default of 5000 ohms. If the resistance of the thermocouple loop surpasses the Trigger Level, a maintenance alert will be generated.
Baseline resistance:	The resistance of the thermocouple loop obtained after installation, or after resetting the baseline value. The trigger level may be calculated from the baseline value.
Reset baseline resistance:	Launches a method to recalculate the Baseline value (which may take several seconds).
TC diagnostic mode sensor 1or 2:	This field will read either enabled or disabled indicating when the thermocouple degradation diagnostic is on or off for that sensor.

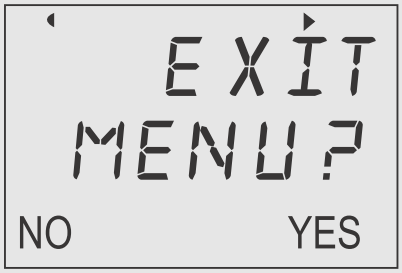
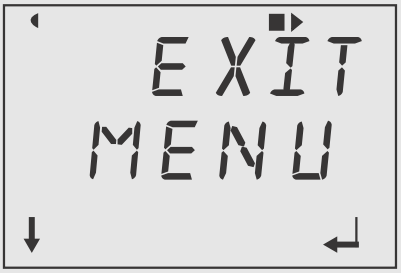
C Local Operator Interface (LOI)

- The LOI requires option code M4 to be ordered.
- To activate the LOI, push either configuration button. Configuration buttons are located on the LCD display (remove the housing cover to access the interface. See Table C-1 for configuration button functionality and Figure C-1 for configuration button location).

When using the LOI for configuration, several features require multiple screens for a successful configuration. Data entered will be saved on a screen-by-screen basis; the LOI will indicate this by flashing SAVED on the LCD display each time.





Note
Entering into the LOI menu effectively disables the ability to write to the device by any other host or configuration tool. Ensure this is communicated to necessary personnel before using the LOI for device configuration.

Figure C-1: LOI Configuration Buttons

A. Configuration buttons

Table C-1: LOI Button Operation

Button		
Left	No	SCROLL
Right	Yes	ENTER

LOI password

An LOI password can be entered and enabled to prevent review and modification of device configuration via the LOI. This does not prevent configuration from HART® or through the control system. The LOI password is a four-digit code that is to be set by the user. If the password is lost or forgotten the master password is “9307”. The LOI password can be configured and enabled/disabled by HART communication via a Field Communicator, AMS Device Manager, or the LOI.

C.1 Number entry

Floating-point numbers can be entered with the LOI. All eight number locations on the top line can be used for number entry. Refer to Table 2-2 for LOI button operation. Below is a floating-point number entry example for changing a value of “-0000022” to “000011.2”

Table C-2: LOI Number Entry

Step	Instruction	Current position (indicated by underline)
1	When the number entry begins, the left most position is the selected position. In this example, the negative symbol, “-“, will be flashing on the screen.	-0000022
2	Press the scroll button until the “0” is blinking on the screen in the selected position.	00000022
3	Press the enter button to select the “0” as an entry. The second digit from the left will be blinking.	00000022
4	Press the enter button to select “0” for second digit. The third digit from the left will be blinking.	00000022
5	Press the enter button to select “0” for the third digit. The fourth digit from the left will now be blinking.	00000022
6	Press the enter button to select “0” for the fourth digit. The fifth digit from the left will now be blinking.	00000022
7	Press scroll to navigate through the numbers until the “1” is on the screen.	00001022
8	Press the enter button to select the “1” for the fifth digit. The sixth digit from the left will now be blinking.	00001022
9	Press scroll to navigate through the numbers until the “1”, is on the screen.	00001122
10	Press the enter button to select the “1” for the sixth digit. The seventh digit from the left will now be blinking.	00001122

Table C-2: LOI Number Entry *(continued)*

Step	Instruction	Current position (indicated by underline)
11	Press scroll to navigate through the numbers until the decimal, ".", is on the screen.	000011.2
12	Press the enter button to select the decimal, ".", for the seventh digit. After pressing enter, all digits to the right of the decimal will now be zero. The eighth digit from the left will now be blinking.	000011.0
13	Press the scroll button to navigate through the numbers until the "2", is on the screen.	000011.2
14	Press the enter button to select the "2" for the eighth digit. The number entry will be complete and a "SAVE" screen will be shown.	000011.2

Usage notes:

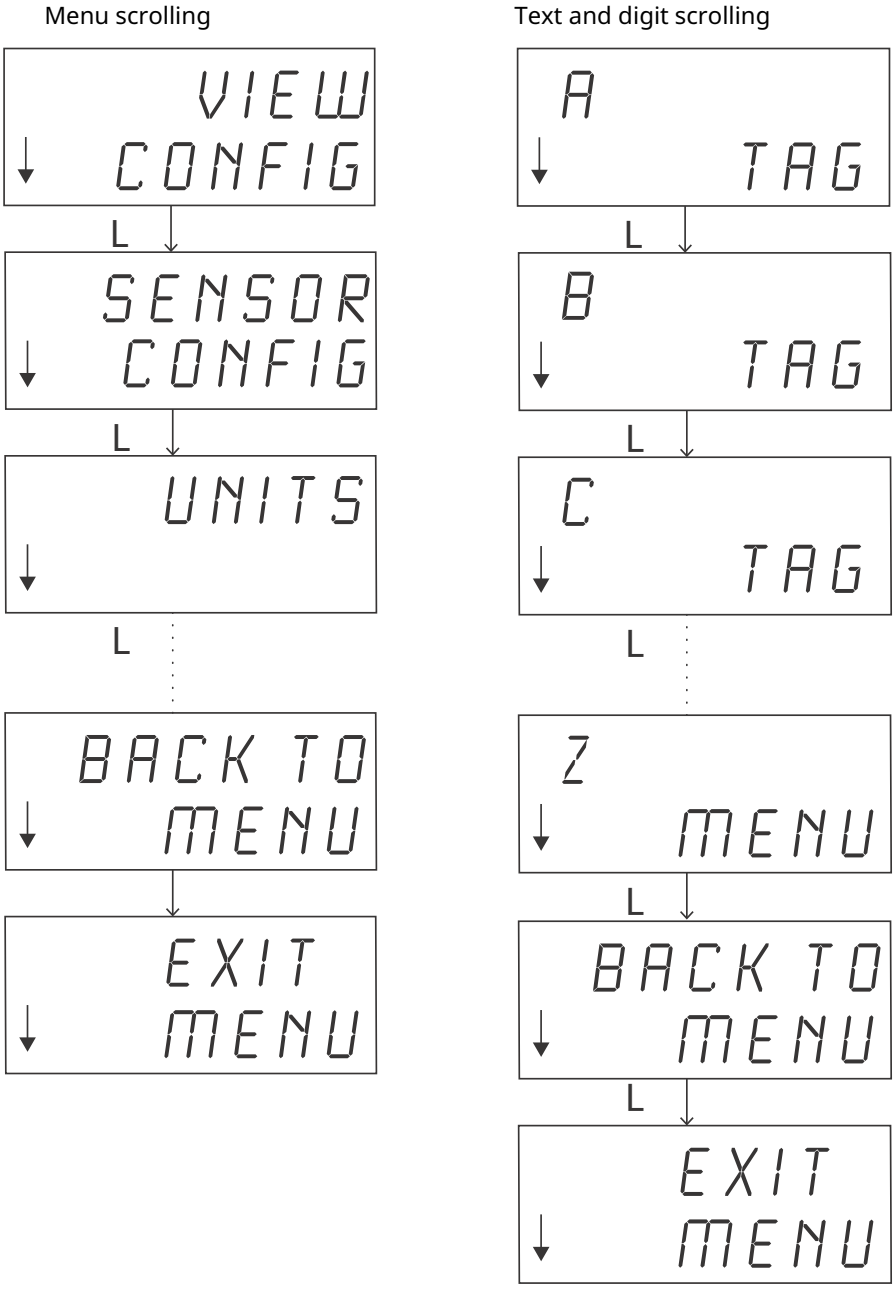
- It is possible to move backwards in the number by scrolling to the left and pressing enter. The left arrow appears as such in the LOI: ;
- The negative symbol is only allowed in the left most position.
- The Over score character "‾ "is used in the LOI to enter a blank space for Tag entry.

C.2 Text entry

Text can be entered with the LOI. Depending on the edited item, up to eight locations on the top line can be used for text entry. Text entry follows the same rules as the number entry rules in Number entry, except the following characters are available in all locations: A-Z, 0-9, -, /, space.

C.2.1 Scrolling

When it is desired to move more quickly through the list of menu choices or alpha numeric characters without individual button presses, a faster scrolling technique is available. Scrolling functionality allows the user to walk through any menu in forward or reverse order, enter text or digits easily and quickly.



Menu scrolling

Simply hold down the left button after it brings you to the next menu item, each of the proceeding menus will be shown one after another while the button is pressed down.

Text or digit entry scrolling

Quickly navigate through number and text menu lists by holding down the left button the same as in Menu.

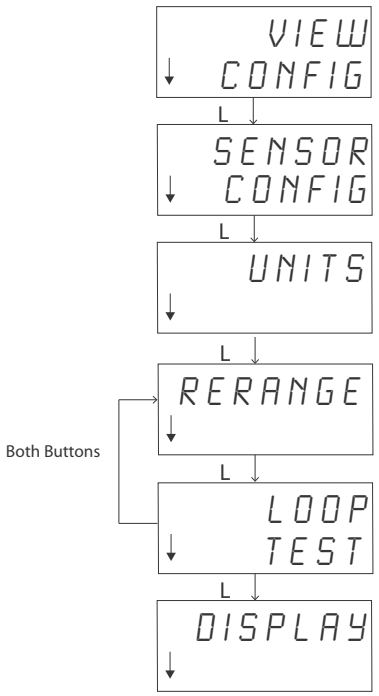


Figure C-2: Scrolling

Scrolling backwards

Moving backwards during digit or text entry was described above in Digit Entry "Usage Notes". During regular menu navigation it is possible to go back to the previous screen by pressing both buttons at the same time.

Figure C-3: Scrolling backwards

C.3 Timeout

The LOI in standard operation will Time Out and return to the home screen after 15 minutes of inactivity. To re-enter into the LOI menu, press either button.

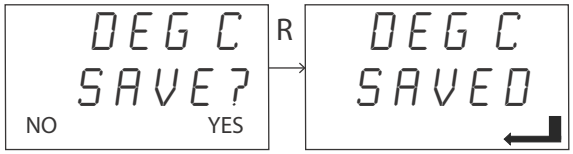
C.4 Saving and canceling

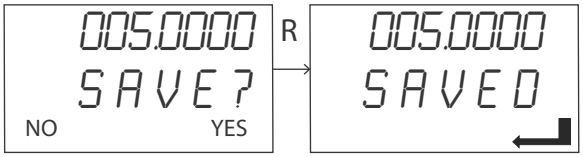
The Save and Cancel functionality implemented at the end of a series of steps allows the user to save the change or exit the function without saving any of the changes. The way these functions are shown should always look as follows:

Saving

Whether you're choosing a setting from a list of choices or entering digits or text the first screen shall show "SAVE?" to ask the user if they want to save the information just entered. You can select the cancel function (choose NO) or the save function (choose YES). After the save function is selected, "SAVED" shall appear on the screen.

Figure C-4: Saving a Setting





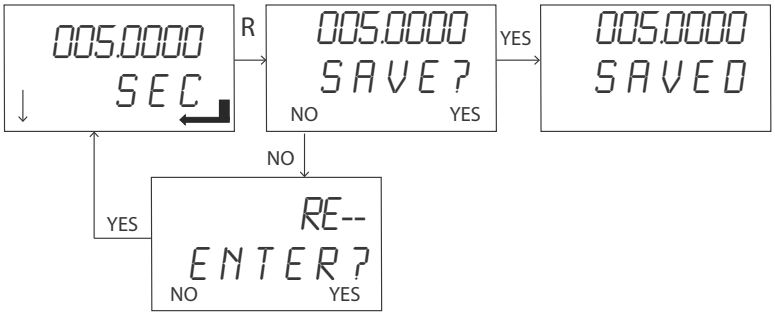


Figure C-5: Saving Text or Values

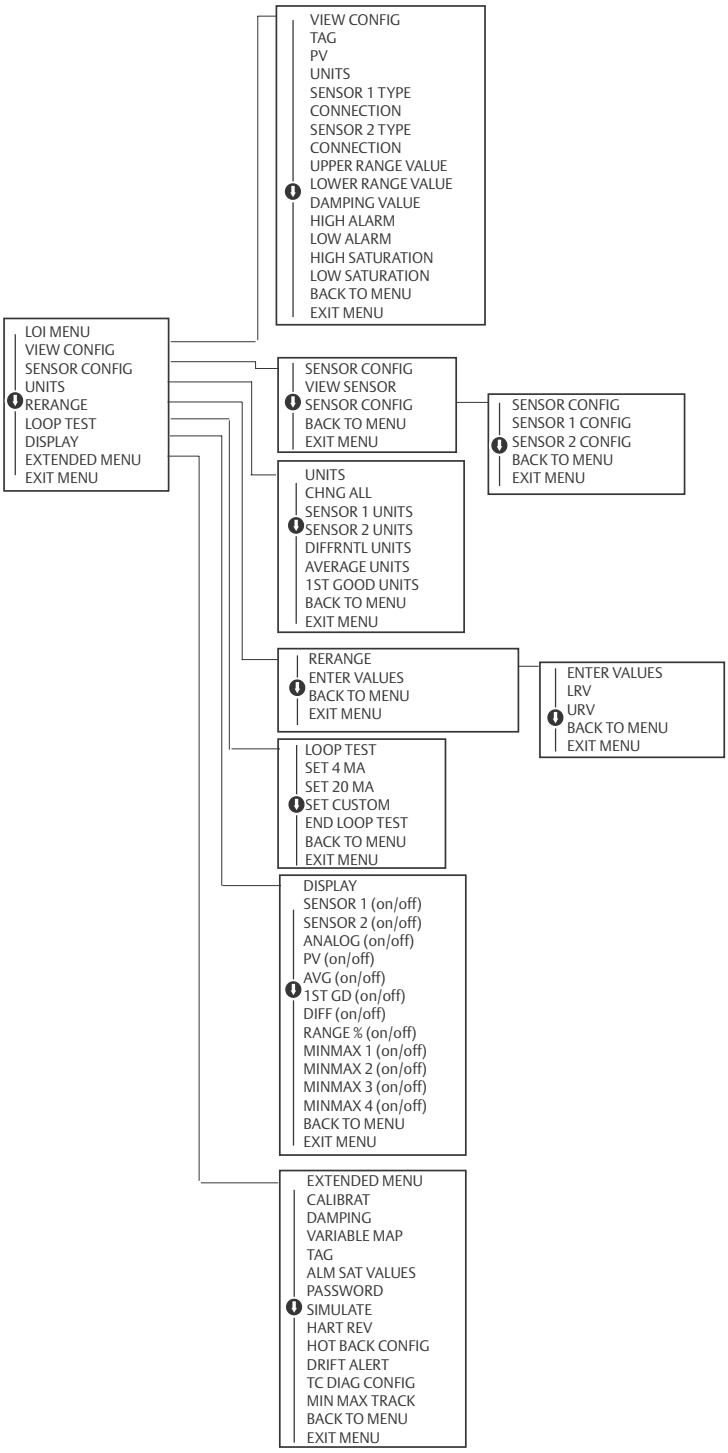

Canceling

When a value or text string is being entered into the transmitter via the LOI and the function is canceled, the LOI menu can offer the user a means to re-enter the value without losing the information entered. Examples of a value being entered are the Tag, Damping, and Calibration values. If you do not want to re-enter the value and desire to continue canceling, select the NO option when prompted.

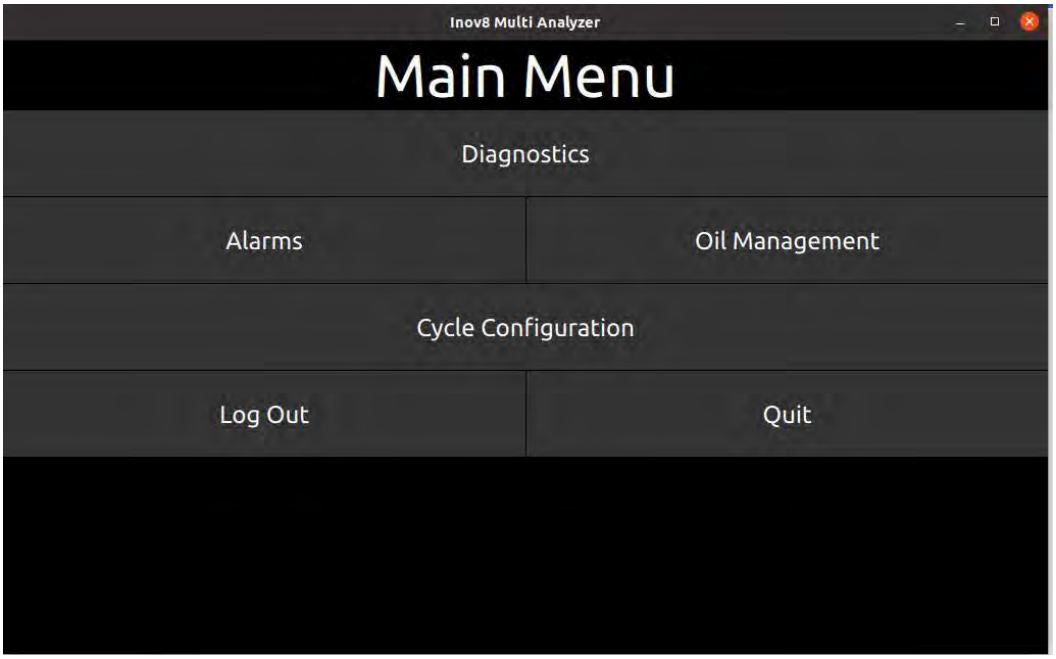
Quick Start (Basic Operation)

Each unit may be supplied with several standard oil files/curves or a custom oil file if requested (and a sample provided).

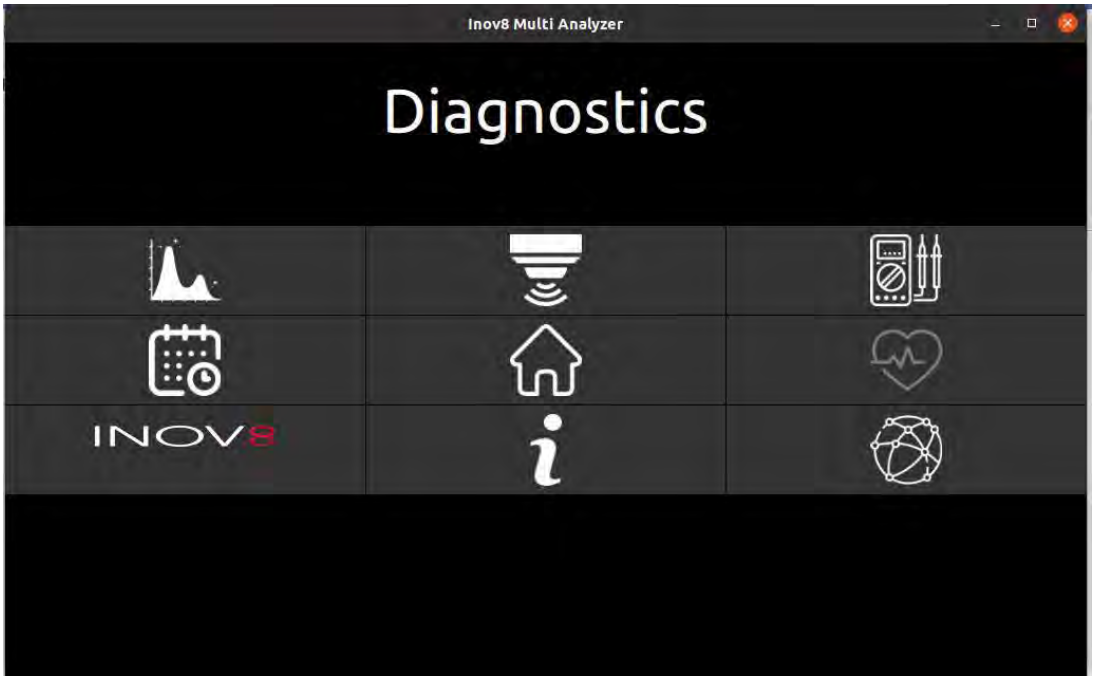
- INOV8 100ppm Standard
- INOV8 500ppm Standard
- INOV8 1000ppm Standard



These files have been produced using a blend of crude oils to create generic curves, which are able to track the suspended concentrations of approximately 70% of known oil types with only minor changes for fine tuning required to match the results from lab sampling.

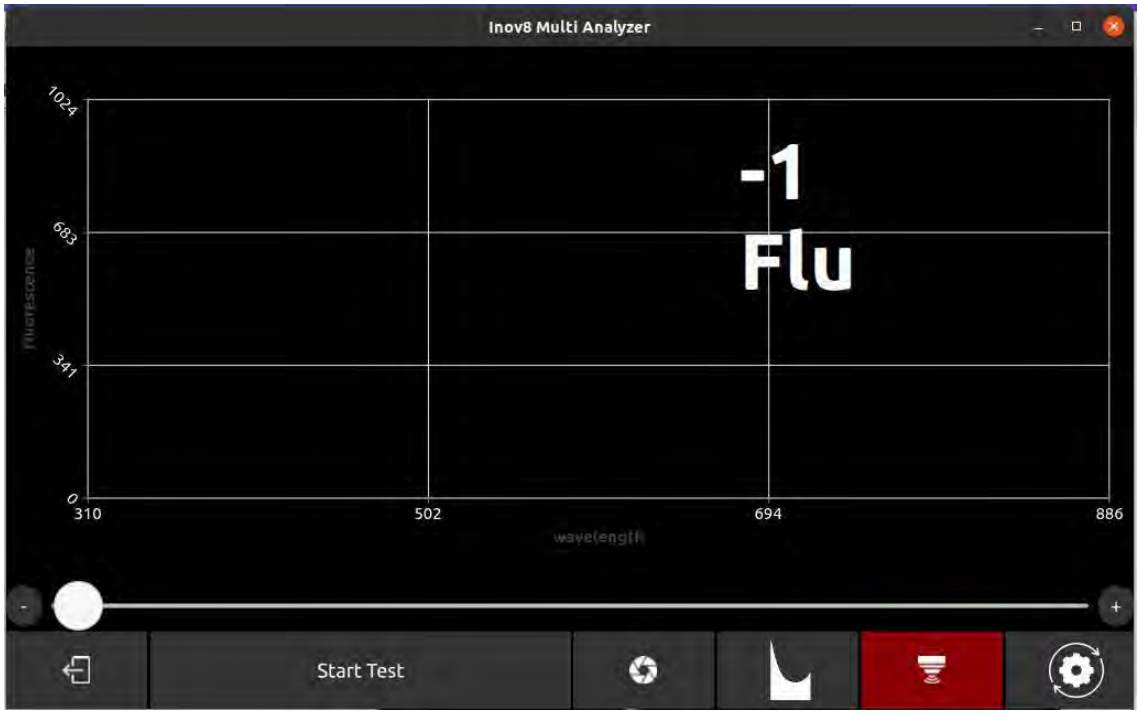
Where a standard oil file is not suitable for reasons of required accuracy or range, a bespoke file can be produced by or under the supervision of trained personnel.

Powering up



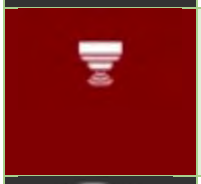
With 24V DC applied, the unit will automatically boot up and carry out diagnostic health checks. Once completed the Main Menu screen will appear. Once the Main Menu appears, please go to here to ensure the clock is set up. This should be done first.

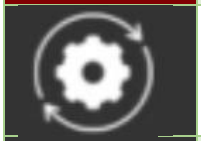
Main Menu

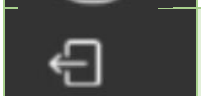


Ensure that an adequate volume of produced water is maintained across the sample chamber. When the analyser is powered up, a measurement cycle will automatically begin, if this has been set.

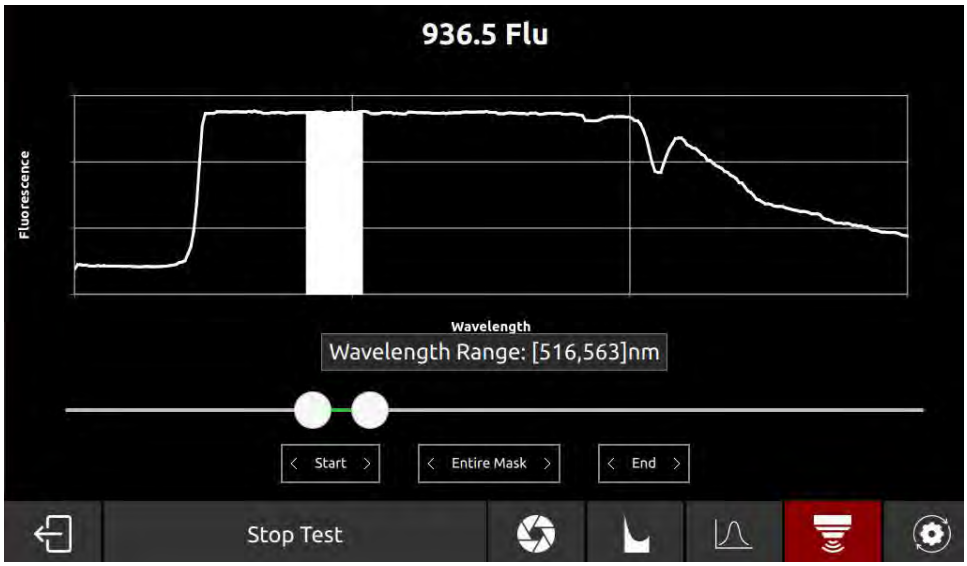
Diagnostics:







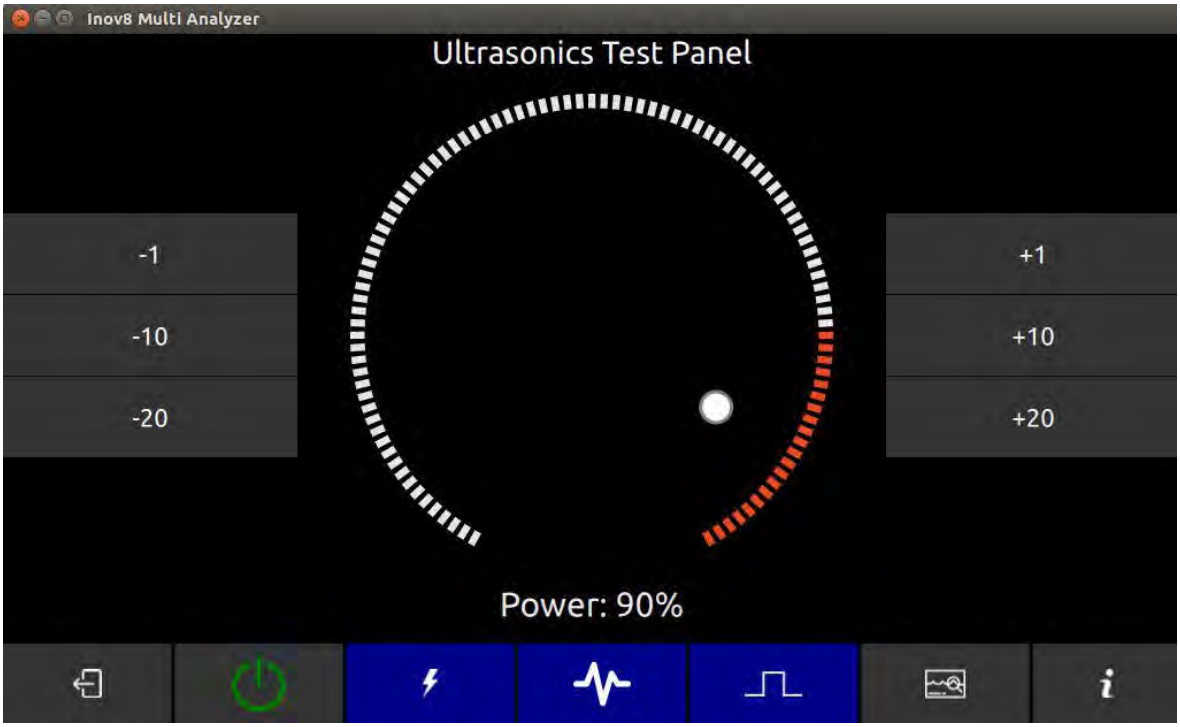
When hovering over each button, a tool tip shows the specific name for it. Please note that on some configurations some options will be disabled.



1 - Spectra

Select the ‘Start Test’ button to start and stop the measurement.

Button	Name	Function
	Integration Time Set Up	This button is the integration time. You can move the slider to achieve the integration time you need, or use the + and – buttons for more accurate setting.
	Spectra Wavelength Set Up	Here you can select the wavelength range so focus the resulting reading to part of the measurement.
	Ultrasonic cleaning	At any time, the ultrasonics button can be selected to action a quick burst of the ultrasonics, lasting 1 second. When active, this button will flash green before turning back to red.
	Find Best Settings	This button will find the best offset, wavelength and integration time for the user based on the current sample.
	Back to diagnostics	Use this back button to go back to the Diagnostics menu.
	Spectrometer Offset	Use this button to move the spectra up or down on the screen. This can be used to 'zero' the spectra which helps to overcome third party fluorescence in or around the sample.



Once the settings have been chosen, either manually or through 'Find Best Settings', the measurement will be displayed as:

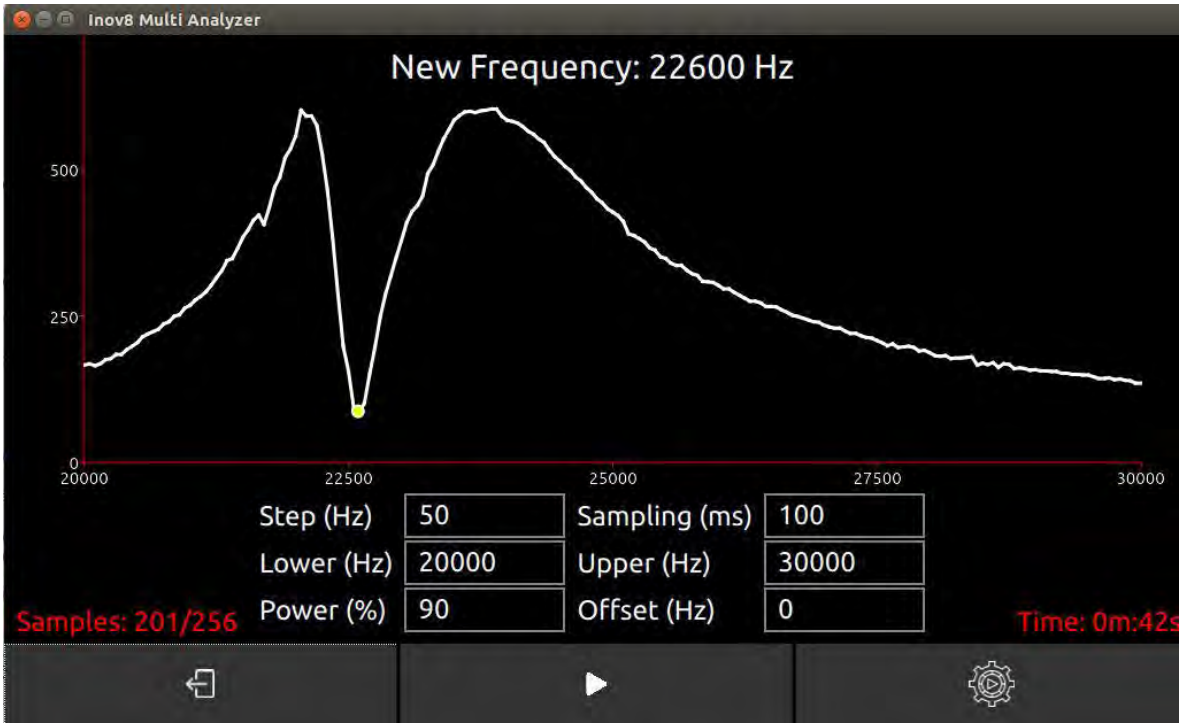
The tool tip is displayed as an information box in the top left corner of the measurement. Here, the Wavelength Range is displayed as both the lower and upper limit.

When creating a sample, 0-100ppm for example, the settings selected in the spectra diagnostics option, must remain unchanged until the sample has been created.

Wavelengths can now be shifted as a whole range or individually in applicable screens. The wavelength mask shown on the spectra now much more closely resembles where you select on the

slider.

2 - Ultrasonics



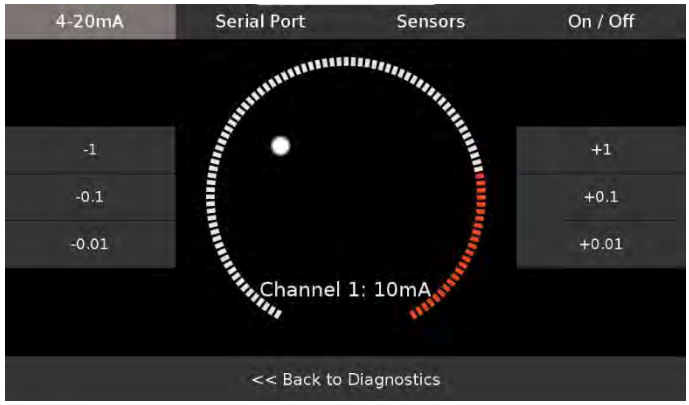
Ultrasonic Functions

Button	Name	Function
	Start Test	The start / stop button will alternate between green and red depending on whether the user has clicked the ultrasonics button on or off.
	Power	This button represents the power at which the ultrasonic cleaning will operate.
	Frequency	This button represents the frequency at which the ultrasonic cleaning will operate.
	Pulse on / off	Here, you can ‘pulse on’ and ‘pulse off’ the ultrasonics over a set period, measured in milliseconds.
	Auto Tune	If enabled, you can enter the ultrasonics auto tune menu here.

	Summary	This is a summary button that displays the power, frequency and pulse times.

On either side of the circular dials found on the Ultrasonic Test Panel, the column of buttons allows you to change the current setting by the shown amount. For example, on the power screen shown on the previous page, the power is set to 90%, if you click the -10 button it will change to 80%.

Auto Tune



Here, you can perform an auto tune with the parameters which you set in the text boxes.

- The Lower and Upper (Hz) settings are simply the beginning and end frequencies of the auto tune, in Hertz.
- Step (Hz) refers to how large the gaps are between frequencies, for example with the above settings the auto tune starts at 20,000 Hz. then jumps to 20,050 Hz, then 20,100 Hz and so on.
- Sampling (ms) is how long the ultrasonics will be run for at every frequency step, this is in milliseconds. The ultrasonics will be off for the same amount of time. So above, on for 100ms and off for 100ms before moving to the next frequency.
- Offset (Hz) allows you to apply a positive of negative offset to fine-tune the ultrasonics further. For example, in certain scenarios the absolute peak cleaning performance may be slightly before or after where the auto tune will naturally pick, this offset allows you to achieve that performance.

3 - Functionality

This section allows you to perform some functionality test. The tabs at the top allow you to choose between a few different hardware options.

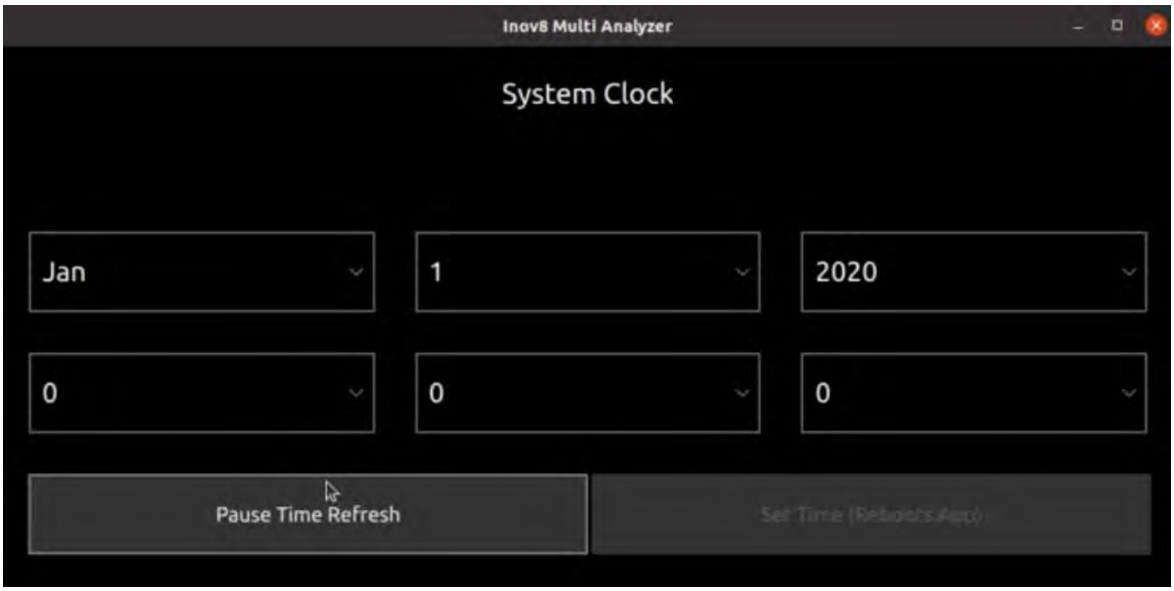
On / Off

This panel allows you to test the light source and relays, by simply turning them on or off and checking that they toggle as expected.

4-20 mA

If the unit is equipped with 4-20 mA module, the panel above can be used to test the output over the full range. Note - The analyser 4-20mA output is passive, therefore it requires a drive voltage of 24vDc to operate wired via 4-20mA channel B on the analyser terminal board.

Serial Port



Serial port shows if the connection with the unit embedded module works correctly. You should see output like what is shown above, if you see ERR or a response time drastically higher than 15ms then please get in touch with the Inov8 Service department. This would indicate a communication issue with the microcontroller.

If possible, please completely power down the unit first for around a minute and then check this again.

Sensors (Pressure, Humidity and Temperature)

Some units might be equipped with a temperature, pressure and humidity sensor which is located on the main controller PCB. This can monitor the conditions inside the unit. Current values will be showed in the screen above. ERR indicates that the sensors are either not installed or there is a problem with PHT module.

4 - Clock

The clock is used to set the time for the equipment. Because many units will either never have an internet connection or at least not a constant connection, we have chosen to manually keep track of the time with a real time clock IC. Because of this the time needs to be set manually.

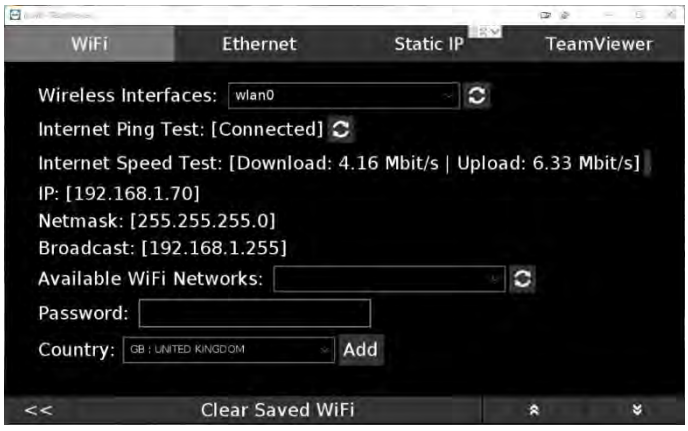
It's important to do this so the data stored in the logs reflects the real time and date. It is advisable to use whatever time it is in the United Kingdom or Coordinated Universal Time (UTC) and in some instances (remote connection) this may be required.

To set the time, first click on the button on the left which says, 'Pause Time Refresh'. Then use the drop-down boxes to set the date and time, which from top to bottom, left to right are:

- Month
- Day
- Year
- Hour
- Minute
- Second

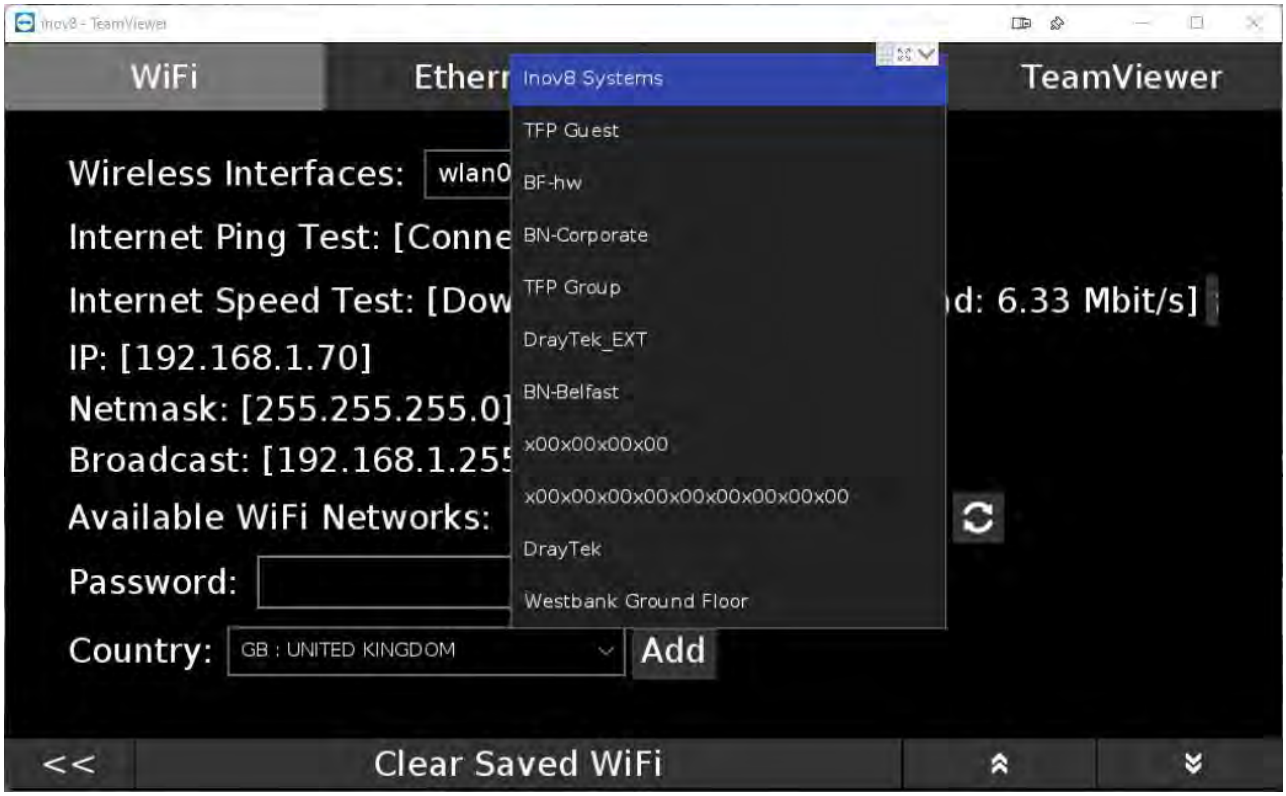
Aim to set the time shortly ahead of where it really is (say 20 seconds) because it will take around that time for you to set all of the dropdowns. When all are set, wait for the real time to catch up to the time you have set and then click the right-hand button 'Set Time'. The app will close and automatically re-open after around a minute.

5 – Information



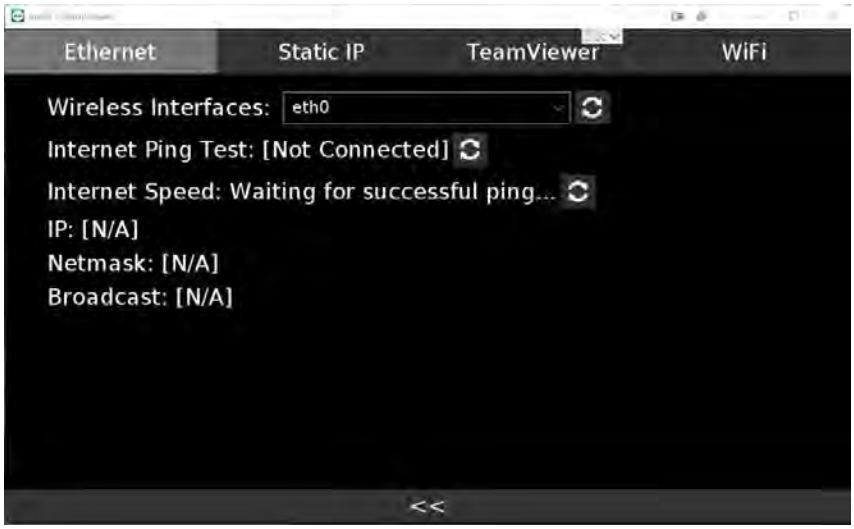
Here there is some useful pieces of information that can often help when a member of our team is trying to remotely diagnose issues or simply check if there is a newer version of software or firmware than what is currently installed.

6 – Networking



Wi-Fi

As shown above, the WiFi tab is initially greyed-out until the refresh button beside the wireless interfaces is pressed. Once an interface is selected, like wlan0 above, an internet ping test is run, if there is an internet connection then a speed test is automatically started.

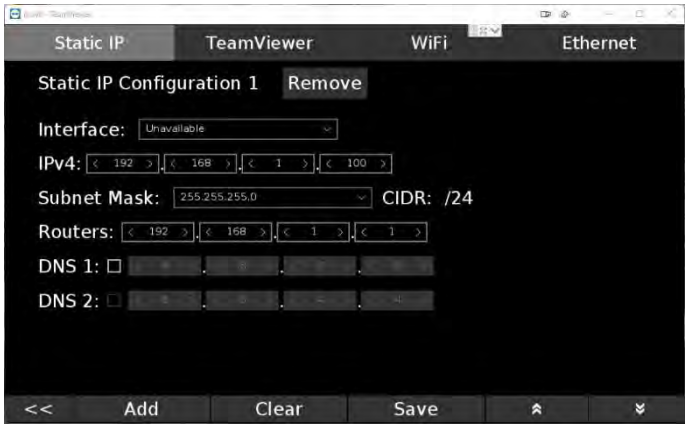


The IP Address, subnet mask and broadcast address are fetched and displayed.

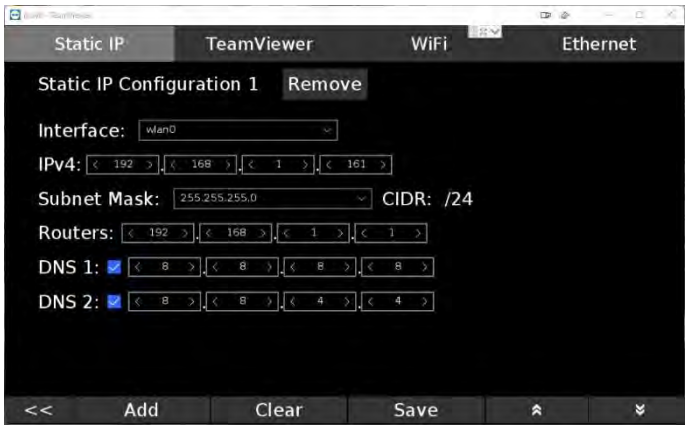
Furthermore, you can search for WiFi networks, after a few seconds the list will be generated, and they can select their network from a drop-down list. After entering the password and selecting the country, you can click add and the analyzer will connect to that network.

This can be confirmed by waiting for a minute, then refreshing the ping test which should now be successful if it wasn't before. If it does not work you may have entered something wrong, click Clear Saved WiFi and try again.

Ethernet



The ethernet tab is mostly the same as above. As you can see, I do not have an ethernet cable connected to the unit.



The other states would be an ethernet cable connected and providing internet access, in which case you would have an IP address and internet connection. Alternatively, you could have a direct connection between an analyzer and another computer, in which case you would have an IP address but no internet connection.

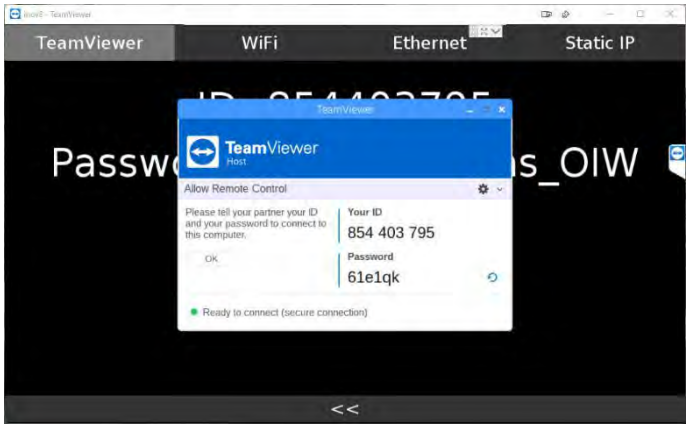
Clear Saved WiFi

The images on the previous page showcase the Static IP setup process. To begin with there will be no saved configs, so the screen will be blank. If you click the add button you will see the options that can be configured. Select an interface from the drop-down menu and set the IP address, subnet mask, routers and DNS servers as required.

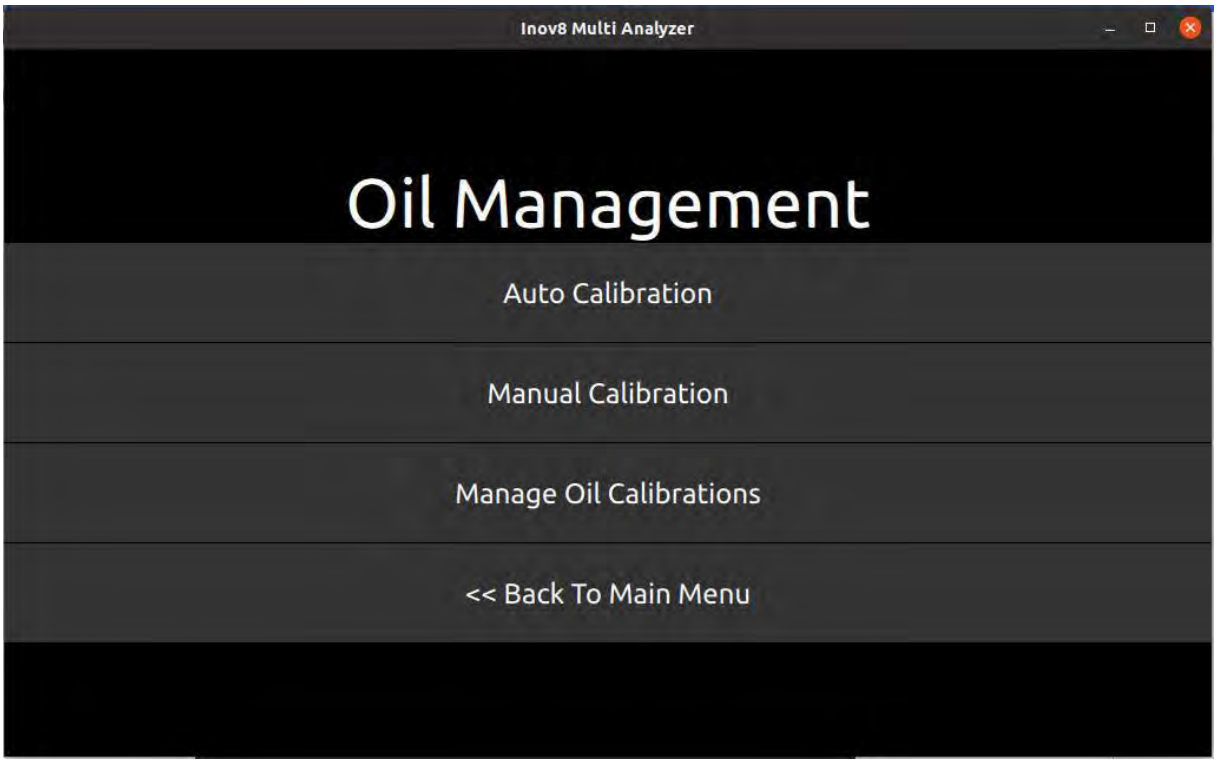
You can add up to two configurations, usually one for WiFi and one for ethernet. When finished, click the save button. You will be warned the unit will reboot, click ok.



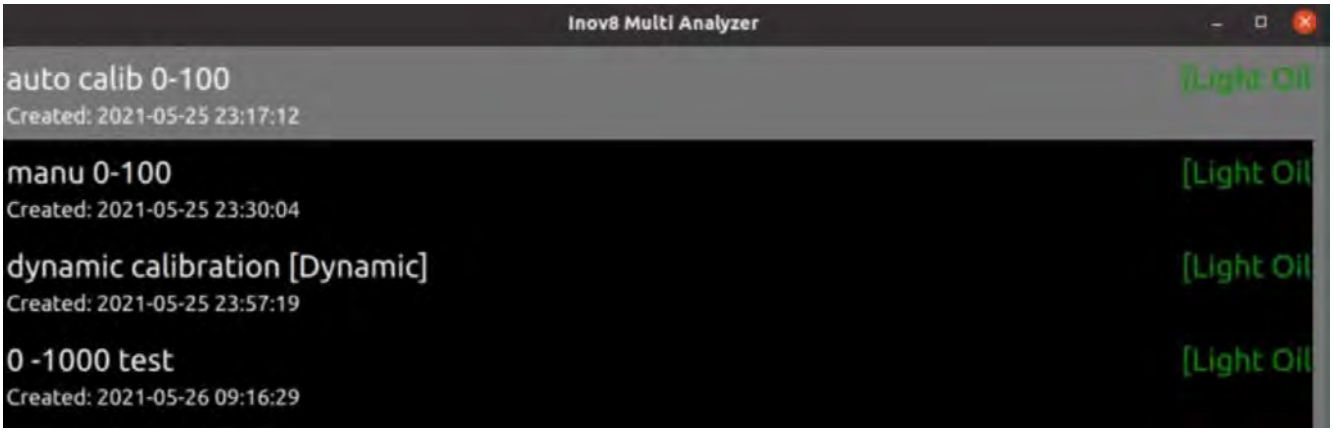
If you have configured the settings correctly, the unit should boot with the set IP address (you can check in the ethernet or WiFi tabs). If it has not been set, the IP address may already be in use by another device on the network. If the IP is correct, but the unit does not have internet connection then some of the settings may not be compatible with the ISP.

Please work with your on-site network engineer or equivalent as they are the only people who will know how this needs to be configured for your network.

TeamViewer



This tab will only be visible if TeamViewer is installed on the unit. It shows the ID and password which should let you connect every time, it does not change.



If you cannot connect over TeamViewer, you can click the ‘Open TeamViewer Status Page’ button which will show the connection status (bottom left), the ID (in-case the app is reading it wrong) and the 6-digit password which can be used instead of Inov8Systems_OIW.

Oil Management

When your first access this page you may not see or have access to the 'Manage Oil Calibrations' button. This will appear once oil files have been created. Below is how the window will appear with 4 created oil files:

PPM Setup: Sample Preparation

Before covering the PPM set up menus, the below instructions explain how to physically create an oil file for calibration.

Procedure:

1. Standards are prepared from an oil sample with the addition of surfactant (or active agent) to increase the oil dispersion in the water. Decon 90 or Loctite 7840 are acceptable.

2. This procedure is the standard for 100ppm and is prepared according to the table below. Additional standards are prepared by stepwise dilution with the initial standard being a water blank, or 0ppm.

	100ppm
Volume of Oil	20 µl
Volume of Surfactant	20 µl
Total Volume in Water	200 ml

3. The first standard is prepared by measuring 200ml of clean water in the graduated cylinder and add to the 500ml graduated glass bottle.

4. Using the pipette, with a fresh tip, add the required amount of surfactant (20 µl) to the water.

5. Next, using the pipette with the same tip, add the required amount of oil (20 µl) to the water and surfactant mixture.

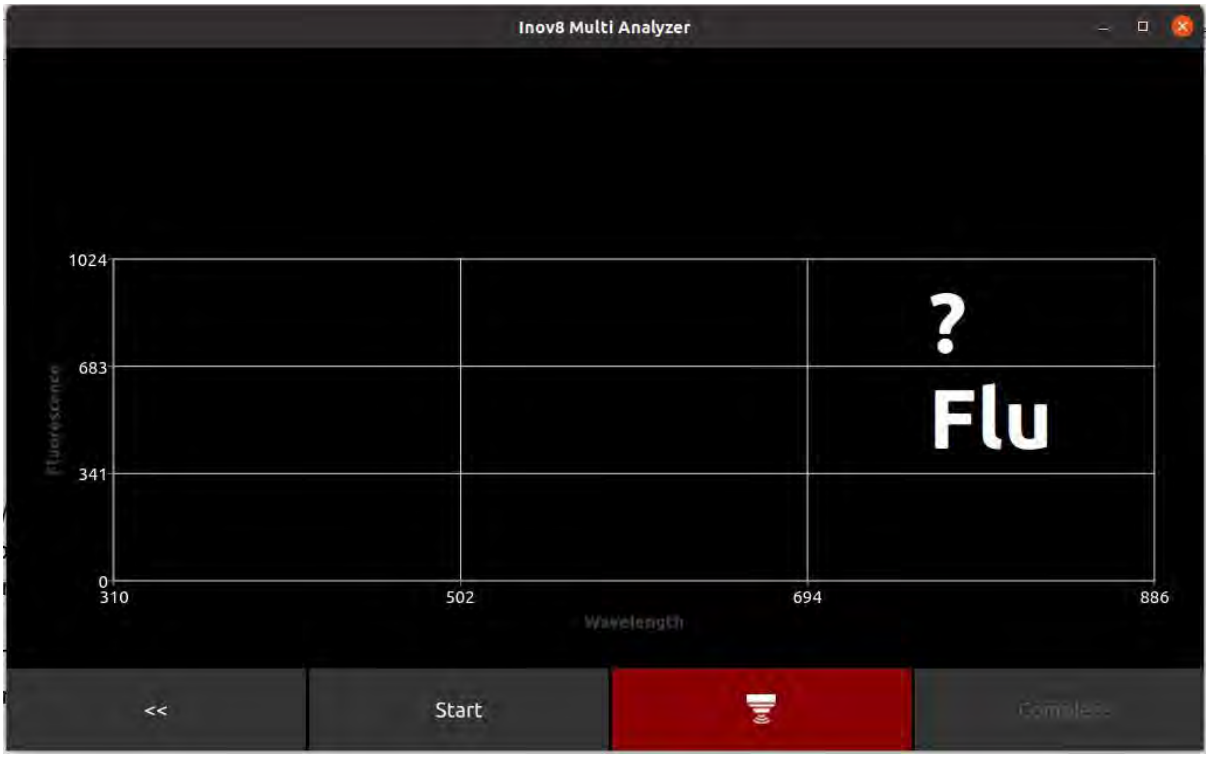
6. Rinse the pipette in the water to clean the tip of any residue.

7. Cap the graduated glass bottle and shake it vigorously to mix for 2 minutes. Ensure that the oil and surfactant are well mixed.

8. Allow the sample to settle for 2 minutes.

9. Ensure the analyser beaker is thoroughly cleaned before adding the mixture. Cleaning can be done by rinsing with water and wiping with a lint free cloth.

10. Add the mixture to the calibration beaker and place inside the calibration chamber.

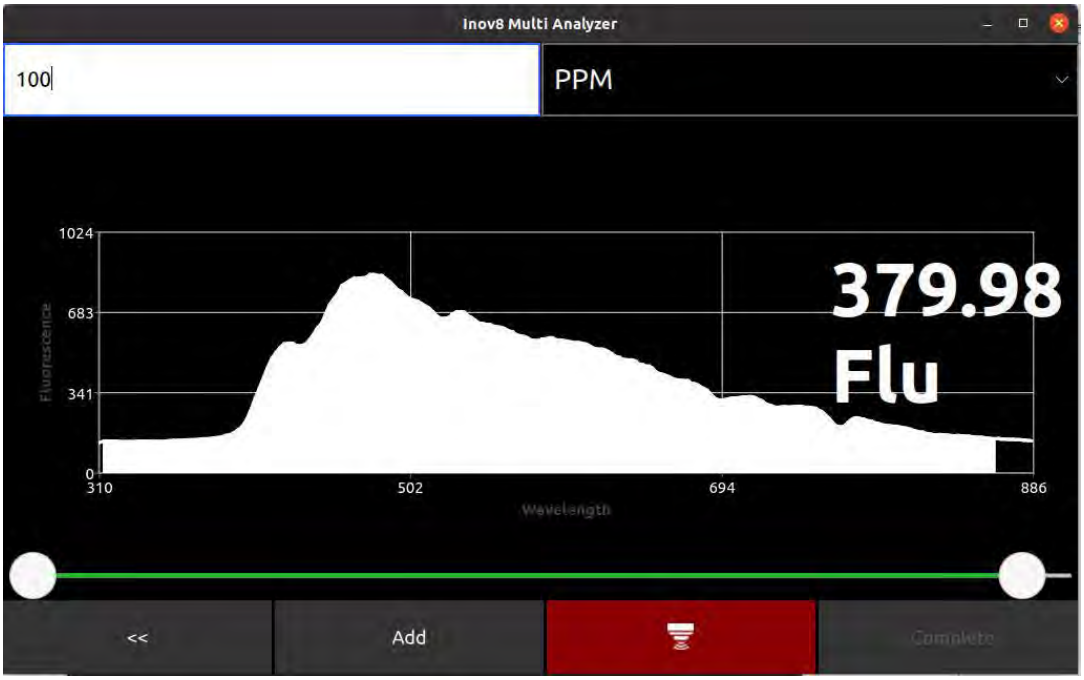


11. Onscreen, users will see the PPM reading.

12. Record your results.

13. Before commencing with the first cut of the sample, ensure the calibration beaker is cleaned. To ensure the best accuracy, thoroughly clean the calibration beaker before subsequent sample cuts.

14. To cut down the sample, the sample volume remains constant at 200ml throughout, and each half-cut dilution is achieved by removing 100ml of the sample and adding 100ml of water to dilute 50% and maintaining the 200ml overall volume.

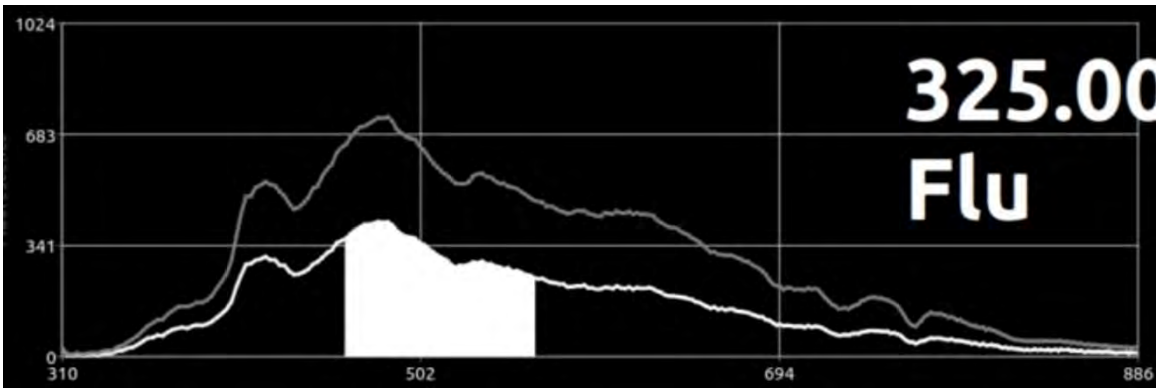


Auto Calibration

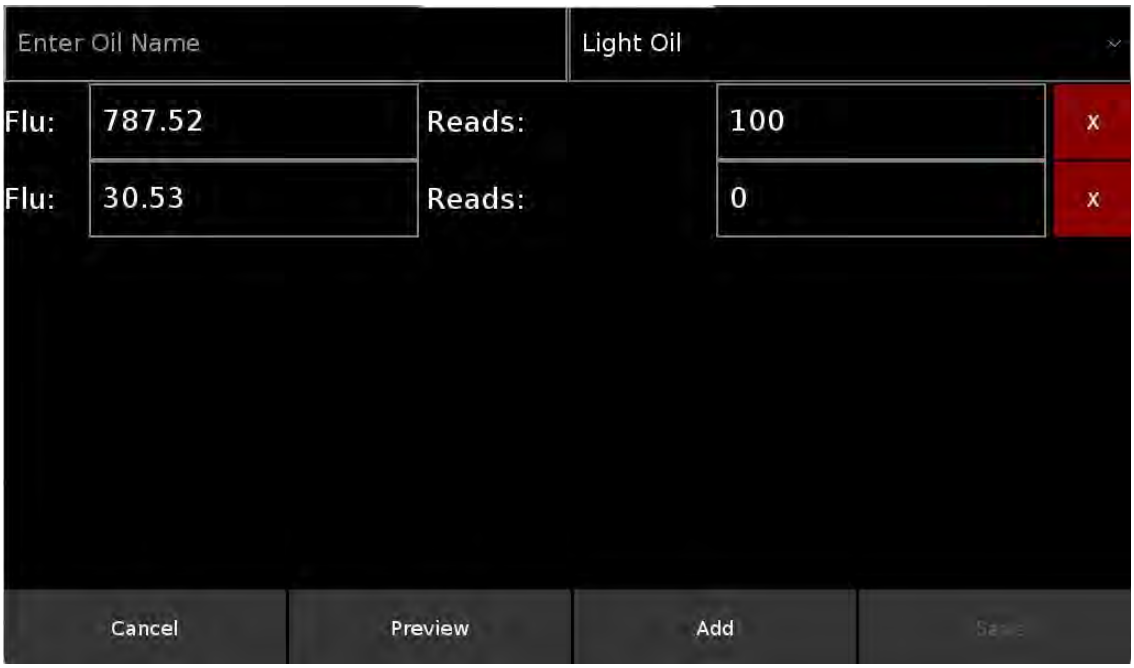
When 'Auto Calibration' is first selected, the user should prepare the sample with the maximum calibration value that will be used for measurement. E.g., for a 0-100 PPM curve, please make up a 100 PPM sample and use this to start, **not clean water for 0.**

The red cleaning button can be used to clean the measurement window, use this when measuring new samples / cut-downs.

When the sample is ready and placed in the calibration chamber, hit the 'Start button'. The unit will find best setting for calibration, which will be later applied during normal measurement cycle.



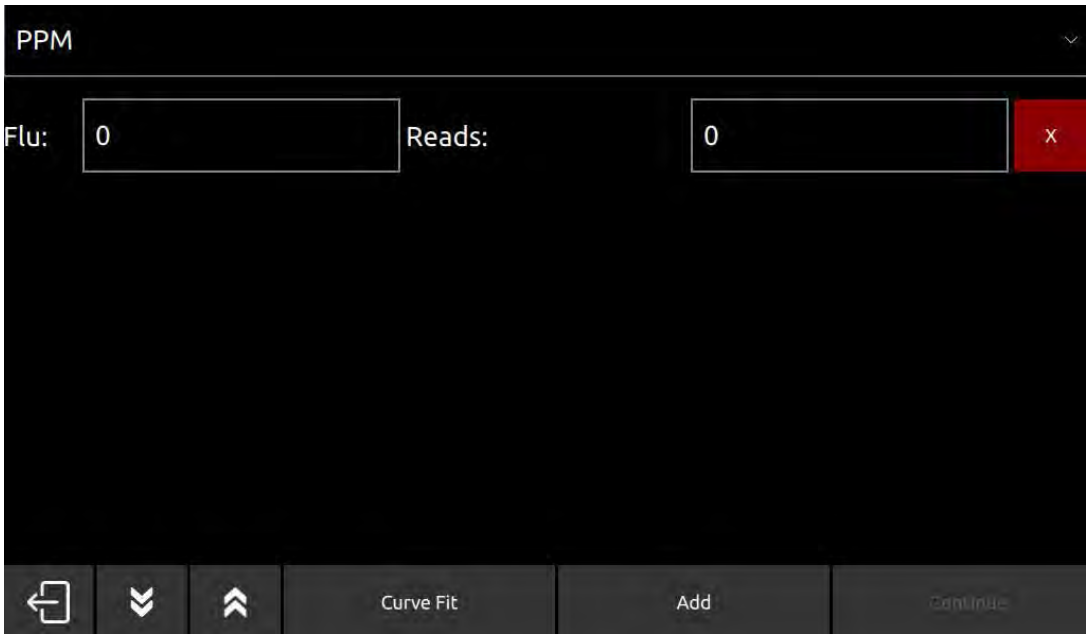
Enter a PPM reading into the correct window (top-left) as shown in the image above. The user can also toggle between PPM and PPB for the measurement units. When the sample measurement first appears on the screen, the wavelength range will be at its maximum. The user can adjust the scroll bar to narrow, widen or move the wavelength mask as required.



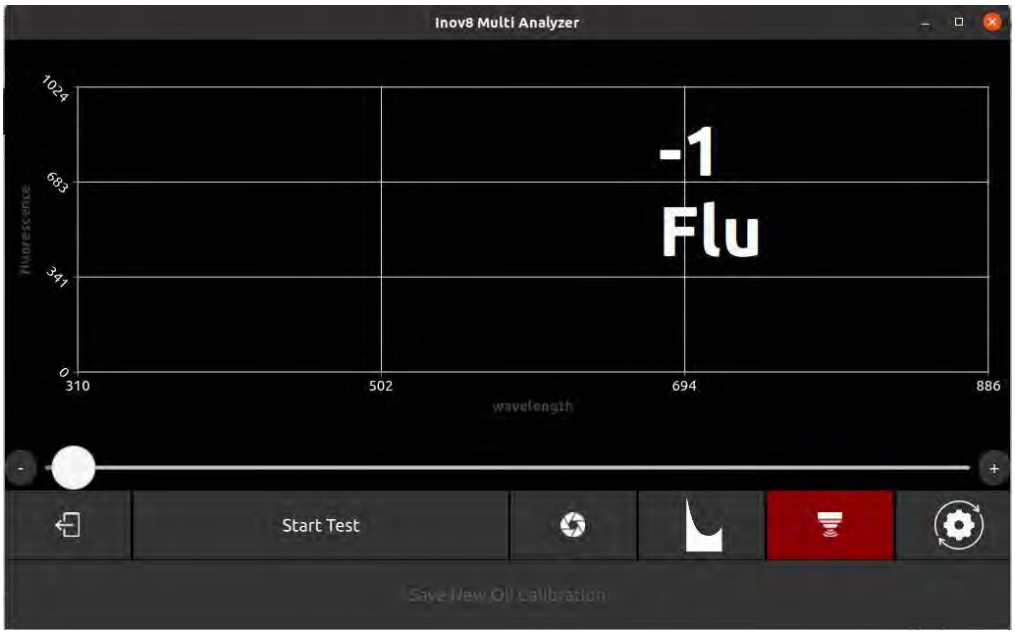
If you do change the wavelength mask, a prompt will appear saying that the integration time must be optimised for the new mask, if you meant to change the mask hit 'OK', if not hit 'Cancel'.

Once you are happy with the current measurement click the 'Add' button, there will be a confirmation prompt. Once added, the top-left value will change to half of the previous PPM to suggest a cut-down. You can manually change this value if needed. Proceed with as many cut-downs as required for your file and finish with a clean / de-ionised water sample for 0 ppm.

A measurement mask will appear for each new datapoint, the grey spectra shown above is the previous datapoint. For cut-downs the new spectra (white) should be lower than the previous spectra (grey). There will be a warning if you try to add a datapoint which is higher than the previous.



Once there are more than two datapoints the ‘Complete’ button will become enabled. After pressing this and confirming, you will be taken to the summary screen shown below.



At this point if you change your mind or realise that something was wrong in your calibration setup and need to repeat the whole process, just press ‘Cancel’. You can edit the datapoints with you want, say if you made a typo in the previous screen etc or even add a datapoint, though this would usually be a niche case because it hasn’t been ‘measured’. When ready, enter a name for the oil file in the top-left corner and the ‘Save’ button will become enabled.

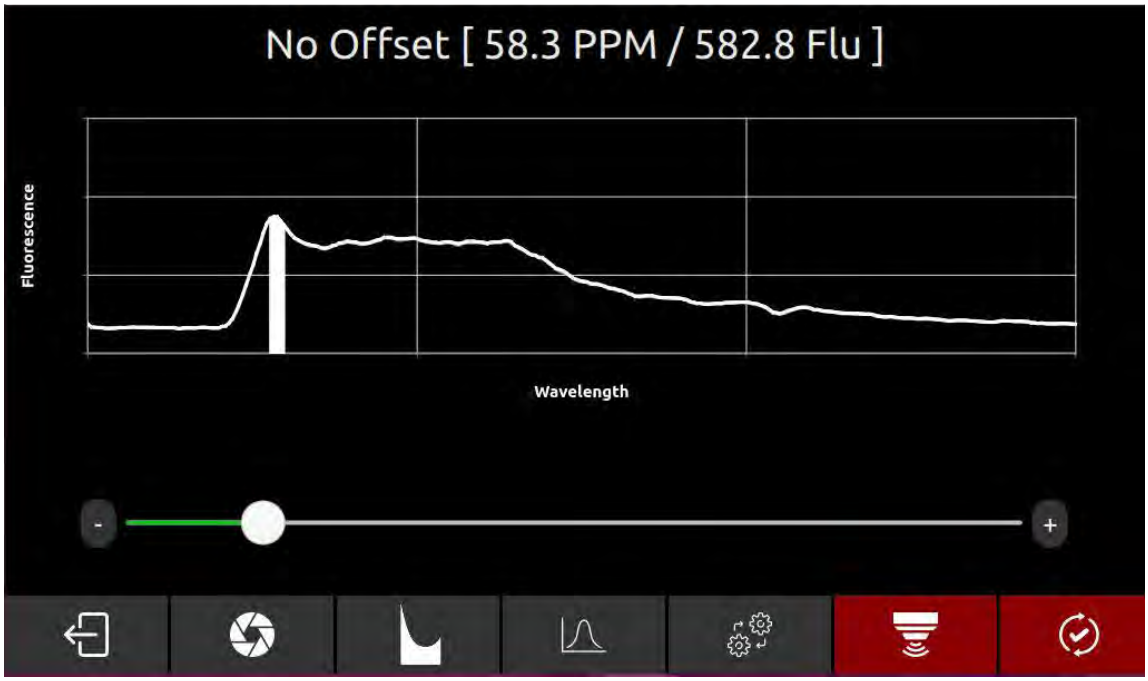
The preview button will show an example of the calibration curve Generated datapoints can be interpolated with 2 different methods: Straight Lines Fit and Best Polynomial Fit. Use Straight Lines Fit when collected datapoints are not matched properly with Polynomial Fit method.

Manual Calibration

Datapoints can be added manually when clicking the ‘Add’ button at the bottom of the screen. The ‘Curve Fit’ button operates the same as covered in the ‘Auto Calibration’ section. Once the datapoints are set, click the ‘continue’ button in the bottom-right to move to the spectra screen.

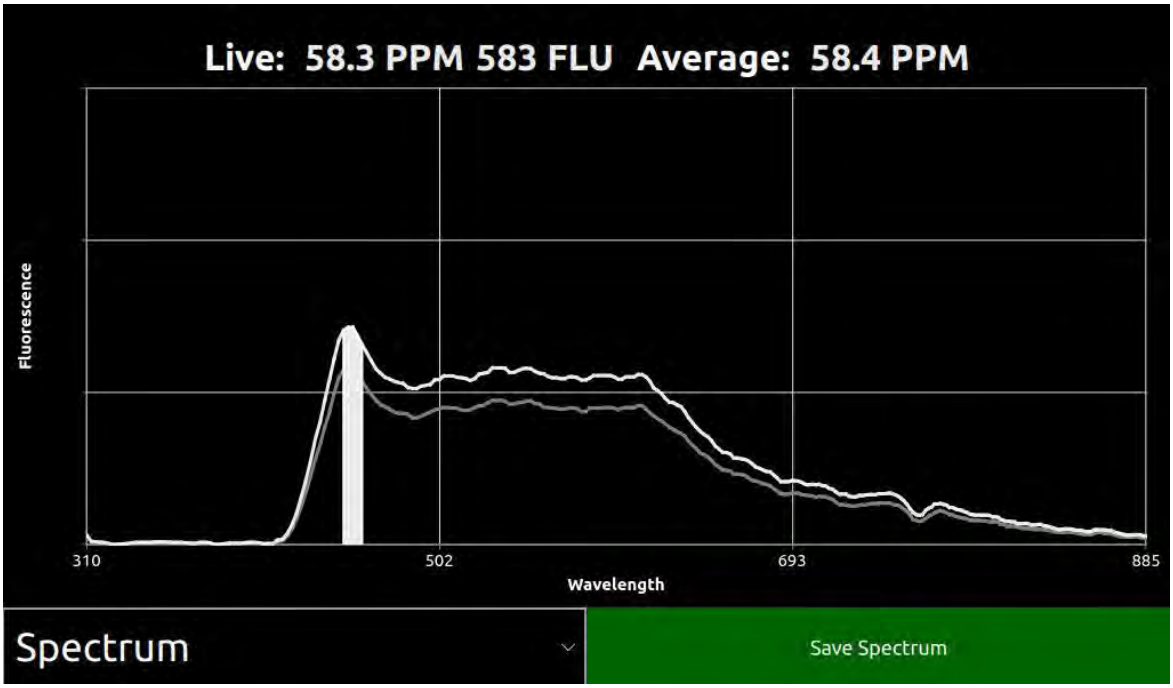
Put a reference sample in the measurement chamber and hit Start Test. The integration time, fluorescence offset, lower and upper wavelengths are to be set by the user manually. Click on each of the icons and set them as desired, see this section for more details.

Click the ‘Save New Oil Calibration’ button when ready and enter a name for the oil file in the popup that appears.



Spectra Offset

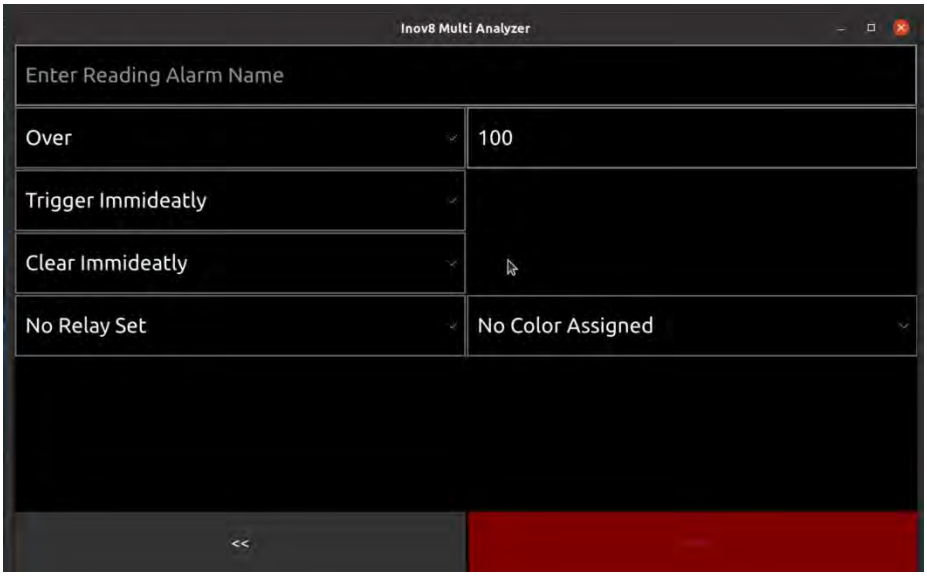
This feature can help to overcome any third-party fluorescence in or around the sample chamber, for example, a fluorescent tracer / dye or organics.



With this ‘vertical shift’ feature, the user can move the zero point of calibration as seen in the images below. There is a visual setting which brings the spectra to the bottom of the screen, while the cycle is running.

In the below screenshot, the image shows the spectra in edit oil for a file with 0 offset. Here the spectra is not at the bottom of the screen. The reading is 58.3ppm.

The image below shows the spectra during the cycle from the same file. You can see that it has been ‘floored’ to the bottom, but is still reading 58.3ppm as this is only a cosmetic operation.



Alarms

Reading Alarms

Once the user clicks on the ‘Alarms’ button on the main menu, they are brought to the ‘Reading Alarms’ screen. The two options here are to create a reading alarm and to manage any alarms that are already created.

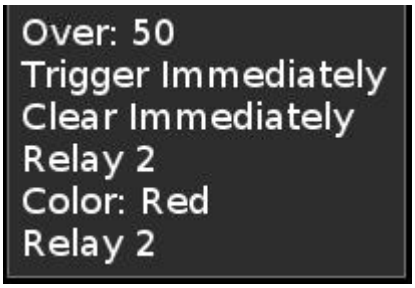
Create Reading Alarms

In the top-left in the above image, where it says 'Over', the user can change this to 'under'. To the right of the text, is the reading value in either PPM or PPM depending on what oil file is active with this alarm, which is configured in the measurement cycle.

If 'over' is selected with 100, then an alarm will trigger if the reading value is over 100 (PPM/PPB). You can configure the alarm to trigger immediately or to be delayed for several readings. If 'Delayed Trigger (readings)' is selected, there is an option to input a number. This means the alarm will only trigger if X consecutive readings are above 100 (or whatever is set).

You can configure the alarm clearing in the same way, either immediate or delayed.

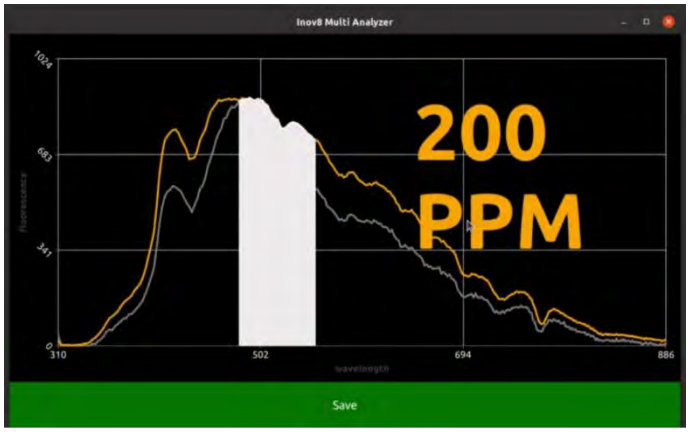
Depending on how the system alarms (to be explained later) are configured you may have both relays (1 & 2) available to select for each alarm, one of the relays or none. You can also choose to set a colour on the alarm as a visual representation for anyone looking at the screen. It's possible set a visual alarm that is not tied to any relay.



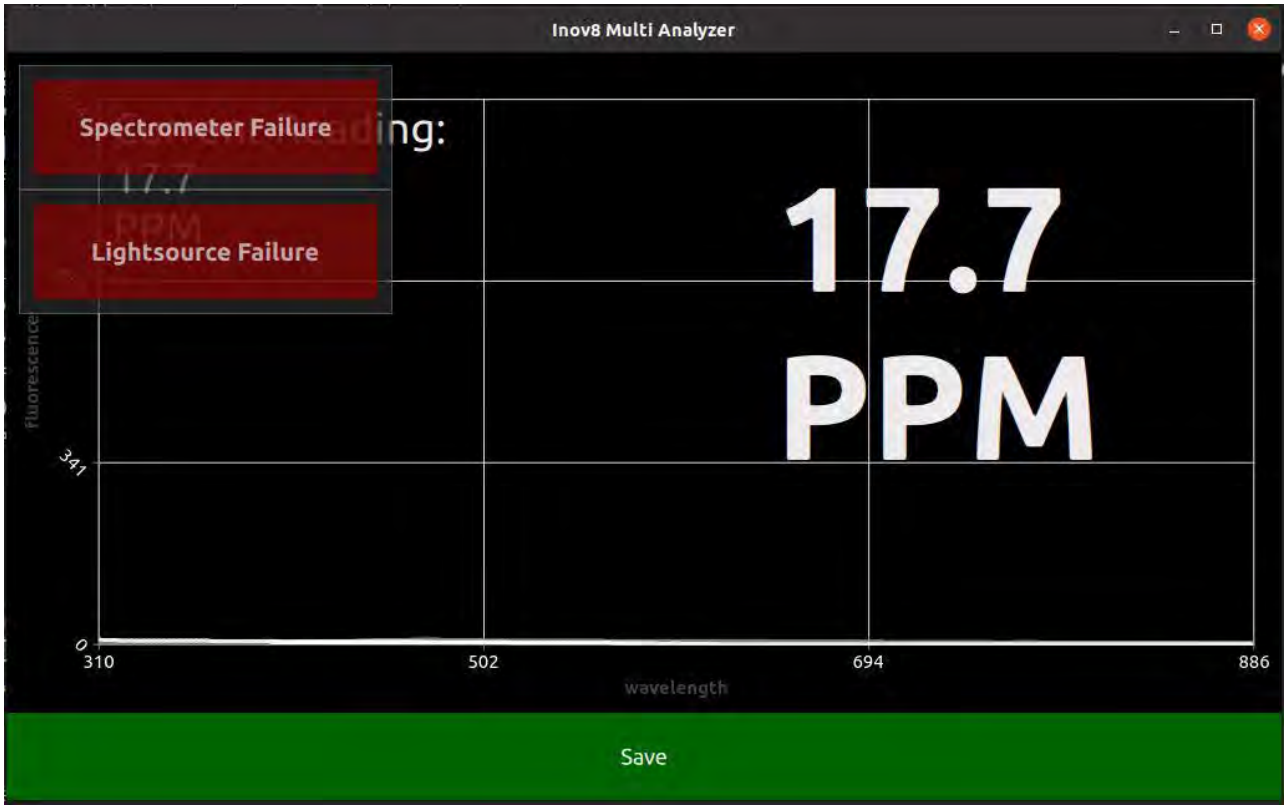
Once you are happy with all the settings, enter a name in the text field along the top of the screen and then click the red ‘Save’ button in the bottom-right.

Manage Reading Alarms

All created alarms are stored here. The date and time of their creation is saved underneath the alarm name. You can view the alarm information by selecting the alarm, which should become highlighted, then by clicking on the ‘i’ information button, as shown below:



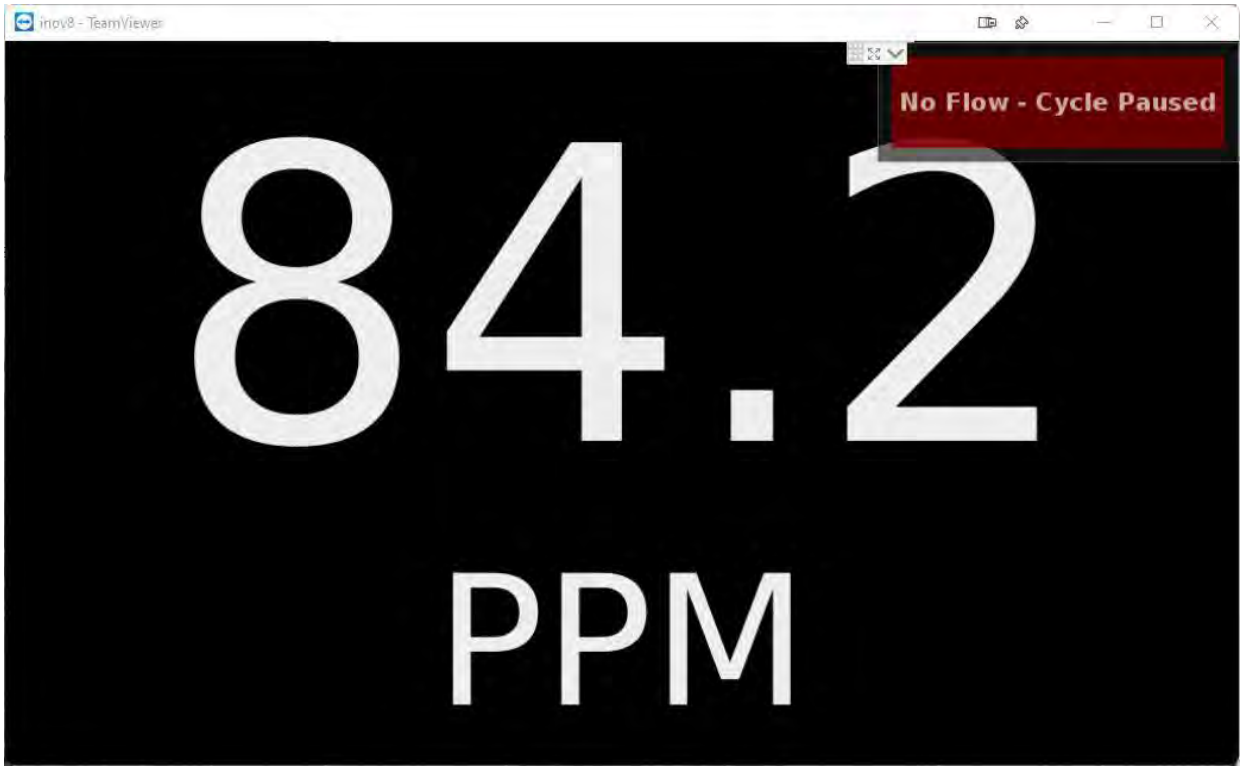
An alarm can be removed by clicking the red ‘Remove’ button, although it should be noted that an alarm cannot be removed if it is in use. A text box will appear to remind the user that the alarm is



in use. Having the alarm selected by a measurement cycle would mark it as ‘in-use’, so if you remove that measurement cycle you will then be able to remove the alarm.

In a later section there is more info on how to link the alarms to a measurement cycle. The below images show how the alarms look on the cycle screens if you selected to tie it to a colour.

System Alarms



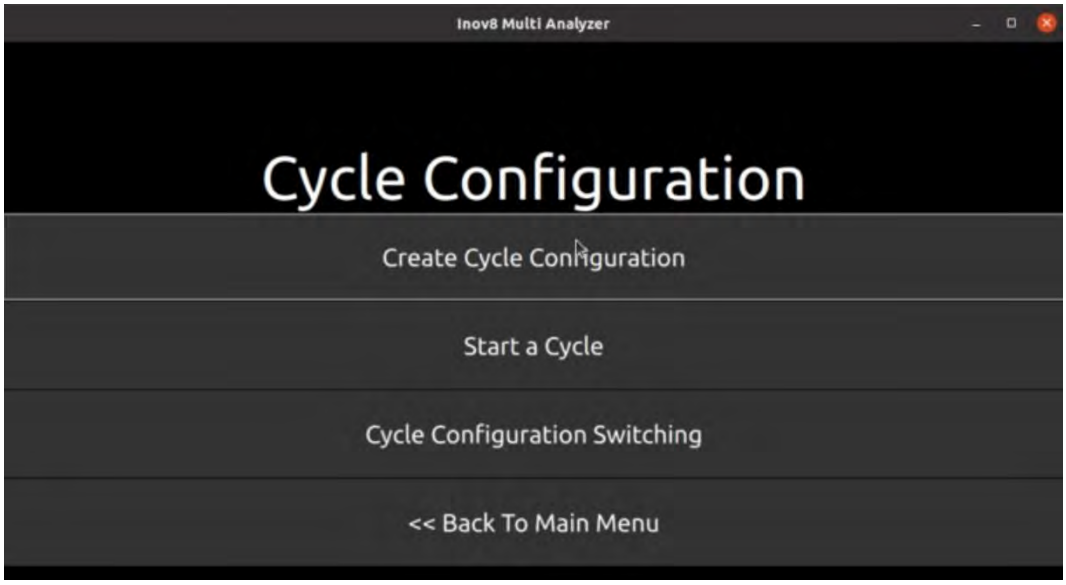
If enabled (let Inov8 know if you want this) the spectrometer and light source operational state is monitored whilst the system is measuring, either during a cycle or in spectra diagnostics. Should either of them be detected in a failure state, an alarm can be raised, both visually on the screen and it can be tied to a relay output.

Power Failure Relay

A power failure system alarm can be enabled, as well as a relay specified for it. This relay will be in an alarmed state (de-energized, same as when there is no power to the unit at all) by default, when the system starts it will remain that way until a cycle starts (should be set to auto-start) then it will be energized so the alarm clears.

If the cycle is stopped for any reason the relay will be alarmed again (de-energized).

Flow Switch



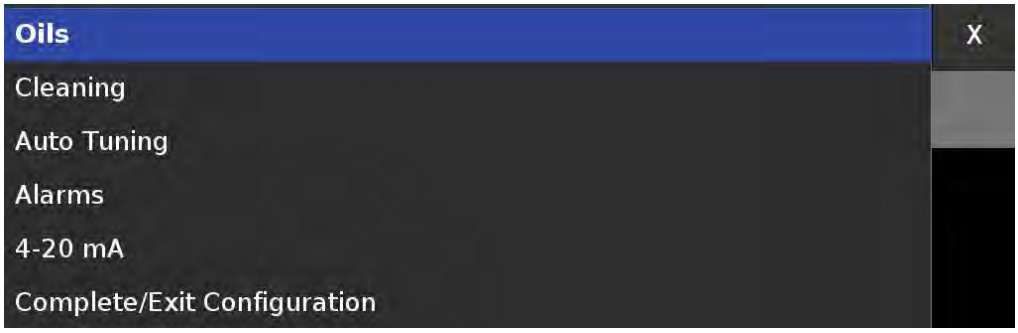
An external flow switch can be used in conjunction with our analyzers. The flow switch needs to have a 5V output which can be connected to the 'Flow' input on the terminal board. Please mention this when ordering your unit to ensure the PCBs and Software are set up to enable this.

When in a 'no flow' state, the cycle pauses, the screen displays a message and the 4-20mA goes to the alarm value set in the config, 23mA by default.

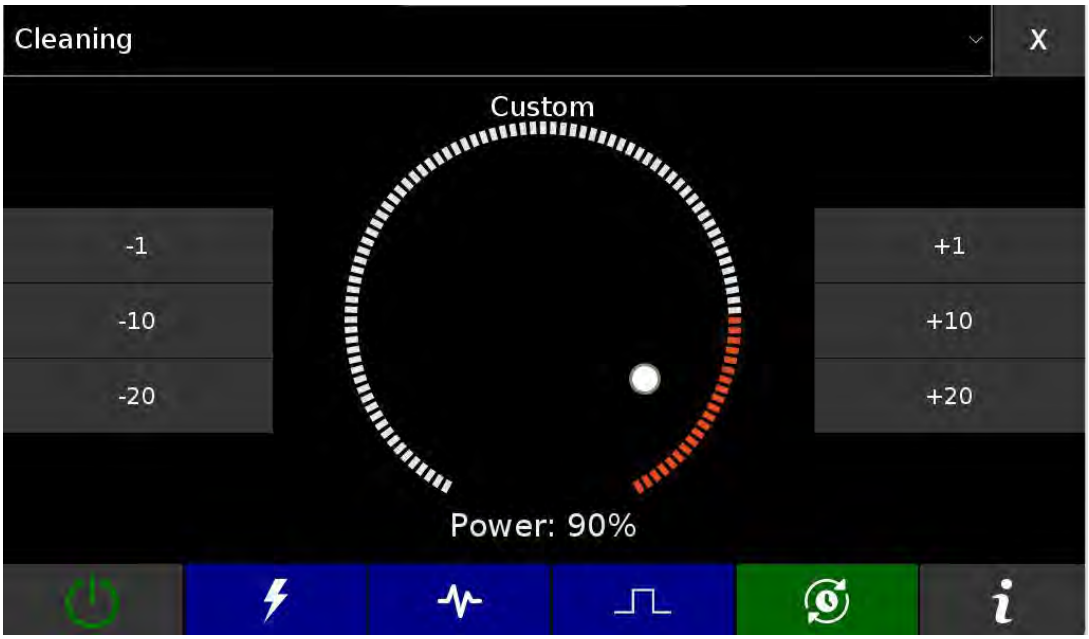
Cycle Configuration

Create Cycle Configuration

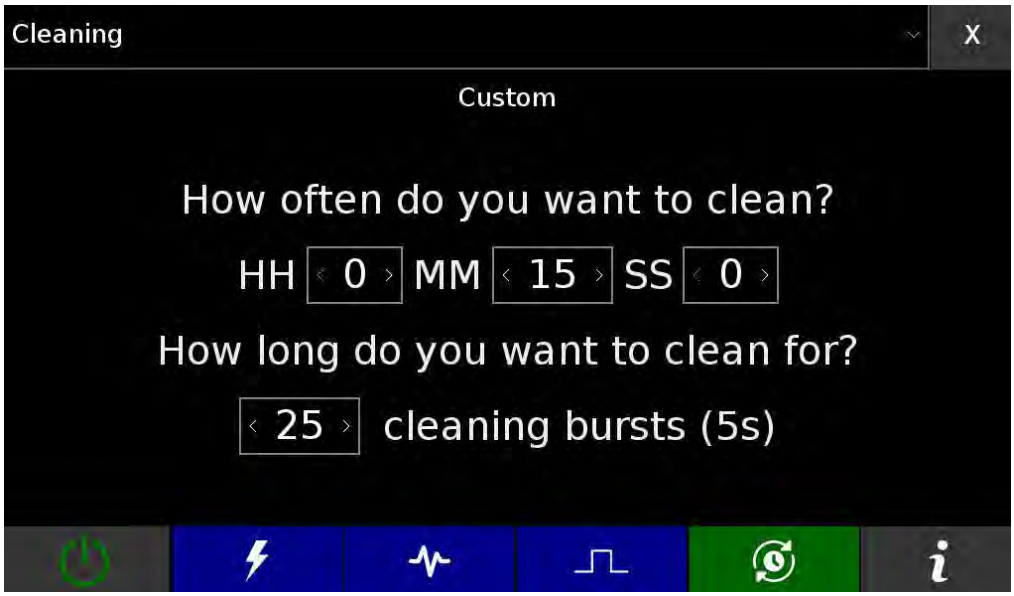
If the analyser has not previously had a cycle configuration, the user will only see the ‘Create Cycle Configuration’ and the ‘Back To Main Menu’ from the window below. The other options will be greyed out.



Oils

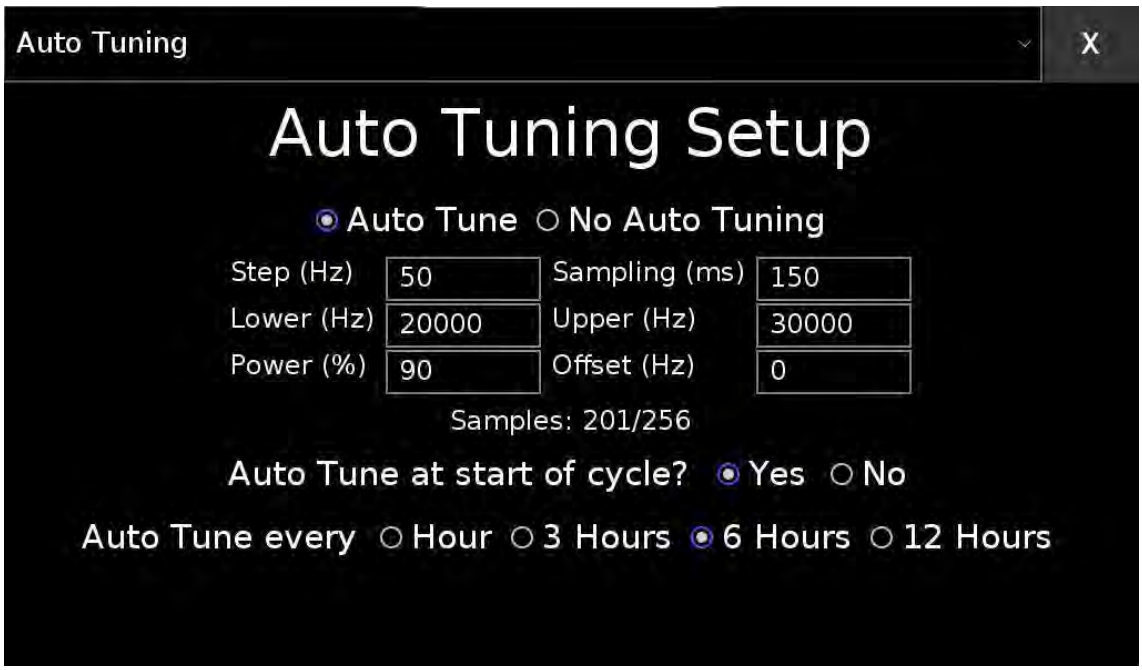


When you click ‘Create Cycle Configuration’ you will see the screen below. Any oil files that have been created, through either auto or manual calibration, will appear in the list. Simply click on the one you wish to measure with and it will be highlighted, as shown above (grey rectangle).



You may not notice it at first, but along the top of this screen, where it says ‘Oils’ (to the left of the ‘X’) is a drop-down menu. Click on it to reveal the other options.

Cleaning



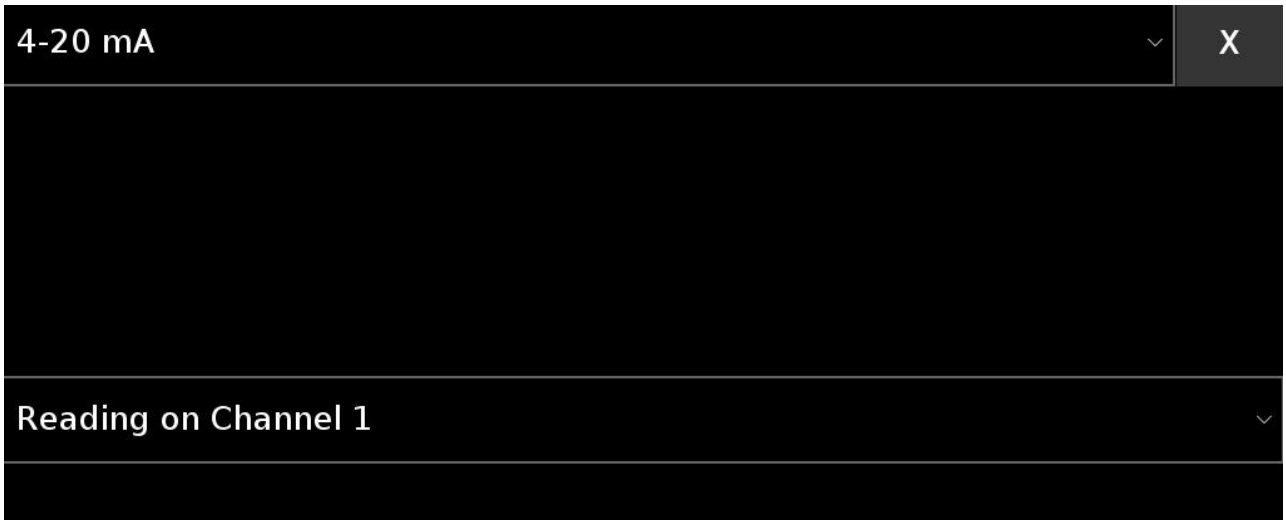
The buttons / icons along the bottom perform the same functions as they do in the diagnostics page, so please read this section for more information. The only new one in green on the right, is to set the cleaning routine.

Use the interactive boxes to set how often you want the ultrasonic cleaning to occur in hours (HH), minutes (MM) and seconds (SS). Then select how many cleaning bursts you want to be run, in effect how long you want to clean for. The cleaning time these bursts equate to is shown in brackets, in the image above, the 25 bursts would last for 5 seconds.

So, the routine above was to clean for 5 seconds every 15 minutes.

Auto Tuning

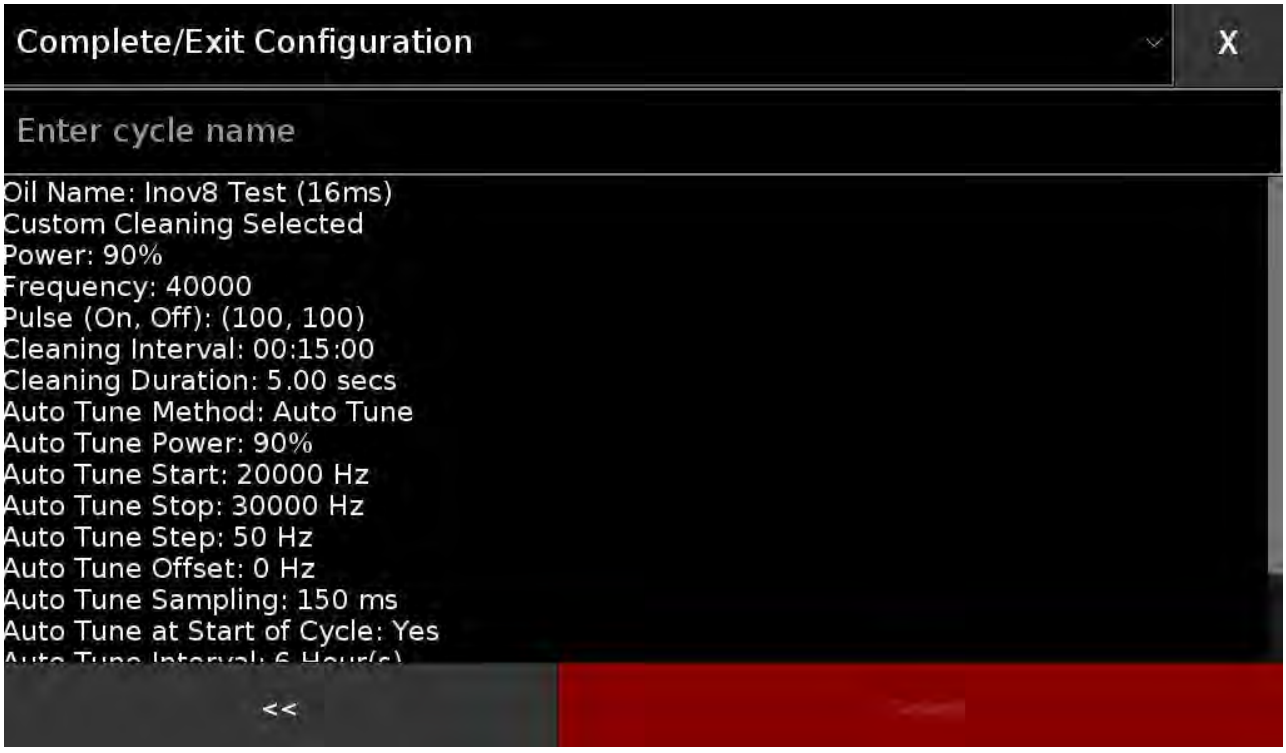
This page allows you to define the auto tune settings for the cycle. You can completely disable auto tuning for this cycle by selecting the 'No Auto Tuning' option for the top radio-button.



If enabled, you can customise the auto tune parameters in the six text boxes, see here for details. Finally, you can choose whether to auto tune at the very start of the cycle and then how long to wait after that before you perform another.

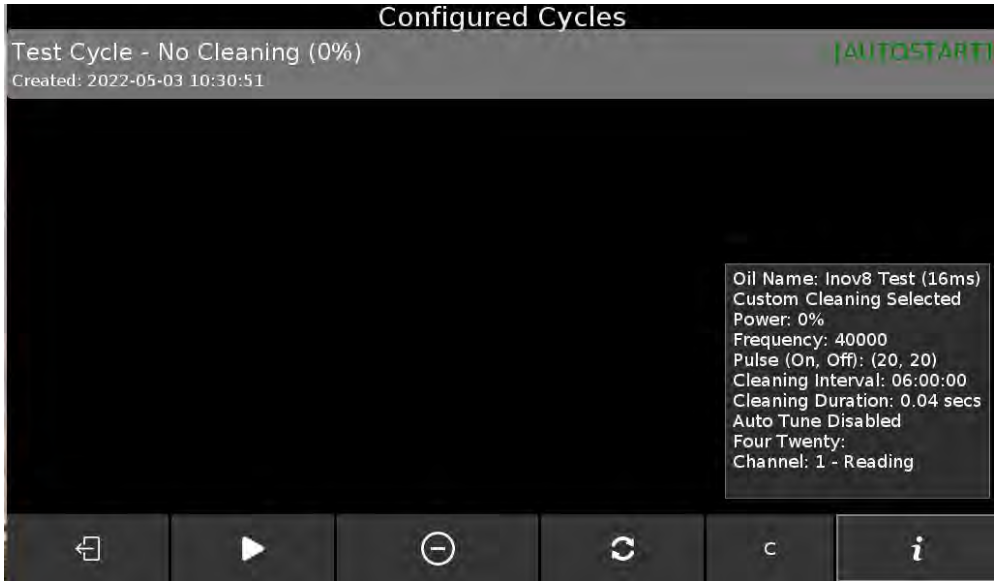
Alarms

If any reading alarms have been configured, you will see this option in the drop-down. You can select any one alarm from the list by clicking on the circle to the left of its name.



4-20mA

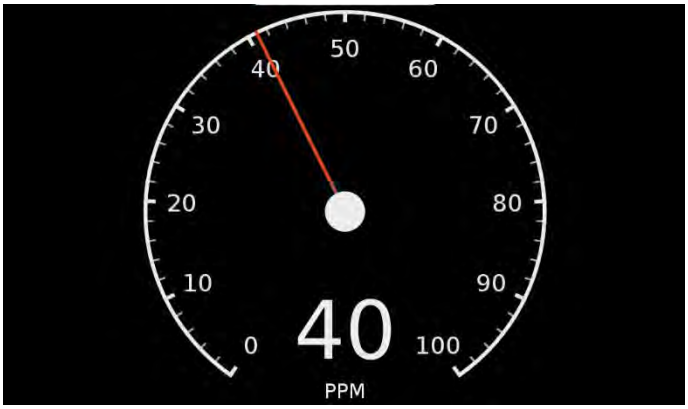
This screen allows you to choose whether to enable the 4-20mA output based on the measurement reading during the cycle (live update) or not.



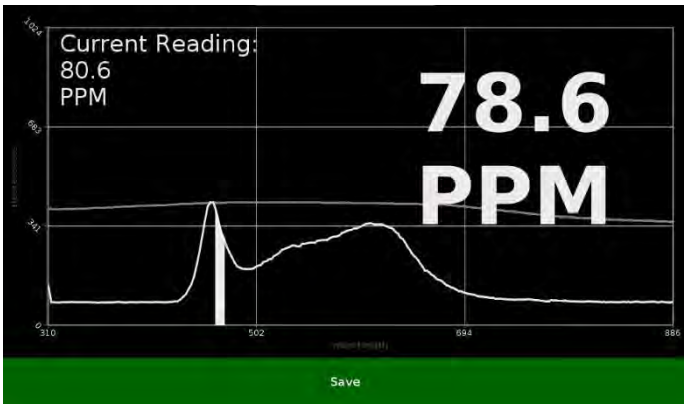
Summary

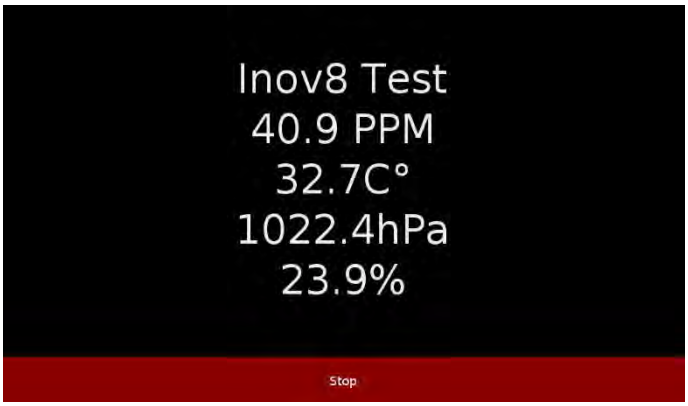
The summary screen lists all the options that you have selected so you can double-check them. Once ready to save, enter a name for the cycle configuration and click ‘Save’. If you wish to cancel either press the ‘X’ in the top right corner on any of the screens or the ‘<<’ in the bottom-left on the summary screen.

Starting a cycle



When you click the ‘Start a Cycle’ button it will bring you to a menu of all the configured cycles currently stored on the system. You can select any of them and start it with the play button.

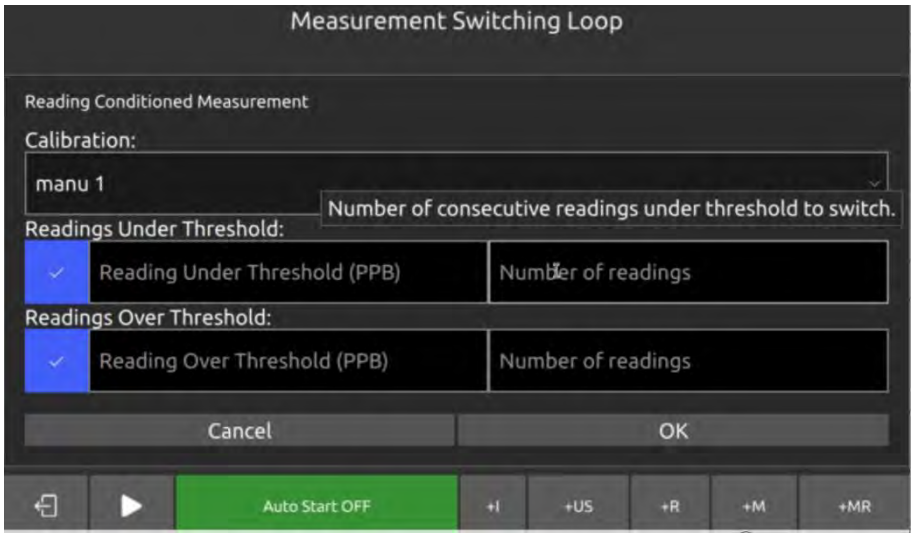




Button	Name	Function
	Back to the previous menu	This button takes you back to the cycle configuration screen.
	Start Measurement	This button will start the highlighted cycle
	Delete Measurement configuration	This button can be used to delete a highlighted cycle.
	Auto start cycle on system boot	Set the current cycle to auto-start as soon as the software boots. Green text [AUTOSTART} appears next to the selected cycle for clarity.
C	Clone ‘Test cycle’	This button allows the user to clone an already created cycle. Doing this allows the user to adjust the cycle but while saving it as a new cycle.
	Info	Provides a pop-up summary of the selected cycle.

When a cycle is started the PPM display screen will automatically appear giving a live value. If the user clicks on the screen it will move to the next one and so on. The available cycle screen are shown below: (PPM, PPM Gauge, Spectra, Info & Stop Cycle)

Cycle Configuration Switching



The user can choose to switch between created oil files in this window. For example, if a 0-100ppm file is being used, but the oil content jumps a little, this feature allows the user to switch to another file, maybe 0-500ppm.

This allows the unit to measure with accuracy at both ends of the oil content. The 0-100ppm file gives greater accuracy at the low end than possible with the 0-500ppm file.

NOTE: This feature is disabled by default, if you think you need it, please contact the service department.

Button	Name	Function
+I	Idle	Add idle state button.
+US	Ultrasonic Cleaning	Add ultrasonic cleaning button.
+R	Relay	Add relay action button.
+M	Measurement Cycle	Add measurement cycle button.
+MR	Cleaning frequency	This button is to add a reading-based measurement step. As shown below the table:

The user can select the calibration from a list of pre-made files. Then the user can untick, either the option for 'Readings Under Threshold' or 'Readings Over Threshold'. An example is to leave 'Readings Over Threshold' ticked and input the reading. If 100 is chosen, the user then selects the number of readings. If 3 is selected, then if the analyser reads over 100ppm over 3 samples, the switch to another cycle will take place.

If the user wants to have the file switching as a default when the analyser is turned on or rebooted, the user must select the 'Auto Start Off' as shown above, until it turns red and will then show 'Auto Start On'.

END

Installation Guide

EXP-1 & EXP-2 Installation Guide

The above equipment is designed and manufactured by ***Inov8 Systems Ltd*** which is located at Unit 6, Edgewater Road Office Park, Belfast, BT3 9JQ. Phone number +44 (0) 28 9069 8297

In compliance with the WEEE Directive 2012/19/EU, this symbol indicates that this product must not be disposed of with your other waste.. Instead, it is your responsibility to dispose of your waste equipment by arranging to return it to a designated collection point for recycling your waste electrical and electronic equipment. Alternatively, you can send the electrical and electronic equipment back to Inov8 Systems, by contacting sales@inov8s.com. By separating and recycling your waste equipment at the time of disposal you will help to conserve natural resources and ensure that the equipment is recycled in a manner that protects human health and the environment. E waste can be disposed as per your country's legal requirements.

Caution / Warning Markings:

These labels are placed on the chassis of the EXP. Do not look directly into the light source.

Declaration of conformity :

This product conforms to the following directives;

- 2014/68/EU Pressure Equipment Directive, module A1
- 2014/34/EU ATEX Directive
- 06/108/EC EMC Directive
- 2012/19/EU Waste Electrical and Electronic Equipment

Standard :

FM3600
FM3615
CSA C22.2 number 30
EN60079-0
EN60079-1
EN60079-28
IEC-60079-0
IEC-60079-1
IEC-60079-28

WARRANTY AGREEMENT:

If you experience any defects in materials or find fault in manufacture of the goods that you have received within one year from the date of shipment, Inov8 Systems will repair, or at its option, replace the defective part free of charge. This is providing that the part is returned to the above address, with shipping charges prepaid. At Inov8 Systems discretion, a Technical Service Specialist may repair/replace the defective parts on location.

Instruments sent to Inov8 Systems must be appropriately packed and the following information must be provided prior to return.

- Inov8 Systems will assign a Return Authorization Number to you.
- The name and address of the company returning the items for repair.
- The department within the company returning the items for repair.
- The name, telephone number and extension of the individual in the company responsible for returning items for repair.
- A brief description of the fault.
- Does not apply to damage sustained in transit
- Shall cease to have effect if the goods have been used for purposes other than those for which they are intended or not in accordance with Inov8 Systems instructions.
- Does not cover misuse or mistreatment by the user.
- Does not cover previous repair or alteration by unauthorized repairmen and/ or repair facility.

Inov8 Systems does not assume responsibility for contingent liability through alleged failure or failures of any of its products or their accessories.

CHECK LIST OF MATERIALS:

- Inspect all shipping packages upon receipt and record any visible damage. Count the number of packages, making sure that the number is in agreement with the shipping paperwork. If there are any outward signs of damage, please retain all containers and packages for inspection by carrier. It is generally good practice to retain the packing material and boxes as they make an excellent way to protect the instrument if you move it our ever need to ship the instrument.
- Make sure that all items received match the packing list and that the quantities are correct.
- Verify that the number of packages received agrees with the package list and shipping papers.
- Notify both Inov8 Systems and the carrier within 48hrs of receipt, in the event of any physical damage to the packaging or goods supplied.

1.0 SAFETY REQUIREMENTS:

1.1 Only suitably competent formally trained personnel should install this equipment.

1.2 The enclosure must not be opened in hazardous environments when powered, without using a ‘hot working’ permit.

1.3 Modifications are not permitted to the equipment’s enclosure, as this will invalidate the hazardous area certifications.

1.4 The equipment must not be powered on if any physical damage is evident. In this event the manufacturer must be contacted for advice before proceeding

1.5 The primary earth connection shall be terminated using an earth wire that complies with regional regulations.

1.6 Only Class I Division 1 (or ATEX/IECEx) certified cable glands are to be used for the cable entry terminations.

1.7 The process connection coupling method must be suitably matched to the maximum expected process pressure.

1.8 Refrain from touching any internal part of the analyser for 12 minutes after turning off the power to the unit. The power reservoir takes time to dissipate.

2.0 Probe Mounting:

2.1 The flange will have been positioned on the probe in the factory at a default position or in line with the customer's specification. The taper bush flange design allows this position to be re-adjusted (Allen key required) during the installation, if required. The flange bolts used must match the flange pressure rating.

2.2 The probe should ideally be inserted to approximately ⅓ of the process pipe diameter.

2.3 **WARNING**: - Live insertion or retraction of the probe on process pressures that are >5.0bar should only be performed in conjunction with an appropriate extraction tool arrangement, unless otherwise agreed by Inov8 Systems

3.0 CERTIFICATIONS:

3.1 The system has the following hazardous area certification classifications: –
Class I Division 1 / ATEX / IECEx and must be installed in line with the requirements of these certifications.

4.0 POWER SOURCE:

The system is compatible with 24V dc and 110-230 VAC power input The requirements are as follows:

4.1 +24V dc (±10%) supply capable of delivering peak current up to 6.0 amps max (140W). The nominal power consumption is <20W.

4.2 110-230 VAC (±10%) supply capable of delivering peak current up to <15W nominal (84W peak).

NB: If the analyser is mains supplied, allowed for a minimum of 30 minutes after powering down the equipment, before opening the enclosure.

Cable entry M20 x 1.5mm [¾" NPT if specified at time of ordering] See Fig 1

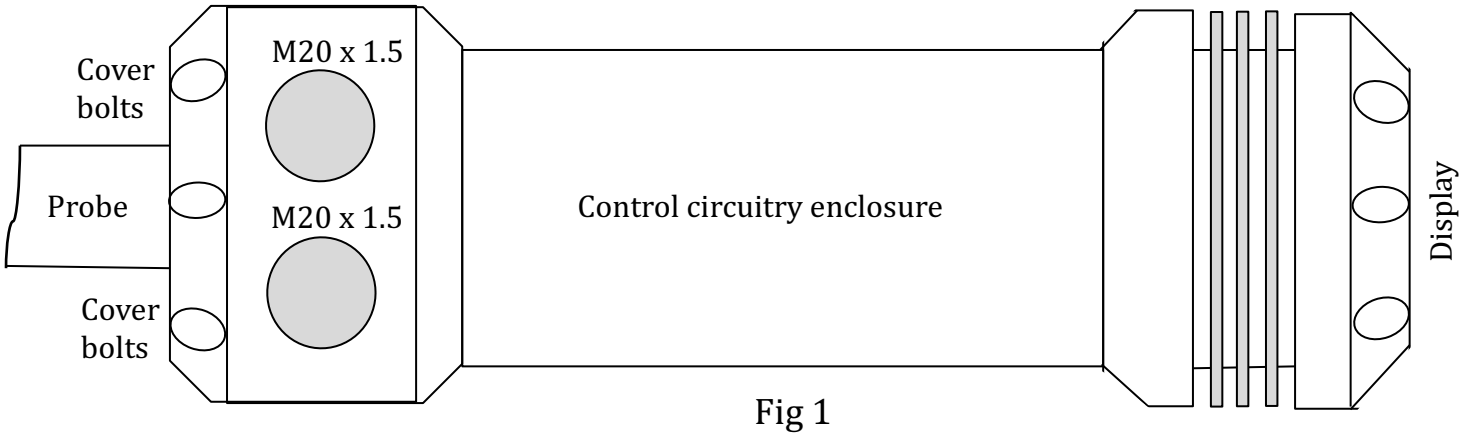

Fig 1

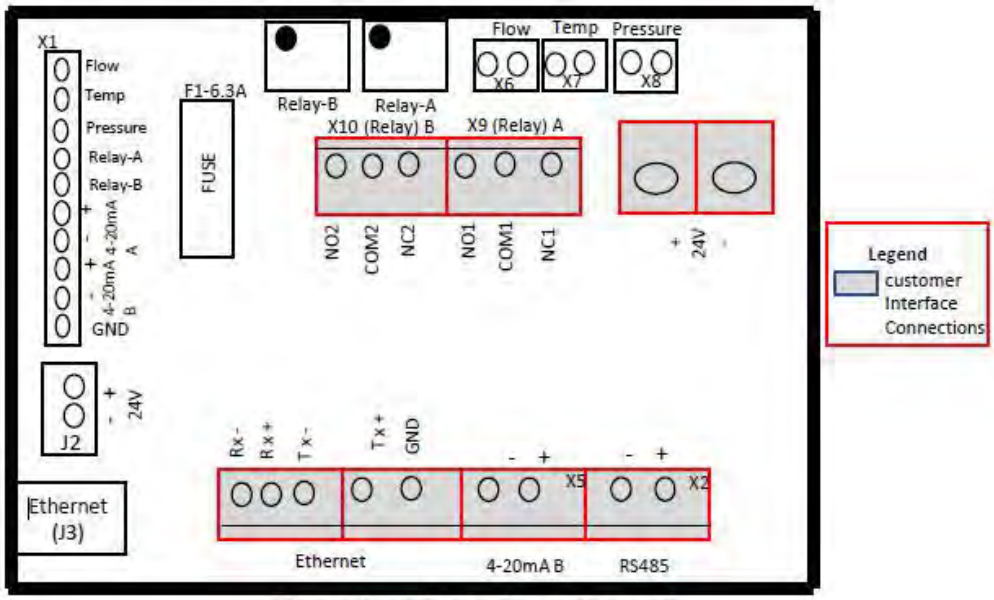
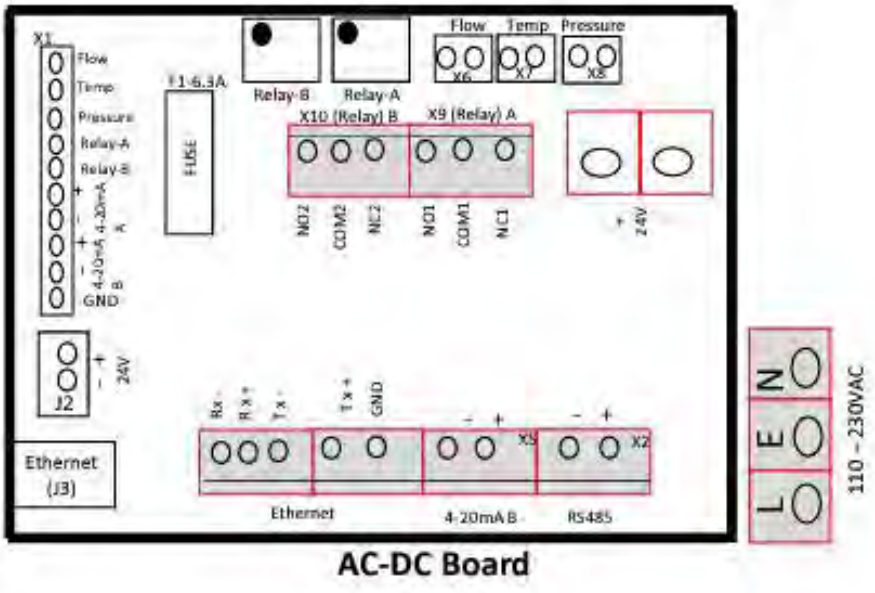
5.0 CONNECTIONS:



The power termination shall be made using a Class I Division 1/ATEX/IECEx rated cable gland. The 24V terminations are made on the Terminal Interface Board using the polarity shown in Fig 2 below. The 110-230 VAC terminations are made on the AC-DC converter board shown in Fig 3 below.

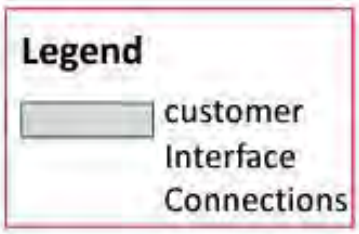
The Data Communications connections are via the second M20 cable entry port. The connections must be via Class I Division 1/ATEX/IECEx rated (see the Specific Conditions of Use) cable glands and are terminated in connectors X2, X4 or X5 as appropriate.

To gain access to the terminal interface board first make sure that power is disconnected. The operator must wait 12 minutes for the power in the capacitors to dissipate, before touching the internal parts of the analyser. Remove the eight cap screws from the ***pipe end*** of the housing and store them safely, carefully slide the enclosure cover off to expose the internal chassis. Store the cover carefully making sure that the flame path is not damaged. The Terminal Interface board is now accessible to make the relevant connections. Take extra care when sliding the enclosure back over the chassis to ensure wires or cabling do not become trapped.



Once all of the connections are complete the cover must be replaced and the eight cap screws secured before applying power.

When powering the analyser using 24VDC, only hookup to the Terminal Interface Board is required.



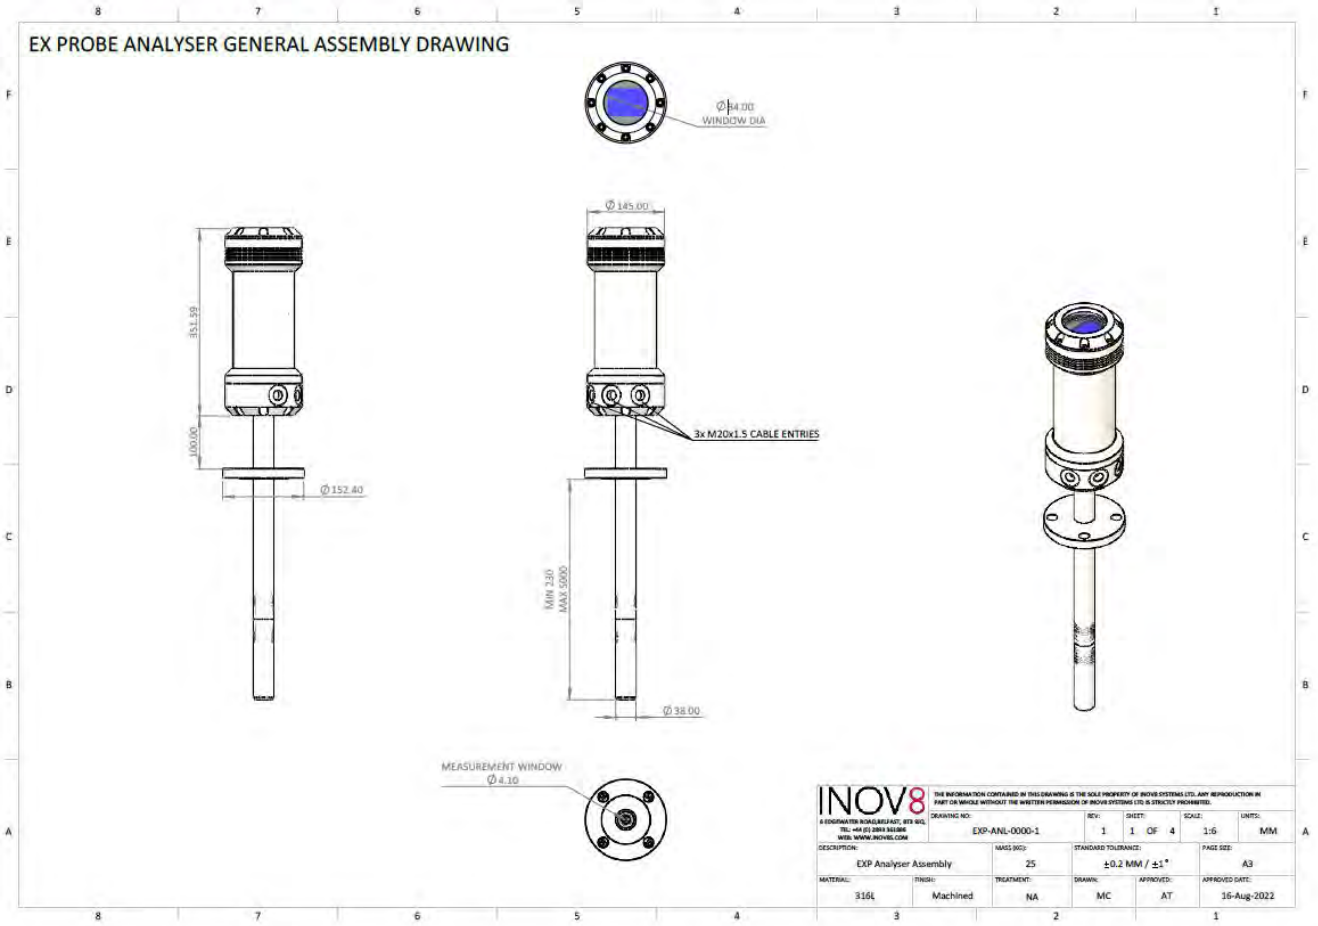
Terminal Interface Board

Terminal Interface Board.
Fig 2.

AC-DC Board

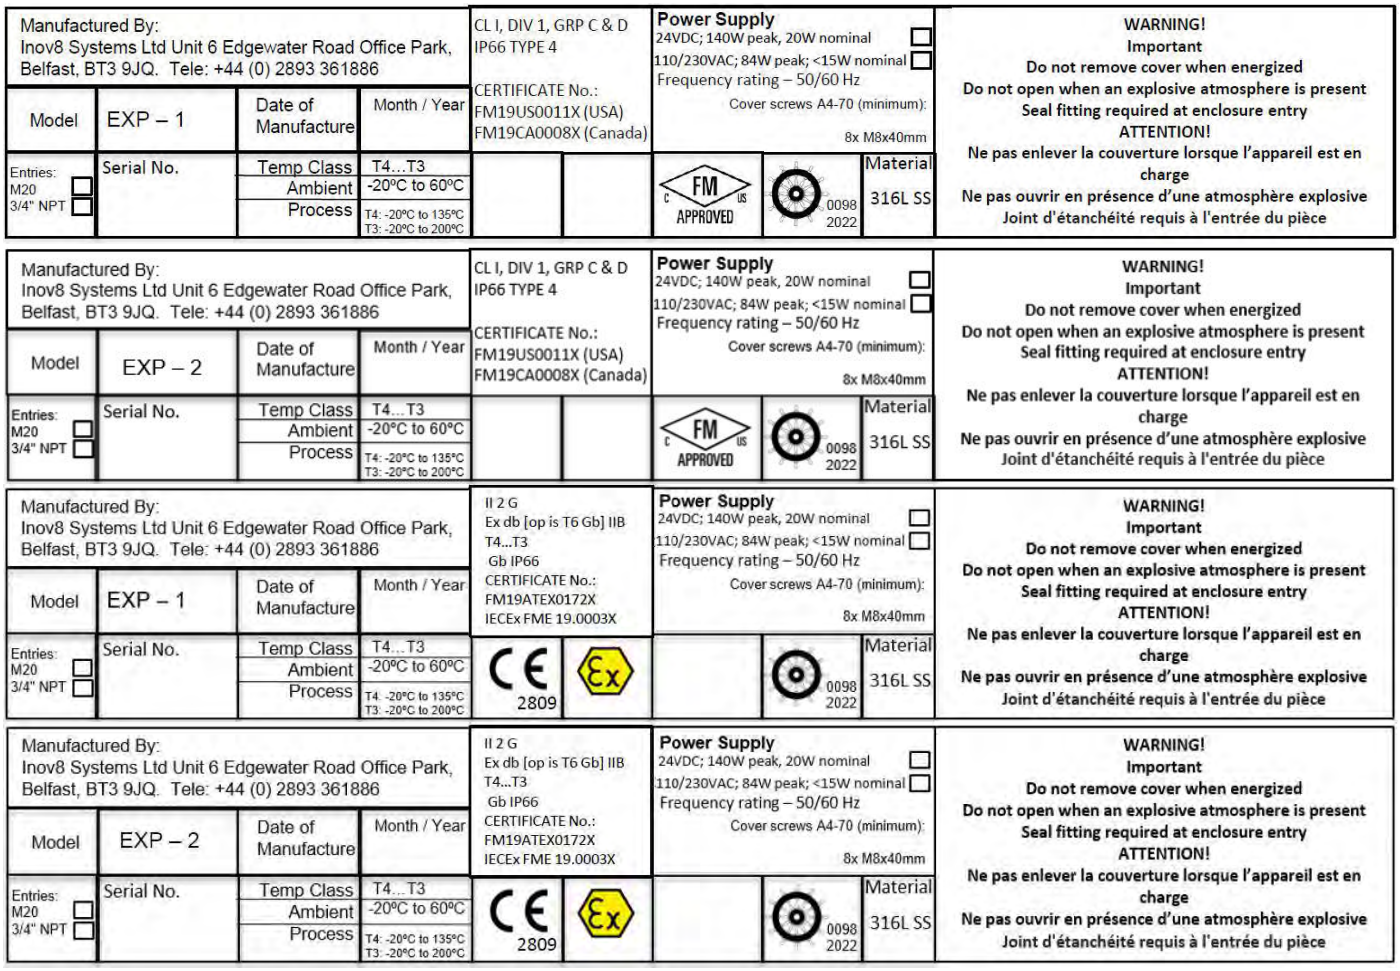
AC-DC Board.
Fig 3.

6.0 ENCLOSURE:



On completion of the installation and prior to power-on, all of the enclosure cover fixing bolts must be torqued to 30Nm.

WARNING: - Any unused ports must be fitted with a Class I Division 1/ATEX/IECEx rated (M20x1.5 OR ¾ NPT) stopping plug (see the Specific Conditions of Use)



7.0 MAINTENANCE:

No routine maintenance is required on this equipment beyond a visual inspection for physical damage. An annual inspection is recommended to ensure that the equipment performance remains optimised.
The analyser requires servicing every 24 months on a preventative maintenance basis to ensure long term reliability of the equipment. This encompasses a light source and transducer replacement (where applicable) and a measurement verification.

8.0 GA Drawing

9.0 Certification Label:

10.0 Specific Conditions of Use

The equipment includes flame path joints. Should any repair of the flame paths be required, consultation with Inov8 is necessary.

The process temperature shall not exceed 200°C for T3 ratings and shall not exceed 135°C for T4 ratings.

For USA & Canada Division rated devices: The cable glands or cable sealing device or blanking plugs for the unused entries (as applicable) used for the installation shall be suitably certified with minimum certification rating of Class I, Division 1, Groups C & D Ta = -20°C to 60°C for temperature class T4 or T3 depending on the final area requirements.

For ATEX & IECEx rated devices: The cable glands or cable sealing device or blanking plugs for the unused entries (as applicable) used for the installation shall be suitably certified with minimum certification rating of Ex db IIB T4…T3 Gb Ta = -20°C to 60°C for temperature class T4 or T3 depending on the final area requirements.

Introduction

Our implementation of HART requires no custom drivers, e.g. DD files etc to run. It uses the standard backwards compatible configuration which will work with any handheld communicator or DCS straight away.

Wire your HART connection into 4-20mA B/2 on our terminal board. Our 4-20mA loop is passive, so either the DCS or handheld communicator you are using will need to supply the loop power (24V).

This manual assumes you are already familiar with our software.

Modifiable Device Parameters

Field	Valid Data
Polling Address	Number between 0-63.
Short Tag	Capital letters and numbers only. 8 characters long.
Long Tag	Any letter and number. 32 characters long.
Descriptor	Capital letters and numbers only. 16 characters long.
Device ID	Number between 0-16,777,215.

Click on **Apply Changes** when you have finished modifying any values. The HART connection will drop out and you will need to re-poll to find the device again after approximately 20 seconds.

Similarly, **Restart Modem** and **Restart Microcontroller** will drop the connection temporarily, these buttons should not need to be used but they are there in case of a lock-up.

You can also change the values in the table above from the HART master and send it a Message.

Supported Messages

Message	**Action**
START	Starts the cycle, if not already running.
STOP	Starts the cycle, if not already stopped.
CLEAN	Runs a burst of ultrasonic cleaning.

Primary Variables

Primary Variable	Measurement	Units	Meaning
PV1	Oil in Water Concentration	PPM	N/A
PV2	Ambient Temperature inside enclosure	Degrees Celsius	N/A
PV3	Cycle Status Indicator	Percentage	0% = Cycle Stopped 100% = Cycle Running

NOTE: The PV1 reading also changes to -1.00 PPM when the cycle is stopped and the PV mA reading changes to 3.2mA – therefore if you cannot make use of PV3 then you can determine if the cycle is running or not from PV1 itself.

1.0 SELECTION & APPLICATION

Users should become familiar with ASME B40.100 (Gauges – Pressure Indicating Dial Type – Elastic Element) before specifying pressure measuring gauges. That document – containing valuable information regarding gauge construction, accuracy, safety, selection and testing – may be ordered from:

ASME International
Three Park Avenue
New York, N.Y. 10016-5990
800-843-2763 (US/Canada)
001-800-843-2763 (Mexico)
973-882-1170 outside North America
email: infocentral@asme.org
www.asme.org

WARNING: To prevent misapplication, pressure gauges should be selected considering media and ambient operating conditions. Improper application can be detrimental to the gauge, causing failure and possible personal injury, property damage or death. The information contained in this manual is offered as a guide in making the proper selection of a pressure gauge. Additional information is available from Ashcroft Inc.

The following is a highlight of some of the more important considerations:

1.1 Range – The range of the instrument should be approximately twice the maximum operating pressure. Too low a range may result in (a) low fatigue life of the elastic element due to high operating stress and (b) susceptibility to overpressure set due to pressure transients that exceed the normal operating pressure. Too high a range may yield insufficient resolution for the application.

1.2 Temperature – Refer to Section 2 of this manual for important information concerning temperature related limitations of pressure gauges, both dry and liquid filled.

1.3 Media – The material of the process sensing element must be compatible with the process media. Use of a diaphragm seal with the gauge is recommended for process media that (a) is corrosive to the process sensing element; (b) contain heavy particulates (slurries) or (c) are very viscous including those that harden at room temperature.

1.4 Oxidizing media – Gauges for direct use on oxidizing media should be specially cleaned. Gauges for oxygen service should be ordered to variation X6B and will carry the ASME required dial marking "USE NO OIL" in red letters. Gauges for direct use on other oxidizing media may be ordered to variation X6W. They will be cleaned but carry no dial marking. *PLUS!*™ Performance gauges or Halocarbon filled gauge or diaphragm fill is required for use with oxidizing media; order variation XCF.

1.5 Pulsation/Vibration – Pressure pulsation can be dampened by several mechanisms; the patented *PLUS! Performance* gauge will handle the vast majority of applications. One exception to this is high frequency pulsation which is difficult to detect. The only indication may be an upscale zero shift due to movement wear. These applications should be addressed with a liquid filled gauge, or in extreme cases, a remotely mounted liquid filled gauge connected with a length of capillary line. The small diameter of the capillary provides excellent dampening, but can be plugged. The Ashcroft 1106 pulsation dampener and 1112 snubber are auxiliary devices which dampen pulsation with less tendency to plug.

1.6 Gauge fills. – Once it has been determined that a liquid filled gauge is in order, the next step is selecting the type of fill. **Glycerin** satisfies most applications. While being the least expensive fill, its usable temperature range is 20/180°F. **Silicone** filled gauges have a broader service range: –40/250°F. Oxidizing media require the use of **Halocarbon,** with a service range of –40/250°F. Pointer motion will be slowed at the low end of the low end of these temperature ranges.

1.7 Mounting – Users should predetermine how the gauge will be mounted in service: stem (pipe), wall (surface) or panel (flush). Ashcroft wall or panel mounting kits should be ordered with the gauge. See Section 3.

2.0 TEMPERATURE

2.1 Ambient Temperature – To ensure long life and accuracy, pressure gauges should preferably be used at an ambient temperature between –20 and +150°F (–30 to +65°C). At very low temperatures, standard gauges may exhibit slow pointer response. Above 150°F, the accuracy will be affected by approximately 1.5% per 100°F. Other than discoloration of the dial and hardening of the gasketing and degradation of accuracy, non-liquid filled Type 1279 (phenolic case) and 1379 (aluminum case) Duragauge® gauge, with standard glass windows, can withstand continuous operating temperatures up to 250°F. Unigauge models 2½″ and 3½″ 1009 and 1008S liquid filled gauges can withstand 200°F but glycerin fill and the acrylic window of Duragauge® gauges will tend to yellow. Silicone fill will have much less tendency to yellow. Low pressure, liquid filled Types 1008 and 1009 gauges may have some downscale errors caused by liquid fill expansion. This can be alleviated by venting the gauge at the top plug (pullout the blue plug insert). To do this the gauge must be installed in the vertical position.

Although the gauge may be destroyed and calibration lost, gauges can withstand short times at the following temperatures: gauges with all welded pressure boundary joints, 750°F (400°C); gauges with silver brazed joints, 450°F (232°C) and gauges with soft soldered joints, 250°F (121°C). For expected long term service below –20°F (–30°C) Duragauge® and 4½″ 1009 gauges should be hermetically sealed and specially lubricated; add "H" to the product code for hermetic sealing. Add variation XVY for special lubricant. Standard Duralife® gauges may be used to –50°F (–45°C) without modification.

2.2 Accuracy – Heat and cold affect accuracy of indication. A general rule of thumb for **dry gauges** is 0.5% of full scale change for every 40°F change from 75°F. Double that allowance for gauges with hermetically sealed or liquid filled cases, except for Duragauge® gauges where no extra allowance is required due to the elastomeric, compensating back. Above 250°F there may exist very significant errors in indication.

2.3 Steam service – In order to prevent live steam from entering the Bourdon tube, a siphon filled with water should be installed between the gauge and the process line. Siphons can be supplied with ratings up to 4,000 psi. If freezing of the condensate in the loop of the siphon is a possibility, a diaphragm seal should be used to isolate the gauge from the process steam. Siphons should also be used whenever condensing, hot vapors (not just steam) are present. Super heated steam should have enough piping or capillary line ahead of the siphon to maintain liquid water in the siphon loop.

2.4 Hot or very cold media – A five foot capillary line assembly will bring most hot or cold process media within the recommended gauge ambient temperature range. For media above

750°F (400°C) the customers should use their own small diameter piping to avoid possible corrosion of the stainless steel. The five foot capillary will protect the gauges used on the common cryogenic (less than –300°F (200°C) gases, liquid argon, nitrogen, and oxygen.) The capillary and gauge must be cleaned for oxygen service. The media must not be corrosive to stainless steel, and must not plug the small bore of the capillary.

2.5 Diaphragm seals – A diaphragm seal should be used to protect gauges from corrosive media, or media that will plug the instrument. Diaphragm seals are offered in a wide variety of designs and corrosion resistant materials to accommodate almost any application and most connections. Visit www.ashcroft.com for details.

2.6 Autoclaving – Sanitary gauges with clamp type connections are frequently steam sterilized in an autoclave. Gauges equipped with polysulfone windows will withstand more autoclave cycles than those equipped with polycarbonate windows. Gauges equipped with plain glass or laminated safety glass **should not be autoclaved.** Gauge cases should be vented to atmosphere (removing the rubber fill/safety plug if necessary) **before** autoclaving to prevent the plastic window from cracking or excessively distorting. If the gauge is liquid filled, the fill should be drained from the case and the front ring loosened before autoclaving.

3.0 INSTALLATION

3.1 Location – Whenever possible, gauges should be located to minimize the effects of vibration, extreme ambient temperatures and moisture. Dry locations away from very high thermal sources (ovens, boilers etc.) are preferred. If the mechanical vibration level is extreme, the gauge should be remotely located (usually on a wall) and connected to the pressure source via flexible tubing.

3.2 Gauge reuse – ASME B40.100 recommends that gauges not be moved indiscriminately from one application to another. The cumulative number of pressure cycles on an in-service or previously used gauge is generally unknown, so it is generally safer to install a new gauge whenever and wherever possible. This will also minimize the possibility of a reaction with previous media.

3.3 Tightening of gauge – Torque should never be applied to the gauge case. Instead, an open end or adjustable wrench should always be used on the wrench flats of the gauge socket to tighten the gauge into the fitting or pipe. NPT threads require the use of a suitable thread sealant, such as pipe dope or teflon tape, and must be tightened very securely to ensure a leak tight seal.

CAUTION: Torque applied to a diaphragm seal or its attached gauge, that tends to loosen one relative to the other, can cause loss of fill and subsequent inaccurate readings. Always apply torque **only** to the wrench flats on the lower seal housing when installing filled, diaphragm seal assemblies or removing same from process lines.

3.4 Process isolation – A shut-off valve should be installed between the gauge and the process in order to be able to isolate the gauge for inspection or replacement without shutting down the process.

3.5 Surface mounting – Also known as wall mounting. Gauges should be kept free of piping strains. The gauge case mounting feet, if applicable, will ensure clearance between the pressure relieving back and the mounting surface.

3.6 Flush mounting – Also known as panel mounting. The applicable panel mounting cutout dimensions can be found at www.ashcroft.com

4.0 OPERATION

4.1 Frequency of inspection – This is quite subjective and depends upon the severity of the service and how critical the accuracy of the indicated pressure is. For example, a monthly inspection frequency may be in order for critical, severe service applications. Annual inspections, or even less frequent schedules, are often employed in non-critical applications.

4.2 In-service inspection – If the accuracy of the gauge cannot be checked in place, the user can at least look for (a) erratic or random pointer motion; (b) readings that are suspect – especially indications of pressure when the user believes the true pressure is 0 psig. Any gauge which is obviously not working or indicating erroneously, should be immediately valved-off or removed from service to avoid a possible pressure boundary failure.

4.3 When to check accuracy – Any suspicious behavior of the gauge pointer warrants that a full accuracy check be performed. Even if the gauge is not showing any symptoms of abnormal performance, the user may want to establish a frequency of bench type inspection.

4.4 When to recalibrate – This depends on the criticality of the application. If the accuracy of a 3-2-3% commercial type gauge is only 0.5% beyond specification, the user must decide whether it's worth the time and expense to bring the gauge back into specification. Conversely if the accuracy of a 0.25% test gauge is found to be 0.1% out of specification then the gauge should be recalibrated.

4.5 Other considerations – These include (a) bent or unattached pointers due to extreme pressure pulsation; (b) broken windows which should be replaced to keep dirt out of the internals; (c) leakage of gauge fill; (d) case damage – dents and/or cracks; (e) any signs of service media leakage through the gauge including its connection; (f) discoloration of gauge fill that impedes readability.

4.6 Spare parts – As a general rule it is recommended that the user maintain in inventory one complete Ashcroft® instrument for every ten (or fraction thereof) of that instrument type in service.

5.0 GAUGE REPLACEMENT

It is recommended that the user stock one complete Ashcroft® instrument for every ten (or fraction thereof) of that instrument type in service. With regard to gauges having a service history, consideration should be given to discarding rather than repairing them. Gauges in this category include the following:

a. Gauges that exhibit a span shift greater than 10%. It is possible the Bourdon tube has suffered thinning of its walls by corrosion.

b. Gauges that exhibit a zero shift greater than 25%. It is likely the Bourdon tube has seen significant overpressure leaving residual stresses that may be detrimental to the application.

c. Gauges which have accumulated over 1,000,000 pressure cycles with significant pointer excursion.

d. Gauges showing any signs of corrosion and/or leakage of the pressure system.

e. Gauges which have been exposed to high temperature or exhibit signs of having been exposed to high temperature – specifically 250°F or greater for soft soldered systems; 450°F or greater for brazed systems; and 750°F or greater for welded systems.

f. Gauges showing significant friction error and/or wear of the movement and linkage.

g. Gauges having damaged sockets, especially damaged threads.

h. Liquid filled gauges showing loss of case fill.

NOTE: ASME B40.100 does not recommend moving gauges from one application to another. This policy is prudent in that it encourages the user to procure a new gauge, properly tailored by specification, to each application that arises.

6.0 ACCURACY: PROCEDURES/DEFINITIONS

Accuracy inspection – Readings at approximately five points equally spaced over the dial should be taken, both upscale and downscale, before and after lightly rapping the gauge to remove friction. **A pressure standard with accuracy at least four times greater than the accuracy of the gauge being tested is recommended.**

Equipment – A finely regulated pressure supply will be required. It is critical that the piping system associated with the test setup be leaktight. The gauge under test should be positioned as it will be in service to eliminate positional errors due to gravity.

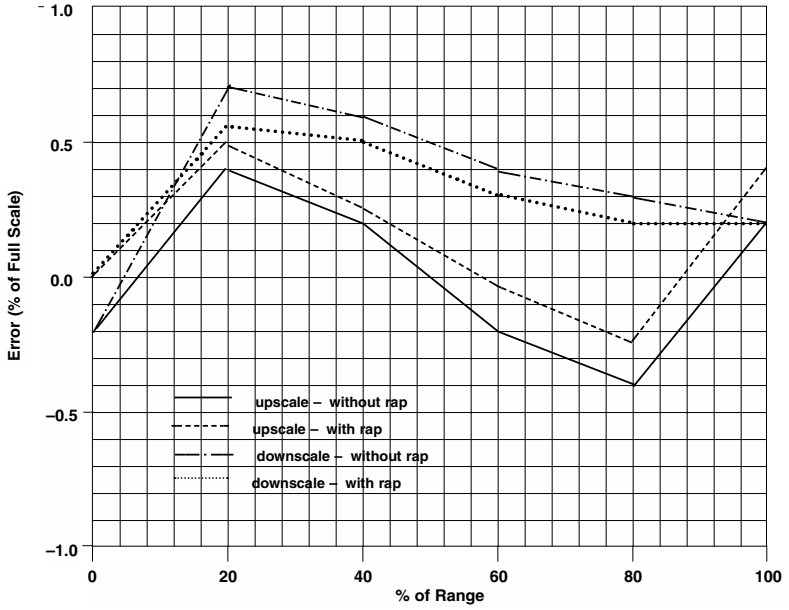
Method – ASME B40.100 recommends that **known** pressure (based on the reading from the pressure standard used) be applied to the gauge under test. Readings including any error from the nominal input pressure, are then taken from the gauge under test. The practice of aligning the pointer of the gauge under test with a dial graduation and then reading the error from the master gauge ("reverse reading") can result in inconsistent and misleading data and should NOT be used.

Calibration chart – After recording all of the readings it is necessary to calculate the errors associated with each test point using the following formula: ERROR in percent = 100 times (TRUE VALUE minus READING) ÷ RANGE. Plotting the individual errors (Figure 1) makes it possible to visualize the total gauge characteristic. The plot should contain all four curves: upscale – before rap; upscale – after rap; downscale – before rap; downscale – after rap. "*Rap*" means lightly tapping the gauge **before** reading to remove friction as described in ASME B40.100.

Referring to Figure 1, several classes of error may be seen:

Zero – An error which is approximately equal over the entire scale. This error can be manifested when either the gauge is

FIG. 1



TYPICAL CALIBRATION CHART

INDICATED VALUE (PSI)

True Value – PSI	Increasing – Without RAP	Increasing – With RAP	Decreasing – Without RAP	Decreasing – With RAP
0	–.4	0	–.4	0
40	+.8	+1.0	+1.4	+1.1
80	+.4	+.5	+1.2	+1.0
120	–.4	–1.0	+.8	+.6
160	–.8	–.5	+.6	+.4
200	+.4	+.8	+.4	+.4

ERROR (% OF FULL SCALE)

True Value – % of Range	Increasing – Without RAP	Increasing – With RAP	Decreasing – Without RAP	Decreasing – With RAP
0	–.20	0	–.20	0
20	+.40	+.50	+.70	+.55
40	+.20	+.25	+.60	+.50
60	–.20	–.05	+.40	+.30
80	–.40	–.25	+.30	+.20
100	+.20	+.40	+.20	+.20

dropped or overpressured and the Bourdon tube takes a permanent set. This error may often be corrected by simply repositioning the pointer. Except for test gauges, it is recommended that the pointer be set at midscale pressure to "split" the errors.

Span – A span error exists when the error at full scale pressure is different from the error at zero pressure. This error is often proportional to the applied pressure. Most Ashcroft gauges are equipped with an internal, adjusting mechanism with which the user can correct any span errors which have developed in service.

Linearity – A gauge that has been properly spanned can still be out of specification at intermediate points if the response of the gauge as seen in Figure 1 (Typical Calibration Chart) is not linear. The Ashcroft Duragauge® pressure gauge is equipped with a rotary movement feature which permits the user to minimize this class of error. Other Ashcroft gauge designs (e.g., 1009 Duralife®) require that the dial be moved left or right prior to tightening the dial screws.

Hysteresis – Some Bourdon tubes have a material property known as hysteresis. This material characteristic results in differences between the upscale and downscale curves. This class of error can **not** be eliminated by adjusting the gauge movement or dial position.

Friction – This error is defined as the difference in readings before and after lightly tapping the gauge case at a check point. Possible causes of friction are burrs or foreign material in the movement gearing, "bound" linkages between the movement and the bourdon tube, or an improperly tensioned hairspring. If correcting these potential causes of friction does not eliminate excessive friction error, the movement should be replaced.

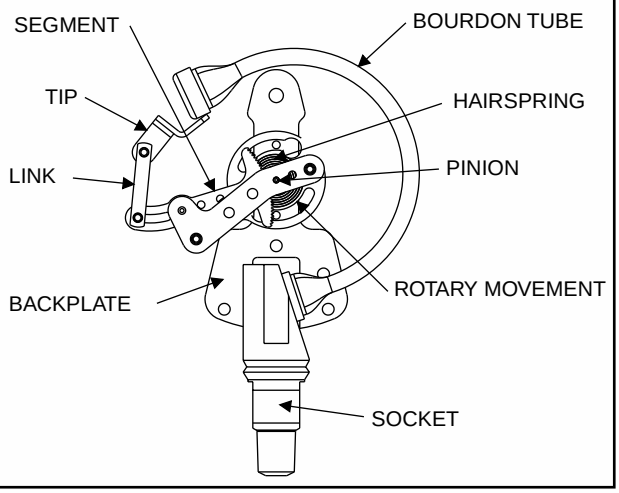
6.1 Calibration – Rotary Movement Gauges and Type 1259 Gauges – Inspect gauge for accuracy. Many times gauges are simply "off zero" and a simple pointer adjustment using the micrometer pointer is adequate. If inspection shows the gauge warrants recalibration to correct span and/or linearity errors, proceed as follows:

a. Remove ring, window and, if solid front case, the rear closure assembly.

b. Pressurize the gauge **once** to full scale and back to zero.

c. Refer to Figure 2 (Ashcroft System Assembly w/Rotary Gear Movement) for a view of a typical Ashcroft rotary system assembly with component parts identified. Refer to Figure 2A for link configuration of Type 1259 gauge.

FIG. 2 ASHCROFT SYSTEM ASSEMBLY W/ROTARY GEAR MOVEMENT



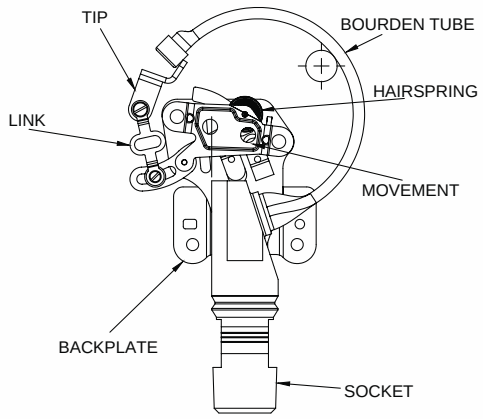


FIG. 2A ASHCROFT TYPE 1259 SYSTEM ASSEMBLY

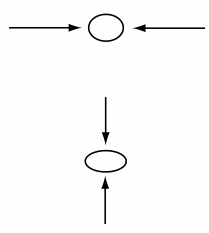


d. Adjust the micrometer pointer so that it rests at the true zero position. For open front gauges the pointer and dial must also be disassembled and the pointer should then be lightly pressed onto the pinion at the 9:00 o'clock position.

e. Apply full scale pressure and note the magnitude of the span error. With open front gauges, ideal span (270 degrees) will exist when at full scale pressure the pointer rests exactly at the 6:00 o'clock position.

f. If the span has shifted significantly (span error greater than 10%), the gauge should be replaced because there may be some partial corrosion inside the Bourdon tube which could lead to ultimate failure. If the span error exceeds 0.25%, loosen the lower link screw and move the lower end of the link toward the movement to increase span or away to decrease span. An adjustment of 0.004 inch will change the span by approximately 1%. This is a repetitive procedure which often requires more than one adjustment of the link position and the subsequent rechecking of the errors at zero and full scale pressure.

g. Apply midscale pressure and note error in reading. Even though the gauge is accurate at zero and full scale, it may be inaccurate at the midpoint. This is called linearity error. For corrections to linearity with the Type 1259 gauges refer to Figure 2B. For rotary movement gauges, note the following: if the error is positive, the movement should be rotated counter clockwise. Rotating the movement one degree will change this error by approximately 0.25%. Rotating the movement often affects span and it should be subsequently rechecked and readjusted if necessary according to step 6.1e and 6.1f.

FIG. 2B LINEARITY ADJUSTMENT & LINK CONFIGURATION FOR ASHCROFT TYPE 1259

h. While recalibrating the gauge, the friction error – difference in readings taken with and without rap – should be

noted. This error should not exceed the basic accuracy of the gauge. If the friction error is excessive, the movement should be replaced. One possible cause of excessive friction is improper adjustment of the hairspring. The hairspring torque,or tension, must be adequate without being excessive. The hairspring should also be level, unwind evenly (no turns rubbing) and it should never tangle.

NOTES:

1 For operation of test gauge external zero reset, refer to page 17.

2 For test gauge calibration procedure, refer to Figure 2 on page 18.

7.0 DIAPHRAGM SEALS

7.1 General – A diaphragm seal (isolator) is a device which is attached to the inlet connection of a pressure instrument to isolate its measuring element from the process media. The space between the diaphragm and the instrument's pressure sensing element is solidly filled with a suitable liquid. Displacement of the liquid fill in the pressure element, through movement of the diaphragm, transmits process pressure changes directly to a gauge, switch or any other pressure instrument. When diaphragm seals are used with pressure gauges, an additional 0.5% tolerance must be added to the gauge accuracy because of the diaphragm spring rate.

Used in a variety of process applications where corrosives, slurries or viscous fluids may be encountered, the diaphragm seal affords protection to the instrument where:

- The process fluid being measured would normally clog the pressure element.
- Pressure element materials capable of withstanding corrosive effects of certain fluids are not available.
- The process fluid might freeze due to changes in ambient temperature and damage the element.

7.2 Installation – Refer to bulletin OH-1 for information regarding (a) seal configurations; (b) filling fluids; (c) temperature range of filling fluids; (d) diaphragm material pressure and temperature limits; (e) bottom housing material pressure and temperature limits; (f) pressure rating of seal assembly; (g) accuracy/temperature errors of seal assembly; (h) diaphragm seal displacement. The volumetric displacement of the diaphragm must at least equal the volumetric displacement of the measuring element in the pressure instrument to which the seal is to be attached.

It is imperative that the pressure instrument/diaphragm seal assembly be **properly** filled prior to being placed in service. Ashcroft diaphragm seal assemblies should only be filled by a seal assembler certified by Ashcroft Inc. Refer to section 3.3 for a cautionary note about not applying torque on either the instrument or seal relative to the other.

7.3 Operation – All Ashcroft® diaphragm seals, with the exception of Type 310 mini-seals, are continuous duty. Should the pressure instrument fail, or be removed accidentally or deliberately, the diaphragm will seat against a matching surface preventing damage to the diaphragm or leakage of the process fluid.

7.4 Maintenance – Clamp type diaphragm seals – Types 100, 200 and 300 – allow for replacement of the diaphragm or diaphragm capsule, if that ever becomes necessary. The Type 200 top housing must also be replaced with the diaphragm. With all three types the clamping arrangement allows field disassembly to permit cleaning of the seal interior.

7.5 Failures – Diaphragm failures are generally caused by either corrosion, high temperatures or fill leakage. Process media build-up on the process side of the diaphragm can also require seal cleaning or replacement. Consult Customer Service, Stratford CT for advice on seal failures and/or replacement.

WARNING: All seal components should be selected considering process and ambient operating conditions to prevent misapplication. Improper application could result in failure, possible personal injury, property damage or death.

8.0 DAMPENING DEVICES

8.1 General – Some type of dampening device should be used whenever the pressure gauge may be exposed to repetitive pressure fluctuations that are fairly rapid, high in magnitude and especially when transitory pressure spikes exceeding the gauge range are present (as with starting and stopping action of valves and pumps). A restricted orifice of some kind is employed through which pressure fluctuations must pass before they reach the Bourdon tube. The dampener reduces the magnitude of the pressure pulse thus extending the life of the Bourdon tube and movement. This reduction of the pressure pulsation as "seen" by the pressure gauge is generally evidenced by a reduction in the pointer travel. If the orifice is very small the pointer may indicate the average service pressure, with little or no indication of the time varying component of the process pressure.

Commonly encountered media (e.g. – water and hydraulic oil) often carry impurities which can plug the orifice over time thus rendering the gauge inoperative until the dampener is cleaned or replaced.

Highly viscous media and media that tend to periodically harden (e.g., asphalt) require a diaphragm seal be fitted to the gauge. The seal contains an internal orifice which dampens the pressure fluctuation within the fill fluid.

8.2 Throttle Screws & Plugs – These accessories provide dampening for the least cost. They have the advantage of fitting completely within the gauge socket and come in three types: (a) a screwed-in type which permits easy removal for cleaning or replacement; (b) a pressed in, non-threaded design and (c) a pressed in, threaded design which provides a highly restrictive, helical flow path. Not all styles are available on all gauge types.

8.3 Ashcroft Pulsation Dampener – Type 1106 Ashcroft pulsation dampener is a moving pin type in which the restricted orifice is the clearance between the pin and any one of five preselected hole diameters. Unlike a simple throttle screw/plug, this device has a self-cleaning action in that the pin moves up and down under the influence of pressure fluctuations.

8.4 Ashcroft Pressure Snubber – The heart of the Type 1112 pressure snubber is a thick porous metal filter disc. The disc is available in four standard porosity grades.

8.5 Ashcroft Needle Valves – Type 7001 thru 7004 steel needle valves provide varying degrees of dampening. These devices, in the event of plugging, can easily be opened to allow the pressure fluid to clear away the obstruction.

8.6 Chemiquip® Pressure Limiting Valves – Model PLV-255, PLV-2550, PLV-5460, PLV-5500 and PLV-6430, available with and without built-in snubbers, automatically "shut off" at adjustable preset values of pressure to protect the gauge from damage to overpressure. They are especially useful on hydraulic systems wherein hydraulic transients

(spikes) are common.

9.0 TEST EQUIPMENT & TOOL KITS

See our website www.ashcroft.com for more details

9.1 Pressure Instrument Testing Equipment

Type 1305D Deadweight Tester

Type 1327D Pressure Gauge Comparator

Type 1327CM “Precision” Gauge Comparator

9.2 Tools & Tool Kits For Recalibration of 4½˝ and Larger Gauges

Type 2505 universal carrying case for 1082 test gauge

Type 266A132-01 span wrench for 1082 test gauge

Type 1281 socket O-Ring kit for 1279/1379 lower connect

Type 1285 4½˝ ring wrench for 1279/1379 lower & back connect

Type 1286 6˝ ring wrench for 1379 lower & back connect

Type 3220 pointer puller (all gauges except 1009 Duralife®)

Type 3530 pinion back-up tool for 1009 Duralife®

Type 3220 Handjack set

Type 1105 Tool Kit

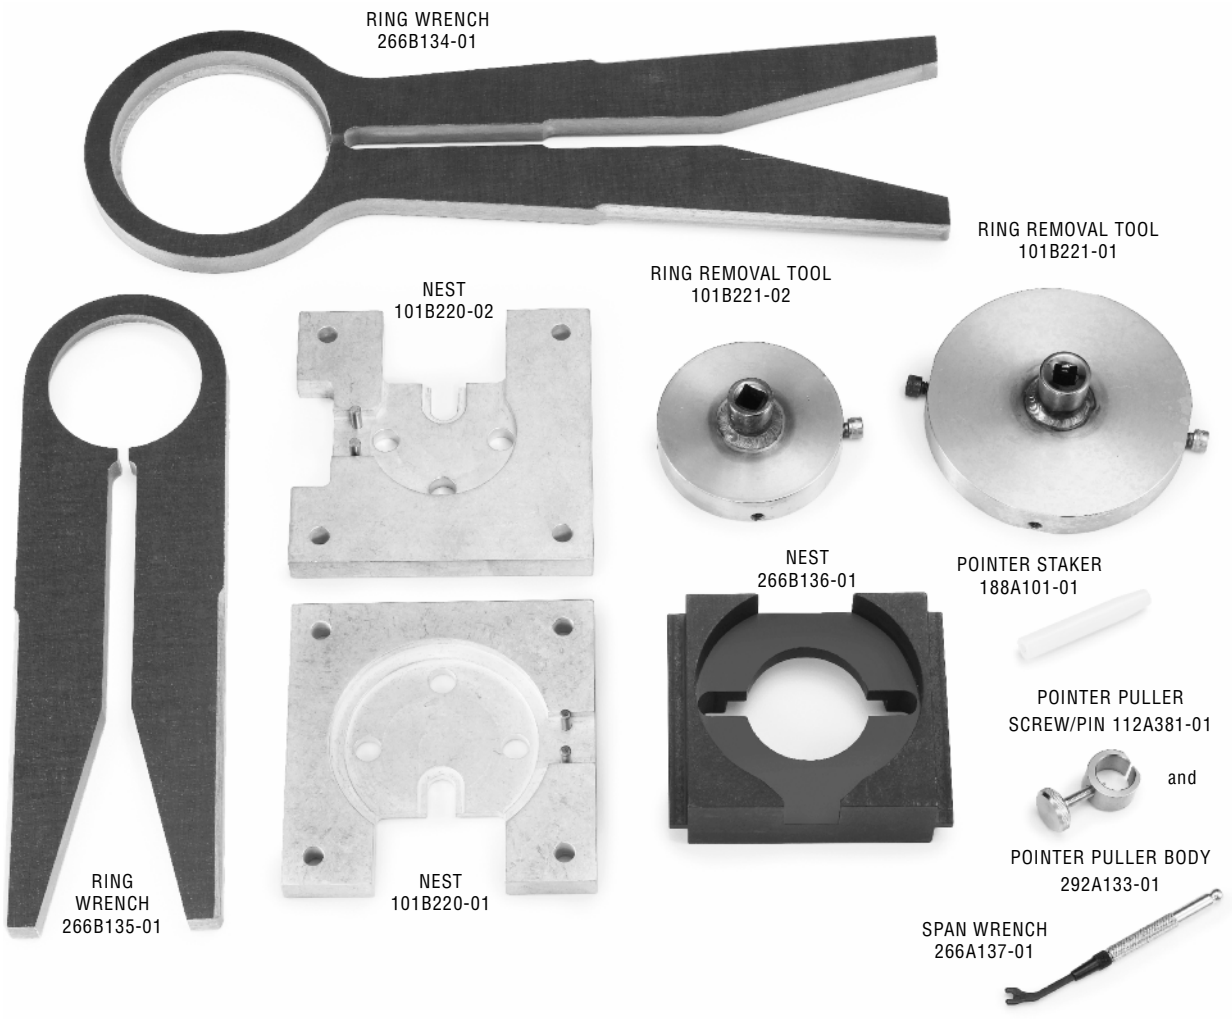
9.3 Kits to Convert a Dry Gauge to a Liquid Filled or Weather Proof Case Gauge

Type 1280 conversion kit for 4½˝ lower connect 1279/1379

Type 1283 conversion kit for 4½˝ back connect 1279/1379

Type 1284 conversion kit for 6˝ lower & back connect

TYPE 1105
TOOL KIT



TYPE 3220
HAND JACK SET

9.4 2½ & 3½ 1009 Duralife® Gauge Tools

Description	Part No.
Pointer Puller Screw/Pin[2][3][4]	112A381-01
Pointer Puller Body[2][3][4]	292A133-01
Pointer Staker[2][4]	188A101-01
Span Wrench[2][5] (to adjust span)	266A137-01
Ring Wrench 3½″[1][5] (for ring removal) (35 1009)	266B134-01
Ring Wrench 2½″[1][5] (for ring removal) (25 1009)	266B135-01
Nest 2½″ & 3½″[1][5] (to hold gauge for ring removal) (25/35 1009)	266B136-01
Ring Removal Tool[6] (25 1009)	101B221-02
Ring Removal Tool[6] (35 1009)	101B221-01
Nest 2½″[6] (to hold gauge for ring removal) (25 1009)	101B220-02
Nest 3½″[6] (to hold gauge for ring removal) (35 1009)	101B220-01
Type 1230 throttle plug insertion (¼ NPT) for 1009 Duralife®)	1230
Type 1231 throttle plug insertion (½ NPT) for 1009 Duralife® (body only)	1231
Tool to open orifice on push-in throttle plug	101A206-01

(1) Formerly 1206T Tool Kit.
(2) Formerly some parts in 1205T Tool Kit.
(3) Both parts must be purchased together.
(4) Previous and current design.
(5) Previous design only.
(6) Current design only.

ASHCROFT® Type 1188 Bellows Gauge Calibration Procedure

CALIBRATION & TROUBLE CORRECTION DIAGRAM

RANGE SPAN ADJUSTMENT

RANGE TOO SHORT
Adjust slide "S" inward

RANGE TOO LONG
Adjust slide "S" outward

POINTER JUMPING

STICKY PARTS
Clean all bearings and gear teeth

LOOSE HAIRSPRING
Remove backlash by disengaging pinion & rotate to tighten

COUNTER BALANCE RUBBING
Bend if necessary to clear socket in travel

NOTE: After adjusting range span, set both movement stops. Set the underload stop so that the pointer will stop at zero. Set the overload stop so that the pointer will pass the maximum range approximately 5˝.

After adjusting span re-zero pointer by removing from pinion and re-assembling at the proper dial mark.

SLUGGISH MOVEMENT

TIGHT HAIRSPRING
Loosen by disengaging pinion & rotate

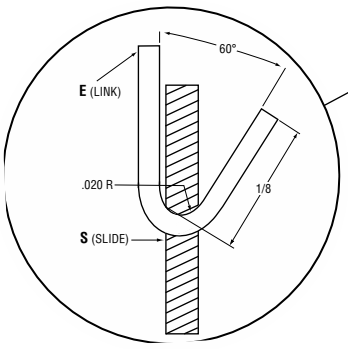
NON LINEAR

NON LINEAR FIRST 3RD.

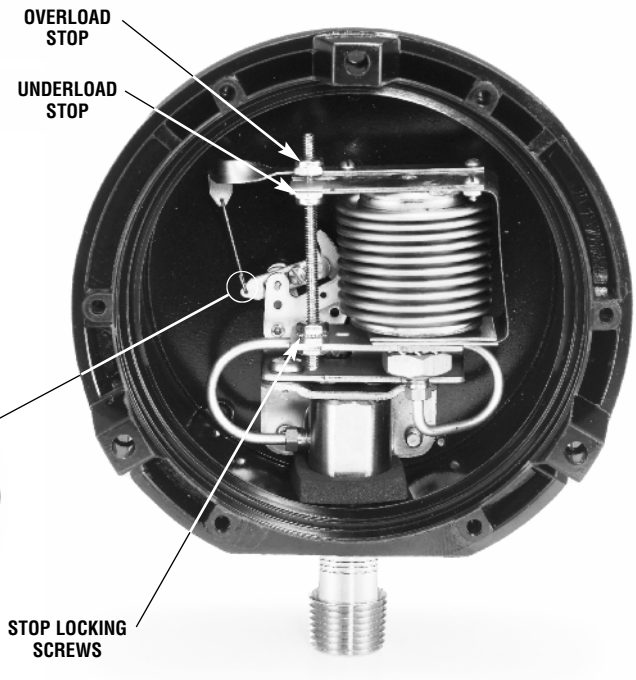
ADJ. ANGLE OF PULL BY INCREASING ANGLE "A"

NON LINEAR LAST 3RD.

ADJ. ANGLE OF PULL BY DECREASING ANGLE "A"



NOTE: To increase or decrease angle "A," bend tip inward or outward as required. Doing this may run the movement segment off the pinion. This can be corrected by cutting off one end off the link "E" decreasing its length, or makin a new length from .032 dia. phos. bronze wire.



Caution: When reproducing link end, follow figure 44 very closely. this will prevent too much play, or, binding in operation.

REF: Replacing System Bellows

After assembling bellows to the gauge socket securely, subject system to 30 psi for five minutes, allowing bellows to travel approximately 1/8˝ against the overload stop. After this, heat treat system for 15 hours at 250°F, this procedure is necssary to prevent gauge drift.

SLIDE AND LINK (angle "A")

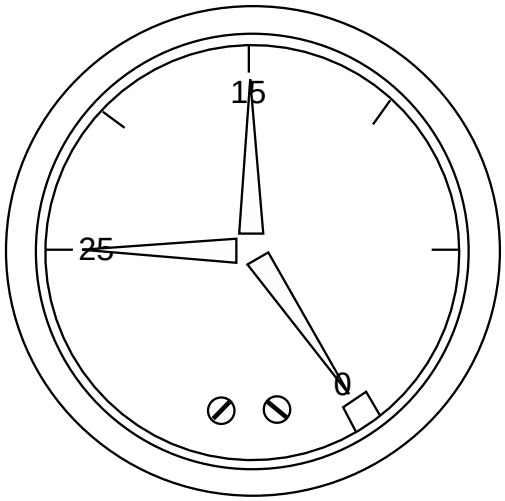
ASHCROFT® Previous Type 1009 Duralife®
Calibration Procedure – Vacuum Range

ASHCROFT®

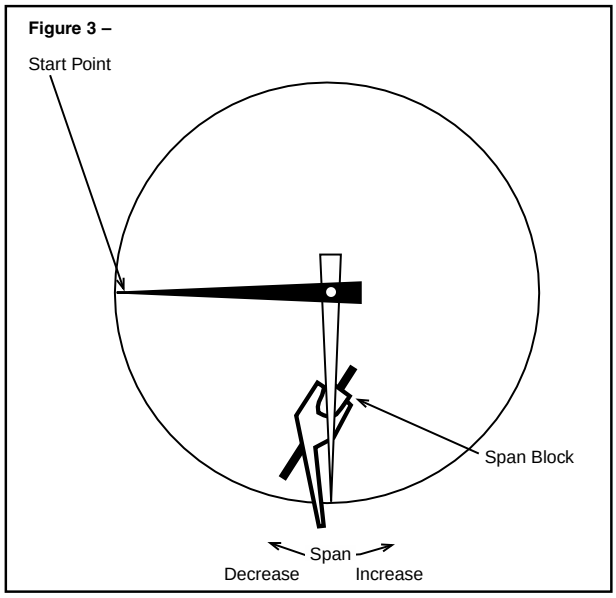


1. Remove ring, window and gasket pointer.
2. Using a pencil, refer to dial and mark the 0 and 25˝ Hg positions on the case flange.
3. Remove dial.
4. Apply 25˝ Hg vac.
5. Lightly press pointer onto pinion carefully aligning it with the 25˝ Hg vac. mark on the flange.
6. Release vacuum fully.
7. Note agreement of pointer to zero mark on flange.
8. If span is high or low, turn span block as shown in Figure 1.

Figure 1 –

9. Repeat steps 4 through 8 until span is correct.
10. Remove pointer.
11. With 25˝ Hg vac applied, reassemble dial, dial screws (finger tight) and point.
12. Apply 15˝ Hg vac. and note accuracy of indication. If required, slide dial left or right to reduce error to 1% maximum.
13. Firmly tighten dial screws.
14. Firmly tap pointer onto pinion.
15. recheck accuracy at 15 and 25˝ Hg vac. (Figure 2).
16. Reassemble window, gasket and ring.

Figure 2 –



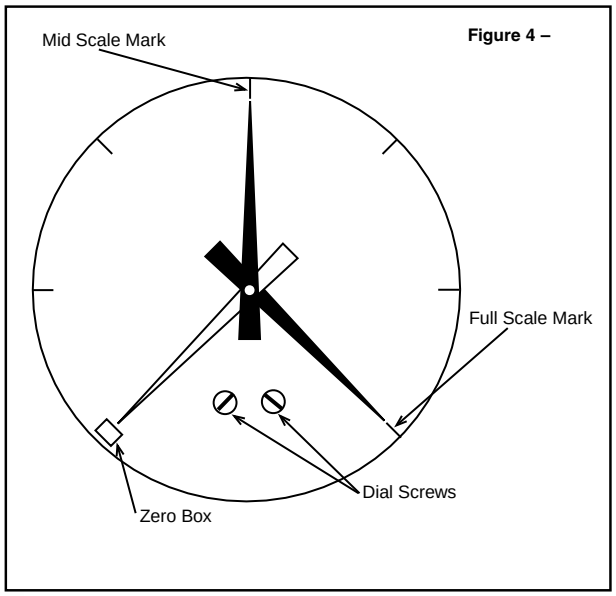
Notes: See page 10 for any tools required to calibrate.

For models produced prior to September 2008 for 2½˝ version and December 2008 for 3½˝ version.
Back of gauge will have a date code sticker.

© 2010 Ashcroft Inc., 250 East Main Street, Stratford, CT 06614-5145, USA, Tel: 203-378-8281, Fax: 203-385-0499, www.ashcroft.com
All sales subject to standard terms and conditions of sale. I&M008-10077 9/01 AMR 05/10

Step 1. With the dial off, install pointer at 9 o'clock "lightly," Figure 3.

Figure 3 –



Step 2. Go to full scale pressure…rotate span block with tool until pointer rests at 6 o'clock.

Step 3. Go to zero pressure (9 o'clock)…if pointer has not moved away from start point, go to Step 4. If pointer has moved, repeat Step 1 until span is correct.

Step 4. Install dial with screws snug.

Figure 4 –

Step 5. Install pointer centered in zero box, Figure 4.

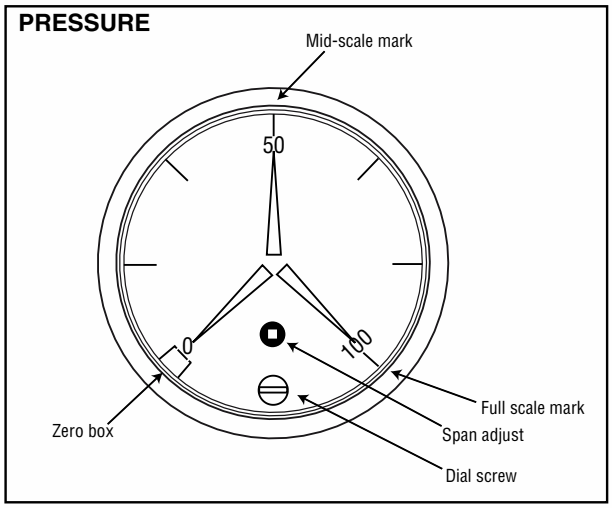
Step 6. Go to full scale pressure…check that pointer is within 1% of full scale mark. If not, remove pointer and dial and return to step 1, Figure 4.

Step 7. Go to mid-scale pressure…rotate dial until mid-scale mark is aligned with pointer, Figure 4.

Step 8. Tighten dials screws and stake on pointer.

Step 9. Check zero and full scale. Reassemble window, gasket and ring.

Notes: See page 10 for any tools required to calibrate.



For models produced prior to September 2008 for 2½˝ version and December 2008 for 3½˝ version.
Back of gauge will have a date code sticker.

All sales subject to standard terms and conditions of sale. I&M008-10077 9/01 AMR 05/10

ASHCROFT® Current Type 1009 Duralife® Calibration Procedure – Pressure and Vacuum Range

Calibration – 1009 Duralife® Gauge –
Inspect gauge for accuracy. At times gauges are simply "off zero" and opening the ventable plug at the top of the gauge will relieve internal gauge pressure and correct the offset. If this is not adequate and inspection shows that the gauge warrants recalibration to correct zero, span and/or linearity errors, proceed as follows:

Remove ring, window, and gasket using Ashcroft Ring Removal Tools P/N 101B220-02 and 101B221-02 for 2½" gauges and 101B220-01 and 101B221-01 for 3½" gauges.

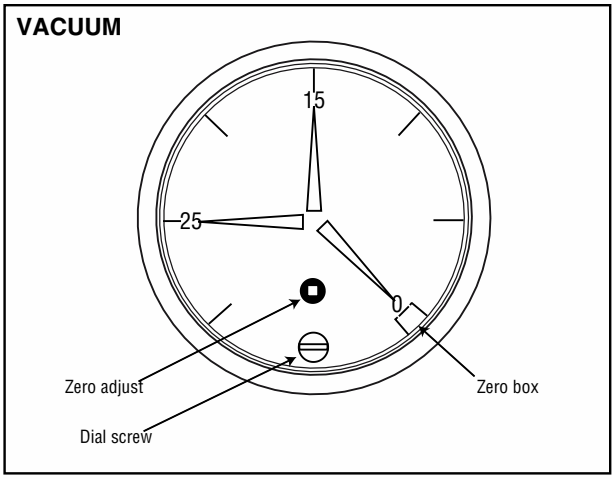
Positive Pressure Ranges –

1. Adjust pointer with a slotted screwdriver until it is in the center of the zero box. This is often all that is required it correct calibration issues.

2. Apply full scale pressure. If error exceeds 1% rotate the black span adjustment device with a #0 square drive bit. Clockwise increases span, counterclockwise decrease span.

3. Fully exhaust pressure and check that pointer still is still in the zero box. If not, repeat step 1 and 2

4. Once 0 and full scale are within tolerance, pressurize gauge to mid-scale.



5. If gauge is within 1%, calibration is complete. If not loosen the dial screw and rotate dial left or right to adjust midpoint. Retighten dial screw.

6. If an adjustment was made in step 5, recheck the gauge at zero and full scale, adjust accordingly until zero, mid and full scale points are in tolerance.

Vacuum Range –

1. Adjust pointer with a slotted screwdriver until it is in the center of the zero box. This is often all that is required it correct calibration issues.

2. Apply 25 inches Hg vacuum. If the error exceeds 1% adjust pointer with a slotted screwdriver until gauge is within tolerance.

3. Vent to 0 pressure and check pointer position in the zero box. If error exceeds 1% rotate the black span adjustment device with a #0 square drive bit. Clockwise rotation moves pointer clockwise, counterclockwise rotation moves the pointer counterclockwise.

4. Repeat step 1 and 2 until 0 and 25 inches of Hg are within gauge tolerance.

5. Apply 15 inches Hg vacuum. If gauge is within 1%, calibration is complete. If not loosen the dial screw and rotate dial left or right to adjust midpoint. Retighten dial screw.

6. If an adjustment was made in step 4, recheck the gauge at zero and 25 inches of Hg vacuum, adjust accordingly until zero, 15 and 25 inches Hg are in tolerance.

7. Continue below.

Re-assemble window and ring to gauge:

a. If plastic window is used, push window back into front of gauge, ensure the o-ring does not roll out of window groove (lubricate if necessary). Align the tabs of the window with the tabs of the case front. Once window is in place, install ring and tighten with tools referenced above and shown on page 10.

b If safety glass is used, reinstall window, gasket, and ring. Ensure that the gasket is seated properly under all four tabs of the ring and does not wrinkle when ring is tightened.

Note: Tighten ring: Apply 120-200inlb of torque. Rotate ring clockwise to tighten. Warning: over tightening of safety glass may induce cracking.

Notes: See page 10 for any tools required to calibrate.

For models produced after September 2008 for 2½˝ version and December 2008 for 3½˝ version.
Back of gauge will have a date code sticker.

	QUANTITY INCLUDED				
ACRYLIC WINDOW	1	1	1	1	1
FRONT O-RING	1	1	1	1	1
DIAPHRAGM(1)	1	1	1	1	2(1-LC:1-BC)
REAR COVER	1	1	1	1	2(1-LC:1-BC)
COVER SCREWS	4	4	-	-	-
THROTTLE SCREWS	2	2	2	2	2
GARTER SPRING	–	1	1	1	1
FILL IDENTIFICATION	1	1	1	1	1
THREADED RING	–	–	1	1	1
TOP FILL PLUG	–	–	1	1	–

1. When Halocarbon fill is a requirement, rear case diaphragm bladder material is Viton instead of the standard Buna diaphragm bladder. Consult factory for part number.

TEMPERATURE LIMITS[1]				60 psi and Under Down Scale Zero Shift Required
	Ambient	Process	Storage	
Dry (IP66)	–20/200°F (–29/93°C)	–20/250°F(1) (–29/121°C)	–40/250°F (–40/121°C)	NONE
LF (glycerin)	20/150°F (7/66°C)	20/200°F (7/93°C)	0/150°F (–18/66°C)	NONE
(silicone)	–40/150°F (–40/66°C)	–40/200°F (–40/93°C)	–40/150°F (–40/66°C)	.12 psi
(halocarbon)	–40/150°F (–40/66°C)	–40/200°F (–40/93°C)	–40/150°F (–40/66°C)	.12 psi

Note: Other than discoloration of the dial and hardening of the gasketing that may occur as ambient or process temperatures exceeds 150°F, non-liquid-filled gauges with standard glass windows, can withstand continuous operating temperatures up to 250°F (121°C). Liquid-filled gauges can withstand 200°F (93°C) but glycerin fill and acrylic window will tend to yellow. Accuracy at temperatures above or below the reference ambient temperature of 68°F will be affected by approximately .4% per 25°F. Gauges with welded joints will withstand 750°F (450°F (232°C) with silver brazed joints) for short times without rupture, although other parts of the gauge will be destroyed and calibration will be lost. For continuous use and for process or ambient temperatures above 250°F (121°C), a diaphragm seal or capillary or siphon is recommended.
(1) Available for temperature below –20°F, see Production Information page ASH-PI-21B for details

1. Unscrew front threaded ring (turn CCW). Remove and discard glass window. For range spans 60 psi and under, shift pointer down scale by the amount shown in the table. With either the glass or plastic window, replace the O-ring with one furnished in the kit.
2. Remove protective paper from acrylic plastic window taking care not to scratch window. Assemble window in gauge.
3. Moisten face of threaded ring with silicone oil or silicone grease where ring bears up against window. Replace front threaded ring and tighten firmly hand tight. See instructions on reverse side for applying proper torque to ring to establish desired squeeze on O-ring seal. **(Fig. 4).**
It is important to hold gauge **rigidly,** otherwise ring lugs may be damaged during removal or assembly process.
4. From rear of gauge, remove and discard these parts: rear cover and cover gaskets from case.
Note: Disregard Step Nos. 5a and 5b if converting to hermetically sealed version.
When converting a 45-1379 with the top fill hole configuration, p/n 256A176-01 fill plug is required and must be ordered separately.
5. Filling Procedures:
a. Manual Filling Procedure: Place gauge face down on bench and **tip gauge** by blocking up front with a ⅜ inch block at the 12 o'clock dial position. Tipping of the gauge is necessary so fluid will flow into front cavity of the case. Pour in fill liquid to within about 1⁄16 inch of rear seal lip. When bubbles stop rising, front cavity is filled. Remove ⅜ inch block and pour in liquid until level is about 1⁄16 inch below rear sealing lip.
Note: An alternative method of filling is to fill the front dial cavity, adding the front window, etc., as in Step No. 3. Then fill the rear of the gauge. This method eliminates the need to tip the gauge.
b. Vacuum Pump Fill Procedure: (This procedure is recommended when filling a large number of gauges.) Place gauge face down and insert a ⅛ inch diameter tube, connected to a vacuum pump, through the 12 o'clock position hole in the rear, solid front portion of the case **(see Fig. 5).** Evacuate the air from the front dial cavity while pouring in the fill fluid through the case back. The vacuum will displace the air with fluid. When the dial cavity is solidly filled, remove the tubing and continue to pour the fill fluid to within 1⁄16 inch BELOW the O-ring channel lip.
Pre-measuring fill amount is not necessary with above methods. For reference, amount of fill is approximately 400 ml. or 14 fluid oz. (4½˝ GA.) and 455 ml. or 16 fluid oz. (6˝ GA.).
c. Note: The liquid fill level should be ⅜˝ (±⅛) as measured from the inside of the ring at the 12:00 o'clock position.
6. On lower connection gauges, assemble rear seal diaphragm to case.
For back connection gauges see instructions on reverse side. **(Fig. 2/4).**
7. For 1279:
Assemble rear cover and six self tapping screws in a criss-cross pattern and torque to 12 in lbs. (±2 in lbs.)
For 1379:
- Thread rear ring and torque to 200 in lbs
- Install stainless steel back cover using two screws. Torque screws to 14 in lbs. (±2 in lbs.)

8. Assemble throttle screw to threaded hole in socket.
Note: If system is monel (socket wrench flat stamped "PHS" or "PH") use monel throttle screw.
9. Check appropriate box on fill identification label, and peel off label back, and attach fill label to gauge case.
10. If gauge is to be repackaged:
a. Include enclosed instruction sheet inside carton.
b. Change type number on carton label to:
(1) Hermetically Sealed – 1279(*)SH.
(2) Liquid Filled – 1279(*)SL.
*Bourdon Tube System Code

Glycerin or silicone should not be used in applications involving Oxygen, Chlorine, Nitric Acid, Hydrogen Peroxide or other strong oxidizing agents, because of danger of spontaneous chemical reaction, ignition or explosion. Halocarbon should be specified. Products with this fill can be ordered from factory.

The use of fluids other than those listed in the table above (for example, Hydrocarbon-based oils) may result in leakage caused by a reaction between the fluid and the elastomeric seals. Consult the factory before filling with any other fluid.

TYPE 1279 & 1379 SOLID FRONT DURAGAUGE®
PRESSURE GAUGE CONVERSION INSTRUCTIONS TO:

- **Convert A Standard Dry Gauge To A Liquid Filled Gauge**
- **Convert A Standard Dry Gauge To A Dry, Weatherproof IP66 Gauge**

ASHCROFT®

INSTRUCTIONS FOR USING CONE TOOL AND RING WRENCH

Garter Spring & Diaphragm Assembly (Back Connection Gauge Only)

A. Place cone tool over socket shank as shown.

B. Moisten lip of socket and outer O-ring surface with silicone oil or grease.

C. Place diaphragm with rib side facing upward over cone into case grove.
Diaphragm O-ring must be completely in socket-shank grove.

D. Place garter spring over cone as shown and slide onto diaphragm in socket grove

E. Assemble rear cover with screws per step 7.

Front Ring Assembly (All Gauges)

A. Assemble ring to case by hand to start.

B. Place ring on wrench as shown

C. Use ½˝ drive extension and torque ring to 200 in. lb

Alternate Method

A. Tighten ring snugly by hand

B. Mark case and ring.

C. Turn ring another 100 to 120 degrees (slightly less than ½ turn) using the ring wrench and ½˝ drive socket wrench or place the blunt end of a wooden or plastic dowel against a ring lug and tap with a hammer.

BACK CONNECTION ASSEMBLED GAUGE

Fig. 2

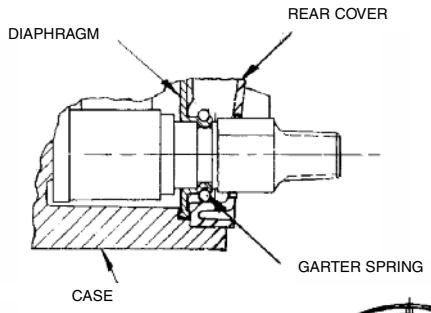

Fig. 3

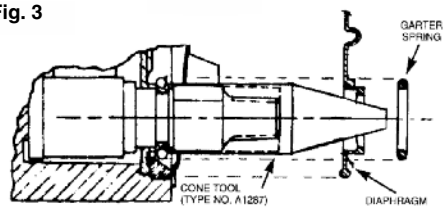

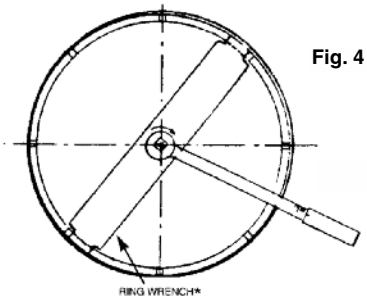

Fig. 4

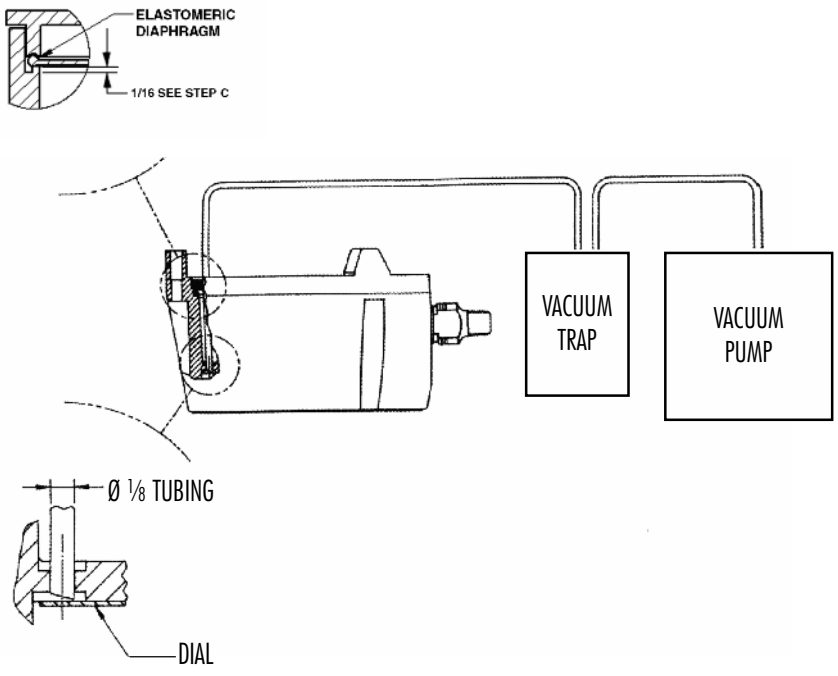
INSTRUCTIONS FOR LIQUID FILLING ASHCROFT® TYPE 1279 AND 1379 SOLID FRONT DURAGAUGE® PRESSURE GAUGES USING A VACUUM PUMP

A. Insert a length of ⅛ ˝ diameter tubing through the 12 o'clock position hole in the rear, solid front portion of the case, as shown.



B. Evacuate the air from the front dial cavity while pouring in the fill fluid through the case back. The vacuum will displace the air with fluid.*

C. When the dial cavity is solidly filled, remove the tubing and continue to pour the fill fluid to within 1/16 ˝ below the o-ring channel lip, as shown.

D. When converting a 45-1379 with the top fill hole configuration, p/n 256A176-01 fill plug is required and must be ordered separately.

*To prevent breakage, reduce vacuum to 15 in. Hg for plain glass and safety glass.

INSTRUCTIONS FOR USE OF EXTERNAL EASY ZERO™ ADJUST FEATURE*

Fig. 1

1. LOOSEN RING-LOCKING SCREW **A**.
2. OBTAIN REQUIRED ADJUSTMENT BY ROTATING KNOB **B** CLOCKWISE OR COUNTER-CLOCKWISE.
3. TIGHTEN SCREW **A** DOWN ON KNOB **B**.

*Applicable only for test gauge with hinged ring design.

ADDITIONAL CALIBRATION INSTRUCTIONS

1) "Standards shall have nominal errors no greater than ¼ of these permitted for the gauge being tested." *(Ref: ASME B40=100-1998)*
2) The instrument used as the calibration standard should have a maximum range no greater than 2x that of the gauge being tested. (i.e. Do not use a 400psi standard to test a 15psi gauge.)
3) "Known pressure shall be applied at each test point on increasing pressure (or vacuum) from one end to the other end of the scale. At each test point the gauge shall be . . .
lightly tapped, and then read . . ."
(*Ref: ASME B40.1 ¶ 6.2.4.1*)
4) To read gauge indication, move eye over red pointer tip at OD of printed dial until red reflection in mirror band is no longer visible, and then read the pointer position in reference to the dial.

Diaphragm Seal Installation and Maintenence Manual

ASHCROFT®

1. Introduction

A diaphragm seal is a device that attaches to the process side of a pressure-measuring instrument to separate the instrument from the process fluid while transmitting pressure across a flexible membrane. The volume enclosed by the diaphragm, the top housing, and the measuring element is completely filled with a pressure transfer fluid. A change in pressure at the process connection causes a displacement of the filling fluid due to deflection of the diaphragm, transferring the change in pressure to the sensing element of the pressure instrument.

2. Safety Information

WARNING: Serious injury or equipment damage can result from failure to properly install, maintain, or operate these components. To assure safe operation and maintenance procedures, read carefully and follow the instructions in this manual.

- Follow all instructions in this document to avoid exposure to pressurized fluid
- Use proper tools and safety equipment in installing or maintaining components
- Assure that process pressure and temperatures are properly monitored and maintained, and the process fluid is appropriate and compatible with the wetted materials of the diaphragm seal
- Follow all of your company's safety procedures in the event of a leak or diaphragm seal failure

3. Diaphragm Seal Components

Though the exact components will vary between specific models, most diaphragm seals will share the same essential parts.

3.1 Top Housing

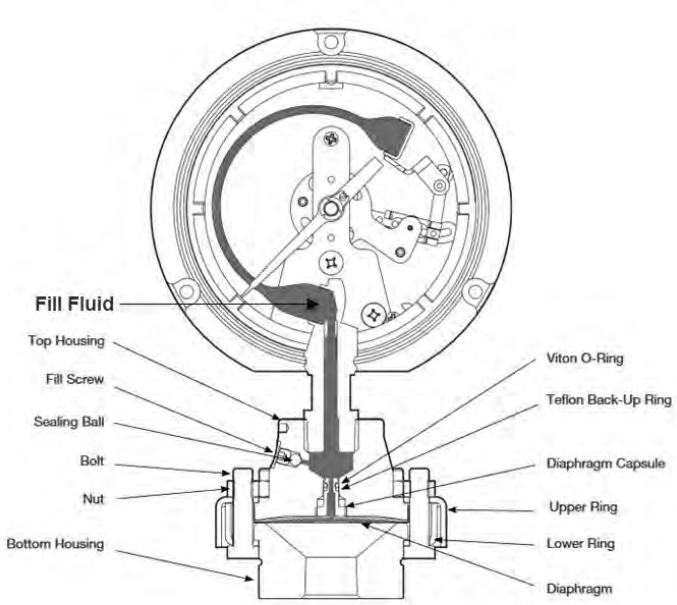
The top housing of the diaphragm seal is used to connect to the pressure measurement instrument. The fill port allows for assemblies to be vacuum filled, then sealed with a ball bearing in a conical seat and secured with a set screw.

3.2 Diaphragm

The diaphragm serves to separate the process fluid from the filling fluid, and as such is a component wetted to the process. Diaphragms can be welded or threaded into the top housing, which in turn can be welded or clamped to a lower housing. Changes in pressure cause the diaphragm to deflect, displacing fill fluid and transmitting pressure to the pressure-measuring instrument. It is important to ensure that a diaphragm has sufficient displacement to operate a pressure-measuring instrument across its entire span. For detailed diaphragm seal and instrument compatibility, see Ashcroft Product Information Page DS-PI-82, "Minimum and Maximum Pressures for Diaphragm Seals," found at Ashcroft.com

3.3 PTFE Gasket

All 100- and 200-series seals are supplied with a single-use PTFE skirted gasket. Refer to Section 4.2.3 for process considerations related to these gaskets.



© 2019 Ashcroft Inc. 250 East Main Street 06614, Tel: 203-378-8281 • Fax: 203-378-0499, All specifications are subject to change without notice.
All sales subject to standard terms and conditions. www.ashcroft.com All rights reserved. 100-200-300_seal_im_RevA_07-26-19

3.4 Lower Housing

The lower housing connects a diaphragm seal to the user's process, and is therefore a wetted part. Lower housings are designed to mate with the process They are avaiable in a wide variety of thread sizes. Lower housings can optionally be provided with threaded flushing connections which can be used to clean the inside of the seal or to flush out process media.

3.5 Fill Fluid

A filling fluid (sometimes referred to as "system fill," "pressure sensing fluid," or, "hydraulic fluid") is required to transmit pressure from the diaphragm membrane to the pressure sensing device. Diaphragm seal assemblies are filled via a vacuum filling process that ensures the system contains no air gaps. Fill fluids are selected based on operating conditions; primarily temperature. Though normally not in contact with the process media, a diaphragm failure may bring process media in contact with the fill fluid, so compatibility with the process media should be a consideration.

4. Specifications

4.1 100/200/300-Series Seals

4.1.1 Threaded Seals: 100, 101, 200, 201, 300, 301

Connections	100, 200, 300: threaded process connection 101, 201, 301: threaded process connection with flushing port
Process Connection Sizes	¼ to 1½ NPT female ¼ to 1 NPT male
Instrument Connection Sizes	¼ or ½ NPT female
Pressure Ratings	2,500 psi (5,000 psi optional)
Added Instrument Tolerance	±0.5% typical
Wetted Components	Diaphragm, bottom housing, PTFE gasket
Non-Wetted Components	Top Housing, clamp rings, assembly hardware

4.2 Temperature Information

4.2.1 Thermal Dissipation

Seals will dissipate thermal energy, though ambient and process conditions will greatly affect the amount of heat that can be lost through the seal. Accessories designed for dissipating heat, such as siphons or capillaries, should be used whenever dealing with elevated process temperatures.

4.2.2 Elastomers and Polymeric materials

Seals made with elastomeric or polymeric wetted components will have lower pressure ratings than those made from metallic components. Refer to the applicable data sheet for temperature and pressure ratings for seals with non-metallic diaphragms or bottom housings.

4.2.3 PTFE Gasketing

The highest acceptable process temperature for PTFE gaskets is 500F. The lowest acceptable temperature is limited by the fill fluid, the lowest of which is Syltherm XLT, rated to -150ºF. For process temperatures below -150ºF or exceeding 500ºF, consider a temperature dissipating device, such as capillary or a a microTube™ or siphon. For processes that are not compatible with PTFE, consider an all-welded diaphragm seal.

5. Fill Fluid Specifications

Fill Fluid	Temperature	Viscosity (cSt at RT)	Variation Code	Notes
Glycerin (food grade)	0°F to 400°F (-18°C to 204°C)	1,300	CG	Direct-mounting only. Not for use with vacuum service
50 cSt Silicone	-40°F to 500°F (-40°C to 260°C)	50	CK	
10 cSt Silicone	-40°F to 500°F (-40°C to 260°C)	10	DJ	
Halocarbon® 4.2	-70°F to 300°F (-57°C to 199°C)	4.2	CF	For use with oxygen/ oxidizing process media
Slytherm® 800	-40°F to 750°F (-40°C to 400°C)	10	HA	High temperature applications
Syltherm® XLT	-150°F to 500°F (-100°C to 260°C)	1.4	CC	Low temperature applications
Calflo® AF	-20°F to 600°F (-29°C to 316°C)	60	KF	High temperature, silicone-free
Mineral Oil	10°F to 400°F (-12°C to 204°C)	75	MY	
Neobee® M-20 (food grade)	5°F to 400°F (-15°C to 204°C)	9.5	NM	
Silicone (food grade)	-40°F to 500°F (-40°C to 260°C)	350	CZ	
Distilled Water	40°F to 185°F (4°C to 85°C)	0.9	FJ	
50/50 Glycerin/Water	15°F to 200°F (-9°C to 93°C)	30	GH	
Propylene Glycol	-50°F to 325°F (-46°C to 163°C)	54	CV	
Ethylene Glycol	20°F to 325°F (-7°C to 163°C)	14	FK	
50/50 Ethylene Glycol/Water	-25°F to 190°F (-32°C to 88°C)	2.9	CT	
80/20 Glycerin/Water	15°F to 225°F (-9°C to 107°C)	270	GR	
95/5 Water/ Propylene Glycol	40°F to 185°F (4°C to 85°C)	1.0	PY

Diaphragm Seal Installation and Maintenence Manual

ASHCROFT®

6. Installation

6.1 General Information

Instruments attached and filled to diaphragm seals should never be tightened or loosened at the top housing. Doing so will alter the dynamics of the fill fluid and diaphragm movement, causing errors in the reading. Assemblies should ONLY be installed and/or tightened at the diaphragm seal lower housing. Most diaphragm seals can be purchased with either a locking device (XLD) or with the instrument welded to the top housing of the seal to prevent tampering (XDU).

Diaphragm seals should be installed in accordance with any safety precautions or installation specifications applicable to the end user. That said, the general principles in the following sections still apply.

6.2 Flushing Ports

Use of flushing ports is application-specific and are often used when process media has the potential to clog inside the lower housing, whether due to process media solidification, suspended solids, polymerization, or other factors. Diaphragm seals with flushing ports must have the flushing ports plugged prior to startup. Flushing ports on most seals are ¼ NPT, though some configurations may have ⅛ or ½ NPT flushing ports. Diaphragm seals can be ordered with the flushing ports pre-plugged with the "XPU" variation. Note that to prevent thread galling or stripping, factory-installed flush plugs may not be fully tightened and should be checked for tightness prior to pressurization.

6.3 Threaded Seals

Note: Torque should never be applied to the pressure instrument when installing the diaphragm seal. Most seals are supplied with either wrench flats or spanner holes to be used when installing the seal into process piping.

Threaded seals are most commonly supplied with NPT threads per ASME B1.20.1. NPT threads require the use of a suitable thread sealant, such as pipe dope or PTFE tape, and must be tightened securely to prevent galled threads and to ensure a leak-tight seal. Torque values will vary by connection size, though 2-3 full turns past finger-tight is often used as a guideline. Refer to ASME B1.20.1 for detailed information regarding NPT threads. For alternate thread types (metric, BSP, etc.), refer to the applicable specification.

7. Maintenence

7.1 Storage

Diaphragm seal assemblies should be stored in accordance with the storage requirements for all instruments attached, as well as any temperature limits listed above. Common instrumentation is shown in the table below. Refer to the respective data sheets or maintenance guides for detailed storage requirements for Ashcroft pressure instruments. Note that certain fill fluids (e.g., distilled water) may have storage and process temperature limitations narrower than the below data.

Pressure Instrument	Minimum Storage Temperature °F (°C)	Maximum Storage Temperature °F (°C)
Pressure Gauge (Dry)	-40 (-40)	250 (121)
Pressure Gauge (Glycerin-filled)	0 (-18)	150 (66)
B-series switches	-20 (-28)	150 (65)
A- Series Switches	-40 (-40)	257 (125)

7.2 Frequency of Inspection

Inspection frequency is application-specific and depends on the severity of the service and how critical the accuracy of the pressure instrument is. For example, a monthly inspection may be necessary for severe service applications, such as corrosive process media or heavy pulsation and vibration. Annual inspections, or even less frequent schedules, are often employed in non-critical applications.

7.3 Removal from Service

Diaphragm seals should be properly isolated and vented from the process prior to disassembly. Most diaphragms can be inspected by removing the diaphragm seal from the process (either by unthreading or by removing it from the mating flange) and viewing the diaphragm through the lower housing. If additional inspection is needed, 100- and 200-series diaphragm seals can be disassembled by removing the clamping screws and separating the top housing and diaphragm from the lower housing. Note that the PTFE wetted gaskets on certain seals are single use, and must be replaced anytime the compression is lost. Replacement gaskets can be ordered from Ashcroft (part number 124A287-01). 300-series seal should not be disassembled, as the diaphragm is merely clamped between the top and bottom housing; disassembling will result in loss of fill fluid.

© 2019 Ashcroft Inc. 250 East Main Street 06614, Tel: 203-378-8281 • Fax: 203-378-0499, All specifications are subject to change without notice.
All sales subject to standard terms and conditions. www.ashcroft.com All rights reserved. 100-200-300_seal_im_RevA_07-26-19

7.4 Diaphragm Seal Failures and Troubleshooting

100, 200, and 300-series diaphragm seal are continuous duty as defined by ASME B40.2. Should the pressure instrument fail or be removed accidentally, the diaphragm will seat against a matching surface in the top housing preventing damage to the diaphragm or leakage of the process fluid.

In the event that a diaphragm failure is suspected, the assembly should be immediately isolated from the process and the cause for failure determined. Most diaphragm failures are caused by corrosion, high temperatures, or fill leakage. Process media build-up in the lower housing can also require cleaning or replacement. In the event of a diaphragm failure due to corrosion, it is critical that the wetted materials of the assembly be evaluated for compatibility before it is replaced.

7.4.1 Troubleshooting Guide

Symptom	Possible Cause	Solution
Instrument not responding to pressure	Poor filling process, loss of fill fluid	Refill diaphragm seal and instrument assembly
	Process media clog or accumulation in lower housing	Clean out lower housing; alternately, use a seal with a flushing port
Process media leaking from process connection	Threaded seals: Inadequate thread sealing	Check that the seal has been properly torqued and that the threads have been sealed with pipe dope or PTFE tape
Rusted bolts/top housing/flange	Corrosive atmosphere	In most cases rust will not affect the performance of the seal. Consider more corrosion-resistant non-wetted materials.
Upscale shift on pressure reading	Temperature error – High Temp	Consider a heat dissipation accessory, such as a capillary or MicroTube™ Siphon
	Overfilling	Refill diaphragm seal and instrument assembly
	Diaphragm permeation	Certain process media can permeate the very thin diaphragm material and react with fill fluid. Review wetted material compatibility

1. INTRODUCTION

This manual has been prepared to provide the end user with general guidelines in the installation, operation and routine maintenance of BFE valves. If, after reviewing the contents of this manual, you require any special instructions, assistance, repair services or have any additional questions, please contact either our factory or our nearest representative for assistance.

2. GENERAL DESCRIPTION

A. CATALOGUE : A copy of our catalogue is available upon request.

B. TECHNICAL DATA : Nameplate & Valve Information.

The nameplate permanently attached to the valve, provides you with the rated working pressure, temperature range and material used. When ordering replacement parts, reference to the information provided on the nameplate will aid in ensuring that you receive correct component parts for your valves. For further information refer to this manual or contact BFE Customer Service.

WARNING!!! Never attempt to modify BFE valves in any way without authorization and assistance of BFE, otherwise the mechanical guarantee will not apply and severe damage to the equipment could result.

3. VALVE STORAGE

A. Preparation and Preservation for Shipment

Preservation and other protective measures for shipment must be sufficient to protect against deterioration and physical damage during shipment. The type of packing must be defined in the Customer's Order and shall be appropriate to ensure safe transportation and conservation before installation.

BFE valves are normally shipped from the factory in boxes, crates or on skids. Protruding parts, such as the handwheels, indicator rods, and stem protectors are sometimes removed from the valves and either attached to the box or crate or packaged separately.

B. Inspection Procedure

All valves and associated parts should be inspected carefully for any visible sign of damage and if necessary, claims promptly submitted to the carrier. Any parts shipped loose or separately should be properly packed to prevent losts or damage. Care should be taken in handling valves to prevent damage, particularly to equipment extending above the valve bonnet and any fittings protruding from the valve body. Upon receipt, the valves should be inspected for shipping damage. If the end protectors are removed for inspection purpose, be sure to re-install them to maintain internal cleanliness. If caps are missing, an inspection of the valve cavity is required. All foreign matter must be removed.

C. Handling

- Most handling can be accomplished by placing "hook" diagonally into holes on each side of the end flanges, or by the usage of straps slung around the arms of the valve body.
- Never lift or move the valve assembly using the bore, shafts, nut as a pressure point.
- Never lift or move the valve assembly by using the actuator, positioner, extensions, handwheel, gland bolting or other valve options.
- Transport, unpack and store being careful not to scratch the surfaces of flanges or gaskets. Also, take steps that will prevent any foreign matter from getting into the valves. Wooden plate or plastic caps should not be removed until the valves are installed.
- The transportation of all packed material must be carried out safely and following the local safety regulations.

D. Storage Procedure

- If the valves are to be stored for any extended period of time, the flange or end protector should be examined to ensure they are fastened securely, and any other open areas should be sealed to prevent any moisture damage.
- All valves should be securely held in place by banding or other means of support to prevent accidental damage due to movement of the valves.
- Valves should be kept in a clean, heated, weather tight (dry), well-ventilated, fire-resistant storage facility with flooring that seals against dust and dirt and will not be subject to flooding.
- Valves should be stored off of the floor on suitable skids, pallets or racks and protected from dirt, debris and exposure to direct sunlight, particularly to soft sealing surfaces.
- Valve assemblies with electrical components, pneumatic tubing, positioners, actuators, and other accessories should be protected from impact.
- The end faces must be protected from rust and dust with plastic or wooden discs fixed with straps.
- Periodical checks at least every 6 months have to be carried out in the storage area to verify that the above mentioned conditions are maintained.

4. VALVE INSTALLATION

A. General

- Remove valve assembly from box or crate with caution.
- Prior to installation, confirm that there are no scratches on the surfaces of flanges and stem. Also, make sure that the inside of the valve port area and seat surfaces are cleaned with a dry cloth. The seat surfaces are most important in achieving optimal valve performance and special attention should be taken to ensure that there are no “scratches” or defects to these surfaces.
- All BFE Valves are shipped from the factory in the closed position and normally will have a coating of rust protective oil. Before installing the valves, all oil or grease (used to protect the valve) should be removed taking care not to damage the seat contact surfaces.
- Following installation of the valve, operate the gate disc fully open and closed at least once prior to hydrostatic testing of the line to ensure freedom of operation.
- Ensure that the construction materials listed on the valve nameplates are appropriate for the service intended and are as specified.
- For threaded ends use conventional sealant, for flanged ends or other ends (clamp etc) use the standard method described in the international standards.
- After the valve installation and before the line testing, it is recommended to perform an accurate cleaning of the lines to eliminate dirt and any foreign matter that could seriously jeopardize the tightness between seat/disc and the correct operation of the valve.
- If the valve has been stored for a long time, check the bolt torque for all bolting.
- Packing compression should be carefully inspected and if necessary packing gland bolts torque should be adjusted.
- If piping system is pressurized with water for testing, and in case the piping system has been shut down after testing for a long time, it is recommended to use corrosion inhibitor with water to pressurize the piping system and after testing, the piping system should be depressurized and the test water completely drained.
- The pipeline must have a pulsation dampener if there are pulsation sources in the line. Lines subjected to pipe vibration and pulsation affect the lifetime of the valve seal parts.
- After completion of hydrostatic testing, the valve should be drained to eliminate any water or test fluid which may have been trapped in the valve.

B. INSTALLATION TABLE BASED ON VALVE CONNECTION TYPE

Simply choose your procedure depending on the Valve End Finish:

FLANGED END

Make sure that two like flanges are being fitted together. Usually the proper set-up is either plain face to plain face or raised face to raised face flange. Tighten the flange bolts in a crossover pattern as follows:

A - Slightly torque all bolts using a crossover bolt sequence. Bolts should be tightened evenly to prevent cocking of the flange and uneven gasket loading.
B - Repeat step 'A' using additional torque until all bolts are tightened properly.
This may require several re-torques because as one bolt is torqued, it will relieve stress on the adjacent bolts.
C - On high pressure, high temperature applications, it is recommended that the bolts be retightened after 24 hours of operation to compensate for any relaxation or creep that may have occurred.

BUTT WELDING END

WARNING!!! Gate and Globe valves should be lightly open to prevent damage to the seating surfaces and stem caused by thermal expansion during the butt welding process.

NOTES:
- Proper welding is required to ensure a pressure tight seat and to retain its ability to withstand stress. Remember that the valve, pipe and weld root must be of compatible materials and the welding be performed by a properly trained welder and approved weld procedures and qualifications.
- Be sure to leave a proper gap between the end of the pipe and the end of the valve. This will allow for expansion of the materials as it is welded, any extended welding time could cause excessive heat build up on the valve seat area which could cause damage such as loosening of the seat rings, surface distortion etc.
- The specified PWHT can then be performed in line without affecting the valve. Shortly after welding, open and close the valve to check for proper operation to make sure no binding has occurred due to welding heat.
- Also welding slags and spatters are to be completely removed and cleaned to avoid damage on seating areas.
- Where possible, attach the electrical ground to the adjoining pipe on the same side of the valve as the weld being made. Do not attach the earth to the handwheel or upper structure of the valve or arcing across the valve seating surfaces could occur.
- Where possible, welding should be done in the flat or horizontal position. Where vertical welding is necessary, progression should be upward (vertical down welding is prone to lack-of-fusion).
- During the PWHT only the valve body must be insulated in order to not overheat the packing-stem region.

SOCKED WELD END

WARNING!!! Gate and Globe valves should be lightly open to prevent damage to the seating surfaces and stem caused by thermal expansion during the socket welding process.

Weld the connection as follows:
A - Remove all grease, oil or paint from the pipe that is to be welded into the valve and from the valve end connections.
B - Insert the pipe into the valve end connection until it bottoms out in the socket weld bore.
C - Withdraw the pipe 1/16" so that a gap remains between the pipe and the bottom of the socket weld bore to prevent cracks (ASME B16.11). Tack the pipe into the valve and complete the fillet weld.
NOTES:
A minimum of two layers should be used for all socket welds. This will decrease the chance of leaking even if one pass contains a weld defect.
- The specified PWHT can then be performed in line without affecting the valve. Shortly after welding, open and close the valve to check for proper operation to make sure no binding has occurred due to welding heat.
- Where possible, welding should be done in the flat or horizontal position. Where vertical welding is necessary, progression should be upward (vertical down welding is prone to lack-of-fusion).
- During the PWHT only the valve body must be insulated in order to not overheat the packing-stem region.

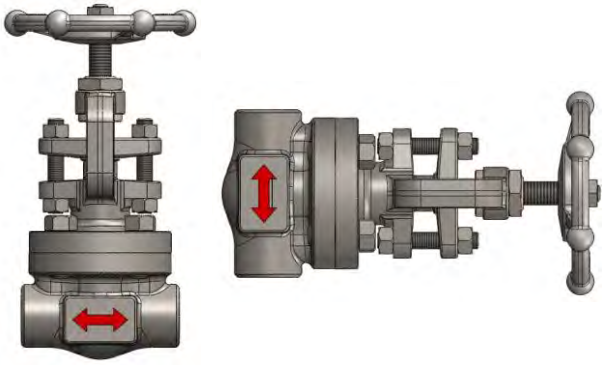
CLAMP END

Clamp installation and maintenance instruction (clamp, clamp gasket and clamp boltings and nut) and are not scope of the valve manual. See the clamp manufuacturer IOM for details.

THREADED END

See Annex A of this manual.

C. VALVE POSITIONING

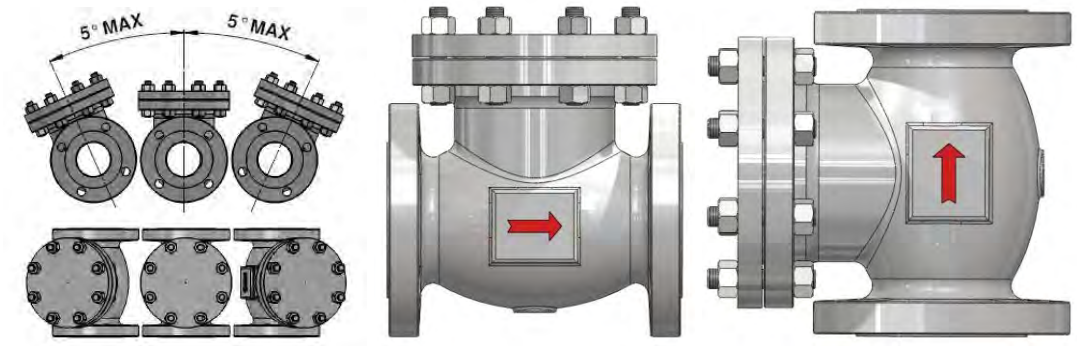


Positioning the valve in the pipe run is very important. Prior to actual installation, check for clearance around the valve to ensure adequate space for proper operation. Also, keep in mind the need for

clearance for future maintenance and repair. Once proper positioning and clearance have been assured the system should be cleaned of all foreign matter. Whenever possible, blow out the pipeline with water to remove grit and dirt. Also be sure to remove the valve end protectors and check the valve again for cleanliness.

ACTUATED VALVES: valves are designed to withstand the actuator only with stem in vertical position. If the installation requires a different stem position, user must fasten the actuator to avoid damage or incorrect working of valve-actuator system.

VALVE POSITIONING for GATE & GLOBE VALVES



Gate and globe valves should be installed with the stem in an upward position on horizontal lines. However, an alternative stem position is at an angle between the vertical and horizontal axis that will allow for complete drainage. If installed with the stem below the horizontal axis, complete drainage is not possible and solids may accumulate in the valve bonnet that will greatly affect the valve operation and service life. A gate valve can be installed in line with disregard to flow direction. However, install the valve carefully according to the flow direction arrow, when the disc is provided with pressure balance holes to prevent abnormal pressure increase.

VALVE POSITIONING for CHECK VALVES

Check valves must be fitted in horizontal pipe runs with the cover facing vertically upward. Variance to either side of the vertical axis must not exceed 5 degrees. Swing check valves and spring loaded check valve design allow for additional position, such as vertical upwards flow. Valves must not be installed in vertical downward flow pipe runs or in horizontal pipe runs with the cover not in vertical up position. Always install valves in the direction indicated by the flow arrow stamped on the body. Piston and stop check valves should be fitted similarly to check valves.

NOTE. Spring loaded check valves can be installed with fluid direction from downward, but it's not advisable, the gravity effect cannot ensure a proper sealing in the event of a back-flow from downward.

D. PURGING AND TESTING OF LINE

Once the valve is in line, open the valve and flush or blow out the line again to remove any dirt or foreign objects that may have collected during installation. Check for tightness of body/bonnet bolts and for proper packing gland adjustment. Operate the valve to ensure correct operation. Pressure test the valve to ensure the integrity of all joints.

5. VALVE OPERATION

- The gate/globe valve is closed by rotating the handwheel in a clockwise direction; and is opened by rotating the handwheel in a counter clockwise direction.
- Do not apply excessive torque to the gate of the valve after it has reached the fully open or fully closed position as this could result in damage to the gate, stem or operating nut.
- Gate valve should be used in fully opened or fully closed position. If it is used in a slight or half opened position, the disc may vibrate at a high speed that may cause pulsation of the flow. Therefore, do not use a gate valve for flow control or throttling service.
- Globe valves can also operate in either direction or flow, but it is recommended that pressure is always against/under the disc.
- **WARNING!!! If the valve is SLAB or PARALLEL SLIDE TYPE: When the position indicator is in the closed position the valve is fully isolated. DO NOT APPLY ANY ADDITIONAL FORCE.**

6. MAINTENANCE

A. GENERAL

WARNING!!! Do not remove or disassemble the valve while it is under pressure. Depressurize the line and the valve as following:

- ✓ Place the valve in the open position and drain the line.
- ✓ Cycle the valve to relieve the pressure trapped in the body cavity.
- ✓ After removal and before disassembly, cycle the valve several times.

WARNING!!! Line Fluid can be toxic, corrosive or dangerous the health and safety. Protect yourself and others by observing all applicable standard procedures. Make the right choice, ***SAFETY FIRST***!

B. RECOMMENDED PREVENTIVE MAINTENANCE

Maintenance programs vary greatly from application to application, depending on factors such as operational frequency, fluid make-up, external environment, etc. The end user should establish a routine maintenance program to extend the life of the valves and minimize downtime for repair.

SUGGESTED MONTHLY MAINTENANCE	SUGGESTED 6 MONTHS MAINTENANCE
1.Visually inspect the valve for signs of leakage or corrosion.	1.Cycle the valve fully open and closed at least once to check for freedom of operation.
2.Visually inspect the stem packing to avoid any leakage from the stuffing box.	2.Remove the stem protection (if any) and lubricate the valve stem.
3.Lubricate the valve, if necessary (stem and stem nut).	3.Repeat steps 1, 2 and 3 from the monthly maintenance recommendations.

C. MAINTENANCE INSTRUCTION

The maintenance and repair of BFE valves is usually limited to the adjustment of the packing gland and the lubrication of yoke sleeve as previously stated.
For standard maintenance of valves the only components suitable to be substitute are: Stuffing box packing & Body/bonnet gasket.
For special ordinary maintenance the seat replacement and the seal surface retrofit can be performed.
Should you need to perform the mentioned above repairs the following information should be used as a guide in your repairs always in conjunction with the applicable GAD (ask BFE if you don't have it). For special requirements ask BFE for special custom instruction & VGI.

C1. STEM PACKING

If the gland has run out of travel or excessive tightening does not stop the leakage, isolate and de-pressurise the valve for repacking. The valve need not be taken out of line for simple repacking, however, repacking is not recommended while the valve is in service.

If the stem does not backseat correctly and seal completely against the backseat bushing, the stem packing can not be replaced while the valve is under service conditions.

To extract packing remove the gland nuts and studs, lift the gland flange and gland out of the stuffing box. Next, remove old packing, by using an extractor tool of the correct size. Any remnants of old packing must be removed from the stuffing box and the stem. Clean the stem and stuffing box and examine it for damage. Install new packing rings, one at a time.

Each ring should be firmly compressed into position before the next ring is added. Rings should fit snugly into the stuffing box. Install the gland and the gland flange and secure with the gland nuts. Tighten the nuts uniformly, but only to the extent needed to prevent leakage. When graphite packing is to be installed, their replacement may be made by cutting the preformed rings in two halves/by a single cut and carefully opening the ring to allow its insertion into the stuffing box. Procedure to insert is then the same as stated for normal packing.

SUGGESTED GLAND BOLTS TORQUE [Nm]

VALVE NPS	ASME CLASS					
	UP TO ASME 800		FROM 900 UP TO 2680		ABOVE 2680	
	FULL	REDUCED	FULL	REDUCED	FULL	REDUCED
3/8"	5	N.A.	12	N.A.	24	N.A.
1/2"	7	5	14	12	30	24
3/4"	8	7	18	14	35	30
1"	10	8	20	18	40	35
1"-1/4	12	10	22	20	46	40
1"-1/2	14	12	24	22	50	46
2"	16	14	26	24	65	50

C2. GASKET REPLACEMENT (BOLTED BONNET VALVES ONLY)

Complete disassembly procedures are listed below. However, it is recommended that disassembly be limited only to the extent required to carry out repairs.

1 - Isolate and de-pressurize the system and operate the valve to its full open position.
2 - Match mark the body and bonnet, the wedge and body to maintain their relation upon reassembly.
3 - Remove the body bolts and lift up the entire bonnet assembly, taking care not to damage the wedge.
4 - Examine the gasket-seating surface of the body and the bonnet for evidence of wear damage or deterioration.
5 - Discard the old gasket. Replace or repair all damaged parts, then clean the seating surfaces to remove all rust, gasket residue and other debris.
6 - Polish the gasket-seating surfaces using a fine emery cloth. Remove any radial scratches or other defects, taking care that the emery cloth does not remain in the valve.
7 - A radial scratch across the seating surface may allow for a leak path. To affect a good seat, the gasket-seating surface must be flat and should have a finish between Ra=1.6 and Ra=3.2.
8 - Again, clean the surface to remove all polishing residue. Install a new gasket and reassemble the valve. No gasket-sealing compound should be used when installing the gasket. Care should be taken to ensure that the wedge does not contact the seats during reassembly and bolt tightening. Re-tighten the bolts acc.to Annex “B” of this manual.

C3. VALVE SEATING

GENERAL FOR GATE AND SWING CHECK VALVES

The valve and seat ring design and the method of seat ring installation are such that the valve must be removed from the line when seat ring replacement is necessary. Therefore, we recommend that the valve be replaced or returned to the maintenance work shop for seat replacement.

Seat rings for gate valves, sizes 1" and larger, if not too badly damaged (defect not deeper than 0.8 mm), may be repaired in the body by lapping. Smaller size valves can be repaired, but with great difficulty; therefore BFE recommends the installation of new seats.

The seats can be lapped in the body, using a flat lapping plate larger than that of the seat. The plate must have a square hole in the center for attachment to a square end tool. Make a square tool of suitable size and length with one end to fit a brace and the other end attached to the plate. Valve seats can then be hand lapped by using a fine grain compound. Wedges can be lapped on any surface plate, but care should be taken to maintain the correct wedge angle. As noted previously, we recommend that the valves be replaced or returned to the factory for seat ring replacement. However, it's suggested the following instructions are issued to aid in any attempts of seat replacement in the field maintenance work shop.

SEAT REMOVAL & REPLACEMENT FOR GATE AND SWING CHECK VALVES

The valve and seat ring design and method of seat ring installation are such that the valve must be removed from the line when seat ring replacement is necessary. Therefore, BFE recommends that the valve be replaced or returned to the factory for seating ring replacement.

GENERAL FOR GLOBE AND PISTON CHECK VALVES

Prior to lapping the disc of the globe valves, the disc may require machine refinishing. When defects are found on the stem/disc assembly-seating surface, it is recommended to place the stem/disc assembly into a lathe spindle and check the disc diameter, without taking the assembly apart. Hold the disc using a 3-jaw chuck so that large OD and seating surface run true. Grind the seating surface using a tool grinder. Machine only deep enough to clean the surface, then polish the seating surface with a fine emery cloth, retaining the original shape of the disc.

When surface damage is minor, the seats may be repaired by a lapping operation use a small quantity of lapping compound between the seat and the disc surfaces.

It is important that not too much pressure be applied to the disc and seat. With the lapping compound in place, between the mating surface, the disc should be reciprocally rotated, the strokes should be light and the disc should be lifted frequently and turned to a new position (circularly around the valve body) so the lapping will take place over a new area. Continue lapping until all defects are removed, and then apply a final finish with a fine compound. It is recommended that the face of the disc be "blued" to check for contact of seating surface after final lapping. The globe valve stem/disc assembly may be used in the lapping operation, however, due to its loose disc design, it is necessary to prevent the disc from rotating on the stem.

This can be accomplished by preparing a fixture (the valve handwheel can then be re-attached to the stem and used as a convenient handle when re-lapping the seats).

Valves having renewable (threaded-in) seats may have the seat ring replaced only in the factory by means of special tools.

The seat ring may then be removed by un-threading in a counter-clockwise direction. The seat threads in the valve body should be carefully inspected to make sure they are in a usable condition. When installing new seats, the seats should be screwed tightly into the valve body, then unscrewed to make sure they are making continuous contact for a tight seal.

SUGGESTED TOOLS & CONSUMABLES FOR LAPPING

- Lapping compound (Carborundum).
- Grain size: 400 - 600 mesk – for rough finishing.
- Grain size: 800 – 1200 mesk – for fine finishing.
- The surface plate should be homogenous cast iron having approximate HB 250 Hardness.

Machine oil, fillet scraper, bluing compound and waste cloth.

D. LUBRICATION

BFE valves are made from selected materials to give long and trouble free service, when properly installed for the correct applications. Proper care and maintenance in the field can contribute to extended performance of the valve. The general maintenance operation on a valve usually consists of periodical lubrication. See the lubrification chart below for details:

LUBRIFICATION CHART

STEM THREADS LUBRICATION	GEAR HOUSING LUBRIFICATION	SLEEVE LUBRICATION
Exposed stem threads should be kept clean and should be lubricated. Because a tacky lubricant on exposed stem threads can attract abrasive particles from the atmosphere the use of dry lubricants is recommended. Graphite powder can be applied by spraying or by the use of a normal brush. When valves will be supplied according to Statoil specifications, BFE will use Molykote BR2 plus grease approved by STATOIL.	On valves equipped with bevel gear operators, the operators are basically sealed units which are considered to be permanently lubricated. BFE recommends that the operators be at least partially disassembled every three years to inspect the condition of the lubrication and component parts. Should dirt, water or other foreign matter be found during the inspection, the units should be flushed using a commercial cleaner/degreaser which is not corrosive or incompatible with bearings and gears. Other close fitting parts should be liberally coated by hand with grease prior to reassembly.	The valve yoke-sleeve shall be lubricated periodically based on cycle and service conditions, but not less than once a year or 100 cycles maximum. Any good grade of grease may be used on these parts. Only a small amount of grease is required over lubricating the stem bearings will result in the leakage of grease around the bearing housing.
MANCON MACONSYNTH HT (BFE SUGGESTION) or MOLYKOTE BR2 PLUS or TOTAL MULTIS MS2	AGIP GR MU EP 2 (BFE SUGGESTION) or STATOIL UNIWAY LI-62 or ESSO BEACON EP1	MANCON MACONSYNTH HT (BFE SUGGESTION) or MOLYKOTE BR2 PLUS or TOTAL MULTIS MS2

IMPORTANT NOTE!!! For oxygen service use only packing and lubricant BAM or WHA approved. Lubricate only if necessary.

E. LIST OF ORDINARY MAINTENANCE TOOLS

1. Seat removing tools (for removal of the threading seat rings, these tools can be supplied on request).
2. Packing extraction tool (can be supplied upon request)
3. Injector gun (can be supplied upon request).

7. PRECAUTIONS

WORKING PRESSURE AND TEMPERATURE	When using the valve, be sure to work with proper pressure temperature combinations within the maximum allowed as per the ratings marked on valve nameplate. The rating tables are those of ASME B16.34, EN 12516-1 and BFE table T600 as applicable. For special materials and conditions not "Rated", check that the design condition specified in the customer order, are correctly specified and applied (also check the valve nameplate).
VALVE MATERIAL CHOICE	It is the client's responsibility to select the correct material, based upon the media and operational condition. The correct choice will aid in increasing valve life expectancy andvice versa, corrosion, erosion or other factors which can lead to a reduced valve life.
CORROSION ALLOWANCE	Standard valves are designed to be safe taking into account a maximum corrosion allowance of 3mm. Never use the valve with a higher corrosion allowance unless specified in the customer order.
PIPELINE LOAD	Standard valves have not been designed for support purposes, hence the client must avoid any significant pipeline load concentrations at valve interface. If requested, BFE can supply the necessary information to allow the customer to perform the relevant verification or be required to perform the verification based on client data.
CYCLIC LOAD	In case of a significant number of cycles and load variations, further stress analysis shall be performed to verify the valve strength. This being the case, BFE can supply the necessary information to allow the customer to perform the relevant verification, or can be asked to perform the verification based on client data.
START-UP	Once the valve has been installed in accordance with all the procedures and precautions as described in the previous chapters, the valve can be started-up. For gate valves only, be careful not to heat-up the valve in a closed position with fluids inside, this could result in over pressurizing the valve.
NORMAL OPERATION	When in operation, the gate and globe valve can be hand-operated from open to close or vice versa by the handwheel. Prior to operating the valve, make sure that the temperature of the handwheel is not too hot or cold which could result in injury to the operator's hands.
SHUT-DOWN	No special procedures are required for shut-down.
FLUID GROUP P.E.D. / P.E.R.	According to P.E.D. 2014/68/UE & P.E.R. - PRESSURE EQUIPMENT (SAFETY) REGULATIONS, SI 2016 No. 1105 the valves / strainers are classified in category III (highest possible category) and then can be used with fluid group 1 or 2 including unstable gas.
VALVE MODIFICATION	In no case is the user allowed to modify the geometry or the material of valve components. This action determines the immediate expiring of factory warranty.

8. RESIDUAL RISK LIST RELATED TO MACHINERY DIRECTIVE 2006/42/EC

Important note! All BFE Valves and actuator assembly are defined as "Partly Completed Machinery" acc.to Machinery Directive 2006/42/EC.

RESIDUAL RISK	NOTE
NOISE	Valve and operator equipment (e.g. actuator) are designed in order to not generate any noise above 70dB(A). However the user must evaluate the process data in order to consider if the noise generated by the flow can produce with the applicable environmental legislation governing noise nuisance. If required protective equipment such as earplugs or other noise reduction equipments must be used.
EQUIPMENT MAINTENANCE	Any action related to the installation and maintenance of equipments not part of the valve product (e.g. Actuator or Limit-Switch) must be performed according to the IOM issued by the equipment manufacturer.
EQUIPMENT OPERATION	Any action related to the operation of equipments not part of the valve product (e.g. Actuator or Limit-Switch) must be performed according to the IOM issued by the equipment manufacturer.
ELECTRICAL AND ATEX / UKSI	System grounding is the responsibility of the user or system designer during the first installation and at every maintenance operation the grounding must be verified. During maintenance operation must be verified that all electrical and pneumatic energy sources are proper disconnected. All electrical connection where applicable must be performed acc.to local regulations (e.g. EN60079-14)

9. EXPLOSIVE ATMOSPHERES (ATEX / UKSI)

Valves may be used in potentially explosive atmospheres. Where the customer require valves in conformity to ATEX 2014/34/UE or UKSI 2016:1107 B.F.E. can supply valves in conformity to Zone II category 2. In accordance with the above Directives. in this manual B.F.E gives some indications to the valve users on how to operate in safe conditions.

LEAKAGE FROM PACKING	Check frequently the condition of packing and monitor the amount of emission by the use of suitable means (i.e. sniffers); in the case of significant leakage level change or adjust the packing.
LEAKAGE FROM BODY/BONNET CONNECTION	In the case of valve leakage through body-bonnet joint, it is necessary to substitute the gasket.
INADEQUATE LUBRICATION	In the case of long and frequent operations, the friction between stem, yoke sleeve and bonnet, can cause a local increase of the temperature. Therefore BFE recommends lubricating all the parts involved.
INADEQUATE ELECTRIC CONTINUITY	BFE valves are made with permanently contactable steel components hence a full electric continuity is guaranteed. If the connection to the pipeline does not guaranty the metal continuity (i.e. flanged connection with fully or partially non metallic gasket) BFE suggests adopting equipotential devices.
INADEQUATE THERMAL INSULATION	Valves can be used at any temperature allowed by the relevant rating table; the high temperature of external surfaces can be a potential cause of explosion. In this case it is good practice to insulate the valves when used in hot conditions with similar devices as adopted for the rest of the pipeline. However, the temperature of the fluid conveyed in the inner part has to be compared with the minimum temperature for priming of explosive atmosphere in order to check the compatibility.
ELECTRIC COMPONENTS	If the valves need any electrical equipment mounted, check if the Ex certificates of the electric components are for the protection level necessary for the site conditions.
PRESENCE OF POWDERS THAT MAY TRIGGER EXPLOSION	BFE valves are constructed in such a way that any powders in the surrounding environment cannot enter the valve itself. Nevertheless it is recommended to check at regular intervals the fastening of the stuffing box in order to prevent the infiltration of these powders, which, after contact with the inner fluid/gas, might trigger explosions. During the cleaning of the external valve surfaces, it is recommended to use wet cloths to prevent electrostatic effects, which may trigger explosions, if in contact with the powders themselves.

10. ENVIRONMENTAL PRECAUTIONS

The following are the indications of good practice which should be adopted during the life cycle of the product for correct use and in order to protect the environment and prevent pollution.

ASSEMBLY	When installing the valve, the materials for packing and protection have to be removed and disposed of according to the following procedures: DO NOT BURN IN UNCONTROLLED WAY DISPOSE ACCORDING TO THE NATIONAL RULES IN FORCE PREFERABLY RECYCLE – ALL THE PACKING MATERIALS USED ARE RECYCLABLE
OPERATION AND MAINTENANCE	Observe the indications contained in this manual to prevent leakage of products that are harmful for the environment. The material used for the packings is free from asbestos fibres, use products with the same features when replacing. Maintenance should be in accordance with the indications of this manual.
DISPOSAL	When the valve life has come to the end it becomes waste and it should be disposed of according to the following indications DISPOSE ACCORDING TO THE NATIONAL RULES IN FORCE TEMPER WHEN THE VALVE WAS IN CONTACT WITH HARMFUL PRODUCTS PREFERABLY RECYCLE – ALL THE MATERIALS USED ARE RECYCLABLE

ANNEX "A" - NPT ASSEMBLY INSTRUCTIONS

The following steps are applicable to all the NPT connections of the valve (Plugs, End Connections, etc).

STEP-1 : Inspect port and fitting to ensure that both are free of contaminants and excessive burrs.

STEP-2: Apply a strip of an anaerobic liquid pipe sealant around the male threads leaving the first two threads uncovered. If no liquid sealant is available, wrap Teflon tape 1-1/2 turns in a clockwise direction, viewed from the pipe end, leaving the first two threads uncovered.
CAUTION: Teflon tape and some pipe sealants are damaging to hydraulic components. Always use extreme caution and follow manufacturer's recommendations for proper application of any sealant in order to prevent contamination.

STEP 3: Screw finger tight into the port.

STEP 4: Wrench tighten the fitting to the correct turns Past Finger Tight position (See following table).
A properly assembled fittings total thread engagement should be 3 to 6 turns.
CAUTION: Never back off an installed pipe fitting to achieve proper alignment. Loosening installed pipe fittings will corrupt the seal and contribute to leakage and failure.

Torque installation of pipe fittings is not a recommended practice. Thread taper and quality, different port and fitting materials, plating thickness and types, varying thread sealants, orientation, and other factors reduce the reliability of a torqued connection. If torque installation is required, refer to the following table for suggested torque values.

NPT TABLE

ITEM	SCREW SIZE	TURN PAST FINGER TIGHT	TORQUE [Nm]
1	1/8"	1.5 - 3.0	17
2	1/4"	1.5 - 3.0	35
3	3/8"	1.5 - 3.0	55
4	1/2"	1.5 - 3.0	75
5	3/4"	1.5 - 3.0	105
6	1"	1 - 2.5	150
7	1"-1/4	1 - 2.5	210
8	1"-1/2	1 - 2.5	290
9	2"	1 - 2.5	410

ANNEX "B" – BODY-BONNET BOLT OR SCREW TIGHTENING SPECIFICATION

To avoid having bolts over stressed during the valve re-assembly, follow the recommended bolting torques provided here:

BOLTING TORQUE TABLE [Nm]

IMPERIAL BOLT SIZE	METRIC BOLT SIZE	ALL MATERIALS WITH MIN YIELD STRESS @ ROOM TEMPERATURE OF 400MPa AND BELOW. (EG. ASTM A320 B8M CL.1)	ALL MATERIALS WITH MIN YIELD STRESS @ ROOM TEMPERATURE ABOVE 400MPa. (EG. ASTM A320 L7M)	ONLY FOR X5CrNi18.10 (A2-70) 24CrMo5 (G) 21CrMoV57 (GA)
3/8 UNC	M10	**16**	**30**	45
1/2 UNC	M12	**37**	**70**	75
9/16 UNC	M14	**50**	**95**	120
5/8 UNC	M16	**70**	**140**	185
3/4 UNC	M20	**125**	**230**	260
7/8 UNC	M22	**200**	**370**	450
1-UNC	M24	**300**	**550**	670

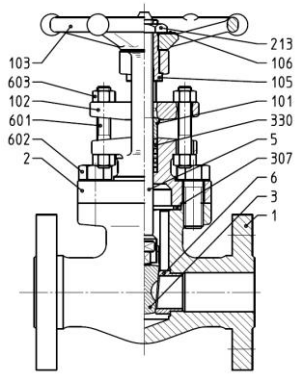
NOTE:

- Torque tolerance ±10%.
- For temperatures above 400°C use 75% of the torque values.
- Torque values are with the bolts lubricated.
- When applying the torque to the bolts, each bolt should be torqued in steps of approximately 20% of the final torque.
- Do not use impacting devices to tighten up the bolting on the body/bonnet. Use suitable mechanical devices for tightening.
- In case of metric bolting use the nearest imperial nominal size available.
- Before installing flange bolts, it is recommend to apply a light coating anti-seize (non-galling, high temperature grease) to the threads of the bolts.

FLANGE BOLT TIGHTENING SEQUENCE

To ensure even distribution of stresses in the fully-installed flange, tighten the bolts in a star pattern then repeat the star pattern while tightening to the next torque value, and so on up to the maximum torque value.

EXAMPLE OF CRISS-CROSS SEQUENCE



ANNEX "C" - TROUBLESHOOTING GUIDE

FAILURE	CAUSE	TROUBLESHOOTING
Leakage of packing	1-Gland flange nuts loose 2-Rings of packing insufficient 3-Packing aged or failing 4-Stem sealing damage	1-Equally tighten gland flange nuts 2-Add packing 3-Replace packing 4-Stem should be maintained in accordance with the correct procedures or replaced according to with the maintenance of pipeline facilities
Leakage between sealing surface	1-Dirt between sealing surfaces 2-Sealing surface damaged	1-Clean sealing surface 2-Repair the sealing surfaces
Operation failure	1-Packing too tight 2-Stem nut over worn 3-Stem bent 4-Foreign matter between the stem and stem nut or gland or gland flange	1-Properly loosen gland flange nuts 2-Replace stem nut 3-Rectify or replace stem 4-Clean foreign matter
Leakage between body/bonnet flanges	1-Bonnet bolts loose 2-Bonnet gasket failure	1-Properly tighten bonnet nuts 2-Replace bonnet gasket
Body and bonnet broken and leaking	1-Static head 2-Fatigue 3-Cracking or breaking from freezing temperatures	1-Careful operation to prevent sudden stopping, pumping and rapid shutting 2-Replace valve that exceeds guarantee period or is found with early fatigue defection 3-Drain away water in winter when valve is not used
Disc fails to open	1- Disc blocked in the body 2- Stem is overheated and blocks the disc	1-Use proper torque 2-When the valve is closed and the pipeline is heated, rotate the handwheel slightly counter clockwise at varying intervals

IF THE PROBLEM PERSISTS, YOU HAVE ANY QUESTIONS OR NEED ADDITIONAL INFORMATION, PLEASE DO NOT HESITATE TO CONTACT BFE'S CUSTOMER SERVICE DEPARTMENT FOR FURTHER ASSISTANCE AND INSTRUCTIONS.

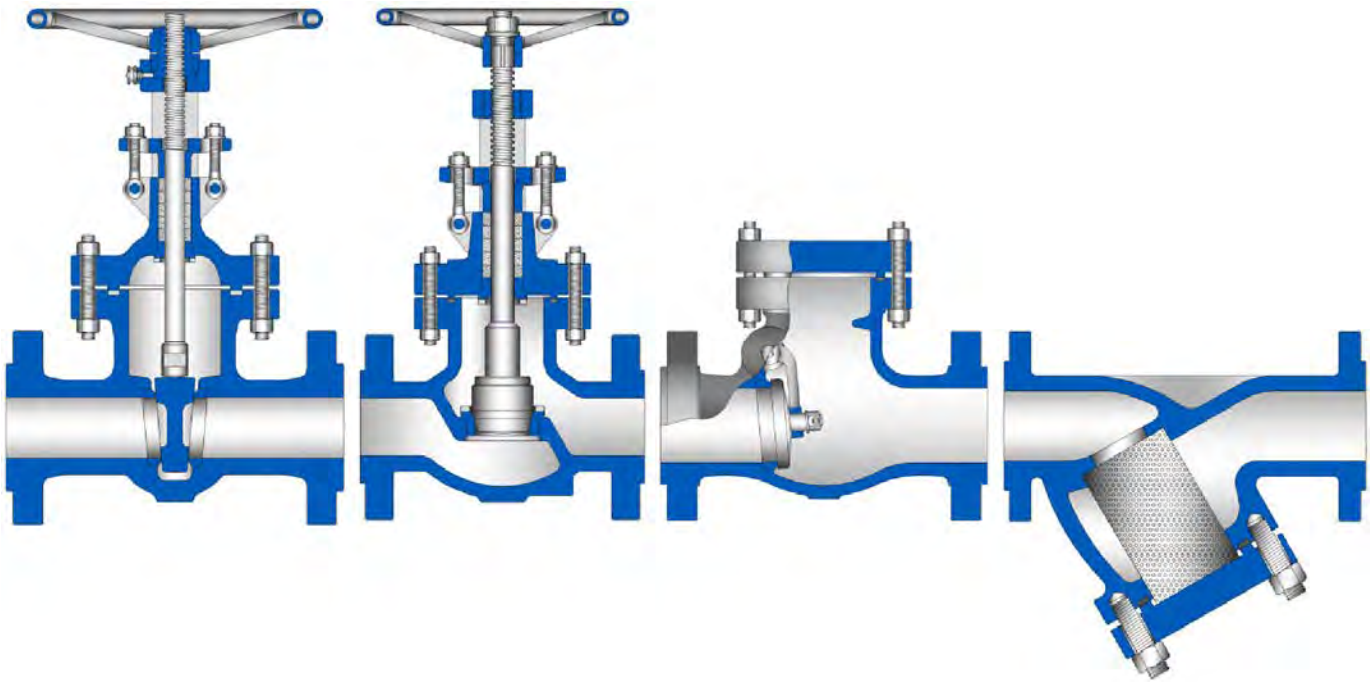
BODY-BONNET CONNECTIONS



BOLTED	WELDED	FULL PENETERATION WELDED
The bolted connection consist of a body bonnet gasket located in its housing between two flanges and compressed by bts.	Welded bonnet valves are supplied in the standard type threaded in and fillet welded bonnet	The bolted connection consist of a full penetration weld.
		

VALVE CONFIGURATIONS (OTHER THEN BASIC)

BELLOW SEAL	CRYOGENIC	HIGH TEMPERATURE
Bellow seal valves feature a formed multi-ply bellows welded to the stem and to the bottom of the bonnet, creating a hermetic seal or impermeable barrier.	Cryogenic valves have an extended bonnet, the extension prevents cryogenic liquids from reaching the stem packing by enabling the liquids to boil and convert to gas.	The heat dissipation extended bonnet construction is made to dissipate heat and to lower the heat at the stem packing and to avoid subsequent failure of the packing and operation of the valve.

1.3	Maintenance and inspections Manutenzioni e ispezioni	pag. 5
1.4	Disposal Smaltimento	pag. 6
1.5	Warning Avvertenze	pag. 6
1.6	Valves Figures Figure Valvole	pag. 7
1.7	Valves Installation Installazione valvole	pag. 9

1.1 INSTALLATION AND ASSEMBLY

Make sure that:

- ✓ The **rating** and any other characteristics indicated on the **tag plate** comply with the operating conditions.
- ✓ The **pressure** and **temperature** values that the valves are exposed to are included within the limits defined in the **international standards** according to the **class** and **material** of construction of the valves.
- ✓ If no indication of temperature limits is made on **tag plate**, please consider as **max temperature limits** the following:

Material - Materiale	Max Temp.	Material - Materiale	Max Temp.
ASTM A216 WCB / GSC25N	450°C	GX5CrNiNb19-11 (1.4552)	300°C
ASTM A217 WC6, ASTM A217 C5 / 1.7363	600°C	ASTM A351 CF8M, ASTM A351 CF8C	440°C

- ✓ For low temperature are utilized valves made for cryogenic service.
- ✓ The valves exposed to corrosive or abrasive fluids are made with specific material for the requested usage.
- ✓ The valves that are used for flammable or explosive fluids are protected with a fire-prevention system connected to the facility in which are installed, or alternatively with a fire extinguisher placed near by the equipment.
- ✓ While in storage valves should be kept closed with the ends plugged.
- ✓ Prior to installation clean the inside to remove any foreign objects.
- ✓ Prior installation verify the integrity of its original packaging

During installation and assembling of the valve pay attention not to contaminate the valves assigned for oxygen use with materials from the facility or site

- ✓ Consider a spacious area for the installation that can provide access for proper operation and maintenance.
- ✓ Swing check valves can be installed inclined or vertical provided the flow direction is upwards.
- ✓ Always keep the flow direction indicated on the valves.
- ✓ Avoid excessive strain and tighten force on the valve that could compromise the structure or deformation therefore will jeopardize the functionality of the valve.
- ✓ Install gate valves on horizontal pipes with the stem in a vertical position that will guarantee good operation and lasting service. (See Figure 3)
- ✓ Cryogenic valves specified to be in gas service shall be capable of operation with the extended bonnet in any position.
- ✓ Valves specified to be in liquid service, other than cold box applications, shall be capable of operation with extended bonnet at or above 45° above the horizontal position. (see Figure 1)
- ✓ Valves specified to be in cold box applications, equipped with extended bonnet, for applications with liquids, shall be capable of operate with the stem oriented 15° to 90° above the horizontal plane (see figure 2).

INSTALLAZIONE E ASSEMBLAGGIO

Assicurarsi che:

Il **rating** e le altre caratteristiche riportate sulla **targhetta** siano in accordo con le condizioni di esercizio.

I valori di **pressione** e **temperatura** ai quali le valvole sono sottoposte sianno inclusi entro I limiti definiti dagli **standard internazionali** in accordo alla **classe** e al **materiale** costruttivo.

Se sulla **targhetta** non è riportata alcuna indicazione dei limiti di temperatura, siano considerati come limiti di **temperatura massima** i seguenti:

Per basse temperature vengano utilizzate valvole realizzate per il servizio criogenico.

Le valvole esposte a fluidi corrosivi o abrasivi siano realizzate con materiale specifico per l'utilizzo richiesto.

Le valvole utilizzate per fluidi infiammabili o esplosivi siano protette con un sistema antincendio collegato all'impianto in cui sono installate, o in alternativa con un estintore posto vicino all'apparecchiatura.

Durante l'immagazzinamento le valvole siano mantenute chiuse con le estremità tappate.

Prima dell'installazione venga pulito l'interno valvole per rimuovere eventuali corpi estranei.

Prima dell'installazione sia verificata l'integrità dell'imballaggio originale

Durante l'installazione e l'assemblaggio della valvola sia fatta attenzione a che le valvole destinate al servizio ossigeno non vengano contaminate con materiali provenienti dall'impianto o dal sito.

Sia considerata un'area spaziosa per l'installazione, che possa consentire l'accesso per il corretto funzionamento e la manutenzione.

Che per le valvole di ritegno a battente, pur installate inclinate o verticali, la direzione del flusso sia verso l'alto.

Sia sempre mantenuta la direzione del flusso indicata sulle valvole.

Siano evitati sforzi eccessivi e forze di serraggio sulla valvola che potrebbero comprometterne la struttura o provocare deformazioni che ne pregiudichino la funzionalità.

Le valvole a saracinesca vengano installare su tubazioni orizzontali con lo stelo in posizione verticale, che ne garantisca un buon funzionamento e un servizio duraturo. (Vedi Figura 3)

Le valvole criogeniche specificate per servizio gas siano in grado di funzionare con il cappello allungato in qualsiasi posizione.

Le valvole specificate per il servizio con liquidi, a eccezione delle applicazioni cold box, possano funzionare con il cappello allungato a 45° o più rispetto la posizione orizzontale. (Vedi figura 1)

Le valvole specificate per le applicazioni cold box, dotate di capello allungato, per applicazioni con liquidi, siano in grado di operare con lo stelo orientato da 15° a 90° sopra il piano orizzontale (vedi figura 2).

✓ Check that the closing torque of the boltings and gland packing is correct; after a few hours of operation you should control and regulate the compression of the packing.	La coppia di chiusura dei tiranti e del premistoppa sia corretta; dopo alcune ore di funzionamento si dovrebbe controllare e regolare la compressione del pacco baderna.
✓ Avoid any stagnation due to condensation in the body of the globe valves.	Sia evitato qualsiasi ristagno dovuto alla condensa nel corpo delle valvole a globo.
✓ Install Check and Globe valve as indicated by arrow marked on valve body	La valvola a globo e la valvola di ritegno siano installate come indicato dalla freccia presente sul corpo della valvola

1.2 USAGE PRECAUTIONS — PRECAUZIONI D'USO

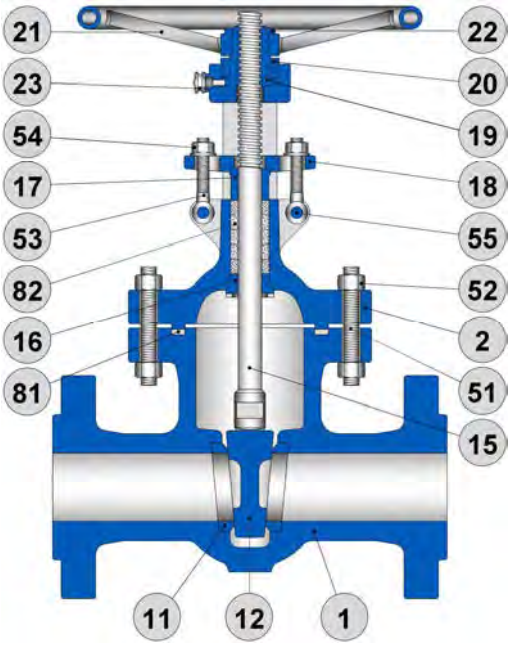
✓ For the valves subject to the PED (European Directive 97/23/EC and 2014/68/EU), attention must be placed in case the material of the body, bonnet or cover is in alloy steel in accordance to ASTM A217 grades WC1, WC5, WC6, WC9, C5 and C12. These materials are suitable for High Temperature Services. In case the temperature of these materials goes under -10°C Valvosider recommends not to pressurize the valve and avoid any hit that could damage theirs mechanical properties. In such conditions it is necessary to proceed with a Thermal Transient phase with a pressure not higher than 0,5 bars that allows the temperature of the valve to gradually return to values higher than -10°C before being pressurized to the applicable rating values. Moreover it will be necessary to prevent the dangerous effects of any abrupt change of pressure, water hammers, impacts from inside due to solid suspension or solid objects passing in the piping, and impacts from outside.	Per le valvole soggette alla PED (Direttiva Europea 97/23/CE e 2014/68/UE), occorre prestare attenzione nel caso in cui il materiale del corpo, del cappello o del coperchio sia in acciaio legato secondo la norma ASTM A217 gradi WC1, WC5, WC6, WC9, C5 e C12. Questi materiali sono adatti per Servizi ad Alta Temperatura. Nel caso in cui la temperatura di questi materiali scenda al di sotto di -10°C Valvosider raccomanda di non pressurizzare la valvola e di evitare qualsiasi colpo che potrebbe danneggiare le loro proprietà meccaniche. In tali condizioni è necessario procedere con una fase Termica Transitoria con una pressione non superiore a 0,5 bar che permetta alla temperatura della valvola di ritornare gradualmente a valori superiori a -10°C prima di essere pressurizzata ai valori nominali applicabili. Inoltre sarà necessario prevenire gli effetti pericolosi di qualsiasi brusco cambiamento di pressione, colpi d'ariete, impatti dall'interno dovuti a sospensioni solide o a oggetti solidi che passano nelle tubazioni, e impatti dall'esterno.
✓ Handle the valves only through the handwheel, lever or the proper controls. Do not use tools or handwheel keys in order not to provoke serious damages to the seats	Maneggiare le valvole solo attraverso il volantino, la leva o i comandi appropriati. Non utilizzare attrezzi o chiavi a mano per non provocare gravi danni alle sedi
✓ Avoid water hammers and sudden temperature and pressure changes	Evitare colpi d'ariete e sbalzi improvvisi di temperatura e pressione
✓ Use correct means of protection and be careful if there are explosive, inflammable, toxic or corrosive fluids or when there are high or low service temperatures	Utilizzare mezzi di protezione corretti e fare attenzione alla presenza eventuale di fluidi esplosivi, infiammabili, tossici o corrosivi o quando ci siano alte o basse temperature di servizio
✓ Particular precautions are necessary to assure seal and the regular operation of the valves when there are fluids with solids in suspension or with high levels of condense	Particolari precauzioni sono necessarie per assicurare la tenuta e il regolare funzionamento delle valvole quando ci sono fluidi con solidi in sospensione o con elevati livelli di condensa
✓ Maintenance and lubrication of the valves must always be done as specified in the maintenance manual provided.	La manutenzione e la lubrificazione delle valvole devono essere sempre effettuate come specificato nel manuale di manutenzione fornito.

1.3 MAINTENANCE AND INSPECTIONS — MANUTENZIONI E ISPEZIONI

✓ Check periodically tightness of bolts and gasket seals based on the thermal cycles and usage; replace gasket seals as soon as possible if any leakages are present.	Controllare periodicamente il serraggio dei tiranti e la tenuta delle guarnizioni in base ai cicli termici e all'utilizzo; sostituire le guarnizioni il più presto possibile in caso di perdite.
✓ Do not tight the packing seal rings with too much strength. If it is necessary to compress the packing seals with higher torque than expected in order to obtain a seal on the stem, replace the packing seal rings.	Non serrare la baderna con troppa forza. Se è necessario comprimere le guarnizioni di tenuta a baderna con una coppia maggiore del previsto per ottenere una tenuta sullo stelo, provvedere alla sostituzione.
✓ For the maintenance and replacement of seals and other components of the valves, use only material that are suitable to the valve's class and temperature as well as to the fluids it makes contact with.	Per la manutenzione e la sostituzione delle guarnizioni e degli altri componenti delle valvole, utilizzare solo materiale adatto alla classe e alla temperatura della valvola, nonché ai fluidi con cui viene a contatto.
✓ Check periodically wall thickness of valves and strainers. If values reach the minimum required standards (ASME B16.34, EN 12516-1, BS 1873, BS 1868, API 600, API 6D), it is necessary to replace the valve immediately.	Controllare periodicamente lo spessore delle pareti delle valvole e dei filtri. Se i valori sono ridotti agli standard minimi richiesti (ASME B16.34, EN 12516-1, BS 1873, BS 1868, API 600, API 6D), è necessario sostituire immediatamente la valvola.

✓ Lubricate regularly the handwheel and the lantern if present; lubricants must be suitable with the valve's fluids. Pay particular attention to the oxygen valves in service.	Lubrificare regolarmente il volantino e la lanterna, se presente; i lubrificanti devono essere adatti ai fluidi di utilizzo della valvola. Prestare particolare attenzione alle valvole per servizio ossigeno.
Empty and vent completely the valve before its removal for maintenance.	Svuotare e sfiatare completamente la valvola prima della sua rimozione per la manutenzione.

1.4 DISPOSAL / SMALTIMENTO



✓ Do not discard any equipment no longer in use in the environment.	Non smaltire nell'ambiente le apparecchiature non più utilizzate
✓ Verify the equipment is empty when is no longer in use.	Verificare che le apparecchiatura non più utilizzate siano vuote.
✓ Remove all harmful residues to health and environment.	Rimuovere tutti i residui nocivi per la salute e l'ambiente.
✓ Discard all unused equipment according to law.	Smaltire tutte le apparecchiature non più utilizzate in accordo alla legge.

1.5 WARNING / AVVERTENZE

✓ The pressure equipment, due to their characteristics and the fluids which they are in contact with, may represent a hazard to humankind, animals and the environment.	Le attrezzature a pressione, a causa delle loro caratteristiche e dei fluidi con cui sono a contatto, possono rappresentare un pericolo per l'uomo, gli animali e l'ambiente.
✓ To prevent and limit the risk deriving from the pressure equipment operation are strictly recommended the above instructions, which are comply with the international codes provisions, to the the technical knowledge and experience of our customers-users, as far as available at the moment when the present document was written and given to the user.	Per prevenire e limitare i rischi derivanti dal funzionamento delle attrezzature a pressione, sono strettamente raccomandate le istruzioni di cui sopra, che sono conformi alle disposizioni dei codici internazionali, alla conoscenza tecnica e all'esperienza dei nostri clienti-utenti, per quanto disponibili al momento in cui il presente documento è stato scritto e consegnato all'utente.
✓ The risk analysis available with the maintenance instructions is useful, but not sufficient to prevent the risks deriving from the pressure equipment installed according to the design project: the installer will find indications to minimise the effects of intrinsic risks which cannot be eliminated.	L'analisi dei rischi disponibile con le istruzioni di manutenzione è utile, ma non sufficiente a prevenire i rischi derivanti dalle attrezzature a pressione installate secondo le specifiche di progetto: l'installatore vi troverà indicazioni per minimizzare le conseguenze dei rischi intrinsechi che non possono essere eliminati.

2 GATE VALVES WITH OUTSIDE SCREW, YOKE AND RISING STEM / VALVOLA A SARACINESCA CON VITE ESTERNA E STELO SALIENTE

2.1 PERIODIC CHECKS / VERIFICHE PERIODICHE

2.1.1 Check the stem packing monthly (part n. 82) / Controllare mensilmente il pacco baderna (componente n. 82)

In case of leaks from the gland, tighten the eye bolts (part n. 53) it will tighten the packing ring seals (part n. 82).

In caso di perdite dal premistoppa, serrare i tiranti a occhiolo (componente n. 53) in modo tale da comprimere ulterirmente il pacco baderna (componente n. 82).

Compression/tighten must not exceed the correct limit in order to avoid difficulties during opening-closing operations or during the adjustment.

La compressione non dovrà superare il limite necessario, al fine di evitare difficoltà durante le manovre di apertura/chiusura o di regolazione.

If it is not possible to compress/tighten the seals, stem packing replacement is necessary, asking the manufacturer for the supply of spare packing seals.

Nel caso non fosse possibile comprimere ulteriormente le guarnizioni, si rende necessaria la sostituzione del pacco baderna, chiedendo la fornitura dei ricambi.

Avoid adding packing rings, unless the maintenance is temporary.

L'aggiunta di alcuni anelli di treccia è da evitare e da riservarsi solo per una manutenzione temporanea.

The regular sealing of the packing ring is guaranteed only by the design-specific seals.

La regolare tenuta del pacco baderna è garantita solo dalle guarnizioni specifiche di progetto.

2.1.2 Check monthly the yoke sleeve lubrication (part n. 19) / Controllare mensilmente la lubrificazione della madrevite (componente n. 19)

Lubrication of valves with grease nipple (part n. 23) must be carried out with a suitable high pressure lubricant device.

La lubrificazione delle valvole con ingrassatore a sfera (componente n. 23), deve essere eseguita con un'apposita pistola lubrificante ad alta pressione.

2.1.3 Bolts tension (part n. 51) / Serraggio tiranti (componente n. 51)

It is recommended to check periodically the bolts tension of valves in service at high temperature and subjected to frequent thermal cycles.

Si raccomanda di controllare periodicamente il serraggio dei tiranti delle valvole in servizio ad alta temperatura e sottoposte a frequenti cicli termici.

Even if the seal leakage are rare, the corrosion could be cause of the losses. In this case it is necessary to replace the seal checking at the same time also the contact surface of the gasket (part n. 81).

Seppure le perdite dalla guarnizione siano rare, la corrosione potrebbe causarle. In tal caso è necessaria la sostituzione della guarnizione (componente n. 81) controllando contemporaneamente anche la superficie a contatto con la stessa.

2.2 MAINTENANCE AND REPLACEMENT OF DAMAGED PARTS / MANUTENZIONE E SOSTITUZIONE DELLE PARTI DANNEGGIATE

2.2.1 Stem (part n. 15) / Stelo (componente n. 15)

Difficulty during operation or stem locking can be caused by the packing ring seals or lantern ring drying up or by the yoke sleeve locking.

Difficoltà di manovra o bloccaggio dello stelo possono essere causati da essiccamento del pacco baderna o della lanterna oppure da bloccaggio della madrevite.

In order to restore normal operation conditions we recommend the following:

Per ristabilire le normali condizioni di funzionamento si consiglia di:

- ✓ Check the packing and lantern ring service capacity, restore packing lubrication and pressure. If the parts are damaged, their replacement is necessary.
- ✓ Controllare la capacità di servizio del pacco baderna e della lanterna, ripristinando lubrificazione e compressione delle guarnizioni. Se i componenti sono danneggiati è necessaria la loro sostituzione.
- ✓ In case of locking due to the lantern ring wear and tear, disassemble the stem and replace the lantern ring.
- ✓ In caso di bloccaggio dovuto ad usura della lanterna, si raccomanda di smontare lo stelo e sostituire la lanterna.
- ✓ Clean the yoke sleeve and replenish with correct lubrication, verify that there is no damage. Damaged or worn yoke sleeve must be replaced with a new one.
- ✓ Pulire la madrevite e ristabilire la corretta lubrificazione, verificando che non sia danneggiata. La madrevite danneggiata o usurata deve essere sostituita con una nuova.

2.2.2 Packing ring seal maintenance with the valve in service

Repacking of the valve while it is under pressure is extremely dangerous, so is not recommended and in any case is at the owner's risk.

The successful completion of a backseat test should not be construed as a recommendation by the manufacturer that a valve may be repacked while it is under pressure.

Preferably the backseat (part n.16) may be used as a means of stopping or reducing packing leakage until the packing can be replaced under no pressure.

In the following paragraph 2.2.3 is explained how repacking the valve, in safety manner, in depressurized conditions.

Manutenzione del pacco baderna con valvola in servizio

La sostituzione del pacco baderna con valvola in pressione è estremamente pericoloso, quindi non è raccomandato ed è comunque a proprio rischio.

L'esito positivo del test di controtenuta non deve essere interpretato come una raccomandazione da parte del produttore a eseguire tale operazione.

Preferibilmente la controtenuta (parte n.16) può essere usata come mezzo per fermare o ridurre le perdite dalla baderna fino a quando non si può procedere alla sua sostituzione in assenza di pressione.

Nel seguente paragrafo 2.2.3 viene spiegato come sostituire il pacco baderna in modo sicuro, in condizioni di depressurizzazione.

2.2.3 Maintenance carried out with the valve out of service

Step 1

- ✓ Empty and drain the valve and the connected pipes;
- ✓ Put valve in half opening position;
- ✓ Loosen the packing eye-bolts;
- ✓ Loosen body-bonnet bolts, then remove them;
- ✓ Pull out the wedge from the stem;
- ✓ Unscrew the stem from the yoke sleeve and slip out of bonnet;
- ✓ Remove gland, gasket, packing and lantern ring if present;
- ✓ Check the parts, replace the worn down or damaged ones and all gaskets.

Step 2

Reassemble the valve, lubricating the parts according to the nature of the fluids the valve is connected to, following the subsequent order:

- ✓ Insert the packing, the lantern ring if present, the gland in their own housing;
- ✓ Screw the stem to the yoke sleeve through the packing, being careful not to damage the gaskets;
- ✓ Replace the wedge on the stem;
- ✓ Fix the bonnet on the body with the bolts, checking the correct position of gasket;
- ✓ Register gland compression and verify the operation and service of the valve;
- ✓ Check bolts, gasket and packing seal a few hours after it has been in service.

The suitability of the valves used for explosive, inflammable, toxic, corrosive fluids or is in service in a special security conditions should be checked through hydraulic test after its maintenance.

Manutenzione effettuata con valvola fuori servizio

Fase 1

- ✓ Svuotare e sfiatare la valvola e le tubazioni collegate;
- ✓ Mettere la valvola in posizione di mezza apertura;
- ✓ Allentare i tiranti del premistoppa;
- ✓ Allentare tutti i tiranti corpo/cappello, poi rimuoverli;
- ✓ Sfilare il cuneo dallo stelo;
- ✓ Svitare lo stelo dalla madrevite e sfilarla dal cappello;
- ✓ Rimuovere premistoppa, guarnizioni, pacco baderna e lanterna se presente;
- ✓ Controllare i componenti, sostituire quelli usurati o danneggiati e tutte le guarnizioni;

Fase 2

Rimontare la valvola, lubrificando i componenti secondo la natura dei fluidi con cui è a contatto, agendo nel seguente ordine:

- ✓ Inserire il pacco baderna, la lanterna se presente, il premistoppa nel proprio alloggiamento:
- ✓ Avvitare lo stelo alla madrevite attraverso il pacco baderna prestando attenzione a non danneggiare le guarnizioni;
- ✓ Reinserire il cuneo sull'attacco dello stelo;
- ✓ Fissare il cappello al corpo con i tiranti, controllando l'esatta posizione della guarnizione,
- ✓ Registrare la compressione del premistoppa e verificare funzionamento e la manovrabilità della valvola;
- ✓ Controllare la tenuta dei tiranti e delle guarnizioni dopo qualche ora di servizio.

L'idoneità delle valvole in servizio con fluidi esplosivi, infiammabili, tossici, corrosivi o che devono operare in condizioni di sicurezza particolari dovrebbe essere controllata per mezzo di prova idraulica dopo operazioni di manutenzione straordinaria.

2.3 WEDGES AND SEALING SEATS

Seats and wedges leakage is not always easy to notice when the valve is in service; if this leak is confirmed, it is necessary to intervene immediately. Seats and wedge surfaces or even both can be seriously damaged without an immediate intervention. In order to repair or replace the parts it is necessary to put the valve out of service and remove the various elements as previously described (2.2.3–1).

Seats maintenance

If seats surfaces are locking, or have cavities or furrows not deeper than 1.5 mm (1/16"), it is possible to repair the

CUNEO E SEDI DI TENUTA

Le perdite delle sedi e dai cunei non sono sempre facili da notare quando le valvole sono in servizio; qualora tali perdite siano confermate è utile agire subito. Le superfici delle sedi o dei cunei, o addirittura entrambi, possono subire danni gravi se non si interviene prontamente. Per effettuare le riparazioni o sostituzioni è necessario mettere la valvola fuori servizio e rimuovere i vari componenti come descritto precedentemente punto (2.2.3–1).

Manutenzione sedi di tenuta

Se le superfici delle sedi mostrano bloccaggio, cavità o solchi profondi non oltre 1,5 mm (1/16") è possibile riparare le

surfaces, restore it to its original condition grinding them with granular abrasive paste.

If is necessary to use paste (normally blue in color) check seats surfaces after final grinding.

Surfaces with defects deeper than 1.5 mm (1/16") cannot be repaired through grinding; in this case the use of spare parts is recommended.

To assemble the valve please follow instruction on paragraph 2.2.3–2

superfici, riportandole alle condizioni originali di perfetta tenuta, lappandole con pasta abrasiva granulare.

Per controllare le superfici delle sedi dopo la lappatura finale è necessario utilizzare pasta di riscontro (normalmente di colore blu).

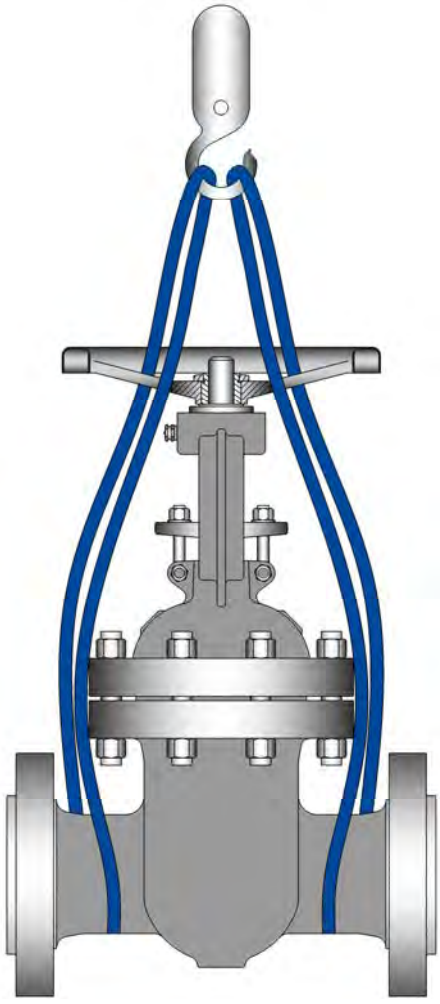
Le superfici che presentano difetti con profondità superiore a 1,5 mm (1/16") non possono essere riparate mediante lappatura; in questo caso si consiglia l'utilizzo di parti di ricambio.

Per il ri-assemblaggio delle valvole seguire le istruzioni come da paragrafo 2.2.3–2

2.4 ACTUATORS

Actuators maintenance on valves must be carried out according to the actuators manufacturer's instruction manual.

ATTUATORI

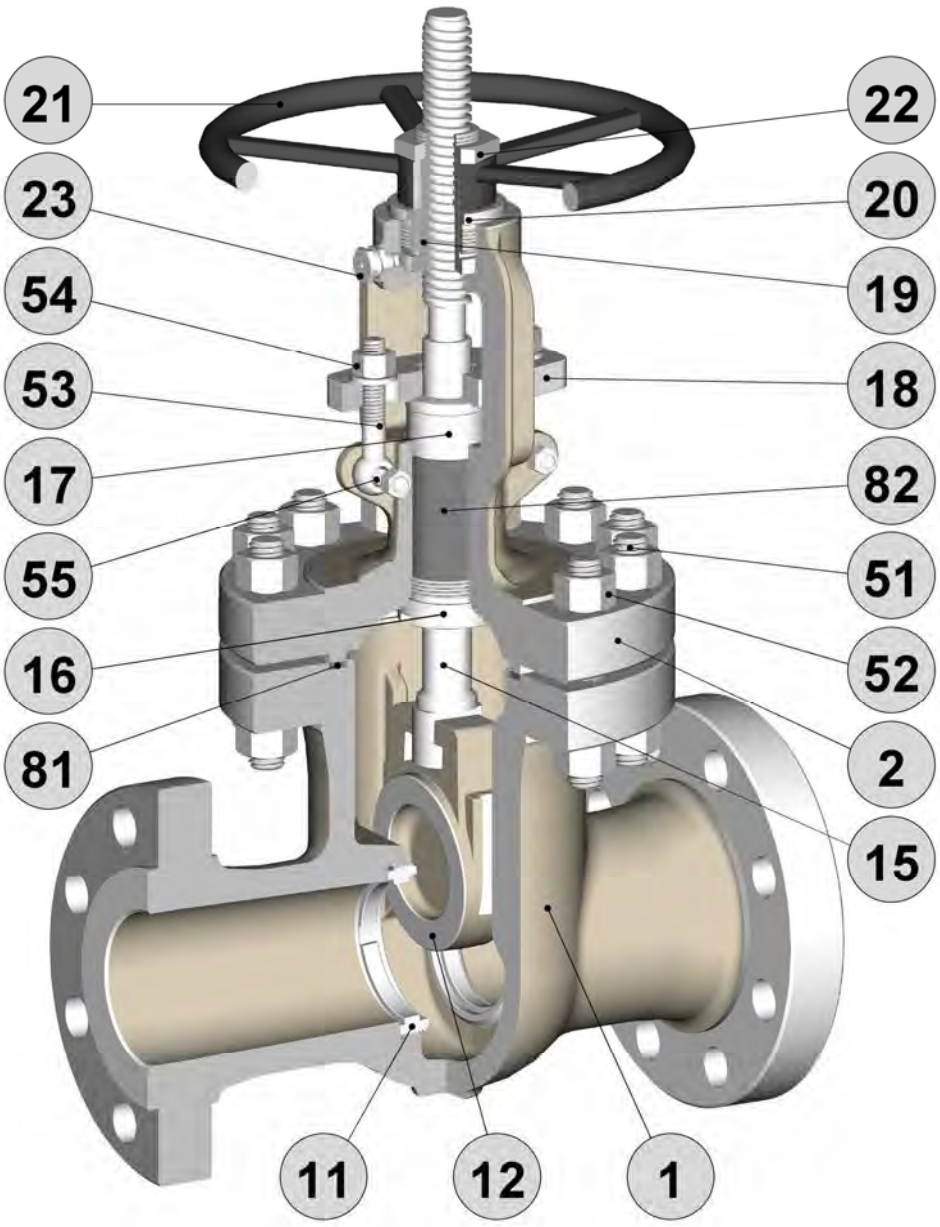


La manutenzione degli attuatori montati sulle valvole deve essere effettuata in accordo alle istruzioni del produttore.

2.5 NOTES

- ✓ Yoke nut of the yoke sleeve is tack welded to the bonnet.
- ✓ See the following figure for valve handling

NOTE



- ✓ La ghiera di fissaggio della madrevite è assicurata al cappello con un punto di saldatura.
- ✓ Per la movimentazione delle valvole attenersi alla figura successiva.

3 GLOBE VALVES WITH OUTSIDE SCREW, YOKE AND RISING STEM / VALVOLA A GLOBO CON VITE ESTERNA E STELO SALIENTE

3.1 PERIODIC CHECKS / VERIFICHE PERIODICHE

3.1.1 Check the stem packing monthly (part n. 82) / Controllare mensilmente il pacco baderna (componente n. 82)

In case of leaks from the gland, tighten the eye bolts (part n. 53) it will tighten the packing ring seals (part n. 82).

In caso di perdite dal premistoppa, serrare i tiranti a occhiolo (componente n. 53) in modo tale da comprimere ulterirmente il pacco baderna (componente n. 82).

Compression/tighten must not exceed the correct limit in order to avoid difficulties during opening-closing operations or during the adjustment.

La compressione non dovrà superare il limite necessario, al fine di evitare difficoltà durante le manovre di apertura/chiusura o di regolazione.

If it is not possible to compress/tighten the seals, stem packing replacement is necessary, asking the manufacturer for the supply of spare packing seals.

Nel caso non fosse possibile comprimere ulteriormente le guarnizioni, si rende necessaria la sostituzione del pacco baderna, chiedendo la fornitura dei ricambi.

Avoid adding packing rings, unless the maintenance is temporary.

L'aggiunta di alcuni anelli di treccia è da evitare e da riservarsi solo per una manutenzione temporanea.

The regular sealing of the packing ring is guaranteed only by the design-specific seals.

La regolare tenuta del pacco baderna è garantita solo dalle guarnizioni specifiche di progetto.

3.1.2 Check monthly the yoke sleeve lubrication (part n. 19) / Controllare mensilmente la lubrificazione della madrevite (componente n. 19)

3.1.3 Bolts tension (part n. 51) / Serraggio tiranti (componente n. 51)

It is recommended to check periodically the bolts tension of valves in service at high temperature and subjected to frequent thermal cycles.

Si raccomanda di controllare periodicamente il serraggio dei tiranti delle valvole in servizio ad alta temperatura e sottoposte a frequenti cicli termici.

Even if the seal leakage are rare, the corrosion could be cause of the losses. In this case it is necessary to replace the seal checking at the same time also the contact surface of the gasket (part n. 81).

Seppure le perdite dalla guarnizione siano rare, la corrosione potrebbe essere causarle. In tal caso è necessaria la sostituzione della guarnizione (componente n.81) controllando contemporaneamente anche la superficie a contatto con la stessa.

3.2 MAINTENANCE AND REPLACEMENT OF DAMAGED PARTS / MANUTENZIONE E SOSTITUZIONE DELLE PARTI DANNEGGIATE

3.2.1 Stem (part n. 15) / Stelo (componente n. 15)

Difficulty during operation or stem locking can be caused by the packing ring seals or lantern ring drying up or by the yoke sleeve locking.

Difficoltà di manovra o bloccaggio dello stelo possono essere causati da essiccamento del pacco baderna o della lanterna oppure da bloccaggio della madrevite.

In order to restore normal operation conditions we recommend the following:

Per ristabilire le normali condizioni di funzionamento si consiglia di:

- ✓ Check the packing and lantern ring service capacity, restore packing lubrication and pressure. If the parts are damaged, their replacement is necessary.
- ✓ Controllare la capacità di servizio del pacco baderna e della lanterna, ripristinando lubrificazione e compressione delle guarnizioni. Se i componenti sono danneggiati è necessaria la loro sostituzione.
- ✓ In case of locking due to the lantern ring wear and tear, disassemble the stem and replace the lantern ring.
- ✓ In caso di bloccaggio dovuto ad usura della lanterna, si raccomanda di smontare lo stelo e sostituire la lanterna.
- ✓ Clean the yoke sleeve and replenish with correct lubrication, verify that there is no damage. Damaged or worn yoke sleeve must be replaced with a new one.
- ✓ Pulire la madrevite e ristabilire la corretta lubrificazione, verificando che non sia danneggiata. La madrevite danneggiata o usurata deve essere sostituita con una nuova.

3.2.2 Packing ring seal maintenance with the valve in service / Manutenzione del pacco baderna con valvola in servizio

Repacking of the valve while it is under pressure is extremely dangerous, so is not recommended and in any case is at the owner's risk.

La sostituzione del pacco baderna con valvola in pressione è estremamente pericoloso, quindi non è raccomandato ed è comunque a proprio rischio.

The successful completion of a backseat test should not be construed as a recommendation by the manufacturer that a

L'esito positivo del test di controtenuta non deve essere interpretato come una raccomandazione da parte del

valve may be repacked while it is under pressure.

Preferably the backseat (part n.16) may be used as a means of stopping or reducing packing leakage until the packing can be replaced under no pressure.

In the following paragraph 3.2.3 is explained how repacking the valve, in safety manner, in depressurized conditions.

produttore a eseguire tale operazione.

Preferibilmente la controtenuta (parte n.16) può essere usata come mezzo per fermare o ridurre le perdite dalla baderna fino a quando non si può procedere alla sua sostituzione in assenza di pressione.

Nel seguente paragrafo 3.2.3 viene spiegato come sostituire il pacco baderna in modo sicuro, in condizioni di depressurizzazione.

3.2.3 Maintenance carried out with the valve out of service

Step 1

- ✓ Empty and drain the valve and the connected pipes;
- ✓ Put valve in half opening position;
- ✓ Loosen the packing eye-bolts;
- ✓ Loosen body-bonnet bolts, then remove them;
- ✓ Unscrew the stem from the yoke sleeve and slip out of bonnet;
- ✓ Remove gland, gasket, packing and lantern ring if present;
- ✓ Check the parts, replace the worn down or damaged ones and all gaskets.

Step 2

Reassemble the valve, lubricating the parts according to the nature of the fluids the valve is connected to, following the subsequent order:

- ✓ Insert the packing, the lantern ring if present, the gland in their own housing;
- ✓ Screw the stem to the yoke sleeve through the packing, being careful not to damage the gaskets;
- ✓ Replace the disc on the stem;
- ✓ Fix the bonnet on the body with the bolts, checking the correct position of gasket;
- ✓ Register gland compression and verify the operation and service of the valve;
- ✓ Check bolts, gasket and packing seal a few hours after it has been in service.

The suitability of the valves used for explosive, inflammable, toxic, corrosive fluids or is in service in a special security conditions should be checked through hydraulic test after its maintenance.

Manutenzione effettuata con valvola fuori servizio

Fase 1

- ✓ Svuotare e sfiatare la valvola e le tubazioni collegate;
- ✓ Mettere la valvola in posizione di mezza apertura;
- ✓ Allentare i tiranti del premistoppa;
- ✓ Allentare tutti i tiranti corpo-cappello, poi rimuoverli;
- ✓ Svitare lo stelo dalla madrevite e sfilarla dal cappello;
- ✓ Rimuovere premistoppa, guarnizioni, pacco baderna e lanterna se presente;
- ✓ Controllare i componenti, sostituire quelli usurati o danneggiati e tutte le guarnizioni;

Fase 2

Rimontare la valvola, lubrificando i componenti secondo la natura dei fluidi con cui è a contatto, agendo nel seguente ordine:

- ✓ Inserire il pacco baderna, la lanterna se presente, il premistoppa nel proprio alloggiamento:
- ✓ Avvitare lo stelo alla madrevite attraverso il pacco baderna prestando attenzione a non danneggiare le guarnizioni;
- ✓ Reinserire l'otturatore sull'attacco dello stelo;
- ✓ Fissare il cappello al corpo con i tiranti, controllando l'esatta posizione della guarnizione,
- ✓ Registrare la compressione del premistoppa e verificare funzionamento e la manovrabilità della valvola;
- ✓ Controllare la tenuta dei tiranti e delle guarnizioni dopo qualche ora di servizio.

L'idoneità delle valvole in servizio con fluidi esplosivi, infiammabili, tossici, corrosivi o che devono operare in condizioni di sicurezza particolari dovrebbe essere controllata per mezzo di prova idraulica dopo operazioni di manutenzione straordinaria.

3.3 DISCS AND SEALING SEATS

Seats and disc leakage is not always easy to notice when the valve is in service: if this leak is confirmed, it is necessary to intervene immediately.

Seats and disc surfaces or even both can be seriously damaged without an immediate intervention.

In order to repair or replace the parts it is necessary to put the valve out of service and remove the various elements as previously described (3.2.3–Step 1).

Seat maintenance

If seats surfaces are locking, or have cavities or furrows not deeper than 1.5 mm (1/16"), it is possible to repair the surfaces, restore it to its original condition grinding them with granular abrasive paste.

If is necessary to use paste (normally blue in color) check seats surfaces after final grinding.

OTTURATORI E SEDI DI TENUTA

La perdita dalla sede e dall'otturatore non sono sempre facili da notare quando la valvola è in servizio: qualora tali perdite siano confermate è utile agire subito.

Le superfici della sede o dell'otturatore, o addirittura entrambi, possono subire danni gravi se non si interviene prontamente.

Per effettuare le riparazioni o sostituzioni è necessario mettere la valvola fuori servizio e rimuovere i vari componenti come descritto precedentemente punto (3.2.3– Fase 1).

Manutenzione sede di tenuta

Se le superfici delle sedi mostrano bloccaggio, cavità o solchi profondi non oltre 1,5 mm (1/16") è possibile riparare le superfici, riportandole alle condizioni originali di perfetta tenuta, lappandole con pasta abrasiva granulare.

Per controllare le superfici delle sedi dopo la lappatura finale è necessario utilizzare pasta di riscontro (normalmente di colore blu).

Surfaces with defects deeper than 1.5 mm (1/16") cannot be repaired through grinding; in this case the use of spare parts is recommended.

To assemble the valve please follow instruction on paragraph 3.2.3–Step 2

Le superfici che presentano difetti con profondità superiore a 1,5 mm (1/16") non possono essere riparate mediante lappatura; in questo caso si consiglia l'utilizzo di parti di ricambio.

Per il ri-assemblaggio delle valvole seguire le istruzioni come da paragrafo 3.2.3 – Fase 2

3.4 ACTUATORS

Actuators maintenance on valves must be carried out according to the actuators manufacturer's instruction manual.

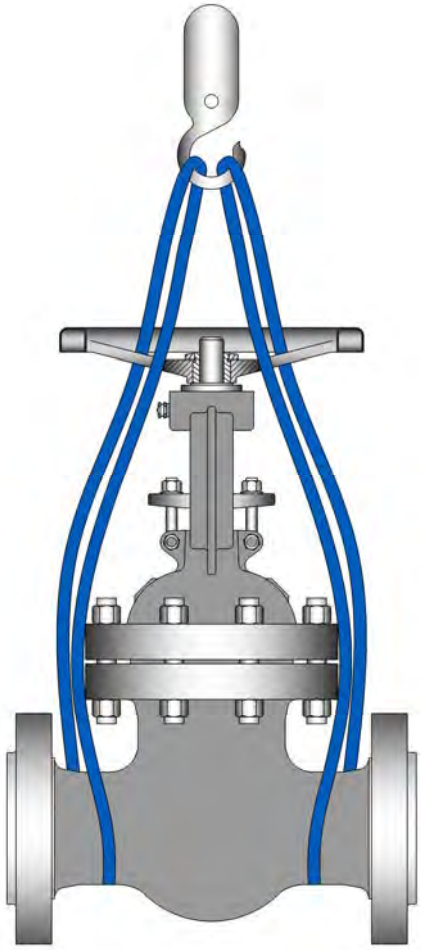
ATTUATORI

La manutenzione degli attuatori montati sulle valvole deve essere effettuata in accordo alle istruzioni del produttore.

3.5 NOTES

- ✓ The use of the globe valve is limited to the differential pressure (ΔP) below the disc (look at the table below)

NOTE

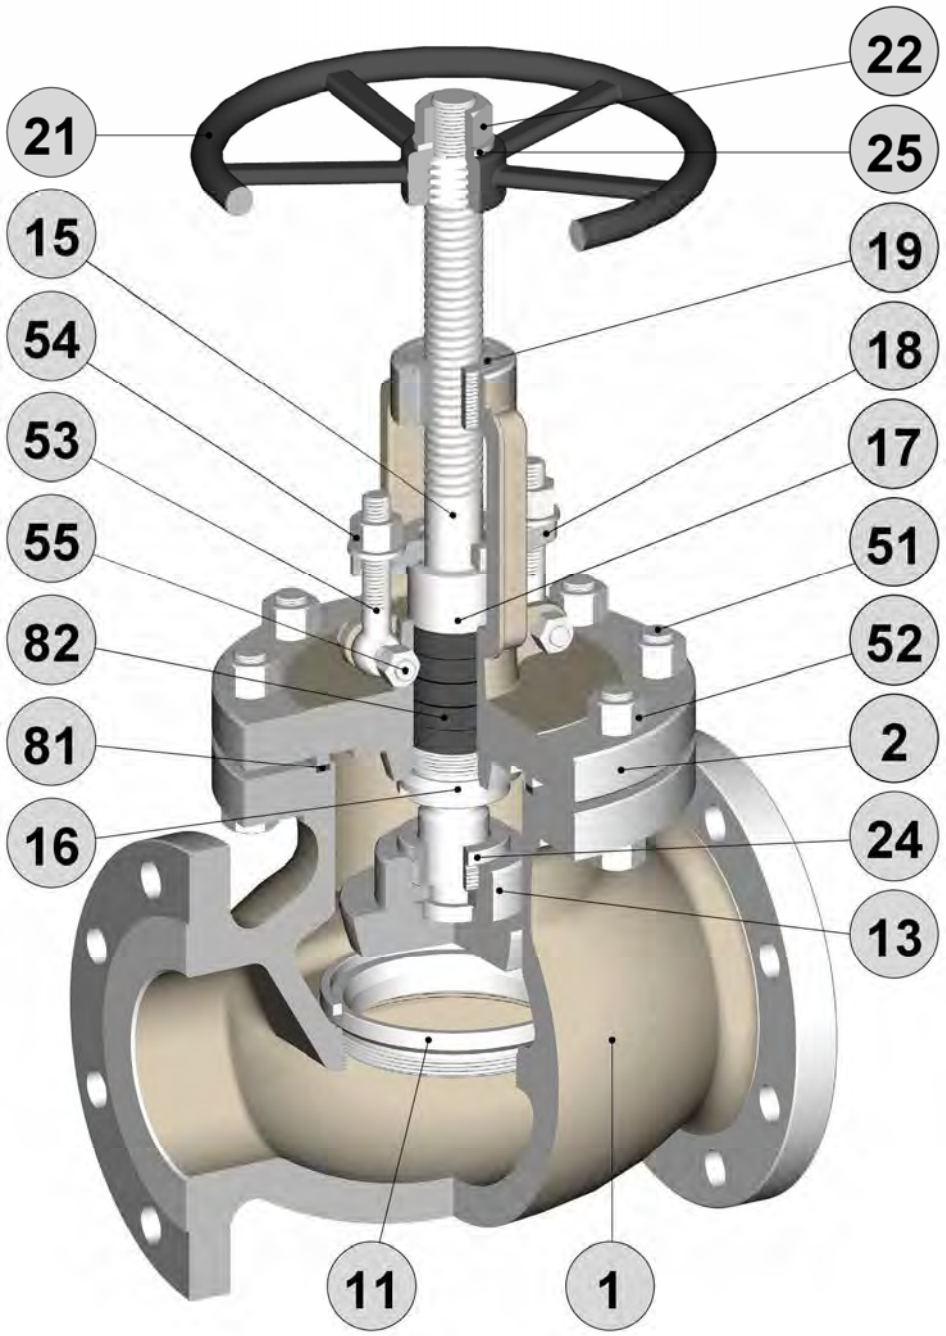


L'impiego delle Valvole a Globo è limitato dalla pressione differenziale (ΔP) sotto l'otturatore (vedi tabella).

DN	5"	6"	8"	10"	12"	14"	16"
Δ P (Bar)	33	21	14	9	6	4,5	3,5

- ✓ If the differential pressure under the disc is higher than the values shown in the table, it is necessary to install the valve with opposite flux and with external by-pass or, if requested, with internal by by-pass.
- ✓ See the following figure for valve handling.

Nel caso in cui la pressione differenziale sotto l'otturatore superi i valori indicati in tabella, occorre prevedere il montaggio della valvola con flusso inverso e con by-pass esterno o, su richiesta, con by-pass interno.



Per la movimentazione delle valvole attenersi alla figura successiva.

4.4	Sectional drawing with part list Disegno in sezione con lista componenti	pag. 23

4 SWING CHECK VALVE / VALVOLA DI RITEGNO A BATTENTE

4.1 PERIODIC CHECKS / VERIFICHE PERIODICHE

We recommend to check periodically the eye bolts tension and gasket seals of the valve according to the usage and high temperature or if the valve is exposed to frequent thermal cycle with a significant change in temperature.

Perform preventive maintenance according to previous experience of plant or equipment.

Si raccomanda di controllare periodicamente e in base all'utilizzo il serraggio dei tiranti e la tenuta della guarnizione delle valvole in servizio ad alta temperatura o sottoposte a frequenti cicli termici con significativo differenziale di temperatura

Effettuare manutenzioni preventive secondo quanto indicato da precedenti esperienze di impianto o di apparecchiatura.

4.2 MAINTENANCE AND REPLACEMENT OF DAMAGED PARTS / MANUTENZIONE E SOSTITUZIONE DELLE PARTI DANNEGGIATE

4.2.1 Gasket leaks / Perdite dalla guarnizione

- ✓ Place the valve out of service;
- ✓ Empty and completely drain the valve and the pipes connected to it;
- ✓ Loosen all bolts and nuts, then remove them;
- ✓ Remove the cover (part n. 3);
- ✓ Check plate (washer n. 25), nut (part n. 42), pin (part n. 28) are in good conditions and correctly connected: if there are damaged parts it must be changed;
- ✓ Remove the disc operating on the hinge (part n. 14);
- ✓ Verify that this step is not hindered by the hinge pin seizing (part n. 26). If the swing check track is not smooth, remove the hinge pin loosing it and taking away the plugs and the undrilled flanges.
- ✓ Check the hinge pin surface: If the seizing signs are dept less than 1.5 mm (1/16") and they are only on the surface connected with the hinge, turn / flip the hinge pin and reassemble.
- ✓ If the depth is greater than 1.5 mm (1/16"),replace the hinge pin.
- ✓ Before replacing the hinge pin check the disc and the seal.

- ✓ Mettere fuori servizio la valvola;
- ✓ Svuotare e sfiatare completamente la valvola e le tubazioni ad essa collegate;
- ✓ Allentare tutti i tiranti e i relativi dadi, poi rimuoverli;
- ✓ Sollevare il coperchio (parte n. 3);
- ✓ Controllare che le parti n. 25 (rosetta), 42 (dado), 28 (spina) siano in buone condizioni e ben collegate: nel caso si riscontrassero parti danneggiate, sarà necessaria la loro sostituzione
- ✓ Sollevare l'otturatore agendo sulla cerniera (parte n. 14);
- ✓ Accertarsi che tale movimento non venga ostacolato da eventuali bloccaggi dello spinotto (parte n. 26). Se la corsa del battente non fosse scorrevole, rimuovere lo spinotto allentando prima e poi togliendo i tappi e le flange cieche.
- ✓ Controllare la superficie dello spinotto: se i segni di bloccaggio sono meno profondi di 1,5 mm (1/16") e limitati alla superficie di contatto con la cerniera, girare lo spinotto e rimontarlo.
- ✓ Se la profondità è superiore a 1,5 mm (1/16"), sostituire lo spinotto.
- ✓ Prima di rimontare lo spinotto, controllare il battente e la sede di tenuta.

4.2.2 Leaks provoked by seal surface damage because of corrosion or do to wear and tear / Perdite dovute al deterioramento della superficie di tenuta a causa usura o corrosione

Disc surfaces wear

- ✓ Disassemble the disc removing the pin, nut and plate;
- ✓ Smooth and grind the seal surface with abrasive paste of fine grained.

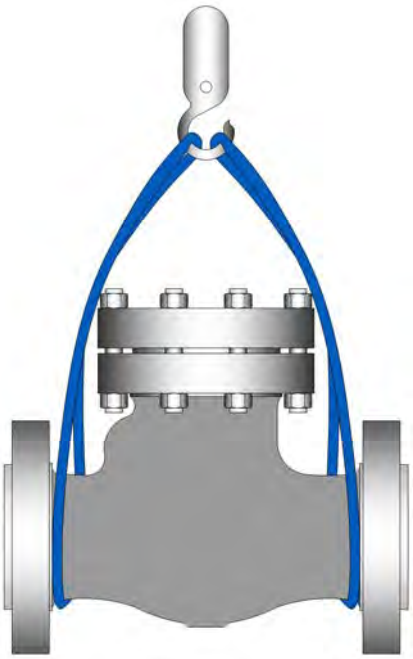
Seat surfaces wear

- ✓ If seats surfaces are locking, or have cavities or furrows not deeper than 1.5 mm (1/16"), it is possible to repair the surfaces, restore it to its original condition grinding them with granular abrasive paste: if it's necessary to use paste (normally blue in color) check seats surfaces after final grinding.
- ✓ Surfaces with defects deeper than 1.5 mm (1/16") cannot be repaired through grinding: in this case the use of spare parts is recommended.

Deterioramento delle superficie dell'otturatore

- ✓ Smontare il battente rimuovendo la spina, il dado e la rosetta;
- ✓ Levigare e lappare lasuperficie di tenuta con una pasta abrasiva a grana fine.

Deterioramento delle superfici della sede



- ✓ Se le superfici delle sedi mostrano bloccaggi, cavità o solchi profondi non oltre 1,5 mm (1/16") è possibile riparare le superfici, riportandole alle condizioni originali di perfetta tenuta, lappandole con pasta abrasiva granulare: è necessario utilizzare pasta di riscontro (normalmente di colore blu) per controllare le superfici delle sedi dopo la lappatura finale.
- ✓ Le superfici che presentano difetti con profondità superiore a 1,5 mm (1/16") non possono essere riparate mediante lappatura: per ripristinare la funzionalità della valvola è raccomandato usare usare parti di ricambio.

4.3 NOTES

See the following figure for valve handling.

NOTE

5.4	Sectional drawing with part list Disegno in sezione con lista componenti	pag. 26

5 STRAINER — FILTRO

5.1 PERIODIC CHECKS — VERIFICHE PERIODICHE

We recommend to check periodically the bolts tension and gasket seals of the valve according to the usage and high temperature or if the valve is exposed to frequent thermal cycle with a significant change in temperature.

Cleaning and preventive maintenance is recommended according to the fluids the valves is in service for; strainers operating in a new system must be cleaned and check after a few hours after it has been in service.

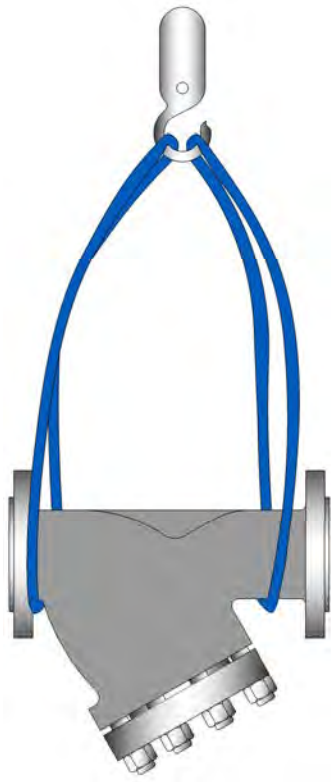
Si raccomanda di controllare, periodicamente e in base all'utilizzo, la tensione dei tiranti e la tenuta della guarnizione dei filtri in servizio ad alta temperatura o sottoposti a frequenti cicli termici con significativo differenziale di temperatura

Effettuare operazioni di pulizia e di manutenzione preventiva in base ai fluidi trattati ed alle condizioni di esercizio; i filtri inseriti in nuovi impianti devono essere puliti e controllati dopo qualche ora dalla messa in servizio.

5.2 MAINTENANCE AND REPLACEMENT OF DAMAGED PARTS — MANUTENZIONE E SOSTITUZIONE DELLE PARTI DANNEGGIATE

If the screen must be cleaned (part n. 29), or in case of seal gaskets has a leakage we recommend the following:

- ✓ Place strainer out of service;
- ✓ Empty and completely drain the strainer and pipes connected to it;
- ✓ Loose all nuts and remove them (part n.52);
- ✓ Remove the cover (part n.3);
- ✓ Remove the screen (part n.29) and clean carefully;
- ✓ Put it back the screen in the original position;
- ✓ We recommend to change the gasket (part n.81) after the strainer is removed.
- ✓ Place the cover and tight the nuts.



Se è necessario pulire la rete (parte n. 3), o in caso in caso di perdita dalla guarnizione, procedere come segue:

- ✓ Mettere fuori servizio il filtro;
- ✓ Svuotare e sfiatare completamente il filtro e le tubazioni ad esso collegate;
- ✓ Allentare tutti i dadi, poi rimuoverli (componente n.52);
- ✓ Sollevare il coperchio (componente n. 3);
- ✓ Rimuovere la rete (parte n. 29) e pulirla accuratamente.
- ✓ In seguito rimontare la rete nella posizione originale;
- ✓ E' raccomandabile sostituire la guarnizione (componente n. 81) quando il filtro viene smontato.
- ✓ Montare il coperchio e stringere i dadi.

5.3 NOTES — NOTE

Instructions for explosion prevention and protection

DIRETTIVA ATEX2014/34/EU E EN 1127-1
Istruzioni per la prevenzione e la protezione dalle esplosioni

7.1 INSTALLATION

For the phase installation the user is responsible for the following steps to be done prior installation:

- ✓ For flanged valves, the flange surfaces and the gaskets must be cleaned and intact before installation.
- ✓ For butt weld valves, the weld area must be cleaned and in appropriate conditions for the welding. All valves must be partially open prior to welding.
- ✓ The valves must be carefully cleaned before installation, both internal and external surfaces. The same cleaning operations must be applied to the entire system in order to avoid the presence of any possible abrasive particles within the piping system.
- ✓ The valve must be electrically ground immediately after installation.
- ✓ Before installation the user must carry out a thorough risk assessment of the facility regarding possible risks of explosion and fire.
- ✓ Adjacent installations must be done in a way that will not create any threats.
- ✓ The valves must be installed in an area where there is a system of drainage and ventilation to control minor losses and effects of the release of combustible gases and vapors.

INSTALLAZIONE

Per la fase di installazione l'utilizzatore è responsabile delle seguenti fasi da espletare prima dell'installazione:

- ✓ Per le valvole flangiate, le superfici delle flange e le guarnizioni devono essere intatte e pulite prima dell'installazione.
- ✓ Per le valvole con saldatura di testa, la zona da saldare deve essere pulita e in condizioni appropriate per la saldatura. Tutte le valvole devono essere parzialmente aperte prima della saldatura.
- ✓ Le valvole devono essere accuratamente pulite prima dell'installazione, sia per le superfici interne che quelle esterne. Le stesse operazioni di pulizia devono essere applicate a tutto l'insieme per evitare la presenza di eventuali particelle abrasive all'interno del sistema di tubazioni.
- ✓ La valvola deve essere messa elettricamente a terra subito dopo l'installazione.
- ✓ Prima dell'installazione l'utilizzatore deve effettuare un'accurata valutazione dei rischi dell'impianto per quanto riguarda i possibili rischi di esplosione e incendio.
- ✓ Le installazioni adiacenti devono essere fatte in modo da non creare alcun pericolo.
- ✓ Le valvole devono essere installate in un'area dove esiste un sistema di drenaggio e ventilazione per controllare le perdite minori e gli effetti del rilascio di gas e vapori combustibili.

7.2 OPERATION AND MAINTENANCE

- ✓ For the operation and maintenance phase the user is responsible to the following:
- ✓ Avoid the presence of any foreign object/material inside the pipe system that can create sparks if in contact with the surfaces of the valve.
- ✓ Avoid the occurrence of any possible exothermic chemical reaction within the plant e.g. possibly in the absence of air and oxygen.
- ✓ Prevent the creation of current flow, e.g. as a result of magnetic induction, current return, lightning.
- ✓ Schedule periodic cleaning of the valve and the entire plant/facility in order to prevent and/or limit dust or any particles that may be a source of ignition of fire or explosions.
- ✓ Gas/air and steam/air atmospheres surrounding the plant must undershoot the temperature of all surfaces, even in case of rare malfunctions.
- ✓ The temperature of the atmosphere should not exceed a maximum value of 80% of the minimum ignition temperature.
- ✓ The temperatures of all surfaces must be at a maximum

FUNZIONAMENTO E MANUTENZIONE

- ✓ Per la fase di funzionamento e manutenzione l'utilizzatore è responsabile di quanto segue:
- ✓ Evitare la presenza di qualsiasi oggetto/materiale estraneo all'interno dell'impianto che possa creare scintille se a contatto con le superfici della valvola.
- ✓ Evitare il verificarsi di qualsiasi possibile reazione chimica esotermica all'interno dell'impianto, a esempio in assenza di aria e ossigeno.
- ✓ Prevenire la creazione di flusso di corrente, a esempio a seguito di induzione magnetica, ritorno di corrente, fulmini.
- ✓ Programmare la pulizia periodica della valvola e dell'intero impianto/struttura al fine di prevenire e/o limitare la polvere o qualsiasi particella che possa essere fonte di innesco di incendi o esplosioni.
- ✓ Le atmosfere gas/aria e vapore/aria che circondano l'impianto devono essere di temperatura inferiore a tutte le superfici, anche in caso di rari malfunzionamenti.
- ✓ La temperatura dell'atmosfera non deve superare un valore massimo dell'80% della temperatura minima di accensione.
- ✓ Le temperature di tutte le superfici devono essere a un

value of 2/3 of the minimum ignition temperature.

✓ The temperature of the atmosphere and the plant should be carefully checked with the usage of appropriate tools.

✓ The plant must be protected by a system capable of: detect and extinguish sparks, eliminate and suppress possible explosions, isolate processes, identify and combat fires, and shut down the system in case of emergency.

valore massimo di 2/3 della temperatura minima di accensione.

✓ La temperatura dell'atmosfera e dell'impianto deve essere controllata attentamente con l'uso di strumenti appropriati.

✓ L'impianto deve essere protetto da un sistema in grado di: rilevare ed estinguere scintille, eliminare e sopprimere possibili esplosioni, isolare i processi, identificare e affrontare gli incendi, arrestare l'impianto in caso di emergenza.

7.3 TOOLS — ATTREZZATURE

✓ Tools must be divided into two categories:

a) Tools that can cause sparks when they are used (e.g. drills, wrenches, screwdrivers, and monkey wrenches).

b) Tools that generate a shower of sparks when used to cut or break off something such as sawing or grinding.

✓ In zones 0 and 20 are not allowed tools which can cause sparks.

✓ In zones 1 and 2 can be used only tools belonging to the category “a”. Tools belonging to category “b” are only allowed if there are no traces of hazardous substance or explosive in the atmosphere.

✓ In any case, the use of any steel tools is absolutely prohibited in zone 1 when there exists the possibility of explosion due to the presence of substances which belong to the group II C (in standard EN 50014) acetylene, carbon disulphide, hydrogen, hydrogen sulphide, ethylene oxide, carbon monoxide, unless it is established that no potentially hazardous atmosphere is present in the workplace during the use of the above mentioned tools.

✓ Steel tools belonging to category “a” are permitted in zones 21 and 22. Steel tools belonging to category “b” are permitted only if the workplace has been isolated from the remaining areas of zones 21 and 22 and the following precautions have been taken:

- Any dust deposits were removed from the workplace, or
- The workplace is kept so wet to prevent dispersion of dust in the air as well as possible development of combustion residual products.

✓ When performing grinding or sawing work in zones 21 and 22 or in the vicinity, you have to be aware that sparks may be dispersed over great distances, and that this could lead to the formation of combustible particles. For this reason also the areas adjacent to the workplace must be protected using the protective measures just mentioned.

✓ The use of tools in zone 1, 2, 21 and 22 must be subject to a “work permit” only.

✓ Le attrezzature devono essere divisi in due categorie:

a) Attrezzi che possono provocare scintille quando vengono usati (per esempio, trapani, chiavi, cacciaviti e chiavi inglesi).

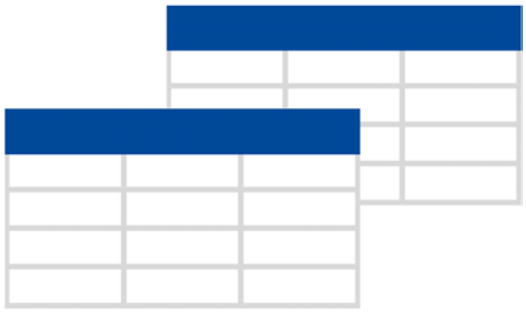
b) Attrezzi che generano una pioggia di scintille quando vengono usati per tagliare o rompere qualcosa, come tagliare o molare.

✓ Nelle zone 0 e 20 non sono ammessi utensili che possono causare scintille.

✓ Nelle zone 1 e 2 possono essere usati solo utensili appartenenti alla categoria "a". Gli utensili appartenenti alla categoria "b" sono ammessi solo se non ci sono tracce di sostanze pericolose o esplosive nell'atmosfera.

✓ In ogni caso, l'uso di qualsiasi utensile in acciaio è assolutamente vietato nella zona 1 quando esiste la possibilità di esplosione a causa della presenza di sostanze che appartengono al gruppo II C (nella norma EN 50014) acetilene, disolfuro di carbonio, idrogeno, solfuro di idrogeno, ossido di etilene, monossido di carbonio, a meno che non sia stabilito che non sia presente un'atmosfera potenzialmente pericolosa nel luogo di lavoro durante l'uso dei suddetti utensili.

✓ Gli utensili in acciaio appartenenti alla categoria "a" sono ammessi nelle zone 21 e 22. Gli utensili d'acciaio appartenenti alla categoria "b" sono permessi solo se il luogo di lavoro è stato isolato dalle restanti aree delle zone 21 e 22 e sono state prese le seguenti precauzioni:



- Qualsiasi deposito di polvere è stato rimosso dal luogo di lavoro, o
- Il posto di lavoro è mantenuto così umido da impedire la dispersione della polvere nell'aria così come il possibile sviluppo di prodotti residui della combustione.

✓ Quando si eseguono lavori di molatura o segatura nelle zone 21 e 22 o nelle vicinanze, bisogna essere consapevoli che le scintille possono essere disperse a grandi distanze, e che questo potrebbe portare alla formazione di particelle combustibili. Per questo motivo anche le aree adiacenti al luogo di lavoro devono essere protette utilizzando le misure di protezione appena menzionate.

✓ L'uso di utensili nelle zone 1, 2, 21 e 22 deve essere soggetto solo ad un "permesso di lavoro".

NOTES
(a) Permissible, but not recommended for prolonged usage above 425 °C (800 °F)
(b) Not to be used over 345 °C (650 °F)
(c) Permissible, but not recommended for prolonged usage above 454 °C (850 °F)
(d) Permissible, but not recommended for prolonged usage above 593 °C (1100 °F)
(e) Not to be used over 427 °C (800 °F)
(f) Not to be used over 454 °C (850 °F)
(g) At temperature over 538 °C (1000 °F), use only when carbon content is 0,04 or higher
(h) Permissible, but not recommended for prolonged usage above 468 °C (875 °F)
(j) Not be used over 538 °C (1000 °F)
(m) Not be used over 595 °C (1100 °F)

All data, subject to technical changes, are only for information and not for official use.

NOTES
(a) Permissible, but not recommended for prolonged usage above 425 °C (800 °F)
(b) Not to be used over 345 °C (650 °F)
(c) Permissible, but not recommended for prolonged usage above 454 °C (850 °F)
(d) Permissible, but not recommended for prolonged usage above 593 °C (1100 °F)
(e) Not to be used over 427 °C (800 °F)
(f) Not to be used over 454 °C (850 °F)
(g) At temperature over 538 °C (1000 °F), use only when carbon content is 0,04 or higher
(h) Permissible, but not recommended for prolonged usage above 468 °C (875 °F)
(j) Not be used over 538 °C (1000 °F)
(m)Not be used over 595 °C (1100 °F)

FLOATING BALL VALVES USE AND MAINTENANCE MANUAL

GENERAL INSTRUCTIONS FOR THE INSTALLATION USE AND MAINTENANCE OF FLOATING BALL VALVES

1.0 INSTALLATION

1.1 Remove the bonnet of the flange or the final protection and clean the surfaces of contact which should be protected with anti-rust

1.2 Ensure that the valve is in open position before the installation

1.3 Install the valve on the conduct and taking care not to put the valve in operation before the conduct is completely clean

2.0 USE

2.1 Floating ball valves are designed for services for ON/OFF services and have to be utilised only in fully open or fully closed position. Improper use of flow control could invalidate de warranty

2.2 The operations of opening and closure are to be carried with the operator which has been furnished and designed for the valve. The manufacturer declines from any responsibility for operations that have been carried out with other tools.

3.0 REMOVAL OF SET FOR MANOUVER

3.1 REMOVAL OF WRENCH

3.1.1 Manually remove the retaining bolt, remove the lever.

4.0 DISASSEMBLING FOR MAINTENANCE

4.1 Check that no pressure is trapped inside the valve body cavity.

4.2 Mark body and body connector for the correct reassembling and alignment of the valve after reassembling.

4.3 Unscrew the body screw/nuts between body and body connector (pos. 03).

4.4 Divide the body (pos. 02) from the body connector (pos. 03).

4.5 Put the ball in closed position (pos. 04).

4.6 Remove the ball without damaging the sealing surface (pos. 04).

4.7 Remove the seats from their slots (pos. 05).

4.8 Unscrew the lever and stem nuts (pos. 06).

4.9 Remove the lever and the stop pad (pos.07) and (pos. 06A).

4.10 Push the stem towards the internal of the body and remove it from inside the valve (pos. 08)

5.0 MAINTAINANCE

5.1 Check the internal surface of the body. There must not be evident signs of abrasion and/or corrosion, otherwise please contact the supplier.

5.2 Check that the ball sealing surface be not damaged.

5.3 Check that the stem is not damaged.

5.4 Control that all seals and gaskets do not show anomalous damages (it is anyway advisable their full substitution)

6.0 ASSEMBLY

Before starting the reconstruction of the valve check that every part is cleaned and free from every external material. Ensure that the assembly takes place in a clean area and that all parts packed are kept as clean as possible, the instruction are opposite to the instruction of disassembly.

6.1 Assemble all gaskets on the stem as per picture (pos. 09).

6.2 Put the stem in the valve body (from inside).

6.3 Put all external seals, the stem spacer and fix the stem with the stem nut (pos. 11-12-06A).

6.4 Put the seats in their slots.

6.5 Smoothly put the ball in the valve body fixing it to the stem in closed position and check the rotations.

7.6 Put the body gasket between the body (pos. 10).

7.7 Approach the body to the body connector by using the mark made on the parts before opening the valve. Take care not to damage the relevant gasket.

7.8 Put screw/bolts between bodies and screw with crossed sequence (pos. 01).

7.9 Fix the stem with the stem nut (pos. 06A).

7.10 Put the handle on the stem (pos. 07).

7.11 Fix the stem stop lever nut (pos. 06).

8.0 FINAL ADVICE

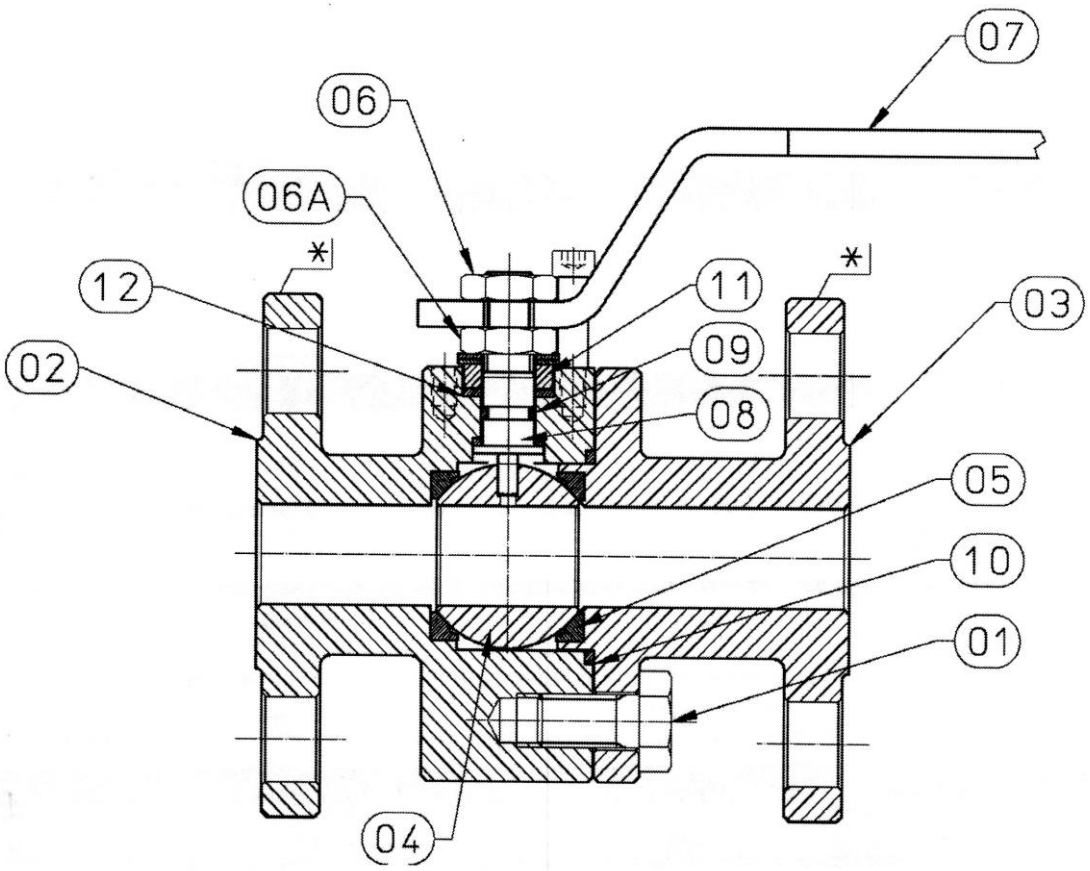
8.1 Carry out after assembly of the valve at least a couple of manoeuvres rotating the stem, in order to permit the components to assess themselves.

8.2 Ensure that in completely open position the reed is parallel with respect to the flow line, and in close position it is perpendicular

9.0 SPARE PARTS RECOMENDED FOR MAINTAINANCE

O-RING SET	Stem
	Closure
INSERT	Seat
SEALS	Stem graphite
	Body graphite

10.0 STORAGE



10.1 The valves are supplied complete with wood or plastic final protectors to be removed prior to installation.

10.2 The ball has to lay in open position during storage

10.3 The valves can be stored in their original packing for up to 18 moths in a clean dry and covered area or in a warehouse having a controlled environment, on shelves or pallets

10.4 If storage is to be in an outside yard for periods longer than 12 months, this has to be told prior to ordering

10.5 The valves stored for over 18 months should be cycled once to ensure freedom of operation

Introduction

Product Description

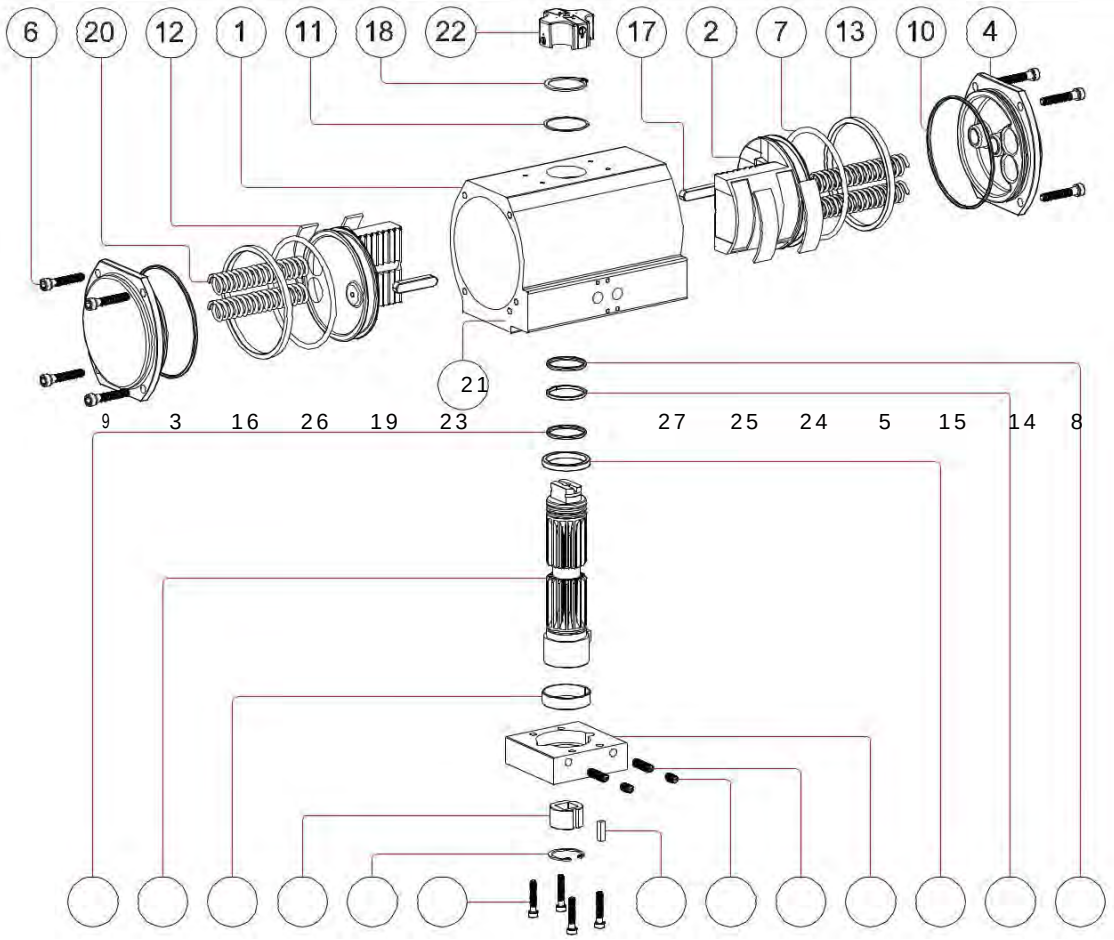
TruTorq actuators are pneumatic quarter turn actuators which are based on a double rack and pinion design. The unique features of the actuator are:

- The “patented” spring encapsulation (no special tools required to change DA to SR, same overall dimensions remain the same for both types).
- The dual encapsulated “POM Delrin” wear pads on the piston prevent metal to metal contact between piston and cylinder wall,
- The piston racks each have an encapsulated support “GUIDE BAR” which rolls against the drive shaft and thus relieves any side loading which reduces pinion & rack wear.
- Triple shaft bearing system to prevent any adverse loading on the driveshaft
- Piston back-up bearings, which are situated behind the pistons ‘o’ ring to ensure linear movement and prevent wear on the cylinder surface
- Integral body adaptor kit, which is interchangeable with a wide range of valves for direct mounting by using an interchangeable insert sleeve, which is retained by a circlip.
- Dual end stop adjustments which are integral to the body adaptor and operate in conjunction with the machined cam on the single piece driveshaft, while remaining outside of the pressurized cylinder.

Introduction

Standards

Trutorq Pneumatic Actuators are designed to and in compliance with the following standards:



DIN3337: Orientation of insert sleeve is 45 degrees offset, not in-line.
ISO5211: Orientation of actuator to valve mounting flange (i.e. F05, F07…)
VDI/VDE 3845: Namur mounting for accessories such as switchboxes, solenoid valves and positioners.
ATEX: Compliance to the ATEX directive (2014/34/EU), certificate available upon request
PED: Compliance to the Pressure Equipment Directive (2014/68/EU), certificate available upon request

Minimum Recommended Solenoid Valve Cv

Actuator Size	2	4	8	12	20	35	55	70	100	150
Solenoid Cv	0.2	0.2	0.5	0.5	0.5	0.5	0.8	0.8	1.1	1.1

- Weights for size 8-150 are for E-Type actuators.
- C-Type weights are approximately 10% lower than indicated for sizes 8-55
- Refer to S-Type manual for S-Type technical information
- Please contact Trutorq or a Trutorq representative for 250 & 400 information.

Actuator Operation

Double Acting

Opening Stroke:

- Looking at the front of the Actuator, PORT ‘A’ is on the left and PORT ‘B’ is on the right.
- To open the Actuator, connect the air supply to PORT ‘A’ to fill the central chamber of the Actuator.
- The two opposing Pistons will open and rotate the driveshaft in a counter-clockwise direction.
- When the pistons reach the end of their travel, the actuator driveshaft will be in the open position.

Closing Stroke:

- Looking at the front of the Actuator, PORT ‘A’ is on the left and PORT ‘B’ is on the right.
- To close the Actuator, connect the air supply to PORT ‘B’ to fill the outer chambers of the Actuator.
- The two opposing Pistons will close and rotate the actuator driveshaft in a clockwise direction.
- When the pistons reach the end of their travel, the actuator driveshaft will be in the closed position.

Actuator Operation

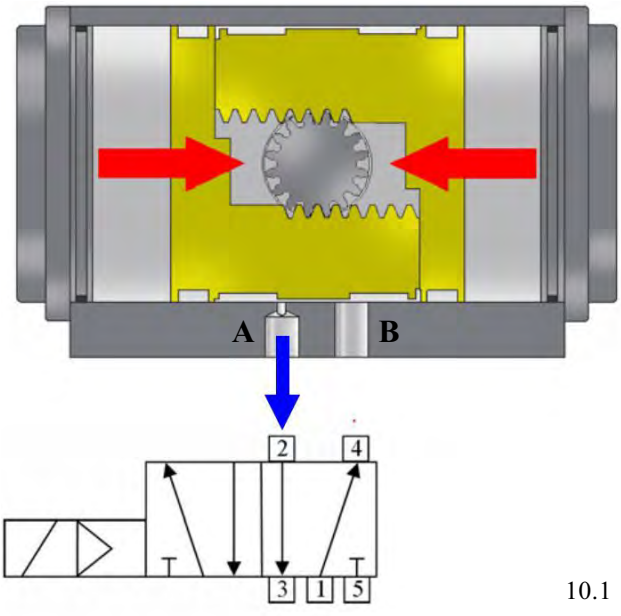
Spring Return

Opening Stroke:

- Looking at the front of the Actuator, PORT ‘A’ is on the left and PORT ‘B’ is on the right.
- To open the Actuator, connect the air supply to PORT ‘A’ to fill the central chamber of the Actuator.
- The two opposing Pistons will open, compressing the springs in the outer chambers and rotate the driveshaft in a counter-clockwise direction.
- When the pistons reach the end of their travel, the springs will be fully compressed and the actuator driveshaft will be in the open position

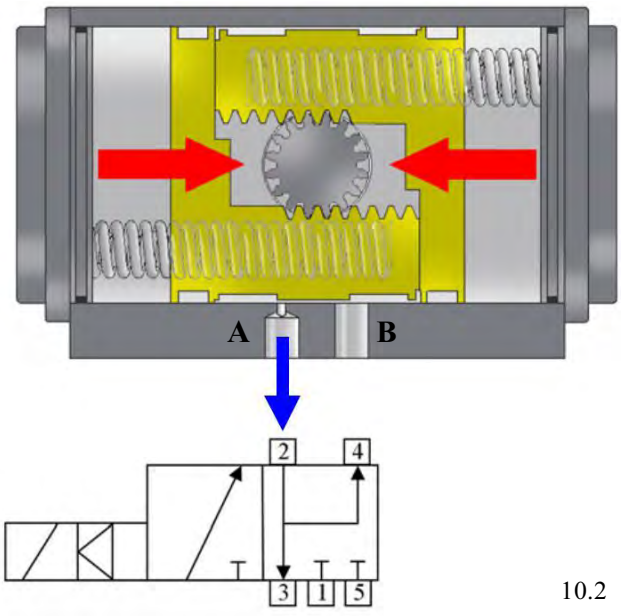
Closing Stroke:

- Looking at the front of the Actuator, PORT ‘A’ is on the left and PORT ‘B’ is on the right.
- To close the Actuator, disconnect the air supply from PORT ‘A’. This will allow the compressed springs to push the pistons back to their starting position.
- As the springs decompress the two opposing Pistons will close and rotate the actuator driveshaft in a clockwise direction.
- When the pistons reach the end of their travel, the actuator driveshaft will be in the closed position.



Actuator Operation

Solenoid Valve Mounting: Namur Type



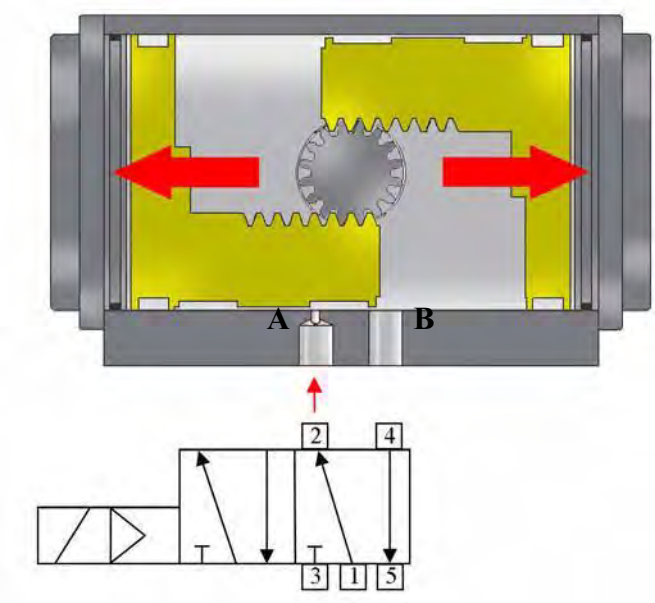
Please ensure you read the IOM manual that is supplied with the solenoid valve in order to ensure correct function. This section is a guide to the function of a solenoid valve in conjunction with a pneumatic quarter turn actuator. The solenoid valves mentioned here are **"namur mounted"** with a modular **"5/2 way / 3/2 way"** (meaning either mode is possible with the same valve).

Certain facts need to be taken into consideration when mounting a namur solenoid valve to a quarter turn pneumatic actuator:

- Port '2' and '4' are always on the namur interface of the solenoid valve
- Port '2' and '4' are always connected to the namur interface of the quarter turn pneumatic actuator
- Port '1' is where instrument air is always connected to the solenoid valve
- Port '1' is always referred to as the air inlet or pressure port on a solenoid valve

10.1

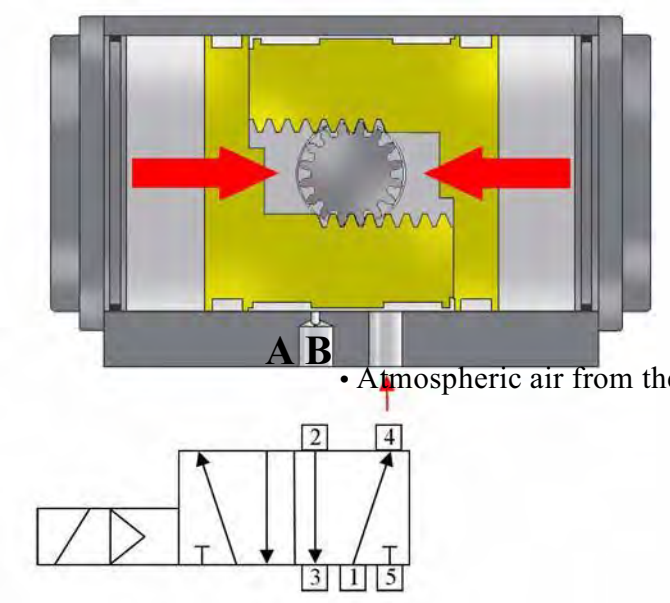
10.2



The above diagrams show a double acting actuator with 5/2 way solenoid valve (10.1) and a spring return actuator with a 5/2 way valve set up to function as a 3/2 way valve (10.2). Both valves are shown in the de-energised state (coil inactive, no electrical current). In both cases the solenoid valves port '2' is connected to the actuators port 'A' through which air will vent out of port '3'.

When connecting a namur solenoid valve, the pneumatic diagram will determine how to connect the ports. Only solenoid valve ports '2' and '4' can be connected to the actuator. Whichever of the two ports shows a vertical arrow pointing away from it, is the port that needs to be connected to the actuators central chamber, in this case port 'A'.

Actuator Operation

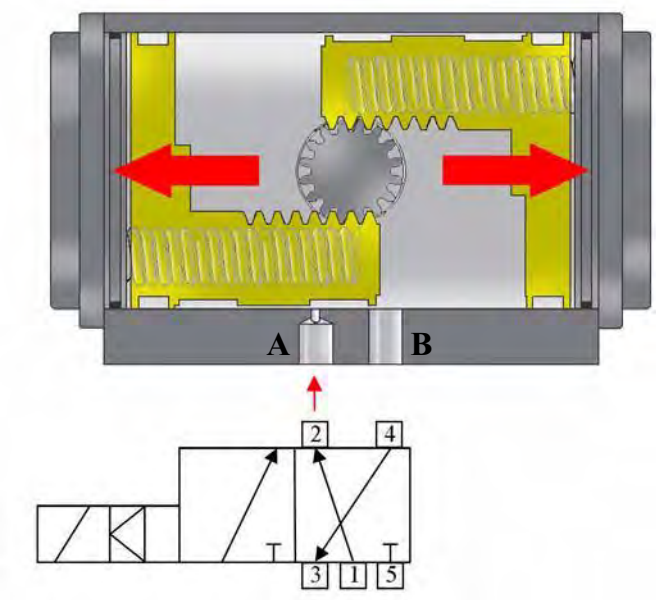


Operation with Solenoid Valves: Double Acting

Please ensure you read the IOM manual that is supplied with the solenoid valve in order to ensure correct function. This section is a guide to the function of a solenoid valve in conjunction with a pneumatic quarter turn actuator. The solenoid valves mentioned here are **"namur mounted"** with a modular **"5/2 way / 3/2 way"** (meaning either mode is possible with the same valve).

Solenoid Coil Energised:

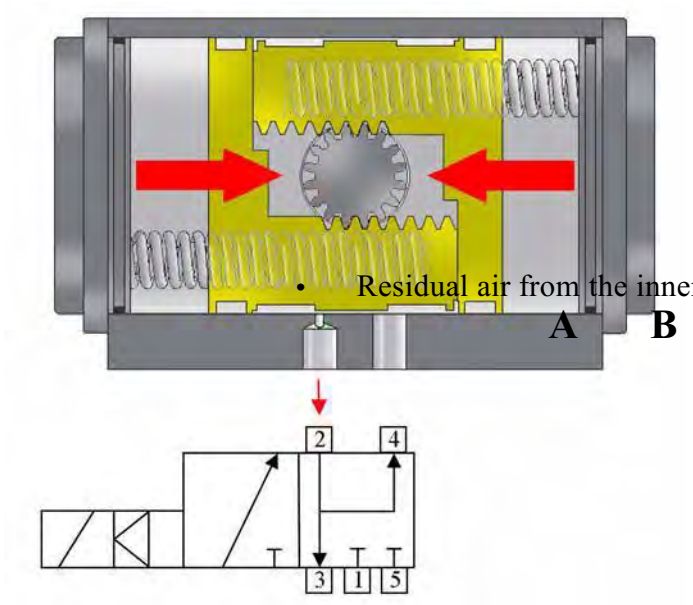
- This allows air to flow from **solenoid inlet port '1'** to **solenoid port '2'** which is connected to **actuator port 'A'**
- As the air enters the center chamber of the actuator, the pistons start to move towards the open position (as indicated by the large red arrows).
- Atmospheric air from the outer chambers will vent out of **actuator port 'B'**, which is connected to **solenoid port '4'** and then exhausts via **solenoid port '5'.**
- **Solenoid port '3'** is not used.



Solenoid Coil De-Energised:

- This allows air to flow from **solenoid inlet port '1'** to **solenoid port '4'** which is connected to **actuator port 'B'**
- As the air enters the outer chambers of the actuator, the pistons start to move towards the closed position (as indicated by the large red arrows).
- Atmospheric air from the inner chamber will vent out of **actuator port 'A'**, which is connected to **solenoid port '2'** and then exhausts via **solenoid port '3'.**
- **Solenoid port '5'** is not used

Actuator Operation



Operation with Solenoid Valves: Spring Return

Please ensure you read the IOM manual that is supplied with the solenoid valve in order to ensure correct function. This section is a guide to the function of a solenoid valve in conjunction with a pneumatic quarter turn actuator. The solenoid valves mentioned here are **"namur mounted"** with a modular **"5/2 way / 3/2 way"** (meaning either mode is possible with the same valve).

Solenoid Coil Energised:

- This allows air to flow from **solenoid inlet port '1'** to **solenoid port '2'** which is connected to **actuator port 'A'**
- As the air enters the center chamber of the actuator, the pistons start to move towards the open position and compressing the springs in the outer chambers (as indicated by the large red arrows).
- Atmospheric air from the outer chambers will vent out of **actuator port 'B'**, which is connected to **solenoid port '4'** and then exhausts via **solenoid port '3'.**
- **Solenoid port '5'** is not used.

Solenoid Coil De-Energised:

- This closes **solenoid port '1'** and stops inlet air from flowing.
- The springs in the outer chambers will move the pistons back to the closed position (as indicated by the large red arrows).
- Residual air from the inner chamber will vent out of **actuator port 'A'**, which is connected to **solenoid port '2'** and then exhausts via **solenoid port '3'.**
- **Solenoid port '5'** is not used.
- **Solenoid port '2'** and **port '4'** are also connected in a loop so no dirty air may enter the actuator (this is available only on some solenoid valves).

Mounting Variations

Below are the two common variations to mounting a 90 degree or 180 degree actuator to a valve.

13.1 mounted **in-line** or **parallel** to the pipe, the actuator and valve are in the standard closed position
13.2 mounted **in-line** or **parallel** to the pipe, the actuator and valve are in the standard open position

13.3 mounted **crossmount** or **offset** to the pipe, the actuator and valve are in the standard closed position
13.4 mounted **crossmount** or **offset** to the pipe, the actuator and valve are in the standard open position

Mounting actuators in these varying positions is due to space constraints in the global assembly or simply due to consistency with prior assemblies already in existence. Please note how the indicator puck always correctly shows the position of the valve disc and hence showing the flowpath of the medium running through the pipe.

13.1 in-line, closed position

13.2 in-line, open position

13.3 crossmount, closed position

13.4 crossmount, open position

Contents

WARNING:

NEVER DISASSEMBLE A UNIT THAT IS PRESSURISED!

Always isolate the actuator pneumatically or hydraulically and electrically.

Always remove all accessories and mounting hardware prior to maintenance.

Other Information

Actuator Lubricant: BERULUB FR16
Spring Lubrication: VALVOLINE L-EP2

Trutorq supplied Repair Kits include all soft components and bearings. Please review the items marked with a star in the parts listing on page 5 for the E-TYPE actuator and page 6 for the C-TYPE actuator.

Always insure you wear the correct safety equipment as stipulated by your local organisations and applicable laws.

Always take care to follow this manual in order to correctly maintain Trutorq actuators.

Before removing the actuator insure that you follow the correct procedure to properly isolate the valve in the piping system.

PLEASE NOTE:

IF YOU EVER HAVE ANY QUESTIONS REGARDING THE MAINTENANCE OF OUR PRODUCTS, PLEASE CONTACT YOUR LOCAL TRUTORQ REPRESENTATIVE.

BE SAFE, DO NOT GUESS YOU ARE DOING IT RIGHT. KNOW YOU ARE DOING IT RIGHT.

ALWAYS FOLLOW COMPANY PROCEDURES AND LOCAL AND NATIONAL HEALTH AND SAFETY GUIDELINES.

WARNING	WARNHINWEIS	ADVERTENCIA
1. DO NOT OPEN WHILE ENERGIZED 2. Check nameplate for correct voltage and classification.	1. NICHT UNTER SPANNUNG ÖFFNEN 2. Siehe Etikett für korrekte Spannung und Klassifizierung.	1. NO LA ABRA MIENTRAS ESTÉ CONECTADA A LA ELECTRICIDAD. 2. Verifique la placa para determinar la clasificación y voltaje correcto.

AVERTISSEMENT	AVVERTENZA
1. NE PAS OUVRIR SOUS TENSION 2. Regardez la plaque pour connaître le bon voltage et la classification.	1. NON APRIRE SOTTO TENSIONE. 2. Controllare la targhetta per voltaggio corretto e classificazione.

INSTALLATION

The solenoid operated safety valves shall only be used within a working temperature range of -52°C to +90°C.

1. Check nameplate for correct voltage and classification.
2. For optimum performance mount the operator upright.
3. The Housing may be rotated 360°.
   The cable entry device shall be certified in type of explosion protection flameproof enclosure "d", suitable for the conditions of use and correctly installed. For ambient temperature up to 60 °C, cables and cable glands suitable for at least 85 °C shall be used. For ambient temperature up to 90 °C, cables and cable glands suitable for at least 115 °C shall be used.
4. For ground terminal termination locted inside on mounting plate, crimping tool CT-1551 from Panduit ® must be used.
5. Thread lubricant Never-Seez Marine Grade from Bostick Inc. or LUBG-6 from Killark ® must be used to seal conduit entry.

SEQUENCE OF INSTALLATION

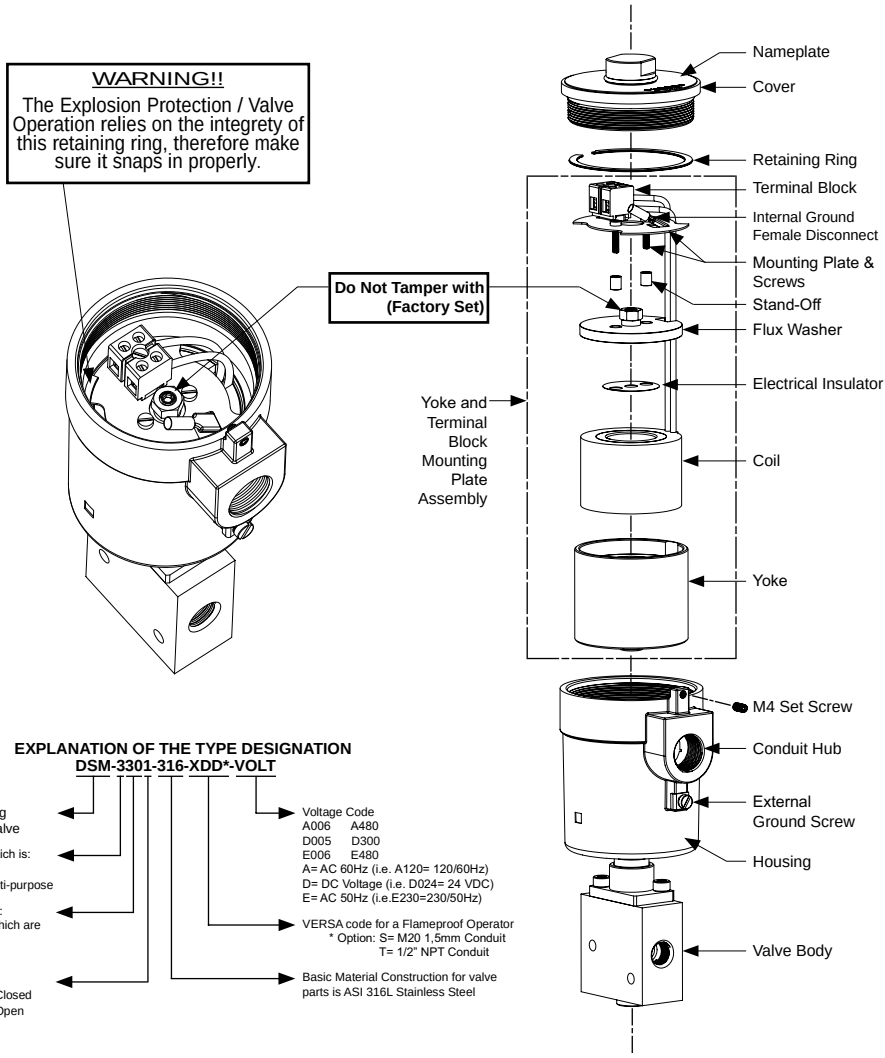
1. Loosen the set screw in the housing by 2 turns (use 1.5mm hexagonal wrench) and remove cover by unscrewing counter-clockwise.
2. Connect the incoming supply cable to the terminal block.
   - Leads connected to the terminals shall be insulated for the appropriate voltage and this insulation shall extend to within 1 mm of the terminal throat.

   Note:
   The terminal block can be removed for ease of wiring but must be re-assembled once connections have been made.

   - All terminal screws, used and unused, shall be tightened down to between 0.4 Nm and 0.45 Nm.
3. Replace the cover by screwing it over the housing and tighten until the two mating faces are in contact. Lock the cover in this position by tightening the set screw.

MAINTENANCE

The solenoid operator itself does not require periodic maintenance.



COIL REPLACEMENT

1. Shut off electrical current.
2. Loosen the set screw in the housing by 2 turns and remove cover by unscrewing counterclockwise.
3. Remove terminal block from mounting plate.
4. Remove retaining ring.
5. Pull out the yoke and terminal block mounting plate assembly.
6. Unscrew the two flux washer mounting screws from the yoke (Care not to lose the electrical insulator and the two stand offs)
7. Disconnect the coil leads from the terminal block, replace the coil with a new one, and connect the new leads to the terminal block.
8. Re-install coil in the yoke, the electrical insulator, the two stand offs, the flux washer and terminal block mounting plate assembly (in that order) and install the two flux washer mounting screws.
9. Place the entire assembly back into the housing and secure by reassembling the retaining ring. **Making sure it snaps in properly and fully retained inside housing groove.**
10. Secure terminal block to mounting plate.
11. Re-place the cover by screwing it over the housing and tightening until the two mating faces are in contact. Lock the cover in this position by tightening the set screw in the housing.

TEMPERATURE CLASS (T-rating)

Ambient temperature range and temperature codes depend on power rating and seal material.

Configuration		Temperature Code			
Power	O-Ring Material	T6	T5	T4	T3

Safety Relief Valves

The Eductor Tube Advantage™

Instruction Manual (Rev. L)

Baker Hughes Data Classification : Public

THESE INSTRUCTIONS PROVIDE THE CUSTOMER/OPERATOR WITH IMPORTANT PROJECT-SPECIFIC REFERENCE INFORMATION IN ADDITION TO THE CUSTOMER/OPERATOR'S NORMAL OPERATION AND MAINTENANCE PROCEDURES. SINCE OPERATION AND MAINTENANCE PHILOSOPHIES VARY, BAKER HUGHES (AND ITS SUBSIDIARIES AND AFFILIATES) DOES NOT ATTEMPT TO DICTATE SPECIFIC PROCEDURES, BUT TO PROVIDE BASIC LIMITATIONS AND REQUIREMENTS CREATED BY THE TYPE OF EQUIPMENT PROVIDED.

THESE INSTRUCTIONS ASSUME THAT OPERATORS ALREADY HAVE A GENERAL UNDERSTANDING OF THE REQUIREMENTS FOR SAFE OPERATION OF MECHANICAL AND ELECTRICAL EQUIPMENT IN POTENTIALLY HAZARDOUS ENVIRONMENTS. THEREFORE, THESE INSTRUCTIONS SHOULD BE INTERPRETED AND APPLIED IN CONJUNCTION WITH THE SAFETY RULES AND REGULATIONS APPLICABLE AT THE SITE AND THE PARTICULAR REQUIREMENTS FOR OPERATION OF OTHER EQUIPMENT AT THE SITE.

THESE INSTRUCTIONS DO NOT PURPORT TO COVER ALL DETAILS OR VARIATIONS IN EQUIPMENT NOR TO PROVIDE FOR EVERY POSSIBLE CONTINGENCY TO BE MET IN CONNECTION WITH INSTALLATION, OPERATION OR MAINTENANCE. SHOULD FURTHER INFORMATION BE DESIRED OR SHOULD PARTICULAR PROBLEMS ARISE WHICH ARE NOT COVERED SUFFICIENTLY FOR THE CUSTOMER/OPERATOR'S PURPOSES THE MATTER SHOULD BE REFERRED TO BAKER HUGHES.

THE RIGHTS, OBLIGATIONS AND LIABILITIES OF BAKER HUGHES AND THE CUSTOMER/OPERATOR ARE STRICTLY LIMITED TO THOSE EXPRESSLY PROVIDED IN THE CONTRACT RELATING TO THE SUPPLY OF THE EQUIPMENT. NO ADDITIONAL REPRESENTATIONS OR WARRANTIES BY BAKER HUGHES REGARDING THE EQUIPMENT OR ITS USE ARE GIVEN OR IMPLIED BY THE ISSUE OF THESE INSTRUCTIONS.

THESE INSTRUCTIONS ARE FURNISHED TO THE CUSTOMER/OPERATOR SOLELY TO ASSIST IN THE INSTALLATION, TESTING, OPERATION, AND/OR MAINTENANCE OF THE EQUIPMENT DESCRIBED. THIS DOCUMENT SHALL NOT BE REPRODUCED IN WHOLE OR IN PART WITHOUT THE WRITTEN APPROVAL OF BAKER HUGHES.

Conversion Table

All the United States Customary System (USCS) values are converted to metric values using the following conversion factors:		
USCS Unit	Conversion Factor	Metric Unit
in.	25.4	mm
lb.	0.4535924	kg
in^2	6.4516	cm^2
ft^3/min	0.02831685	m^3/min
gal/min	3.785412	L/min
lb/hr	0.4535924	kg/hr
psig	0.06894757	barg
ft lb	1.3558181	Nm
°F	5/9 (°F-32)	°C

Note: Multiply USCS value with conversion factor to get metric value.

NOTICE
For valve configurations not listed in this manual, please contact your local **Green Tag™ Center (GTC)** for assistance.

I. Product Safety Sign and Label System

If and when required, appropriate safety labels have been included in the rectangular margin blocks throughout this manual. Safety labels are vertically oriented rectangles as shown in the ***representative*** examples (below), consisting of three panels encircled by a narrow border. The panels can contain four messages which communicate:

- The level of hazard seriousness
- The nature of the hazard
- The consequence of human, or product, interaction with the hazard.
- The instructions, if necessary, on how to avoid the hazard.

The top panel of the format contains a signal word (DANGER, WARNING, CAUTION or ATTENTION) which communicates the level of hazard seriousness.

The center panel contains a pictorial which communicates the nature of the hazard, and the possible consequence of human or product interaction with the hazard. In some instances of human hazards the pictorial may, instead, depict what preventive measures to take, such as wearing protective equipment.

The bottom panel may contain an instruction message on how to avoid the hazard. In the case of human hazard, this message may also contain a more precise definition of the hazard, and the consequences of human interaction with the hazard, than can be communicated solely by the pictorial.

① DANGER — Immediate hazards which WILL result in severe personal injury or death.

② WARNING — Hazards or unsafe practices which COULD result in severe personal injury or death.

③ CAUTION — Hazards or unsafe practices which COULD result in minor personal injury.

④ ATTENTION — Hazards or unsafe practices which COULD result in product or property damage.

II. Safety Alerts

Read - Understand - Practice

Danger Alerts

A DANGER alert describes actions that may cause severe personal injury or death. In addition, it may provide preventive measures to avoid severe personal injury or death.

DANGER alerts are not all-inclusive. Baker Hughes cannot know all conceivable service methods nor evaluate all potential hazards. Dangers include:

- High temperature/pressure can cause injury. Ensure all system pressure is absent before repairing or removing valves.
- Do not stand in front of a valve outlet when discharging. STAND CLEAR OF VALVE to avoid exposure to trapped, corrosive media.
- Exercise extreme caution when inspecting a pressure relief valve for leakage.
- Allow the system to cool to room temperature before cleaning, servicing, or repairing. Hot components or fluids can cause severe personal injury or death.
- Always read and comply with safety labels on all containers. Do not remove or deface container labels. Improper handling or misuse could result in severe personal injury or death.
- Never use pressurized fluids/gas/air to clean clothing or body parts. Never use body parts to check for leaks, flow rates, or areas. Pressurized fluids/gas/air injected into or near the body can cause severe personal injury or death.
- It is the owner's responsibility to specify and provide protective wear to protect persons from pressurized or heated parts. Contact with pressurized or heated parts can result in severe personal injury or death.
- Do not work or allow anyone under the influence of intoxicants or narcotics to work on or around pressurized systems. Workers under the influence of intoxicants or narcotics are a hazard to themselves and other employees. Actions taken by an intoxicated employee can result in severe personal injury or death to themselves or others.
- Always perform correct service and repair. Incorrect service and repair can result in product or property damage or severe personal injury or death.
- Always use the correct tool for a job. The misuse of a tool or the use of an improper tool can result in personal injury, damage to product or property.
- Ensure the proper "health physics" procedures are followed, if applicable, before starting operation in a radioactive environment.

Caution Alerts

A CAUTION alert describes actions that may result in a personal injury. In addition, they may describe preventive measures that must be taken to avoid personal injury. Cautions include:

- Heed all service manual warnings. Read installation instructions before installing valve(s).
- Wear hearing protection when testing or operating valves.
- Wear appropriate eye and clothing protection.
- Wear protective breathing apparatus to protect against toxic media.

III. Safety Notice

Proper installation and start-up is essential to the safe and reliable operation of all valve products. The relevant procedures recommended by Baker Hughes, and described in these instructions, are effective methods of performing the required tasks.

It is important to note that these instructions contain various “safety messages” which should be carefully read in order to minimize the risk of personal injury, or the possibility that improper procedures will be followed which may damage the involved Baker Hughes product, or render it unsafe. It is also important to understand that these “safety messages” are not exhaustive. Baker Hughes can not possibly know, evaluate, and advise any customer of all of the conceivable ways in which tasks might be performed, or of the possible hazardous consequences of each way. Consequently, Baker Hughes has not undertaken any such broad evaluation and, thus, anyone who uses a procedure and/or tool, which is not recommended by Baker Hughes, or deviates from Baker Hughes recommendations, must be thoroughly satisfied that neither personal safety, nor valve safety, will be jeopardized by the method and/or tools selected. If not so satisfied, please contact your local *Green Tag* Center if there are any questions relative to procedures and/or tools.

The installation and start-up of valves and/or valve products may involve proximity to fluids at extremely high pressure and/or temperature. Consequently, every precaution should be taken to prevent injury to personnel during the performance of any procedure. These precautions should consist of, but are not limited to, ear drum protection, eye protection, and the use of protective clothing, (i.e., gloves, etc.) when personnel are in, or around, a valve work area. Due to the various circumstances and conditions in which these operations may be performed on Baker Hughes products, and the possible hazardous consequences of each way, Baker Hughes can not possibly evaluate all conditions that might injure personnel or equipment. Nevertheless, Baker Hughes does offer certain Safety Alerts, listed in Section II, for customer information only.

It is the responsibility of the purchaser or user of Baker Hughes valves/equipment to adequately train all personnel who will be working with the involved valves/equipment. Further, prior to working with the involved valves/equipment, personnel who are to perform such work should become thoroughly familiar with the contents of these instructions.

IV. Warranty Information

Warranty Statement:[1] Baker Hughes warrants that its products and work will meet all applicable specifications and other specific product and work requirements (including those of performance), if any, and will be free from defects in material and workmanship.

CAUTION
Defective and nonconforming items must be held for Baker Hughes’ inspection and returned to the original F.O.B point upon request.

Incorrect Selection or Misapplication of Products: Baker Hughes cannot be responsible for customer’s incorrect selection or misapplication of our products.

Unauthorized Repair work: Baker Hughes has not authorized any non-Baker Hughes affiliated repair companies, contractors or individuals to perform warranty repair service on new products or field repaired products of its manufacture. Therefore customers contracting such repair services from unauthorized sources must do at their own risk.

Unauthorized Removal of Seals: All new valves and valves repaired in the field by Baker Hughes Field Service are sealed to assure the customer of our guarantee against defective workmanship. Unauthorized removal and/or breakage of this seal will negate our warranty.

[1] Refer to Baker Hughes’s Standard Terms of Sale for complete details on warranty and limitation of remedy and liability.

IV. Warranty Information (Cont.)

V. Terminology for Safety Relief Valves

Accumulation - the pressure increase over the maximum allowable working pressure of the vessel during discharge through the SRV, expressed as a percentage of that pressure or in actual pressure units.

- Backpressure - the pressure on the discharge side of the SRV:
  - Built-up backpressure - the pressure that develops at the valve outlet, after the SRV has been opened, as a result of flow.
  - Superimposed backpressure - the pressure in the discharge header before the SRV is opened.
  - Constant backpressure - the superimposed backpressure that is constant with time.
  - Variable backpressure - the superimposed backpressure that varies with time.
- Blowdown - the difference between set pressure and re-seating pressure of the SRV, expressed as a percentage of the set pressure or in actual pressure units.
- Cold Differential Set Pressure - the pressure at which the valve is adjusted to open on the test stand. This pressure includes the corrections for backpressure and/or temperature service conditions.
- Differential Between Operating and Set Pressures - Valves in installed process services will generally give best results if the operating pressure does not exceed 90% of the set pressure. However, on pump and compressor discharge lines, the differential required between the operating and set pressures may be greater because of pressure pulsations coming from a reciprocating piston. The valve should be set as far above the operating pressure as possible.
- Lift - the actual travel of the disc away from the closed position when a valve is relieving.
- Maximum Allowable Working Pressure - the aximum gauge pressure permissible in a vessel at a designated temperature. A vessel may not be operated above this pressure, or its equivalent, at any metal temperature other than that used in its design. Consequently, for that metal temperature, it is the highest pressure at which the primary pressure SRV is set to open.
- Operating Pressure - the gauge pressure to which the vessel is normally subjected in service. A suitable margin is provided between operating pressure and maximum allowable working pressure. For assured safe operation, the operating pressure should be at least 10% under the maximum allowable working pressure or 5 psi (.34 bar), whichever is greater.
- Overpressure - a pressure increase over the set pressure of the primary relieving device. Overpressure is similar to accumulation when the relieving device is set at the maximum allowable working pressure of the vessel. Normally, overpressure is expressed as a percentage of set pressure.

© 2024 Baker Hughes Company. All rights reserved.

V. Terminology for Safety Relief Valves (Cont.)

- Rated Capacity - the percentage of measured flow at an authorized percent overpressure permitted by the applicable code. Rated capacity is generally expressed in pounds per hour (lb/hr) for vapors, standard cubic feet per minute (SCFM) or m3/min for gases, and in gallons per minute (GPM) for liquids.
- Relief Valve - an automatic pressure-relieving device, actuated by static pressure upstream from the valve. A relief valve is used primarily for liquid service.
- Safety Relief Valve (SRV) - an automatic pressure-relieving device used as either a safety or relief valve, depending upon application. The SRV is used to protect personnel and equipment by preventing excessive overpressure.
- Safety Valve - an automatic pressure-relieving device actuated by the static pressure upstream of the valve, and characterized by a rapid opening or “pop” action. It is used for steam, gas, or vapor service.
- Set Pressure - the gauge pressure at the valve inlet for which the relief valve has been adjusted to open under service conditions. In liquid service, the inlet pressure at which the valve starts to discharge determines set pressure. In gas or vapor service, the inlet pressure at which the valve pops determines the set pressure.
- Simmer - the audible passage of a gas or vapor across the seating surfaces just before “pop.” The difference between this start-to-open pressure and the set pressure is called “simmer.” Simmer is generally expressed as a percentage of set pressure.

VI. Handling and Storage

Handling

Always keep the inlet flange down on a crated or uncrated flange valve to prevent misalignment and damage to valve internals.

ATTENTION!

Never lift the full weight of the valve by the lifting lever.

ATTENTION!

Do not rotate the valve horizontally or lift/carry using the lifting lever.

VI. Handling and Storage (Cont.)

Wrap a chain or sling around the discharge neck and around the upper bonnet structure to move or hoist an uncrated valve. Ensure the valve is in a vertical position during the lift.

ATTENTION!

Handle carefully. Do not drop or strike the valve.

Do not subject SRVs, either crated or uncrated, to sharp impact. Ensure that the valve is not bumped or dropped during loading or unloading from a truck. While hoisting the valve, take care to prevent bumping the valve against steel structures and other objects.

ATTENTION!

Prevent dust and debris from entering inlet or outlet of the valve

Storage

Store SRVs in a dry environment and protect them from the weather. Do not remove the valve from the skids or crates until immediately before installation.

Do not remove flange protectors and seating plugs until the valve is ready to be bolted into place during the installation.

VII. Pre-Installation and Installation Instructions

When SRVs are uncrated and the flange protectors or sealing plugs are removed, exercise meticulous care to prevent dirt and other foreign materials from entering the inlet and outlet ports while bolting the valve in place.

© 2024 Baker Hughes Company. All rights reserved.

VIII. Design Features and Nomenclature

Cap and Lever Interchangeability

In the field, it is often necessary to change the type of cap or lever after a valve has been installed. All flanged **Consolidated™ SRVs** are designed to be converted to any type of lever or cap desired. It is not necessary to remove the SRV from the installation, nor will the set pressure be affected when making such a change.

Design Simplicity

Consolidated SRVs have few component parts, resulting in savings by minimizing spare parts inventory and simplifying valve maintenance.

Nomenclature Related to Design Features

The nomenclature of the components of 1900 Series valves, including those with design options for Dual Media, Dual Media soft-seat bellows, O-ring seat, liquid trim, and Thermodisc, is identified in Figures 1 through 10.

Simple Blowdown Adjustment

The Consolidated single blowdown ring design makes it possible to set and test a valve at the customer's shop when it is impractical to set and media may be very low, the ring can be positioned so that the set point can be observed without damaging the valve. Blowdown can be attained by positioning the ring in accordance with the adjusting ring position (see Tables 12 through 14).

Valve Interchangeability

A standard Consolidated SRV may be converted to the Dual Media, Dual Media soft-seat bellows type, the o-ring seat seal type, etc., and vice versa. Should conversion be required, this interchangeability lowers costs and requires fewer new parts than replacing entire valve types.

Note: The 1900 Dual Media (DM) was previously called Universal Media (UM). Unless otherwise noted, the 1900 Universal Media shall be inspected, disassembled, reassembled, tested, installed, operated and maintained per the instructions of the 1900 Dual Media.

IX. Introduction

The safety relief valve (SRV) is an automatic, pressure-actuated relieving device suitable for use either as a safety valve or relief valve, depending on application.

SRVs are used on hundreds of different applications, including liquids and hydrocarbons; therefore, the valve is designed to meet many requirements.

The 1900 Series valves included in this manual may be used to meet the requirements for ASME Section III and Section XIII (UV Designator). They cannot be used on ASME Code Section I steam boilers or superheaters, but may be used on process steam.

XI. Recommended Installation Practices

Mount safety relief valves in a vertical, upright position only.

Do not mount valve at the end of pipe through which there is normally no flow or near elbows, tees, bends, etc.

Heed all service manual warnings. Read installation instructions before installing valve(s).

A. Mounting Position

Mount SRVs in a vertical (upright) position (in accordance with API RP 520). Installing a safety relief valve in any position other than vertical (±1 degree) will adversely affect its operation as a result of the induced misalignment of moving parts.

A stop valve may be placed between the pressure vessel and its relief valve only as permitted by code regulations. If a stop valve is located between the pressure vessel and SRV, the stop valve port area should equal or exceed the nominal internal area associated with the pipe size of the SRV inlet. The pressure drop from the vessel to the SRV shall not exceed 3% of the valve's set pressure, when flowing at full capacity.

Ensure the flange and sealing faces of the valve and connective piping are free from dirt, sediment, and scale.

Ensure all flange bolts are drawn evenly to prevent distortion of the valve body and the inlet nozzle.

Position SRVs for easy access and/or removal so that servicing can be properly performed. Ensure sufficient working space is provided around and above the valve.

B. Inlet Piping

The inlet piping (see Figure 13) to the valve should be short and directly from the vessel or equipment being protected. The radius of the connection to the vessel should permit smooth flow to the valve. Avoid sharp corners. If this is not practical, then the inlet should be at least one additional pipe diameter larger.

The pressure drop from the vessel to the valve shall not exceed 3% of valve set pressure when the valve is allowing full capacity flow. The inlet piping should never be smaller in diameter than the inlet connection of the valve. Excessive pressure drop in gas, vapor, or flashing-liquid service at the inlet of the SRV will cause the extremely rapid opening and closing of the valve, which is known as "chattering." Chattering will result in lowered capacity and damage to the seating surfaces. The most desirable installation is that in which the nominal size of the inlet piping is the same as, or greater than, the nominal size of the valve inlet flange and in which the length does not exceed the face-to-face dimensions of a standard tee of the required pressure class.

Do not locate SRV inlets where excessive turbulence is present, such as near elbows, tees, bends, orifice plates or throttling valves.

Section VIII of the ASME Boiler and Pressure Vessel Code requires the inlet connection design to consider stress conditions during valve operation, caused by external loading, vibration, and loads due to thermal expansion of the discharge piping.

The determination of reaction forces during valve discharge is the responsibility of the vessel and/or piping designer. Baker Hughes publishes certain technical information about reaction forces under various fluid flow conditions, but assumes no liability for the calculations and design of the inlet piping.

External loading, by poorly designed discharge piping and support systems, and forced alignment of discharge piping can cause excessive stresses and distortions in the valve as well as the inlet piping. The stresses in the valve may cause a malfunction or leak. Therefore, discharge piping must be independently supported and carefully aligned.

Vibrations in the inlet piping systems may cause valve seat leakage and/or fatigue

© 2024 Baker Hughes Company. All rights reserved.

XI. Recommended Installation Practices (Cont.)

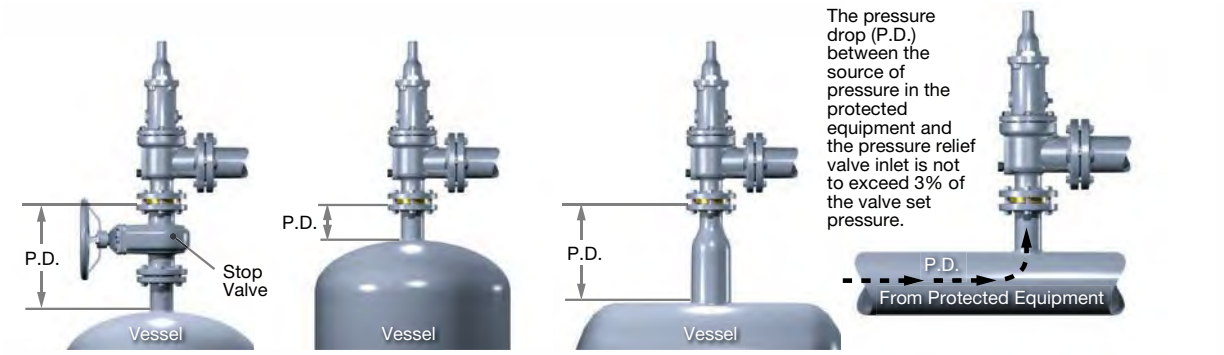

Figure 13: Pressure Drop on the Inlet Piping

failure. These vibrations may cause the disc seat to slide back and forth across the nozzle seat and may result in damage to the seating surfaces. Also, vibration may cause separation of the seating surfaces and premature wear to valve parts. High-frequency vibrations are more detrimental to SRV tightness than low-frequency vibrations. This effect can be minimized by providing a larger difference between the operating pressure of the system and the set pressure of the valve, particularly under high frequency conditions.

Temperature changes in the discharge piping may be caused by fluid flowing from the discharge of the valve or by prolonged exposure to the sun or heat radiated from nearby equipment. A change in the discharge piping temperature will cause a change in the length of the piping, which may cause stresses to be transmitted to the SRV and its inlet piping. Proper support, anchoring or provision for flexibility of the discharge piping can prevent stresses caused by thermal changes. Do not use fixed supports.

C. Outlet Piping

Alignment of the internal parts of the SRV is important to ensure proper operation (see Figure 14). Although the valve body will withstand a considerable mechanical load, unsupported discharge piping consisting of more than a companion flange long-radius elbow, and a short vertical pipe is not recommended. Use spring supports to connect outlet piping to prevent thermal expansion from creating strains on the valve. The discharge piping should be designed to allow for vessel expansion as well as expansion of the discharge pipe itself. This is particularly important on long distance lines.

A continual oscillation of the discharge piping (wind loads) may induce stress distortion in the valve body. The resultant movement of the valve's internal parts may cause leakage.

Where possible, use properly supported drainage piping to prevent the collection of water or corrosive liquid in the valve body.

When two or more valves are piped to discharge into a common header, the built-up backpressure resulting from the opening of one (or more) valve(s) may cause a superimposed backpressure in the remaining valves. Under these conditions, the use of bellows valves is recommended. The use of bellows valves may also permit the use of a smaller-size manifold. In every case, the nominal discharge pipe size should be at least as large as the nominal size of the SRV outlet flange In the case of long discharge piping, the nominal discharge pipe size must sometimes be much larger.

ATTENTION!

All non-bellows valves should have a bonnet plug installed. Bellows valves must have an open bonnet vent.

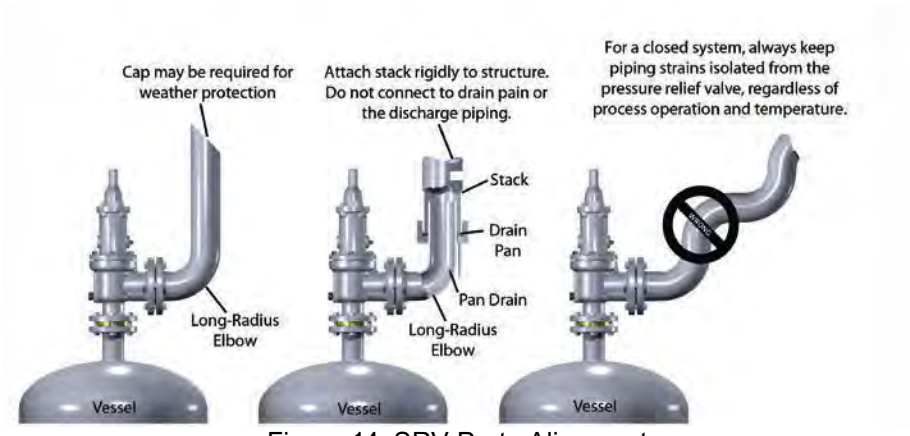

Figure 14: SRV Parts Alignment

XII. Disassembly of 1900 Series Safety Relief Valves

A. General Information

Consolidated SRVs can be easily disassembled for inspection, the reconditioning of seats or the replacement of internal parts. Appropriate set pressure can be established after reassembly. (See Figures 1 through 10 for parts nomenclature.)

ATTENTION!

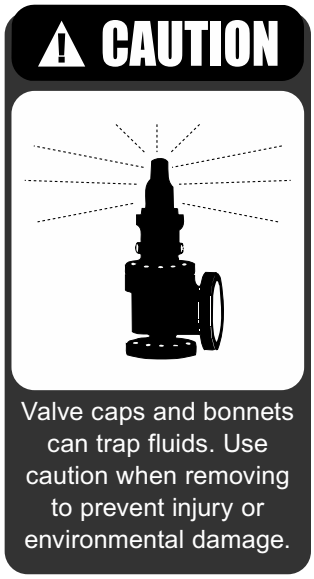
Do not interchange parts from one valve with parts from another valve.

B. SRV Disassembly

1. If equipped, remove the lifting lever gear as follows:

- Plain Lever (see Figure 4)
  - Remove cotter pin, lever pin and plain lever [one-piece design] or top lever [two-piece design].
- Packed Lever (see Figure 3)
  - Disassembly not required. Rotate lever counterclockwise, positioning lifting fork so that it clears release nut during cap removal.

2. Remove the cap.
3. Remove the cap gasket (27), if applicable.
4. Remove adjusting ring pin (4) and adjusting ring pin gasket (5).
5. If the existing blowdown is to be restored upon reassembly, determine the position of the adjusting ring (3) with respect to the disc holder (8) as follows:



- Turn the adjusting ring counterclockwise (move notches on the adjusting ring from left to right).
  - Record the number of notches that pass the ring pinhole before the ring contacts the disc holder.

ATTENTION!

This procedure does not substitute for actual pressure testing.

Wear necessary protective equipment to prevent possible injury

Valve caps and bonnets can trap fluids. Use caution when removing to prevent injury or environmental damage.

Before disassembling the valve, ensure there is no media pressure in the vessel.

Many pressure vessels protected by Consolidated Safety Relief Valves contain dangerous materials. Decontaminate and clean the valve inlet, outlet, and all external surfaces in accordance with the cleaning and decontaminating recommendations in the appropriate Material Safety Data Sheet.

© 2024 Baker Hughes Company. All rights reserved.

XII. Disassembly of 1900 Series Safety Relief Valves (Cont.)

6. Follow the procedure appropriate to the orifice valve type:

- Using a depth micrometer or a dial caliper, measure the distance from the top of the spindle (15) to the top of the adjusting screw (19). This allows the adjusting screw to be readjusted close to the proper spring compression without excessive testing.
- Record the measurement for reference when reassembling the valve.
- D through U orifice valves:
  - Loosen the adjusting screw locknut (20).
  - Remove the adjusting screw from the bonnet (11). Use pliers to prevent the spindle from turning when removing the adjusting screw.
- V and W orifice valves:

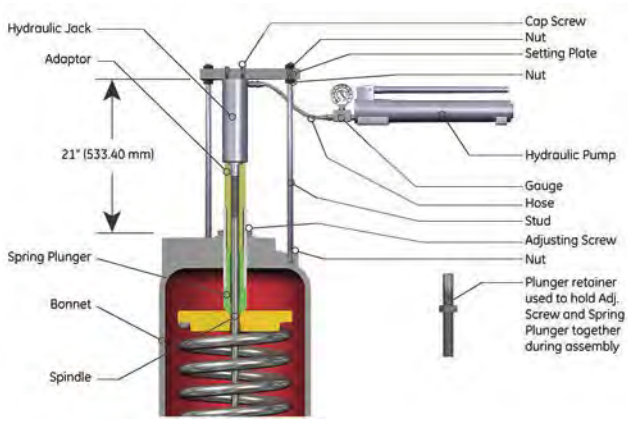


Figure 15: Setting Device for V and W Orifice

  - Attach the setting device (see Figure 15).
  - Apply enough pressure to the plunger using the ram to free the adjusting screw.
  - Loosen the adjusting screw locknut.
  - Completely unscrew the adjusting screw from the bonnet.

7. Remove the stud nuts (14) and lift off the bonnet (11).

ATTENTION!

Set the valve using the setting procedures after reassembly

8. Remove the bonnet gasket (12).
9. Remove the spring (18) and the spring washers (17). Keep the spring and spring washers together as a unit, at all times.
10. Follow the procedure appropriate to the valve type:

- D through L orifice valves:
  - Remove the upper internal parts by carefully pulling “straight up” on the spindle (15). For bellows valves, take care to avoid damaging the bellows or its flange. If parts are fouled use a suitable solvent for loosening the components.
  - Clamp the skirt portion of the disc holder (8) snugly between two wooden V-blocks in a suitable vise.
  - Compress the spindle retainer (16) with a screwdriver or similar tool through the slots provided and remove the spindle.
- M through U orifice valves:

ATTENTION!

Special lifting tools are available for ease of upper internal part removal

  - Use a screwdriver to compress the spindle retainer (16).
  - Remove the spindle (15).
  - Insert the lifting tool (see Figure 16) into the disc holder spindle pocket and tighten the eyebolt.
  - Remove the disc holder (8) and disc (6) by lifting up on the lifting tool.
- Valve V and W orifice valve:
  - Use the lifting lugs to lift the disc holder (8) and to remove all internals (see Figure 16).

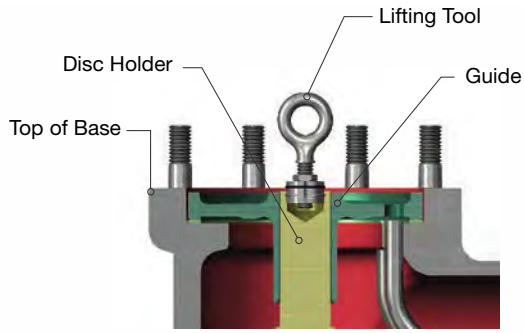

Figure 16: Lifting Tools for M through U Orifice Valves

© 2024 Baker Hughes Company. All rights reserved.

XII. Disassembly of 1900 Series Safety Relief Valves (Cont.)

ATTENTION!

The bellows convolutions (see Figure 17) are very thin and fragile. Take care to protect them from damage.

11. Remove the guide (9) from the disc holder (8). (For restricted lift valves, see Checking Lift on Restricted Lift Valves.) For V and W orifice unbolt the bellows from guide before guide removal.

12. For D through U orifice bellows valves (see Figure 7), the bellows is attached to the disc holder (8) by right-hand threads. Use a special spanner wrench on the bellows ring to remove it by turning counterclockwise (see Figure 17).

13. Remove the bellows gasket. For V and W orifice bellows valves (see Figure 9), the bellows is bolted to the disc holder (8). Remove these bolts to disassemble the bellows from the disc holder.

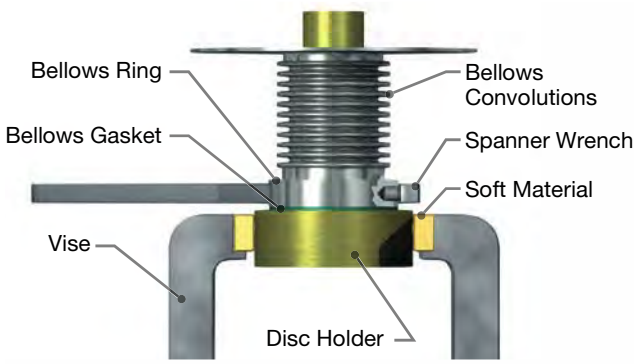

Figure 17: Removing the Bellows Ring

14. Follow the procedure appropriate to the orifice valve type:

- For D through U orifice valves (see Figure 7), remove the disc (6) from the disc holder (8) as follows:
  - Grasp disc holder by the stem portion, disc end down, and firmly strike down onto a clean, wood surface. Disc should dislodge from disc holder.

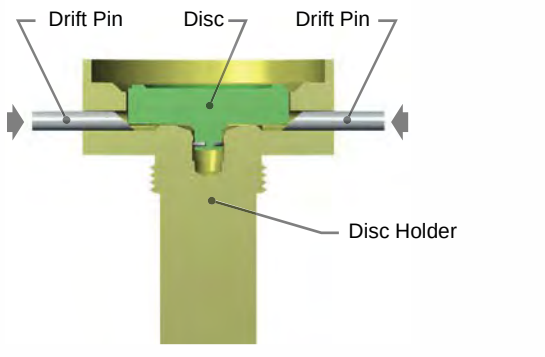

Figure 18: Removing the Disc with Drift Pins

  - If disc did not dislodge from disc holder, then clamp the stem portion of the disc holder, disc end up, firmly between two wooden V-blocks in a vise.
  - Start inserting special drift pins into the holes in the disc holder (see Figure 18) with the tapered portion of the pins working against the top of the disc, as indicated.
  - Use a light machinist hammer to tap each pin alternately until the disc snaps out of the recess in the disc holder.
- For V and W orifice valves (see Figure 9), remove the disc from the disc holder as follows:
  - Turn the disc holder on its side
  - Remove the retaining bolts (7)
  - Attach the lifting lug to the disc and lift out
  - Inspect guide rings (48) for wear and replace if necessary.

15. For O-ring seat seal and universal media soft-seal valves only (See Figures 10a, 10b &10c), remove the retainer lock screw (s), retainer, and O-ring or Teflon™ seal.

16. Remove the adjusting ring (3) by turning it counterclockwise (from left to right).

ATTENTION!

The nozzle (2) is normally removed for routine maintenance and service.

© 2024 Baker Hughes Company. All rights reserved.

XII. Disassembly of 1900 Series Safety Relief Valves (Cont.)

- 17. The nozzle (2) is threaded onto the base (1) and is removed by turning it counterclockwise (from right to left). Before removing the nozzle, soak the threaded joint with a suitable penetrating liquid or solvent. If the nozzle is frozen to the base, apply dry ice or other cooling medium to the inside of the nozzle and heat the base from the outside with a blowtorch in the area of the nozzle threads.

ATTENTION!

Should heat be applied, use care to prevent cracking of cast parts.

- 18. Using a three- or four-jaw chuck welded vertically to a stand bolted to a concrete floor, clamp the nozzle (2) into the chuck and break the body loose with a heavy rod or pipe (see Figure 19).

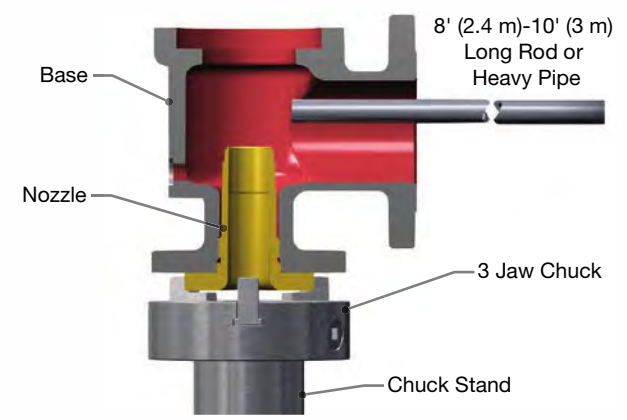

Figure 19: Loosening the Nozzle from the Base

ATTENTION!

Exercise care when inserting a rod or pipe in the outlet. Ensure the valve nozzle is not damaged during the operation.

19. Use a large pipe wrench on the nozzle flange to remove the nozzle (2) from the base (1) (see Figure 20).

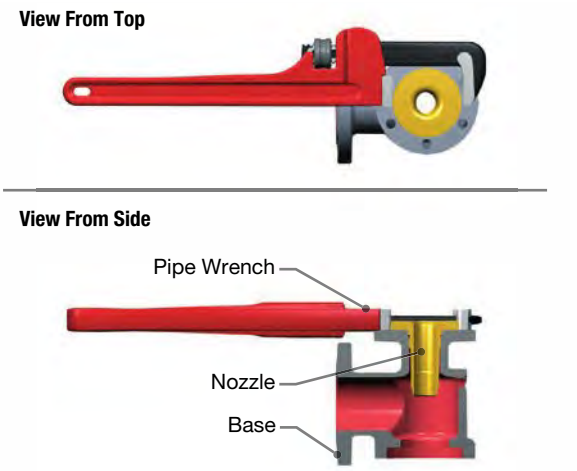

Figure 20: Removing the Nozzle from the Base

C. Cleaning

1900 Series SRV internal parts may be cleaned with industrial solvents, cleaning solutions, and wire brushes. If cleaning solvents are used, take precautions to protect yourself from potential danger from fume inhalation, chemical burns, or explosion. See the solvent's Material Safety Data Sheet (MSDS) for safe handling recommendations and equipment.

Do not sandblast internal parts because it can reduce the dimensions of the parts. The base (1), bonnet (11), and screwed cap (21) may be sand-blasted, but take care not to erode internal surfaces or damage machined surfaces.

XIII. Maintenance Instructions

A. General Information

After the valve has been disassembled, closely inspect the seating surfaces. Usually, a lapping of seats is all that is necessary to return a valve to working order. If an inspection shows badly damaged valve seating surfaces, machining will be required before lapping. O-ring seat seal valve nozzles can only be reconditioned by machining, not lapping. (For specific information concerning the machining of nozzle and disc seating surfaces, see the Re-Machining Nozzle Seats and Bores and Re-Machining the Disc Seat sections.)

ATTENTION!

See Optional **Glide-Aloy™** Parts to determine if the valve contains Glide-Aloy treated components (i.e., the disc holder and/or the guide). Coding on the valve nameplate identifies these components.

The seating surfaces of the metal-seated Consolidated SRV are flat. The nozzle seat is relieved by a 5º angle on the outside of the flat seat. The disc seat is wider than the nozzle seat; thus, the control of

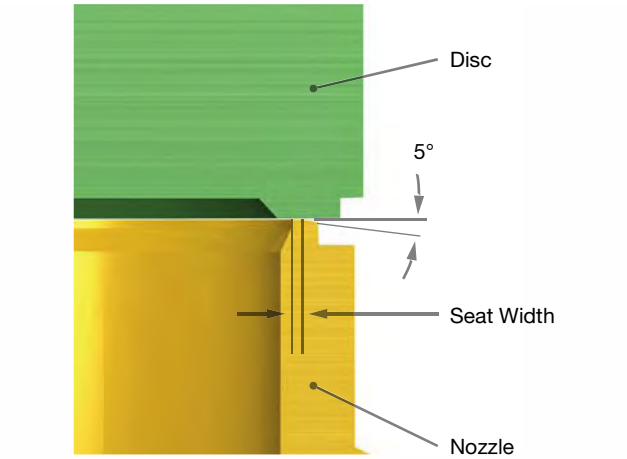

Figure 21: Seating Surface

seat width is the nozzle seat (see Figure 21).

A cast iron lap, coated with a lapping compound, is used for reconditioning the seating surfaces of the nozzle (2) and disc (6).

ATTENTION!

To establish leak-free valve seats, the nozzle seating surface and the disc seating surface must be lapped flat.

B. Lapping Nozzle Seats (Non-O-Ring Styles)

ATTENTION!

Nozzle laps (See Figure 22) are available from Baker Hughes. Do not use these laps if the valve nozzle can be removed and machined to the proper seat dimensions (see Tables 1a and 1c).

Lap the 5º angle of the nozzle first (see Figure 22, View A). Then, invert the nozzle lap and use the flat side as a “starter” lap to ensure the seat is square (see Figure 22, View B). Use a ring lap in a circular motion to finish lapping see Figure 22, View C and Reconditioning of Laps (Figure 24 in Section XIII.G). Keep the lap squarely on the flat surface and avoid rocking it. Rocking will cause rounding of the seat.

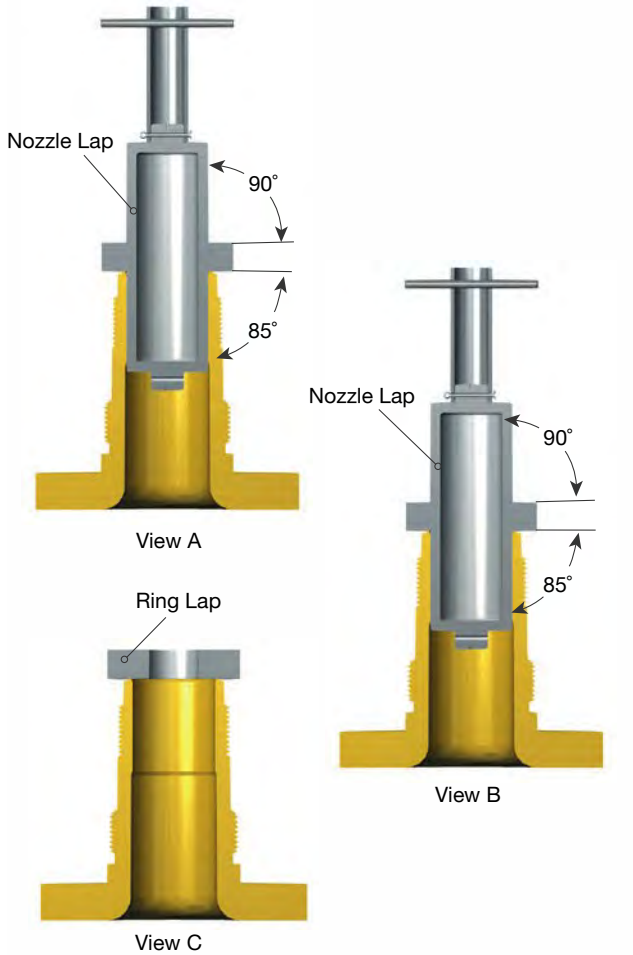

Figure 22: Lapping Nozzle Seats

XIII. Maintenance Instructions (Cont.)

C. Lapped Nozzle Seat Widths

A wide nozzle seat will induce simmer, especially in the smaller-orifice, lower-pressure valves. For this reason, the seats of valves other than O-ring valves should be as narrow as is practical. Since the seat must be wide enough to carry the bearing load imposed upon it by the spring force, the higher-pressure valves must have wider seats than the lower-pressure valves. The nozzle seat width should conform to the measurements in Tables 1a to 1c.

To measure the seat width, use a Model S1-34-35-37 Bausch and Lomb Optical Co. measuring magnifier or an equivalent seven-power glass with a .750" (19.05 mm) scale showing graduations of .005 inch (0.13 mm). Figures 21a and 21b illustrate the use of this tool in measuring the nozzle seat width.

If additional lighting is required for measuring, use a gooseneck flashlight similar to the Type A Lamp Assembly (Standard Molding Corp.), or equivalent.

Table1a: Nozzle Seat Width Standard 1900 Series Metal Seat Design [3]

XIII. Maintenance Instructions (Cont.)

D. Lapping Disc Seats

Use a ring lap or lapping plate to lap the disc in a circular motion, applying uniform pressure and slowly rotating the disc or lap.

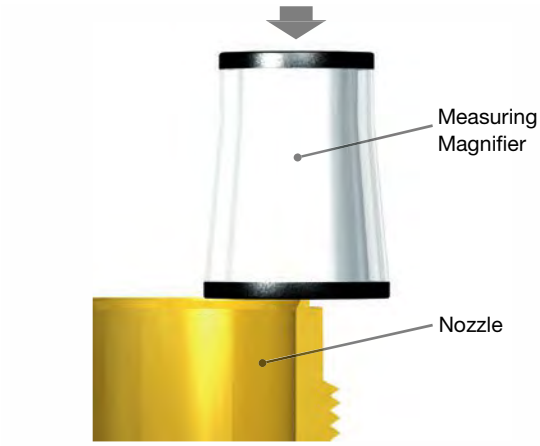

Figure 23a: Measuring Magnifier

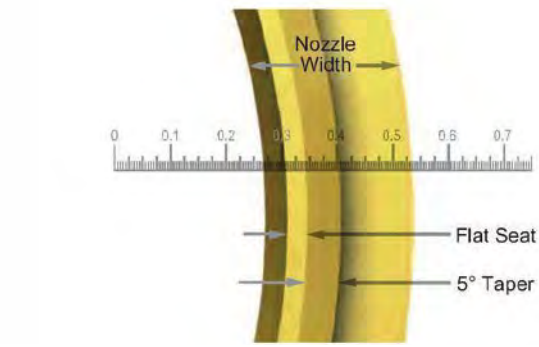

Figure 23b: Measuring Magnifier Detail

E. Precautions and Hints for Lapping Seats

To ensure a quality lapping process, observe precautions and guidelines as follows:

- Keep work materials clean.
- Always use a fresh lap. If signs of wear (out of flatness) are evident, recondition the lap.
- Apply a very thin layer of lapping compound to the lap to prevent rounding off the edges of the seat.
- Keep the lap squarely on the flat surface, and avoid rocking the lap, which causes rounding of the seat.
- When lapping, keep a firm grip on the lapped part to prevent dropping it and damaging the seat.
- Lap in a circular motion while applying a uniform pressure. Slowly rotate the lap to evenly distribute the lapping compound.
- Wipe off the old compound and replace it with new compound frequently. Apply more pressure to speed the cutting action of the compound.
- To check the seating surfaces, remove all compound from the seat and the lap. Then, shine the seat with the same lap using the lapping method as described above. Low sections on the seating surface show up as shadow in contrast to the shiny portion.
- If shadows are present, further lapping is necessary. Only laps known to be flat can be used. It should take only a few minutes to remove the shadows.
- When lapping is complete, any lines appearing as cross-scratches can be removed by rotating the lap on its axis (which has been wiped clean of compound) on the seat.
- Thoroughly clean the lapped seat using a lint free cloth and a cleansing fluid.

ATTENTION!

Before assembly, lap the contact surfaces of the nozzle, soft-seat disc (DM DA) and o-ring retainer to provide metal-to-metal seat tightness in the event of O-ring failure.

© 2024 Baker Hughes Company. All rights reserved.

XIII. Maintenance Instructions (Cont.)

F. Lapping O-Ring Seating Surfaces

Refer to Figures 10a and 10b and assemble the O-ring retainer to the disc holder (8) (D through J orifice) or disc (6) (K through U orifice) using the retainer lock screw(s)
as follows:

1. Apply 3A lapping compound to the retainer seating surface.
2. Place the O-ring retainer on the nozzle seat (see Figure 10a and 10b) and lap the O-ring retainer to the nozzle (2).
3. Once uniform contact is established, clean the nozzle (2) and O-ring retainer.
4. Repeat the procedure with 1000-grit compound.
5. Remove the retainer lock screw(s) and O-ring retainer, and thoroughly clean the O-ring retainer, retainer lock screws, and disc holder (8) or disc (6).

G. Reconditioning of Laps

Ring laps are reconditioned by lapping them on a flat lapping plate in a figure-eight motion (see Figure 24). To ensure the best results, recondition the ring laps after each use. Use an optical flat to check the quality of the lap.

Nozzle laps (see Figure 25) must be re-machined to recondition the lapping surfaces. Place the nozzle lap in a lathe between centers (see Figure 25). The surfaces marked A and B must be running concentrically.

One lapping surface is 90º and the other is 85º. The angle of each surface is marked on the lap. Machine surfaces C and D by taking light cuts at the proper angle until the lapping surfaces are reconditioned.

H. Re-Machining Nozzle Seats and Bores

1. Remove the nozzle (2) from the valve to be

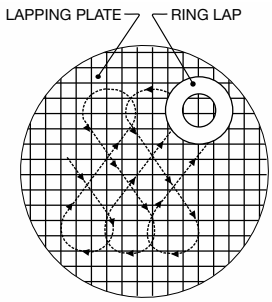

Figure 24: Lapping Pattern

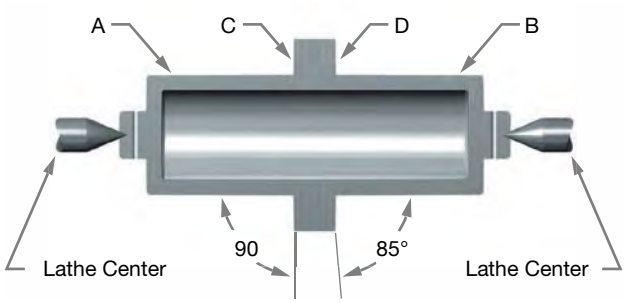

Figure 25: Nozzle Lap in a Lathe

remachined. If it cannot be removed from the base (1), re-machine it inside the base.

2. Set-up the lathe and nozzle (2) as follows:

- Grip the nozzle in a four-jaw independent chuck (or collet, if appropriate) using a piece of soft material such as copper or fiber between the jaws and the nozzle (see Figure 26).
- True-up the nozzle so that the surfaces marked B, C, and D run true within .001” (.025 mm) on the total indicator reading (see Figure 26).

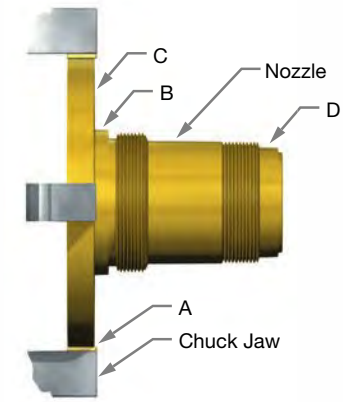

Figure 26: Nozzle Positioned in a Jaw

© 2024 Baker Hughes Company. All rights reserved.

XIII. Maintenance Instructions (Cont.)

3. Re-machine the metal-to-metal seat (see Figure 21 and Tables 1a, 1b and 1c) as follows:

- Make light cuts across the surface L at 5º until the damaged areas are removed. Turn to the smoothest possible finish.
- Cut back the outside surface at G until dimension N is obtained. The surface at G is common to all nozzles.
- Re-machine diameter H, until dimension E is obtained. Reestablish angle P.

The nozzle is now ready for lapping.

- Discard the nozzle when the minimum dimension D (see Figure 29a, 29b and 29c and Table 3a, 3b, 3c) is reached.

4. Re-machine the o-ring seat seal (see Figure 29b and Table 3b) as follows:

- Make light cuts across surface A at 45º until the damaged areas are removed. Turn to the smoothest possible finish.
- Cut back the outside surface at M until dimension J is obtained. Re-machine radius B.

I. Re-Machining the Disc Seat

Machine the standard disc seating surface (see Figure 27) as follows:

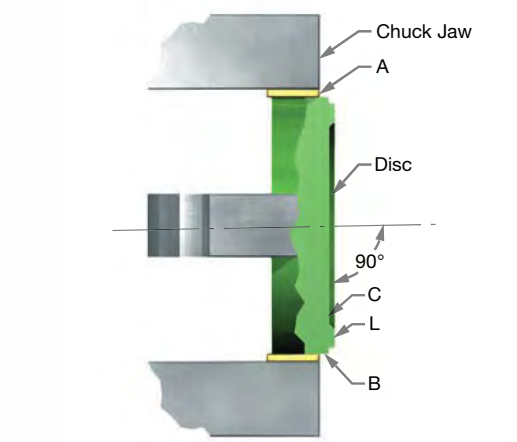

Figure 27: Standard Disc Seating Surface

1. Grip the disc (6) in a four-jaw independent chuck (or collet, if appropriate), using a piece of soft material such as copper or fiber between the jaws and the disc (see Figure 27).
2. True-up the disc (6) so that the surface marked B and C run true within .001" (0.025 mm) on the total indicator reading (see Figure 27).
3. Make light cuts across the seating surface L until damaged areas are removed. Turn to the smoothest possible finish.

   The disc (6) is now ready for lapping.

   - Discard the disc if the minimum dimension N or T (Figures 32a, 32b, 32c and Tables 5a and 5b) is reached. Do not reestablish surface C (see Figure 27).

ATTENTION!

Do not machine a Thermodisc, o-ring Seat disc, or Soft-seat (DM DA) disc.

J. Checking Spindle Concentricity

It is important that the spindle (15) of an SRV be straight in order to transmit the spring load to the disc (6) without binding laterally. Over-gagging is a common cause of bent spindles. Check the essential working surfaces of the spindle using any of the recommended methods as follows:

1. Set up the V-block support (see Figure 28) as follows:

- Place the ball-pointed spindles in a piece of material B that has been recessed to permit free rotation of the spindle (15). For hollow spindles, a ball-pointed support is required.
- Support the spindle with a V-block A placed near the upper end of the spindle, but below the threads.
- Apply a dial indicator at approximately 45º to the outer edge of the spring washer seat at C.
- Rotate the spindle. The total indicator reading should not exceed .007” (.17 mm). Straighten the spindle, if necessary. To straighten the spindle, place the unthreaded portion of the small and large end in padded V-blocks, with the point of maximum indicator readout upward, and then apply a downward force with a padded press or jack as required, until the spindle is within the specifications.

K. Set Pressure Change-Disc Holder

The disc holder (8) must be replaced if the set

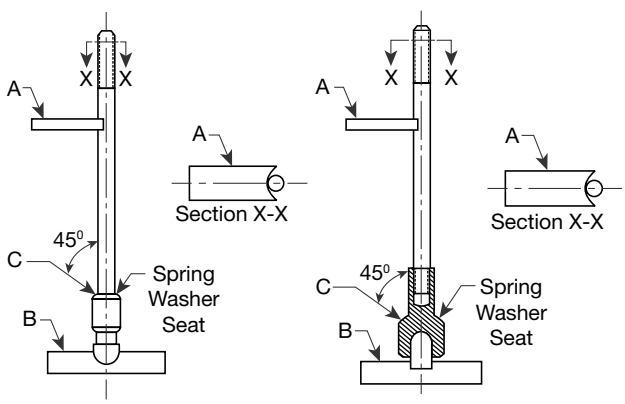

Figure 28: V-Block Support Setup

© 2024 Baker Hughes Company. All rights reserved.

pressure must be changed and the change involves crossing the dividing line between high pressure and low pressure. Determine whether the disc holder must be changed when changing the set pressure (see Tables 2a and 2b).

L. Checking Lift on Restricted Lift Valves

ATTENTION!

Restricted lift valves may be identified by the restricted lift value stamped on the nameplate.

General

Restricted lift valves have a limit washer that prevents the disc (6) and disc holder (8) from lifting beyond the required lift and resulting capacity. The D-2 and E-2 valves are naturally a restricted lift valve, as the seat dimensions and bore diameter are identical to the F orifice nozzle. The 1900 DM D and E have components identical to the 1900 F DM, but with limit washers.

Other 1900 Series valves may be restricted in the same manner when necessary. These valves may be restricted to a minimum lift of 30% of the full rated capacity or .080″ (2.03 mm).

It is important to check lift on all restricted lift valves after servicing or replacing parts. This procedure is necessary to ensure reliability of the nameplate capacity.

ATTENTION!

The required lift for a restricted lift valve is indicated on the valve nameplate (see Figure 29). The minimum certified lift shall be per National Board NB-18 document.

Note: The values to be subtracted from the full lift measurement given in the “Value to be subtracted” chart on page 33 are not in all cases the same as the lift value given in NB-18 document. This is due to accounting for O-ring expansion on O-ring seated valves. Nameplate lift values shall be per NB-18 document.

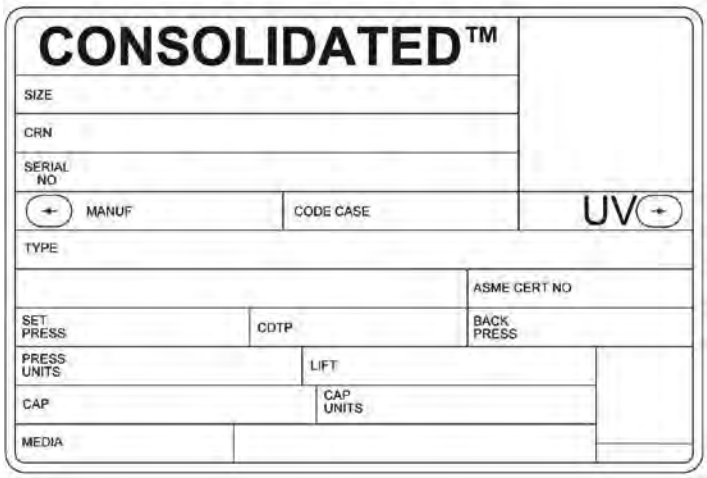

Figure 29: Valve Nameplate
(**Note:** Lift value to be obtained from NB-18 document)

XIII. Maintenance Instructions (Cont.)

M. Determining the Correct Limit Washer Length

Determine the correct limit washer length (see Figure 30) as follows:

1. Assemble the disc (6) and disc holder (8) (installing the bellows gasket and bellows, if applicable) as follows:

ATTENTION!

Do not use an impact wrench on bellows valves.

ATTENTION!

For O-ring seated valves, leave out the O-ring when determining the limit washer length.

- Place the guide over the disc holder barrel and connect the spindle (15) to the disc holder (8).
- Install the eductor tube (40) in base (1), if applicable.
- Install the adjusting ring (3) below the seat.

2. Install the guide gasket (10), and insert the disc assembly from Step 1 into the base (1).
3. Install the bonnet gasket (12) and bonnet (11) (leaving out the spring assembly at this time).
4. Tighten the stud nuts (14) to compress the bonnet gasket (12).
5. Place a dial indicator on the bonnet (11) and over the spindle (15) and then zero the indicator. Measure total lift by pushing the disc (6) upward. Subtract the required lift of the valve from the measured lift to find the required limit washer length. Value to be subtracted shall be per chart below.
6. Machine the limit washer to the required length.
7. Machine the inside chamfer, deburring and polishing as required.
8. Disassemble the valve.
9. Install the limit washer with the chamfer down and reassemble the valve as described in Steps 2 through 4.
- 10. Measure the lift of the valve and compare it with the required lift as given on the NB-18 document (-0.000”, +0.005” [-0.000 mm, +0.127 mm]). Take one of the following steps, based on the results, if the lift is not correct:
- If the actual lift is less than required, machine the limit washer as necessary to obtain the required lift. (Machine chamfer, deburr and polish before installation into the valve.)
- If the actual lift is greater than required, obtain a new limit washer, and return to Step 7. (Machine chamfer, deburr and polish before installation into valve.)

11. Once correct lift is obtained, disassemble the valve. Install spring assembly and O-ring (if required).

ATTENTION!

Ensure the limit washer has been chamfered to fit over the radius of the disc holder (8). The limit washer must be installed so that the chamfered end is mating to the back face of disc holder.

ATTENTION!

Check all dimension requirements for each valve. Do not interchange internal parts or use a different base after a set of parts has been custom-fit.

ATTENTION!

For bellows Type D and E valves, check the outside diameter and, if necessary, emery cloth down to .680″ (17.3 mm) maximum diameter in order to avoid interference with the bellows threads.

XIV. Inspection and Part Replacement

A. Nozzle Inspection Criteria

Nozzle should be replaced if:

- Dimension from seat to first thread, after re-machining and lapping, is less than D min. (see Tables 3).
- Threads are damaged from pitting and/or corrosion.
- Top of flange and intersecting surface are damaged from galling and/or tearing.
- Seat width is outside specification and can not be reestablished per Nozzle Dimensions in Table 3a & 3c (see Tables 3a, 3b or 3c).

B. Nozzle Seat Width

Using a measuring magnifying glass (see Lapped Nozzle Seat Widths), determine whether the seating surface must be machined before lapping. If the seat can be lapped flat without exceeding the required seat width (see Tables 1a, 1b or 1c), it does not require machining. To reduce the seat width, the 5º angle surface must be machined and all seat dimensions need to be verified, and reestablished if necessary. The nozzle must be replaced if the D dimension is reduced below the minimum (see Tables 3).

ATTENTION!

Flange thickness changes the center-to-face dimension. Ensure the minimum dimension for orifice D through P is .656" (16.67 mm), and for Q through W is .797" (20.24 mm).

C. Nozzle Bore Inspection

All 1900 Series SRV nozzles manufactured after August 1978 have increased bore diameters. Original and new nozzles are interchangeable, but the rated capacities are different (see Tables 4).

D. 1900 Series SRV Standard Disc Inspection Areas

The standard 1900 Series disc (see Figure 32) can be machined until the N dimension is reduced to its minimum size (see Table 5). The T dimension is provided to ensure the disc has not been machined beyond its limits. If re-machining reduces the thickness of the disc (T min.), the entire disc holder assembly drops with respect to the seating plane of the nozzle. This creates a significant change in the huddle chamber configuration and results in significantly more simmer before opening.

E. 1900 Series Thermodisc Replacement Criteria

The Thermodisc must be replaced if:

- Seat defects and damage cannot be lapped out without reducing the A dimension below those listed in Table 6 (see Figure 33).

F. 1900 Series Cryodisc Replacement Criteria

The Cryodisc must be replaced if:

- Seat defects and damage cannot be lapped out without reducing the A dimension below those listed in Table 7 (see Figure 34).

ATTENTION!

The A dimension on orifice D through H of the thermal lip disc is difficult to measure. If the .006" (0.15 mm) minimum thickness of the thermal lip cannot be measured, replace the Thermodisc. The A dimension on orifice D through H of the cryogenic disc is also difficult to measure. If the .008" (0.19 mm) (D, E, F orifice), .009" (0.23 mm) (G orifice), or .011" (0.27 mm) (H orifice) minimum thickness of the cryogenic disc lip cannot be measured, replace the Cryodisc.

G. Disc Holder Inspection Criteria

Several disc holder designs are available, depending on the service and the type of valve (see Figure 35).

For identification, the G diameter (Dia.) is provided (see Tables 7a and 7b).

XIV. Inspection and Part Replacement (Cont.)

Set Pressure Change: If it is necessary to change valve set pressure, it may also be necessary to change the disc holder (8). Determine if the disc holder must be changed to/from low pressure from/ to high pressure when changing the set pressure (see Tables 2).

Media Change: If the protected media is changed in form from a compressible fluid (air, gas, or steam) to a non-compressible fluid (liquid), it is necessary to change from a standard to a liquid trim disc holder for non-DM valves. No change in disc holder is required for the DM valve when the protected media changes from compressible to non-compressible, or vise-versa.

Bellows Conversion: If a conventional 1900 Series SRV has a D, E, F, G or H orifice disc holder (8), the disc holder must be replaced with a new disc holder included in the bellows conversion kit.

O-Ring Conversion: If a standard metal-seated 1900 Series SRV is to be converted to an o-ring valve, the disc holder (8) must be replaced with an o-ring disc holder which is included in the o-ring conversion kit. For K through U orifice valves, the standard disc holder may be machined to receive the larger o-ring disc.

Soft-Seat Universal Media Conversion: If a DM metal-seated 1900 Series SRV is to be converted to a soft-seat valve, the disc (2) must be replaced with an soft-seat disc (2) which is included in the soft-seat conversion kit.

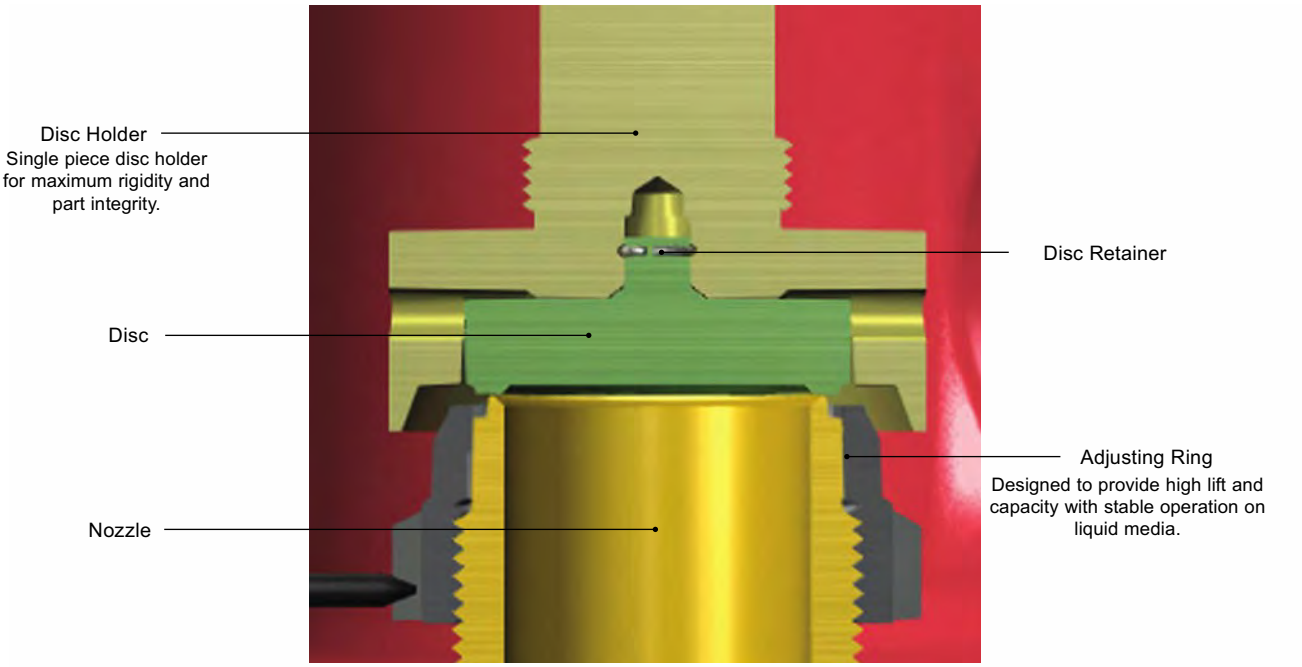

Figure 36: 1900 Series Liquid Service (LA) Internals

XIV. Inspection and Part Replacement (Cont.)

H. Guide Inspection Criteria

Replace the guide (9) if:

- Visible galling is present on the inside guiding surface.
- Gasket seating areas are pitted and cause the valve to leak between the bonnet (11) and base (1).

The guide (9) type varies depending on the valve type: O-ring valve, bellows valve, or standard valve.

Inspect the guide as follows:

- Find the correct valve orifice size and disc holder (8) measurements (see Table 9).
- Measure the barrel portion of the disc holder and compare it to the nominal measurement on Table 6 to determine the maximum allowable clearance between the disc holder and the guide.
- Replace the guide and disc holder if the clearance between the inner diameter (I.D) and the guide and/or the outer diameter (O.D) of the disc holder is not within the clearance dimensions.

I. Spindle Inspection Criteria

Replace the spindle (15) if:

- The bearing point is pitted, galled, or distorted.
- Threads are torn so that release nut and/or release locknut will not thread on or off.
- The spindle cannot be straightened less than the .007″ (0.17 mm) total indicator reading (See Checking Spindle Concentricity and Figure 28).

Table 9: Allowable Clearance for Guide and Disc Holder (Std.(1 and 2) and DM(2))

(1) For valves manufactured prior to 1978, contact the factory for dimensions and clearances.

(2) Guide and disc holder assembly: The disc holder and the guide may be retained provided their diametrical clearance falls within the limits within the table. If the fit between the assembled parts is outside the allowable clearance, replace either component or both to provide proper assembly clearance.

XIV. Inspection and Part Replacement (Cont.)

J. Spring Inspection Criteria

Replace the spring (18) if:

- Pitting and corrosion of the coils reduce coil diameter.
- Spring ends are not parallel in the free height condition.
- Obvious uneven coil spacing or spring distortion is present.
- The maximum clearance between A and A_1 and between B and B_1 (see Figure 37) is more than:

– .031" (.79 mm) for springs with an inner diameter (ID) of less than 4" (100 mm).

– .047" (1.19 mm) for springs with an ID of 4" (100 mm) or greater.

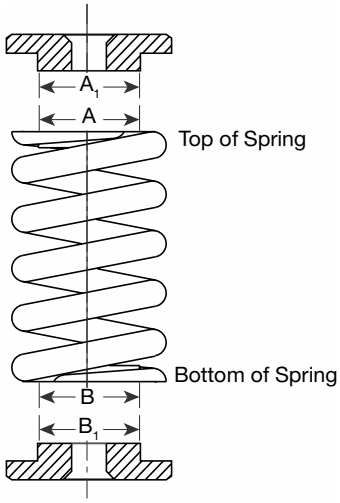

Figure 37: Spring Allowed Tolerance

If there is constant backpressure in a conventional 1900 Series SRV (without balancing bellows), check that the cold differential set pressure of the replacement spring (18) is within the recommended range. If the relieving temperature causes the cold differential set pressure, then select a spring based on the valve's actual set pressure, not on the cold differential set pressure (See Set Pressure Compensation).

ATTENTION!

If a spring must be replaced, order a spring assembly, as it includes custom fit spring washers.

XV. Reassembly of 1900 Series SRV

A. General Information

The 1900 Series SRV can be easily reassembled after the required internal parts maintenance has been performed. All parts should be clean before reassembly.

B. Preparation

Before beginning reassembly take these steps as follows:

1. Inspect guiding surfaces, bearing surfaces, flange faces, retainer recesses, and grooves for cleanliness (See Replacement Parts Planning for recommended compounds and tools).
2. Check all gaskets used during reassembly. Reuse undamaged, solid metal gaskets (not pitted or creased) and replace all soft gaskets.
3. Before installing the (flat) gaskets, apply a light uniform coating of lubricant to the surface to be sealed. Then coat the top of the gasket with lubricant.
4. If lapping of bearing points was necessary, ensure all lapping compound is removed. Then, thoroughly clean both surfaces and rinse with alcohol or another suitable cleaner.
5. Apply a light, uniform layer of lubricant to each bearing surface.
6. If the valve has an O-ring seat seal, the O-ring should be replaced. Please refer to its tag plate (see Figure 38) to determine O-ring material and “as-built” part number.

C. Lubrication

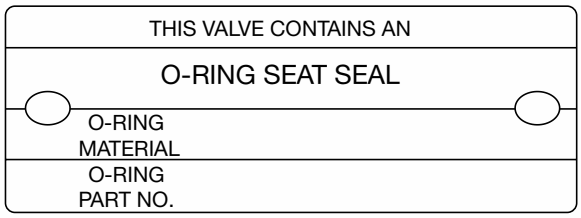

Figure 38: Valve O-Ring Tag

Use a nickel-based, anti-seize lubricant on all threads and bearing surfaces. Recommended lubricant is Jet – Lube, Baker Hughes Non-metallic, product code #14613.

D. Reassembly Procedure

1. If the nozzle (2) was removed, apply thread lubricant to the nozzle threads before reinstalling it in the valve base (1).
2. Insert the nozzle (2) into the inlet flange of the base (1) and torque to the correct value (see Table 10).

Table 10: Nozzle Torque (Values +10% - 0%)

Orifice		Required Torque	
Std.	DM	ft-lbs	Nm
D-1	D	95	129
E-1	E	165	224
D-2	D	95	129
E-2	E	165	224
F	F	165	224
G	G	145	197
H	H	165	224
J	J	335	454
K	K	430	583
L	L	550	746
M	M	550	746
N	N	640	868
P	P	1020	1383
Q	Q	1400	1898
R	R	1070	1451
T-4	T	1920	2603
U	U	1920	2603
V	V	1960	2657
W	W	2000	2712

3. Install the adjusting ring (3) on the nozzle (2) below the seat level so that the disc (6) will seat on the nozzle and not on the adjusting ring.
4. For restricted lift valves:

If the nozzle (2) did not require machining, the same limit washer (tagged during disassembly) may possibly be reused. However, lift should be checked and verified as described in Checking Lift on Lift-Restricted Valves.

If the nozzle was remachined, measure the required lift as described in Checking Lift on Lift-Restricted Valves and replace limit washer if necessary.

5. Assemble the disc/disc holder as follows:

- Before assembly of the disc (6) into the disc holder (8), remove the disc retainer (7) from the back of the disc.

© 2024 Baker Hughes Company. All rights reserved.

XV. Reassembly of 1900 Series SRV (Cont.)

- Use 1000-grit lapping compound on the bearing surface to lap the disc (6) into the disc holder (8) and to properly establish the bearing surface.
- For D through U orifice valves with metal-to-metal discs (see Figure 1 to 6), place the disc retainer (7) into the groove in the disc (6). The retainer should "snap" into the disc holder (8) with moderate finger or hand force. Check that the disc "rocks" after set in place.
- For V and W orifice discs (see Figure 9), place the disc into the disc holder and secure it with disc retaining bolts.

ATTENTION!

Do not use excessive force to insert the disc (6) into the disc holder (8).

- For O-ring disc sizes D through J (see Figure 10a), reassemble the disc holder using a new O-ring Seat Seal, O-ring retainer, and retainer lock screw(s).
- For O-ring disc sizes K through U (see Figure 10b), reassemble the disc using a new O-ring Seat Seal, O-ring retainer, and retainer lock screws. Assemble the disc into the disc holder.
- For O-ring seat Dual Media (DM DA), follow the instructions in Appendix A.

6. Install the bellows gasket and bellows ring as follows:

- For bellows valves D through U (see Figure 7):
  - Clamp the stem portion of the disc holder (8), barrel-end up, firmly between two wooden V-blocks in a vise.
  - Place a new bellows gasket on the disc holder.
  - Thread the bellows ring, hand-tight, down to the gasket on the disc holder.
  - Use a pin spanner wrench or special cable-type wrench to tighten the bellows ring until a pressure-tight joint is formed.
- For bellows valves V and W:
  - Place a new bellows gasket on the disc holder.
  - Bolt the assembly in place and tighten bolts to 7-9 ft-lbs (9.5-12.2 Nm).

7. On restricted lift valves, install the limit washer with the chamfered side down.
8. For D through U valves:

- Place the guide (9) over the disc holder (8). If bellows are present, the weight of the guide will slightly compress the bellows.
- For V and W orifice valves:
  - Install guide rings into the grooves located inside the guide ID. Make sure the space where the upper and lower guide ring ends meet is positioned 180° apart. Mark both the guide and disc holder at the point where the bottom guide ring ends meet. This mark must be faced 180° away from the outlet when the assembly is place into the valve. Gently lower the guide down onto the disc holder ensuring that guide rings remain in their respective groove.

9. Set the disc holder (8), disc side down, on the work surface. Place a small amount of 1000- grit lapping compound onto the ball end of the spindle (15) and place it in the spindle socket of the disc holder. Turn the spindle clockwise and then counterclockwise to seat the spindle/disc holder bearing point. When finished, clean lapping compound from all parts.
10. Spread a small amount of 320-grit lapping compound on the spring washer bearing surface.
11. Place the spring washer (17) over the spindle/ spring washer bearing surface and turn it clockwise and then counterclockwise to seat it on the bearing surface. In the same manner, lap the adjusting screw (19) into the bearing surface of the upper spring washer to establish a smooth bearing surface. When finished, clean lapping compound from all parts.
12. Place the spindle retainer (16) over the end of the spindle head or disc holder (8), as applicable.
13. Apply lubricant sparingly to the ball tip of the spindle (15).
14. Place a new guide gasket (10) in the base (1).
15. Install the spindle/disc guide assembly as follows:

- For D through L size valves:
  - Place the spindle (15) in the disc holder (8) and align the spindle retainer (16) so that the gap is midway between the two slots.
  - Use a screwdriver to compress the spindle retainer and guide it into the retaining groove. Ensure the spindle turns freely.
  - Lift complete assembly and carefully lower it into the valve base (1).
  - Ensure proper fit for a conventional valve by aligning the hole in the guide (9) over the

© 2024 Baker Hughes Company. All rights reserved.

XV. Reassembly of 1900 Series SRV (Cont.)

extended end of the eductor tube (40).

- For M through U size valves:
  - Install lifting tool (see Figure 16) onto disc holder and carefully lower the disc holder assembly into the valve base.
  - Ensure proper fit for a conventional valve by aligning the hole(s) in the guide over the extended end of the eductor tube(s).
  - Then, install the spindle in the disc holder and align the spindle retainer so that the gap is midway between the two slots.
  - Use a screwdriver to compress the spindle retainer and guide it into the retaining groove. Ensure the spindle turns freely.
- For V and W size valves:
  - Using the same lifting lugs used during disassembly (see Figure 16), carefully lower the disc holder assembly into the valve base.
  - Install the spindle in the disc holder and align the spindle retainer so that the gap is midway between the two slots.
  - Use a screwdriver to compress the spindle retainer and guide it into the retaining groove. Ensure the spindle turns freely.

- 16. Apply a small quantity of lubricant to the spring washer bearing surface of the spindle (15).
- 17. Place the spring assembly on the spindle (15).
- 18. Place a new bonnet gasket (12) in the base (1) before installing the bonnet (11). Uniformly tighten the stud nuts (14) using the appropriate bolt tightening pattern (see Figure 39). Determine the required torque for the subject valve (see Table 11). Determine the torque values for each round of the pattern (see Table 11). The last round ensures that all stud nuts are at the required torque.
- 19. With the adjusting screw locknut (20) assembled near the top of the adjusting screw (19), apply a small quantity of lubricant to the spherical end and threads of the adjusting screw.

20. Thread the adjusting screw (19) into the bonnet (11) until it contacts the spring washer (17).

- For V and W orifices, use the setting device to assemble the spring plunger and adjusting screw. Contact the factory for procedure on how to use the setting device.

- 21. Use pliers to hold the spindle (15) and prevent it from turning in the disc holder (8). Turn the adjusting screw (19) clockwise until the original distance between the end of the spindle and the top of the adjusting screw is obtained. This method of compressing the spring (18) will approximately reestablish the original set pressure. The valve must still be reset for the required pressure.

22. Restore the adjusting ring (3) to its original position, with reference to the disc holder (8), as recorded.

23. Fit the adjusting ring pin (4) with a new adjusting ring pin gasket (5).

24. Install the adjusting ring pin (4) in the valve assembly in the original position. If the original position is not known, verify the number of notches on the adjusting ring (3) and refer to Tables 12, 13, 14 or 15 depending on the valve serial number or trim. Set the ring position according to the applicable set pressure and orifice size.

The valve is now ready for setting and testing.

(1) Position Relative to Disc Holder

ATTENTION!

If the valve has an O-ring seal, tighten the lock and adjusting screw (19) before final setting of the adjusting ring (3).

ATTENTION!

Ensure the adjusting ring pin (4) enters the notch in the adjusting ring (3), but does not bind the adjusting ring. If binding occurs, cut the adjusting ring pin until adjusting ring moves freely from side-to-side within the notch.

XVI. Setting and Testing

A. General Information

Before putting the reconditioned valve in service, it must be set to open at the required set pressure as shown on the nameplate. Although the valve can be set on the service installation, it is more convenient to set the valve and check seat tightness on a test stand. Any spring replacement shall be in accordance with current Baker Hughes guidelines.

Mount safety relief valves in a vertical, upright position only.

B. Test Equipment

The test stand used for testing SRVs normally consists of a pressure source supply line with a throttle valve and receiver that have the following features:

- Outlet for attaching the valve to be tested
- Pressure gauge with a shut-off valve
- Drain line with a shut-off valve
- Adequate receiver volume for the valve to be tested and to achieve proper operation

Do not mount valve at the end of pipe through which there is normally no flow or near elbows, tees, bends, etc.

C. Test Media

For best results, valves shall be tested by type as follows:

- Steam valves are tested on saturated steam.
- Air or gas valves are tested on air or gas at ambient temperature.
- Liquid valves are tested on water at ambient temperature.

D. Setting the Valve

Set the valve to open at the set pressure as shown on the nameplate. If a cold differential set pressure is indicated on the nameplate, set the valve to open at that pressure. (The cold differential set pressure is the set pressure corrected to compensate for backpressure and/or operating temperature.) A new cold differential set pressure may need to be determined if changes are to be made to the set pressure or backpressure or if the service temperature changes.

E. Set Pressure Compensation

Cold Differential Set Pressure for Temperature Compensation

During production testing, the SRV is often tested at temperatures that are different from the temperatures the SRV will be exposed to in service. Increasing the temperature from ambient temperature causes the set pressure to decrease. The decrease in set pressure is due to thermal expansion of the seating area and spring relaxation. Therefore, it is important to compensate for the difference between production test temperature and service temperature. The service temperature is the normal operating temperature of the SRV. If the operating temperature is unavailable, do not correct the SRV set pressure.

Table 17 lists the set pressure multipliers to be used when computing the cold differential set (CDS) pressure for valves being set on an air or water test stand at ambient temperatures

Valves to be used in saturated steam service are tested on saturated steam. Therefore, no CDS is required. However, valves in superheated steam service are tested on saturated steam and require a CDS.

500	277.8	1.031
600	333.3	1.038
700	388.9	1.044
800	444.4	1.050

Cold Differential Set Pressure for Back Pressure Compensation

ATTENTION!

Install a bellows to allow the set pressure to remain constant for valves with variable superimposed backpressure.

When a conventional 1900 Series SRV operates with a constant backpressure, the cold differential set (CDS) pressure is the set pressure minus the constant backpressure.

When Consolidated Type 1900-30 D-2, 1900-30 E-2, and 1900-30 F through W balanced bellows valves are used with constant or variable backpressure, no compensation to the valve's set pressure is required due to backpressure.

Sample Calculations for 1900 Series Consolidated Safety Relief Valve

Set pressure 2500 psig (172.37 barg), temperature 500ºF (260ºC), backpressure atmospheric.

Set Pressure . . . . . 2500 psig (172.37 barg)

Multiplier (see Table 17) X1.019

Cold Differential Set Pressure. . . . 2548 psig (175.68)

Set pressure 2500 psig (172.37 barg), temperature 500ºF (260ºC), constant backpressure. . . . . 150 psig (10.34 barg)

Set Pressure . . . . . 2500 psig (172.37 barg)

Minus Constant Back Pressure -150 psig (-10.34 barg)

Differential Pressure . . . . . 2350 psig (162.03 barg)

Multiplier (see Table 18) X1.019

Cold Differential Set Pressure. . . . . 2395 psi

Set pressure 2500 psig (172.37 barg), temperature 100º F (260ºC), constant backpressure. . . . . 150 psig (10.34 barg)

Set Pressure . . . . . 2500 psig (172.37 barg)

Minus Constant Back Pressure -150 psig (-10.34 barg)

Cold Differential Set Pressure 2350 psig (162.03 barg)

Set pressure 400 psig (27.58 barg) on superheated steam, temperature 650º F (343.3 ºC), backpressure atmospheric Operating Temperature . . . . . 650º F (343.3 ºC)

Operating pressure . . . . . 330 psig (27.75 barg)

Minus Temperature of Saturated Steam at 330 psig (27.75 barg). . . . . .-430º F (-221.1ºC)

Degrees of Superheat . . . . . .220º F (104.4ºC)

Set Pressure . . . . . 400 psig (27.58 barg)

Multiplier (see Table 17) X1.014

Cold Differential Set Pressure 405.6 psig (27.97 barg).

XVI. Setting and Testing (Cont.)

ATTENTION!

- Ensure valves for steam service are set using saturated steam.
- Ensure valves for gaseous service are set using air or nitrogen.
- Ensure valves for liquid service are set using water.

ATTENTION!
STANDARD 1900 SERIES (GS, LA & SS TRIMS)

The ASME Boiler and Pressure Vessel Code Section XIII (UV) set pressure tolerance is:
+/- 2 psi (.14 bar) ≤ 70 psi (4.8 bar)
and +/- 3% > 70 psi (4.8 bar)

ATTENTION!
1900 DUAL MEDIA (DM) SERIES

The 1900 DM set pressure tolerance is more conservative than the ASME Boiler and Pressure Vessel Code Section XIII (UV) criteria. The set pressure tolerance shall be as follows:

Air / Nitrogen
+0 psi, -2 psi (.14 bar) ≤ 70 psi (4.8 bar)
+0%, -3% > 70 psi (4.8 bar)

Water
+ 2 psi (.14 bar), -0 psi ≤ 70 psi (4.8 bar)
+3%, -0% > 70 psi (4.8 bar)

F. Setting the Pressure

1. Before mounting the valve on the test stand, remove all dirt, sediment, or scale from the test tank nozzle and the inlet port of the valve. Ensure the test gauge has recently been calibrated on a deadweight gauge tester.
2. Mount the valve on the test stand.
3. If the adjusting screw (19) of the reconditioned valve has been turned down to its original position, slowly bring the pressure up in the test tank to the CDS pressure. If the valve opens before the desired pressure is reached, additional compression is required on the spring (18), as follows:

- Hold the spindle (15) to prevent rotation and turn the adjusting screw clockwise.
- If the valve does not open at the desired pressure, maintain the required pressure in the test tank and slowly release the compression on the spring by turning the adjusting screw counterclockwise until the valve opens.
- Continue adjustment until the valve opens at the desired pressure.

4. After the required set pressure is obtained, tighten the adjusting screw locknut (20) and repeat the test. Obtain at least two repeat openings at the same pressure to ensure the valve is set accurately.

ATTENTION!

On compressible fluids, set pressure is defined as the pressure where the valve pops open, NOT as the pressure when it begins to simmer.

ATTENTION!

On liquid valves, set pressure is indicated by the first continuous flow of water from the valve outlet.

G. Seat Tightness Testing

General Information: Set up a typical test arrangement for determining seat tightness for SRVs on air or gas service (in accordance with ANSI B147.1/ API RP 527) (see Figure 40).

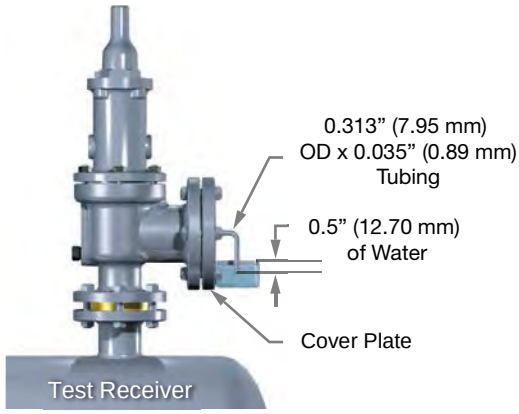

Figure 40: Typical Test Arrangement

ATTENTION!

Leakage may be detected by application of a soap solution, or equivalent, at points of possible leakage.

1. Cut the end of a piece of .313″ (7.93 mm) OD tubing with .035″ (0.89 mm) wall so that it is square and smooth.
2. Insert the tubing so that it is perpendicular to and .5″ (12.7 mm) below the surface of the water.
3. Use the tubing to take a leakage measurement.

XVI. Setting and Testing (Cont.)

G.1 Metal-to-Metal Seats

1. With the valve mounted vertically (see Figure 40), determine the leakage rate, in bubbles per minute, with pressure at the SRV inlet held at 90% of the set pressure immediately after popping. For valves set at 50 psig (3.45 barg) or below, hold pressure at 5 psig (0.34 barg) below set point. The test pressure shall be applied for a minimum of 1 minute for valves on inlet sizes through 2″ (50.8 mm); 2 minutes for sizes 2.5″ (63.5 mm), 3″ (76.2 mm) and 4″ (101.6 mm), and 5 minutes for the 6″ (152.4 mm), 8″ (203.2 mm), 10″ (254 mm) and 12″ (304.8 mm) sizes. For metal-to-metal valves designated for gaseous service, the leakage rate shall not exceed maximum bubbles per minute (see Table 19). When using saturated steam as the test medium, the test pressure shall be held for at least 3 minutes.
2. Check that there is no visible leakage for valves designated for steam service (and tested on steam) or for liquid service (and tested on water).

G.2 O-Ring Seat Seal Valve

The tightness standard for O-ring seat seal valves shall be no leakage at or below the test pressures listed (see Table 20).

Table 19: Valve Leakage Rate (Metal Seat)

Set Pressure (60°F or 15.6°C)		Valve Orifice D & E			Valve Orifice F and Larger		
		Approximate Leakage per 24 hrs			Approximate Leakage per 24 hrs		
Pressure		Leakage Rate (Bubbles per Minute)	ft^3	m^3	Leakage Rate (Bubbles per Minute)	ft^3	m^3
(psig)	(barg)						
15-1000	1.03-68.95	40	0.6	0.02	20	0.3	0.01
1500	103.42	60	0.9	0.03	30	0.45	0.01

XVI. Setting and Testing (Cont.)

H. Recommended Backpressure Testing for Joint Leakage

If the valve is to be used in a closed discharge system, backpressure-test the valve after it has been set for the correct opening pressure. Conduct testing by installing the screwed cap (21) with a cap gasket (27) and applying air or nitrogen to the base drain connection or to the valve outlet. Seal all other openings.

Test pressure should be the greater of 30 psig (2 barg) or the actual valve backpressure. Hold air or nitrogen pressure for 3 minutes before applying leak detector solution to all connections (joints).

On bellows valves, hand-tighten a clean pipe plug in the bonnet vent connection in order to obtain the smallest possible leak path. Remove this plug after the test.

Apply liquid leak detector to the following SRV components and examine for leakage during backpressure testing:

- Nozzle/base joint.
- Adjusting ring pin seal.
- Base/bonnet joint.
- Bonnet/cap joint.
- “Tight” bonnet vent plug, if conventional valve.
- “Loose” bonnet vent plug, if bellows valve.

Gag the safety valve during ring adjustments to avoid possible severe personal injury or death.

If a leak is discovered, attempt repair of the leaking joint(s) by tightening it while the SRV is still on the stand. If the leak continues, tear down the leaking joint(s) and inspect both the metal surface(s) and gasket(s). If the valve internals have been disturbed, it is necessary to retest in accordance with the instructions within this manual. Otherwise, repeat the backpressure tests outlined above.

I. Blowdown Adjustment

Blowdown adjustments are made by means of the adjusting ring (3) on 1900 Series SRVs.

If longer or shorter blowdown is required, it can be obtained as follows:

ATTENTION!

Unless the test stand capacity is equal to or greater than that of the valve, return the adjusting ring (3) to the recommended position and do not attempt to set blowdown (see Tables 12 through 15).

To increase the blowdown (lower reseating pressure), raise the adjusting ring (3) by moving the notches from left to right past the ring pin hole.

ATTENTION!

The valve will not achieve rated relieving capacity if the adjusting ring (3) is positioned too low.

To decrease the blowdown (raise reseating pressure), lower the adjusting ring by moving the notches from right to left past the adjusting ring pin hole.

XVI. Setting and Testing (Cont.)

J. Hydrostatic Testing and Gagging

When hydrostatic tests are required after installation of an SRV, remove the SRV and replace it with a blind flange If the hydrostatic test pressure will not be greater than the operating pressure of the equipment, a test gag may be used. Very little force, i.e., hand-tight pressure, on the test gag is sufficient to hold hydrostatic pressures. Too much force applied to the gag may bend the spindle (15) and damage the seat. After a hydrostatic test, the gag must be removed and replaced by the sealing plug furnished for this purpose (see Figure 41). (Test gags for Consolidated SRVs can be furnished for all types of caps and lifting gears.)

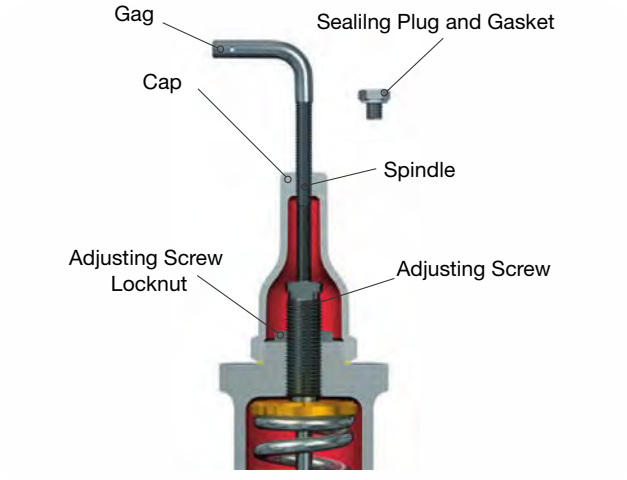

Figure 41: Hydrostatic Testing

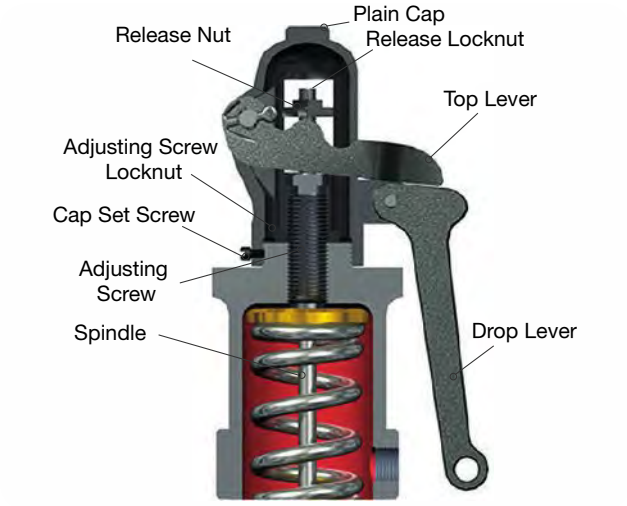

Figure 42: Plain Lever

K. Manual Popping of the Valve

Consolidated SRVs are furnished, when so ordered, with packed or plain lifting levers for hand-popping or with an air-operated lifting device for remote control (see Figures 42 through 44).

When the valve is to be opened by hand, ensure the pressure at the valve inlet is at least 75% of the valve's set pressure. Under flowing conditions, the valve must be fully lifted from its seat so that dirt, sediment, and scale do not become trapped on the seating surfaces. When allowing the valve to close under flowing conditions, completely release the lever from maximum lift to snap the valve back on its seat.

Since the deadweight of a Packed Lever, and Air-Operated Packed Lever has a tendency to lift the valve, the lever should be supported or counterweighted so that the lifting fork does not contact the release nut (see Figures 43 and 44)

The air-operated lifting device is designed to fully open the valve with 75% of set pressure under the valve disc in compliance with ASME Section XIII (UV). For certain applications, the air operator may be designed to fully open the valve with no pressure at the valve inlet. An air-operated device can be operated from a remote point and can be used as a "drop out" valve. (A typical design is shown in Figure 44, and can be purchased from Baker Hughes.)

XVII. Troubleshooting 1900 Series SRVs

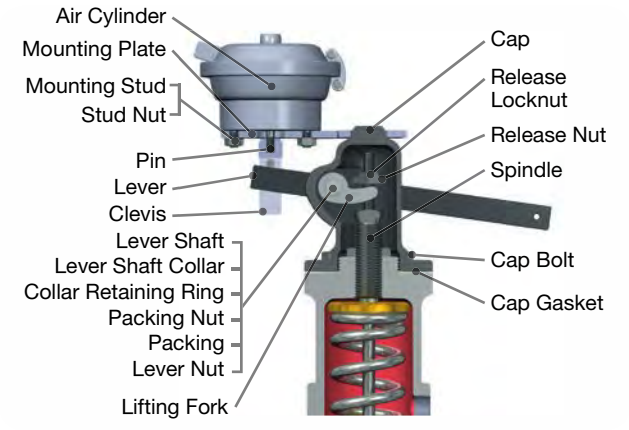

Figure 44: Air-Operated Packed Lever

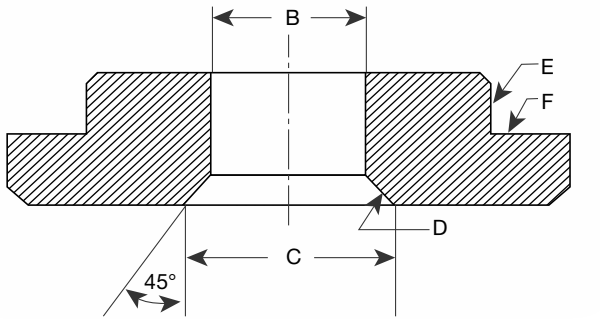

Figure 45: Lower Spring Washer

Table 21: Troubleshooting Seat Leakage, Simmer, and Chatter		
Malfunction	Cause	Solution
Seat Leakage	Damaged seats.	Rework seats or replace part.
	Improper installation.	Inspect installation, i.e., piping.
	Operating pressure too close to set pressure.	Increase differential.
	Excessive system vibration.	Recheck application.
	Misalignment of valve components.	Ensure valve is installed vertically. Ensure valve has been properly assembled.
	Debris trapped on seats.	Pop valve to clean seats. Rework seats.
Simmer	Damaged seats.	Rework seats or replace part.
	Wide nozzle seat.	Rework seat.
	Improper adjusting ring setting.	Check ring setting.
	Misalignment/binding.	Inspect valve and installation.
Chatter	Improper installation or valve sizing.	Check for piping restrictions. Check required capacity.
	Built-up back pressure.	Check outlet piping.
	Improper ring setting.	Check ring setting.

XVIII. 1900 Series Safety Relief Valve Options

A. General Information

Consolidated Type 1900 Flanged SRVs can be readily converted from conventional to bellows style, or vice versa, in the customer's repair shops. Table 22 shows the parts necessary for the typical conversion.

B. Conversion from Conventional to Bellows Type

ATTENTION!

Remove the bonnet plug (41) from the bellows valves (see Figure 7) and vent the bonnet (11) to a safe area.

Convert from a conventional to a bellows type valve as follows:

1. Remove the eductor tube (40) from the base (1) by selecting a drill bit approximately .016" (0.40 mm) smaller in diameter than the outside diameter of the eductor tube. Drill into the bore of the eductor tube where the tubing is attached to the base. This will reduce the tube wall thickness to the extent that it can easily be collapsed for removal. The bellows flange will cover the hole in the guide surface which will remain after the tube is removed.
2. Machine the existing lower spring washer (17) (see Figure 45 and Table 22).

Table 22: Conversion Parts: Conventional and Bellows Style Valves

Valve Orifice Size	New Parts to Convert From	
	Conventional to Bellows Valve	Bellows to Conventional Valve
D, E, F, G, H	1. Bellows assembly - Standard Material, 316L Stainless Steel. 2. Set of gaskets for bellows valve. 3. Guide for bellows valve. 4. Disc holder for bellows valve. 5. Spindle for bellows valve (F, G and H only). 6. Spindle retainer for bellows valve. 7. Base studs for bellows valve (D, E, F and G only). 8. Machine existing lower spring washer (F, G and H orifices only). Upper spring washer, no change. 9. Drill .719″ (18.26 mm) dia. on bonnet boss and tap 1/2" N.P.T. (as required) (1)	1. Eductor tube for conventional valve. (Not required for UM valves.) 2. Set of gaskets for conventional valve. 3. Guide for conventional valve. 4. Disc holder for conventional valve. 5. Spindle for conventional valve (F, G and H only). 6. Spindle retainer for conventional valve. 7. Base studs for conventional valve (D, E, F and G only). 8. New lower spring washer for conventional valve (F, G and H orifices only). Upper spring washer, no change. 9. Bonnet vent plugged (if desired).

XVIII. 1900 Series Safety Relief Valve Options (Cont.)

Table 22 (Cond.): Conversion Parts: Conventional and Bellows Style Valves		
Valve Orifice Size	New Parts to Convert From	
	Conventional to Bellows Valve	Bellows to Conventional Valve
K, L, M, Q, R, T, U Also J, N, P manufactured after 1981.(2)	• 1. Bellows assembly - Standard Material, 316L Stainless Steel. • 2. Set of gaskets for bellows valve. • 3. Drill .719″ (18.26 mm) dia. on bonnet boss and tap 1/2" N.P.T. (as required) (1) • 4. Studs (1905-30 K and L, 1906-30 K and L only).	• 1. Eductor tube for conventional valve. (Not required for UM valves.) • 2. Set of gaskets for conventional valve. • 3. Bonnet vent plugged (if desired). • 4. Studs (1905 K and L, 1906 K and L only).
J, N, P Manufactured before 1982.(2)	• 1. Bellows assembly - Standard Material, 316L Stainless Steel. • 2. Set of gaskets for bellows valve. • 3. Guide for bellows valve. • 4. Disc holder for bellows valve. • 5. Drill .719″ (18.26 mm) dia. on bonnet boss and tap 1/2 N.P.T. (as required). (1) • 6. Studs (1905-30 N and P, 1906-30 N and P only).	• 1. Eductor tube for conventional valve. (Not required for UM valves.) • 2. Set of gaskets for conventional valve. • 3. Bonnet vent plugged (if desired). • 4. Drill .438″ (11.11 mm) dia. through guide flange 1.813 (46.04 mm) from guide bore centerline (J orifice only). • 5. Studs (1905 N and P, 1906 N and P only).
V, W	• 1. Bellows assembly. • 2. Set of gaskets for bellows valve. • 3. Disc holder for bellows valve. • 4. Guide for bellows valve. • 5. Lift restricting ring. • 6. Studs.	• 1. Set of gaskets for conventional valve. • 2. Bonnet vent plug (if desired).

(1) Valves manufactured after 1980 are furnished with bonnet vent machined.

(2) J, N, P orifice valves manufactured after 1981 are furnished with threaded disc holder and reduced guide bore for balanced bellows conversion.

© 2024 Baker Hughes Company. All rights reserved.

C. Conversion from Bellows to Conventional Type

Convert from a bellows to a conventional type valve as follows:

1. Secure the eductor tube (40) in the base (1) by expanding or swaging into the hole provided. The upper end of the eductor tube should project above the guide surface of the base approximately .125″ (3.18 mm) and the lower end should point directly and squarely toward the valve outlet. When the valve is assembled, the hole at the outer edge of the guide flange must fit loosely around the projection of the eductor tube.
2. For F, G and H orifice valves only, machine the new lower spring washer (17) (see Figure 46 and Table 23).

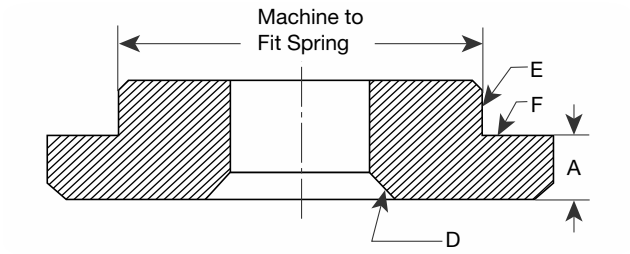

Figure 46: Lower Spring Washer F, G, and H Valves

ATTENTION!

For all 1900 Series SRVs, dimension A may not be less than specified in Table 24.

Table 23: Machining Conventional to Bellows Type Lower Spring Washer

XVIII. 1900 Series Safety Relief Valve Options (Cont.)

D. Optional Glide-Aloy Parts

Optional Glide-Aloy Parts and the Repair Processing of Such Components

Glide-Aloy is a proprietary process of Baker Hughes utilized to provide a combination of a low coefficient of friction between sliding components and to protect the surfaces of the components to which the process has been applied. A Glide-Aloy surface-hardened valve component may be recognized by its flat, dull gray color and slick surface. The parent metal should not be visible on a new component.

ATTENTION!

Do not attempt to remove the coating of a Glide-Aloy treated component.

The Glide-Aloy reaction bonding process is commonly applied to Consolidated 1900 Series SRV disc holders and/or guides, when specified. Although the entire surface area of the component is treated, only the guiding surface is critical. When Consolidated 1900 Series SRVs contain Glide-Aloy parts, they may be identified by the coding found on the valve nameplate.

Example: 1905Jc-2-G1 where the “G” designation indicates Glide-Aloy:

G1 - Glide-Aloy Holder

G2 - Glide-Aloy Guide

G3 - Glide-Aloy Holder and Guide

Glide-Aloy treated components may be cleaned by low-pressure compressed air, microbead blasting, or brushing. Also, a non-chlorinated, hydrocarbon shop solvent may be used. The latter is for personnel safety reasons and not because of any incompatibility between chlorides and Glide-Aloy.

Regarding personnel safety, all personnel should be familiar with the appropriate processes as well as the material safety data sheets (MSDS) supplied by the vendor of any cleaning compounds used. Personal protective equipment (protective gloves, goggles, etc.) should be worn so as to avoid contact with materials that may be splashed during the cleaning process.

For a component in service after the cleaning process is completed, visually inspect parts to ensure all debris is removed, and that the components have the required finish.

Baker Hughes’ experience indicates that if the components have been properly cleaned, adequate coating will remain to ensure proper operation. The coating may appear lighter or missing in some areas, but the desired results will be achieved as a result of the coating characteristics imparted to the parent metal during the original coating process.

Components that are deeply gouged or galled, and that do not meet dimensional requirements, cannot be cleaned and returned to service. Machining removes the coating and renders the parts unacceptable. The surface-hardness approximates that of diamonds, and is approximately .002″ (0.051 mm) thick.

ATTENTION!

Do not machine the guiding surfaces that have been Glide-Aloy treated.

ATTENTION!

Follow recommendations for safe handling of solvents as specified in the MSDS and observe safe practices for any cleaning method.

[1] After August 1978, all 1900 SRV Nozzles manufactured have increased bore diameter. The above chart shows how each orifice was affected. Nozzles - original vs. new - are interchangeable, but nozzle laps are not. On the outer diameter (O.D) of the new nozzles, the letter “C” is stamped. If this stamp becomes obliterated, the nozzle bore diameter must be measured to select the correct nozzle lap from above chart (see Table 24).

[2] Nozzle lap handles are interchangeable between original and new nozzle laps.

[3] Ring laps - One set of three (3) ring laps is recommended for each orifice to assure ample flat laps are available at all times.

XIX. Maintenance Tools and Supplies (Cont.)

A. Lapping Tools

The following tools are required for proper maintenance of Consolidated Safety Relief seats, and may be purchased from Baker Hughes.

Nozzle Lap - The nozzle lap is used for lapping the nozzle seat and has one flat side, and one side with a 5º angle. This lap guides in the bore of the nozzle; therefore, a different size lap is required for each valve orifice.

Ring Lap - The ring lap is used for lapping the disc seat and finish lapping the nozzle seat.

Lapping Plate - The lapping plate is used for reconditioning the ring lap. It may also be used for lapping the disc (6). One 11″ (279.40 mm) diameter plate is required for the entire line of valves (Part No. 0439004).

Lapping Compound - Lapping compound is used as a cutting medium when lapping the valve seats (see Table 26).

Table 26: Lapping Compound Types

Brand	Grade	Grit	Lapping Function	Size Container	Part No.
Clover	1A	320	General	4 oz	199-3
Clover	3A	500	Finishing	4 oz	199-4
Kwik-Ak -Shun	----	1000	Polishing	1 lb 2 oz	199-11 199-12

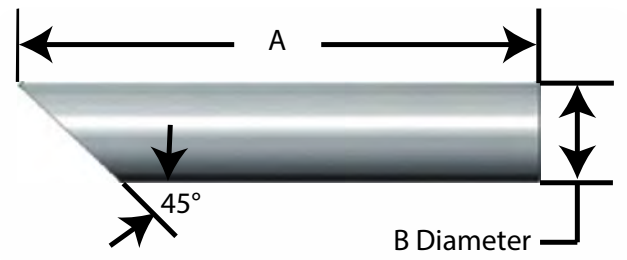

Figure 47: Drift Pins Specification

Drift Pins - Two drift pins are required for the removal of the disc (6) from the disc holder (8) (see Figure 47 and Table 27a).

Lifting Tools - Lifting tools are used for the removal of the upper internal parts of larger valves (see Table 27b).

Table 27a: Drift Pin Types

XX. Replacement Parts Planning

A. Basic Guidelines

Use the following guidelines as reference for developing a replacement parts plan:

1. Classify the total number of valves in service by size, type, and temperature class.
2. Classify parts inventory by the tendency to require replacement.

- Class I - Most frequently replaced
- Class II - Less frequently replaced but critical in an emergency

3. Parts for the valve types covered by this manual are classified on Tables 27 and 28. “Qty. Parts” is the number of parts or sets recommended to achieve a desired need probability as it relates to the total number of valves in service by size and type. For example, a “Qty. Parts of 1” (25.4 mm) for “Valves in Service of 5” (127.00 mm) means that one part should be stocked for every five valves of the same type and size in service.
4. When ordering replacement parts, state the size, type, and serial number of the valve for which parts are required using correct nomenclature (see Figures 1 through 10).
5. Predicted availability indicates the percentage chance the user plant will have the right parts to make a proper repair (i.e., if Class I parts are stocked at the owner’s facility, the parts needed to repair the valve in question will be immediately available in 70% of all instances).

B. Replacement Parts List

Consult the Recommended Spare Parts list (see Tables 27 and 28) to define the parts to be included in the inventory plan. Select the desired parts and determine those required for proper maintenance of the valve population in the plant.

C. Identification and Ordering Essentials

When ordering service parts, furnish the following information to ensure receipt of the correct replacement parts:

1. Identify valve by the following nameplate data:

- Size
- Type
- Temperature Class
- Serial Number
  - Example 1: 1.5″ (38.10 mm) 1910Fc S/N TD-94578

2. Specify parts required by:

- Part Name (see Figures 1 through 10)
- Part Number (if known)
- Quantity

In addition, the serial number is stamped on the top edge of the outlet flange. Include the one or two letters preceding the figures in the serial number.

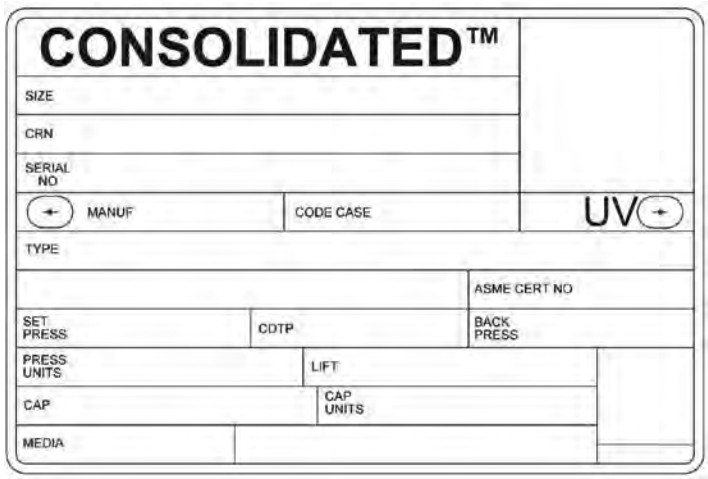

Figure 48: Typical Valve Nameplate

XX. Replacement Parts Planning (Cont.)

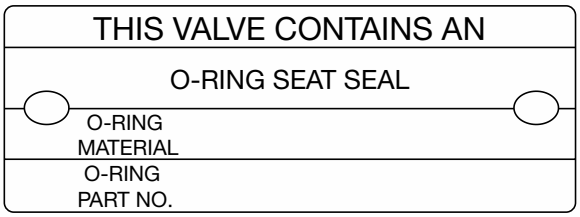

Figure 49: Typical Valve Nameplate

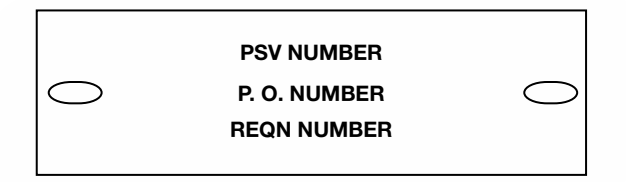

Figure 50: Optional Tag Number Nameplate

When the SRV is repaired, a metal repair nameplate (see Figure 51), Board “VR” symbol and stamp number, and the date of repair is permanently attached to the valve near the original nameplate. This repair nameplate may also contain information regarding altered set pressures, capacities, or blowdown, as applicable.

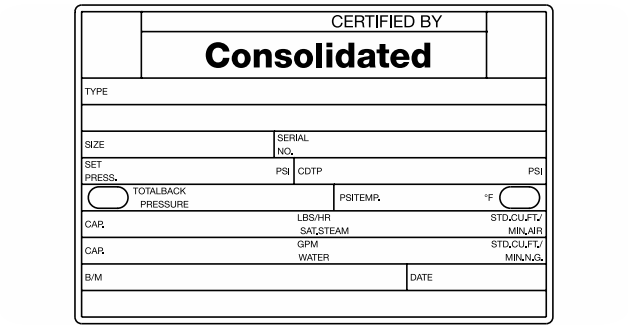

Figure 51: Repair Nameplate

ATTENTION!

To determine if the valve contains Glide-Aloy components (i.e., the disc holder (8) and/or the guide (9)), which are identified by the coding found on the valve nameplate, see Optional Glide-Aloy Parts.

XXI. Genuine Consolidated Parts

Each time replacement parts are needed, keep these points in mind:

- Baker Hughes designed the parts
- Baker Hughes guarantees the parts
- Consolidated valve products have been in service since 1879
- Baker Hughes has worldwide service
- Baker Hughes has fast response availability for parts

XXIII. Manufacturer's Field Service, Repair and Training Program

A. Field Service

Baker Hughes maintains the largest and most competent field service staff in the industry. Service technicians are located at strategic points throughout the United States to respond to customer's requirements for service. Each Service technician is trained and experienced in servicing Consolidated products.

It is highly recommended that the professional expertise of a Consolidated Field Service Engineer be employed to make final field adjustments during the initial setting of all Consolidated Safety Valves.

For further information, please contact your local **Green Tag™ Center**.

B. Factory Repair Facilities

The Baker Hughes Consolidated Repair Department, in conjunction with the manufacturing facilities, is equipped to perform specialized repairs and product modifications, e.g. butt-weld, bushing replacements, code welding, pilot replacement, etc.

For further information, please contact your *Green* Tag Center.

C. Maintenance Training

Rising costs of maintenance and repair in the Utility and Process Industries indicate the need for trained maintenance personnel. Baker Hughes conducts service seminars that can help your maintenance and engineering personnel to reduce these costs.

Seminars, conducted either at your site, or at our manufacturing plant, provide participants with an introduction to the basics of preventative maintenance. These seminars help to minimize downtime, reduce unplanned repairs and increase valve safety. While they do not make "instant" experts, they do provide the participants with "Hands On" experience with Consolidated Valves. The seminar also includes valve terminology and nomenclature, component inspection, trouble shooting, setting and testing, with emphasis on the ASME Boiler and Pressure Vessel Code.

For further information, Please contact your local Green Tag Center.

Appendix A - 1900 DM Soft Seat Disc Retainer Assembly

Place O-ring [55] into disc [6] as shown in Figure 10b.

Place the O-ring retainer [54] into the inside diameter of the O-ring [55].

Insert retainer screw(s) [49] through the retainer [54] and into the disc [6].

Insert disc assembly into assembly fixture. Apply an adequate amount of force with the assembly tool till the oring retainer clicks into the disc. The assembly fixture can be fabricated by the assembler. The assembler has the liberty to choose the axial tightening mechanism, mechanical/hydraulic etc. The Consolidated factory uses Enerpac hydraulic cylinder to provide the axial clamping force. The layout of the soft seat assembly tool and the cut drawings is provided in the Appendix B.

Tighten the retainer screw(s) [49] per Table 1 below.

Loosen assembly fixture, remove the disc assembly, and continue with next step.

Table 31: Retainer Screw Torque Values

7.10 IOM for Heaters

Caloritech™

Immersion Heaters

CX & DX Series

Installation, Operation, & Maintenance Instructions

Special Notes

CAUTION

ELECTRIC SHOCK HAZARD. All electric heating equipment installations must be performed by qualified personnel in accordance with the local electrical codes and standards and must be effectively grounded to eliminate shock hazard.

WARNING

FIRE/EXPLOSION HAZARD. This heater shall be used with protection controls. The following controls are recommended:

Liquid Immersion Applications

a. Liquid level control to maintain all the heating elements totally immersed at all times, in conjunction with temperature controls to limit the liquid temperature below the maximum allowable process design temperature, or
b. Heating elements sheath temperature controls to limit to the maximum allowable sheath design temperature

Gaseous and/or vapour phase immersion applications

a. Heating elements sheath temperature controls to limit to the maximum allowable sheath design temperature.

Note: This heater is not intended to be used in hazardous locations and does not bare the required certification or product markings required to be used in hazardous locations.

WARNING

FIRE/EXPLOSION HAZARD. Do not exceed the ratings of the flange as listed in ANSI BI6.5. In case of code stamped of registered heater, do not exceed the rating as stated in the data report and/or registration documents. Do not operate the heater in the presence of combustible gases, vapours, dusts or fibres unless the heater is specifically marked for the hazardous location and heater operating temperature does not exceed the temperature code rating. Corrosion of the sheath could result in a ground fault which, depending upon the fluid being heated, could cause a fire or an explosion.

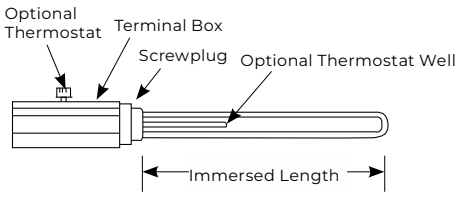
WARNING

FIRE HAZARD. If a thermostat is provided, it is designed for temperature control service only. Since the thermostat does not fail safe, it should not be used for temperature limiting duty. Wiring to this device is the users' responsibility.

Heaters are capable of developing high temperatures, therefore extreme care should be taken to:

a. Do not use this heater in area classified as hazardous locations.
b. Maintain distance between heater and combustible materials.

CAUTION



CAUTION. This document presents the minimum requirement pertaining to the installation, operation, and maintenance of the respective equipment as required by the manufacturer only. Any additional considerations, including but not limited to any design consideration, in-service inspection, and fitness-for-service assessment for all pressure boundary components to meet any safety principles and local jurisdictional regulatory requirements, shall be the responsibility of the user.

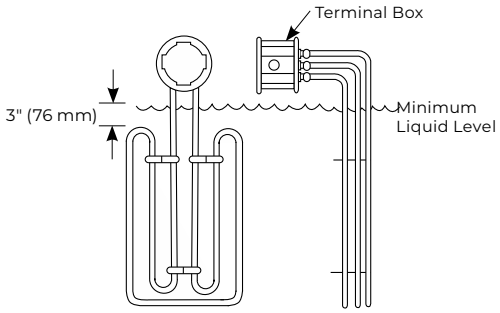
Screwplug Immersion Heater



Flanged Immersion Heater

Flanged Immersion Heater
(with optional stilted terminal box)

Over-the-Side Immersion Heater
(bottom mount)

Over-the-Side Immersion Heater
(side mount)

B. DESCRIPTION

1. Immersion heaters for liquid service are designed for operation only while completely immersed in liquids. Never allow the heating elements to be exposed while energized or failure will result.

CAUTION

CAUTION Use the heater only in liquids and at pressures for which it was designed (unless specifically designed for non-liquid applications). Normally copper sheath is recommended in water, steel or alloy sheath in oil, and the appropriate alloy sheath for heating chemical solutions. Check factory for recommendations.

2. In the case of flanged (and some screwplug type) heaters where a gasket seal is required, the gasket surface should be clean and dry before the heater is seated.

WARNING

WARNING DO NOT insulate over the heater flange, stilted area and terminal enclosure.

3. The terminals must be protected at all times from moisture or vapour. In hazardous locations, explosion resistant terminal housings must be used. In outdoor locations, moisture resistant housings are required. It is recommended to use a drip loop to prevent moisture from entering the terminal box via the wire.

4. Protect terminals of heating elements from drippings, condensation, fumes, spray or any other substance which could result in element contamination.

5. When melting solids by direct immersion, a surface vent should be provided to allow gases to escape. Operate the heater on ½ voltage until melted material completely covers the heating elements. Heaters used for this purpose may require special design features. Check factory for recommendations.

C. INSTALLATION

CAUTION Heaters with overtemperature devices require specific installation orientation.

ELECTRIC SHOCK HAZARD Disconnect all power before installing or servicing the heater. Failure to do so could result in personal injury and/or property damage. All maintenance and installation should be done by qualified personnel in compliance with local codes.

FIRE OR SHOCK HAZARD Moisture accumulation on the dielectric material of the elements, sheath corrosion or overtemperature on the heaters could cause a fault to ground generating arcing and molten metal. Install proper ground fault protections to prevent personal injury or property damage.

WARNING Heaters are electrical components, designers are responsible for the proper integration to the electrical systems, including protections, backups, and controls.

1. Unpack and check heater for any damage that may have been caused during shipping.
2. Remove any protective packaging in the screw or flange connecting fitting.
3. Remove any dessicant material in the electrical box.
4. Insert heater into vessel/reservoir and verify that the heating elements are not making contact with the surface of the vessel.
5. Check that all terminal connections are tight.

CAUTION Use copper conductors only with sufficient current carrying capacity for the heater circuit load and in accordance with the local electrical code. Check the heater nameplate for minimum conductor temperature rating. Temperature deration factors must be applied for heaters operating above 30°C (86°F).

6. Check supply voltage for compliance with heater nameplate voltage. DO NOT connect the heater to a voltage source other than listed on the heater nameplate.
7. A line voltage or pilot duty thermostat should be used to control the heater. The pilot duty thermostat must be used with a contactor and (if required) a transformer. Generally, heaters supplied with built-in thermostats will be factory prewired if suitable for line voltage operation. Integral thermostats not factory prewired are usually intended for pilot duty.
8. It is recommended that the control circuits be supplied from the isolated secondary windings of transformers avoiding the need for two supply circuits, or as an alternative, that mechanical or electrical interlocking be provided so that both supplies must be disconnected before live parts can be made accessible.
9. If there is even the slightest possibility that the liquid level may fall below the elements, a level control switch or overtemperature sensing device affixed to the uppermost heating element is required. Check factory for recommendations.
10. If the heater is installed in a pressurized system, a safety relief valve must be used to prevent a hazardous pressure buildup.
11. Horizontal element support bundles may be necessary with an immersed length over 1270 mm (50").
12. For flange heaters installed in a pressurized system, proper bolting hardware must be used that is suitable for the pressures and temperatures of the equipment. Use an appropriate gasket for the pressure and temperature; torque the bolts on an even clockwise or counter clockwise pattern.

D. OPERATION

RISK OF EXPLOSION Do not operate heater at voltages higher than the rating specified on the nameplate. Failure to do this will cause elevated temperatures.

WARNING For metal sheathed heaters, prior to operation an insulation resistance check must be performed. Heater with values less than 0.5 MΩ should follow a drying process. Please contact factory for details on procedure if heater is under 0.5 MΩ.

FIRE Hazard Heater should be submersed in the fluid for proper operation and to avoid element overheating that could result in fire or damage of the heater.

WARNING When operating the heaters in a closed system or vessel, system designers must ensure that proper controls are used to maintain the temperature and pressure at normal levels.

WARNING Low megohm on heating elements with epoxy or hermetic seals cannot be serviced in the field. Typical resistance values when sealed are 1000 MΩ or greater.

1. Check that all connections are tight.
2. If a thermostat is provided, verify that it is operating properly by cycling it and verifying cutout.
3. Perform an IR test prior to energization and verify that levels are acceptable (500,000 ohms min).
4. Energize the heater and check for signs of hotspots in the electrical connections or vessel.
5. Retorque all bolted fitting connections and all electrical connections after 10 cycles.
6. Always maintain a minimum of 51 mm (2") of liquid above the heated portion of the element or element failure may result.
7. Heating elements should be kept above sediment deposits or it may overheat and shorten life expectancy.

E. MAINTENANCE

WARNING Disconnect all power before servicing the heater or heated equipment. Failure to do so could result in personal injury and/or property damage. All maintenance and installation should be done by qualified personnel in compliance with local codes.

1. Heaters stored for prolonged periods may absorb moisture. Using a 500V DC megger (insulation resistance tester) check the value of the insulation resistance to ground for each circuit. Initial readings of over 500,000 ohms to ground are normally acceptable. Should lower readings be observed, check factory for instructions.
2. Periodically check electrical connections for tightness and check wire insulation for any damage and replace if necessary.
3. Remove the immersion heater periodically to inspect for corrosion, sludge build-up and for scale removal. Do not continue to use a heater showing visible signs of damage.

Caloritech™

PLEASE ADHERE TO INSTRUCTIONS IN THIS MANUAL
Failure to do so may be dangerous and may void certain provisions of your warranty.

For further assistance, please call 24hr hotline: 1-877-325-3473 (U.S.A. and Canada)
Please have model and serial numbers available before calling.

WARRANTY: Under normal use the Company warrants to the purchaser that defects in material or workmanship will be repaired or replaced without charge for a period of 18 months from date of shipment, or 12 months from the start date of operation, whichever expires first. Any claim for warranty must be reported to the sales office where the product was purchased for authorized repair or replacement within the terms of this warranty.

Subject to State or Provincial law to the contrary, the Company will not be responsible for any expense for installation, removal from service, transportation, or damages of any type whatsoever, including damages arising from lack of use, business interruptions, or incidental or consequential damages.

The Company cannot anticipate or control the conditions of product usage and therefore accepts no responsibility for the safe application and suitability of its products when used alone or in combination with other products. Tests for the safe application and suitability of the products are the sole responsibility of the user.

This warranty will be void if, in the judgment of the Company, the damage, failure or defect is the result of:

- Vibration, radiation, erosion, corrosion, process contamination, abnormal process conditions, temperature and pressures, unusual surges or pulsation, fouling, ordinary wear and tear, lack of maintenance, incorrectly applied utilities such as voltage, air, gas, water, and others or any combination of the aforementioned causes not specifically allowed for in the design conditions or,
- Any act or omission by the Purchaser, its agents, servants or independent contractors which for greater certainty, but not so as to limit the generality of the foregoing, includes physical, chemical or mechanical abuse, accident, improper installation of the product, improper storage and handling of the product, improper application or the misalignment of parts.

No warranty applies to paint finishes except for manufacturing defects apparent within 30 days from the date of installation.

The Company neither assumes nor authorizes any person to assume for it any other obligation or liability in connection with the product(s).

The Purchaser agrees that all warranty work required after the initial commissioning of the product will be provided only if the Company has been paid by the Purchaser in full accordance with the terms and conditions of the contract.

The Purchaser agrees that the Company makes no warranty or guarantee, express, implied or statutory, (including any warranty of merchantability or warranty of fitness for a particular purpose) written or oral, of the Article or incidental labour, except as is expressed or contained in the agreement herein.

LIABILITY: Technical data contained in the catalog or on the website is subject to change without notice. The Company reserves the right to make dimensional and other design changes as required. The Purchaser acknowledges the Company shall not be obligated to modify those articles manufactured before the formulation of the changes in design or improvements of the products by the Company.

The Company shall not be liable to compensate or indemnify the Purchaser, end user or any other party against any actions, claims, liabilities, injury, loss, loss of use, loss of business, damages, indirect or consequential damages, demands, penalties, fines, expenses (including legal expenses), costs, obligations and causes of action of any kind arising wholly or partly from negligence or omission of the user or the misuse, incorrect application, unsafe application, incorrect storage and handling, incorrect installation, lack of maintenance, improper maintenance or improper operation of products furnished by the Company.

Thermoplongeurs

Séries CX et DX

ISO 9001

Instructions pour l'installation, le fonctionnement et l'entretien

Remarques particulières

MIS EN GARDE

RISQUE D'ÉLECTROCUTION. Toutes les installation d'équipment électrique de chauffage doivent être réalisées par un personnel qualifié, conformément aux codes et normes électriques locaux, et doivent être dûment mises à la terre afin de suppreimer les risques d'électrocution.

DANGERS D'INCENDIE/D'EXPLOSION LIÉS. Cet appareil de chauffage doit être utilisé avec des commandes de protection. Les contrôles suivants sont recommandés :

ATTENTION

Applications d'immersion liquide

a. un régulateur de niveau de liquide pour maintenir tous les éléments chauffants entièrement immergés en tout temps, ou

b. des régulateurs de gaine de contrôle de températures élevées afin de limiter la température maximale permise de la gaine.

Applications d'immersion en phase gazeuse et/ou vapeur

ATTENTION

a. des régulateurs de gaine de contrôle de températures élevées afin de limiter la température maximale permise de la gaine.

Note: Cet appareil de chauffage n'est pas destiné à être utilisé dans des endroits dangereux et ne porte pas la certification ou les marques de produit requises pour être utilisé dans des endroits dangereux.

RISQUE D'INCENDIE ET D'EXPLOSION. Ne depassez pas les puissances nominales de la bride figurant dans la norme B16.5 ANSI. En présence d'un code imprimé sur un appareil chauffant enregistré, ne pas dépasser la valeur indiquée dans le rapport de données et/ou les documents d'enregistrement. Ne faites pas fonctionner le thermoplongeur en presence de gaz combustibles, de vapeurs combustibles, de poussieres combustibles ou de fibres combustibles, a moins que le thermoplongeur ne soit specialement prevu pour un tel emplacement dangereux, et que la temperature de fonctionnement du thermoplongeur ne depasse pas le code de temperature. La corrosion de la gaine peut resulter en un defaut à la terre, qui, selon la nature du liquide en cours de rechauffement, pourrait causer un incendie ou une explosion.

ATTENTION

RISQUE D'INCENDIE. Si un thermostat est fourni, il est conçu uniquement à des fins de contrôle de la température. Puisque le thermostat ne dispose daucun système le protégeant des défaillances, il ne faut pas s'en servir pour limiter la température. C'est à l'utilisateur qu'il revient d'effectuer le câblage de ce dispositif.

Les thermoplongeurs peuvent atteindre des températures élevées, c'est pourquoi il faut faire extrêmement attention de prendre les mesures suivantes:

a. N'utilisez pas cet appareil de chauffage dans une zone classée comme zone dangereuse.

b. Conserver une certaine distance entre le thermoplongeur et les matières combustibles.

MISE EN GARDE

MISE EN GARDE. Ce document présente les exigences minimales relatives à l'installation, au fonctionnement et à l'entretien de chaque équipement, tel que requis par le fabricant. Toute considération supplémentaire, y compris, mais sans s'y limiter, toute considération de conception, d'inspection en service et d'évaluation de l'aptitude au service, pour tous les composants à limite de pression, afin de respecter des principes de sécurité et des exigences réglementaires locales, relève de la responsabilité de l'utilisateur.

Thermoplongeur à bride
(avec boîtier de terminaison surélée facultatif)

Thermoplongeur amovibles pour montage de fond

Thermoplongeur amovibles pour montage de fond

B. DESCRIPTION

1. Les thermoplongeurs employes pour des liquides sont conçus pour ne fonctionner que s'ils sont completement immerges dans des liquides. Ne laissez jamais les elements chauffants a l'air libre tandis qu'ils fonctionnent, sans quoi une panne se produira.

MIS EN GARDE

MIS EN GARDE. Ne vous servez du thermoplongeur que dans des liquides, et a des pressions pour lesquelles ii a ete conqu (a moins qu'il n'ait ete conqu particulierement pour des applications non liquides). Normalement, la gaine en cuivre est recommandee dans l'eau, la gaine en acier ou en alliage dans l'huile, et la gaine en alliage appropriee sert a chauffer /es solutions chimiques. Demandez a l'usine de vous donner ses recommandations.

2. Dans le cas des thermoplongeurs a bride (et certains modeles a bouchon filete), si un joint d'etancheite est necessaire, la surface du joint d'etancheite doit être propre et seche avant que le thermoplongeur ne soil mis en place.

ATTENTION

ATTENTION. Defense d'isoler par-dessus la bride, la zone surélevée et le boîtier de terminaison du thermoplongeur.

3. Les bornes doivent etre protegees a tout moment de l'humidite et des emanations. Dans les lieux a risques, il faut employer des boîtiers de terminaison antideflagrants. À l'exterieur, des boîtiers resistants a l'humidite sont obligatoires. Il est recommande d'employer un anneau d'ecoulement pour empecher l'humidite de penetrer dans le boîtier de terminaison a travers le cable.
4. Protegez les bornes des elements chauffants contre les ecoulements, la condensation, les emanations, les pulverisations ou contre toute autre substance qui pourrait provoquer une contamination des elements.
5. Lorsque vous faites fusionner des solides par immersion directe, il faut prévoir un orifice de ventilation à la surface, afin de laisser les gaz s'échapper. Faites fonctionner le thermoplongeur à ½ tension, jusqu'à ce que la matière fusion-née recouvre complètement les éléments chauffants. Les thermoplongeurs utilisés dans ce but peuvent nécessiter des caractéristiques de conception spéciales. Demandez à l'usine de vous donner ses recommandations.

C. INSTALLATION

MIS EN GARDE. Les thermoplongeurs dotes de dispositifs de surchauffe necessitent une orientation particulière d'installation.

RISQUE D'ÉLECTROCUTION. Debranchez toute l'alimentation électrique avant d'installer, de reparer ou d'entretenir le thermoplongeur. Faute de quoi, il y a un risque de blessures physiques et/ou d'endommagement des lieux et objets qui s'y trouvent. L'entretien et l'installation, dans leur ensemble, doivent être effectues par un personnel qualifie et se conformer aux codes locaux.

RISQUE D'IN CENDIE OU RISQUE D'ÉLECTROCUTION. L'accumulation d'humidité sur la matière dielectrique des éléments, la corrosion des gaines, ou la surchauffe des thermoplongeurs peut provoquer un defaut de la mise à la terre, ce qui produira des etincelles et la fusion du metal. Pour éviter toute blessure physique ou tout endommagement des lieux et objets qui s'y trouvent, installez des protections adequates contre les défauts de mise a la terre.

MIS EN GARDE. Les thermoplongeurs sont des composants electriques. Les concepteurs sont responsables de l'intégration correcte dans les systèmes électriques, ce qui englobe les protections, les systèmes de relève et les contrôles.

1. Deballez le thermoplongeur. Verifiez-le pour détecter tout dégât qui aurait pu survenir pendant le transport.
2. Retirez le conditionnement de protection du raccord de couplage à bouchon fileté ou à bride.
3. Retirez le produit dessicant situe dans le coffret électrique.
4. Insérez le thermoplongeur dans la cuve ou le réservoir. Vérifiez que les elements chauffants ne sont pas en contact avec la surface de la cuve.
5. Vérifiez que tous les raccordements des bornes sont bien serrés.
6. Vérifiez que la tension de l'alimentation est conforme à la tension figurant sur la plaque signaletique du thermoplongeur. NE BRANCHEZ PAS le thermoplongeur à une source de tension autre que celle figurant sur la plaque signalétique du thermoplongeur.

ATTENTION. Utilisez uniquement des conducteurs en cuivre dont l'intensité de courant admissible est suffisante pour la charge du circuit du thermoplongeur, conformément au code électrique local. Consultez la plaque signalétique du thermoplongeur pour connaître les caractéristiques thermiques minimales du conducteur. Les facteurs de réduction de la valeur nominate du courant doivent être appliqués pour les thermoplongeurs fonctionnant à plus de 30°C (soit 86°F).

7. II faut se servir d'un thermostat de circuit de commande ou de tension de ligne pour commander le thermoplongeur. Le thermostat de circuit de commande doit être utilisé avec un contacteur et (au besoin) un transformateur. En général, les thermoplongeurs fournis avec des thermostats integres seront câblés d'avance à l'usine si cela convient à un fonctionnement sur tension de secteur. Les thermostats intégraux qui ne sont pas cables d'avance à l'usine sont normalement prevus pour une fonction avec un circuit de commande.
8. II est recommandé d'alimenter les circuits de commande à partir des bobinages secondaires isolés des transformateurs, en évitant le besoin de deux circuits d'alimentation. Autrement, il est recommande de fournir l'enclenchement électrique afin que les deux alimentations soient débranchées avant que des parties electrifiees ne puissent être rendues accessibles.
9. S'il existe une possibilité, même faible, de voir le niveau de liquide tomber au-dessous des éléments, il est obligatoire d'avoir un commutateur de controle du niveau ou un dispositif de détection de surchauffe, fixé sur l'élement chauffant le plus haut. Demandez à l'usine de vous donner ses recommandations.
10. Si le thermoplongeur est installé dans un systéme pressurisé, une soupape de sûreté et de decharge doit être employee pour empêcher une accumulation dangereuse de la pression.
11. Des faisceaux horizontaux de soutien des éléments peuvent s'avérer nécessaires si la longueur immergee dépasse 1270 mm (50 po).
12. Pour les thermoplongeurs a bride installes dans un systéme pressurisé, la quincaillerie de boulonnage adéquate doit être employée. Elle doit convenir aux pressions et aux températures de l'équipement. Employez un joint d'étanchéité adéquat pour la pression et la temperature de l'équipment. Serrez les boulons selon un schéma uniforme, soit dans le sens des aiguilles d'une montre, soit dans le sens inverse des aiguilles d'une montre.

D. FONCTIONNEMENT

RISQUE D'EXPLOSION. Ne faites pas fonctionner le thermoplongeur à des tensions supérieures à la puissance nominale figurant sur la plaque signaletique. Faute de quoi, vous provoquerez des temperatures élevées.

ATTENTION. Pour les thermoplongeurs à gaine demétal, il faut effectuer une vérification de la résistance del'isolation avant le fonctionnement. Un thermoplongeur dont les valeurs sont inférieures à 0,5 MΩ doit êtresoumis à un processus d'assèchement. Adressez-vousà l'usine qui vous exploquera la procédure si les valeursdu thermoplongeur sont inférieures à 0,5 MΩ.

RISQUE D'INCENDIE. Pour que le thermoplongeur fonctionne bien, et pour éviter la surchauffe des éléments chauffants, qui pourrait provoquer un incendie ou endommager le thermoplongeur, il faut que le thermoplongeur soit immergé dans le liquide.

ATTENTION. Quand on fait fonctionner les thermoplongeur dans un systéme fermé ou dans un cuve, les concepteurs due systéme doivent fair attention que les contrôles adéquats sont employés pour conserver la température et la pression a un niveau normal.

ATTENTION. Le probleme d'un re/eve faible des megohms sur /es elements chauffants dotes de sceauxen epoxy or hermetiques ne peut pas etre resolu sur place. Les valeurs normales de la résistance, en présence de sceaux, sont de 1000 MΩ ou plus.

1. Verifiez que tous les branchements sont serrés.
2. Si un thermostat est fourni, vérifiez qu'il fonctionne correctement en le faisant passer par son cycle et en vérifiant la coupure du circuit.
3. Effectuez un test IR avant la mise sous tension. Vérifiez que les niveaux sont acceptables, à 500,000 ohms.
4. Mettez le thermoplongeur sous tension. Vérifiez les signes de pointes locales de temperature dans les raccords électriques ou dans la cuve.
5. Au bout de dix cycles, resserrez toutes les raccords de coupage à boulons, et tous les raccords électriques.
6. Maintenez toujours un minimum de 51 mm (2 po) de liquide au-dessus de la partie chauffée de l'élément, sans quoi l'élment peut tomber en panne.
7. Les éléments chauffants doivent être gardes au-dessus des dépôts de sédiments, sans quoi, ils peuvent surchauffer et s'user prématurément.

E. ENTRETIEN

ATTENTION. Debranchez toute l'alimentation électrique avant d'installer, de réparer ou d'entretenir le thermoplongeur. Faute de quoi, il ya un risque de blessures physiques et/ou d'endommagement des lieux et objets qui s'y trouvent. L'entretien et l'installation, dans leur ensemble, doivent être effectues par un personnel qualifié et se conformer aux codes locaux.

1. Les thermoplongeurs entreposes pendant de longues periodes peuvent absorber de l'humidité. À l'aide d'un mégohmmétre 500 VDC (appareil de mesure de résistance de l'isolation), érifiez la valeur de la resistance de l'isolation à la terre pour chaque circuit. Des relevés initiaux de plus de 500,000 ohms à la terre sont normalement acceptables. Si vous obtenez des relevés inferieurs, consultez l'usine qui vous donnera ses instructions.
2. De temps en temps, vérifiez que les branchements électriques sont serres. Vérifiez que l'isolation des câbles n'est pas endommagée. Remplacez-la au besoin.
3. De temps en temps, retirez le thermoplongeur afin de l'inspecter et de détecter toute corrosion ou accumulation de dépôts, et de retirer le calcaire. Ne continuez pas à vous servir d'un thermoplongeur sur lequel des signes de dommages sont visibles.

Caloritech™

VEUILLEZ RESPECTER LES CONSIGNES DE CE MANUEL

Á défaut de quoi vous prenez des risques et certaines dispositions de votre garantie seront annulées.

Pour de l'aide supplémentaire, veuillez composer notre numéro d'urgence 24 h par jour: 1-800-410-3131 (U.S.A. et Canada). Merci de préparer vos numéros de modèle et de série avant d'appeler.

GARANTIE: Dans des conditions normales d'utilisation, la Société garantit à l'acheteur que les produits ayant des défauts matériels ou de fabrication seront réparés ou remplacés sans frais pour une période de 18 mois à compter de la date d'expédition ou 12 mois à partir de la date de début de fonctionnement, selon la date qui arrive à expiration la première. Toute réclamation dans le cadre de la garantie doit être adressée à l'agence commerciale dans laquelle le produit a été acheté afin d'obtenir une réparation ou un remplacement selon les termes de cette garantie.

Non obstant toute loi fédérale ou provinciale au contraire, la Société ne pourra être tenue pour responsable des frais encourus pour l'installation, le retrait du service, le transport ou les dommages de quelque nature que ce soit, y compris les dommages résultant d'un manque d'utilisation, d'interruptions d'activité ou de dommages directs ou indirects.

La Sociéte ne peut anticiper ou contrôler les conditions d'utilisation du produit et, par conséquent, décline toute responsabilité quant à l'application et l'adaptation en toute sécurité de ses produits lors de leur utilisation seuls ou en combinaison avec d'autres produits. Il est de la seule responsabilité de l'utilisateur d'effectuer des tests pour vérifier l'application et l'adaptation en toute sécurité des produits.

Cette garatie sera nulle si, à l'appréciation de la Societété, le dommage, la panne ou le défaut a été causé par:

- Des vibrations, des radiations, de l'érosion, de la corrosion, une contamination du processus, des conditions opératiores anormales, le températion et la pression, une poussée ou une pulsation anormale, l'encrassement, une usure normale, un manque d'entretien, des services appliqués de manière inappropriée tels que le voltage, l'air, le gaz l'eau et autres, ou toute autoriées par les conditions de régime; ou
- Tout acte omission de la part de l'Acheteur ses agents, employés ou entrepreneur indépendant, comprenant pour une plus grande précision, mais pas au point de limiter la généralité de ce qui précède, une mauvaise utilisation physique, chimique ou mécanique, un accident, une mauvaise installation du produit, de mauvaises conditions de stockage ou de manipulation du produit, une application inappropriée ou en défaut d'alignment des pièces.

Aucune garantie ne s'applique à la finition de peinture, excepté dans le cas de défauts de fabrication apparents dans les 30 jours à compter de la date d'installation.

Le Société n'assume ni m'autorise auncune personne à assumer en son nom toute autre obligation ou responsabilité en rapport avec le/les produit(s).

L'Acheteur accepte que la Société ne fournisse aucune garantie, expresse, implicite ou légale (y comprise toute garantie de qualité marchande ou de convenance à des fins particulières), écrite ou orale, du produit ou de la main-d'oeuvre indirecte, à l'exception des dispositions exprimées ou contenues dans le présent accord.

RESPONSABILITÉ: Les données techniques contenues dans le catalogue ou sur le site Web song sujettes à modification sans préavis. La Société se réserve le droit d'apporter des modifications par rapport aux dimensions ou à la conception si nécessaire. L'Acheteur reconnaît que la Société ne sera pas dans l'obligation de modifier ces articles manufacturés avant la formulation des modifications de conception ou des améliorations apportées aux produit par la Société

La Société ne sera pas tenue de dédomanger ou d'indemniser l'Acheteur, l'utilisateur final ou toute autre partie pour les actions, les réclamations les responsabilités, les préjudices les sinistres, la perte d'usage, le perte d'activité, les dommages, les dommages indirects ou consécutifs, les demands, les sanctions, les amendes, les dépanses (y compris les dépenses légales), les pertes, les obligations et les conséquences d'une action de quelque nature que ce soit découlant entièrement ou en partie de la négligence ou de l'omission de l'utilisateur ou de la mauvise utilisation, de la mauvaise application, de l'utilisation dangereuse, de mauvaise installation, du manque d'entretien, du mauvaise entretien ou de la mauvaise opération des produits fournis par la Société.

1. Supply Description and Installation Instruction

FLUEight S.r.l. General Scope of Work related to CANNON ARTES S.p.A. order No. -30 2400452 Rev.0 dated February 2nd, 2024 is the supply of the following components:

1. No. 1 Model 8® Belt Oil Skimmers in un-painted SS 316 w/ 3" NPT Oil Discharge (Flat Mount), w/ out motor, w/ standard capacity tail pulley, Corrosion Resistant Steel belt length 876mm (from center of head pulley to center of tail pulley), wiper blades inserts Hybrid Ceramic impregnated and No. 1 Support Plate in SS 304 [bolts, nuts and washers for securing oil skimmer included].

This is the manual for all Items.

3.1 Installation and setup

Oil Grabber® Model 8 is composed by:

1. Base Unit w/ gear reducer
2. Tail Pulley w/ its Yoke, Cable/Tether and Shaft
3. Belt

Step 1. Mounting the base unit.

Although the Oil Grabber can be put on any part of the tank, it is best positioned where the bulk of the oil is accumulating.

MOUNTING: (See Fig. 1)

Mounting surface should be level.

A. Disassemble the base mounting assembly, flat mount trough and flat mount plate, noting the position of all bolts, nuts, and washers, as well as the adjustment cam.
B. Drill four ½" clearance holes in mounting surface (matching those on the flat mount plate) and securely bolt the flat mount plate in place.
C. Assemble base assembly and flat mount trough on top of flat mount plate making sure to reinsert the adjusting cam in its correct position.
D. Replace the bolts removed putting light tension on the (3) bolts holding the main base to the flat mount plate. **Do not** tighten until final belt adjustment is made. (Step 12)

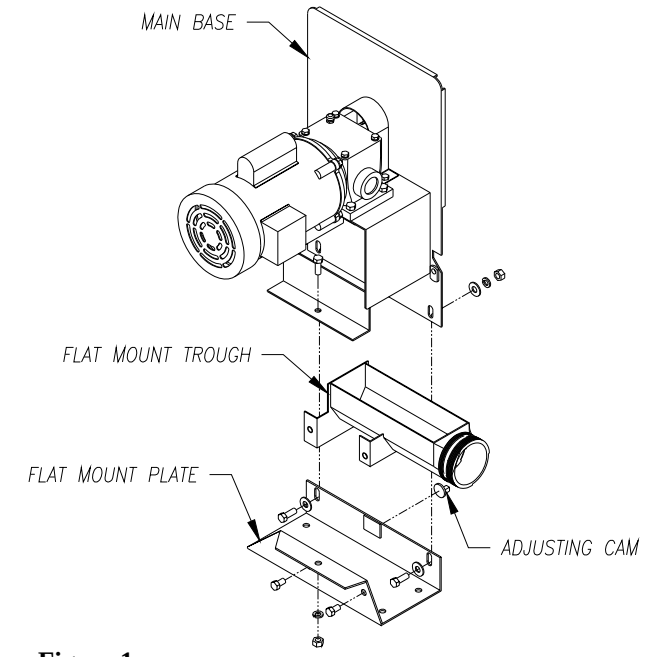

Figure 1

Step 2. Remove the guard over the head pulley by lifting straight up.

Step 3. Locate the adjustable wiper assembly on the outside trough and loosen the locknut. Turn adjusting screw clockwise until wiper is completely open. **(See Fig. 2)**

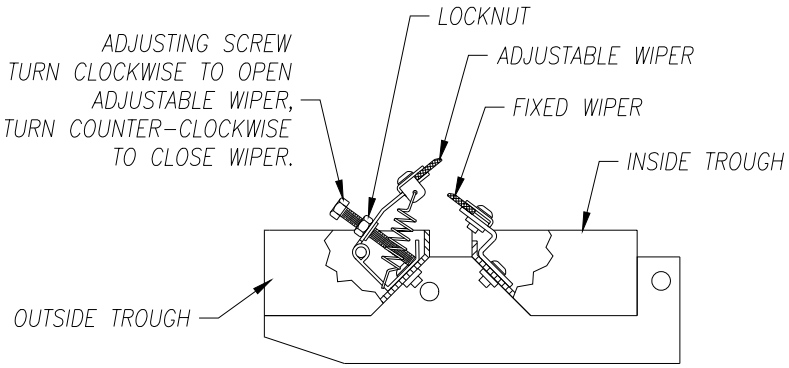

Figure 2

FLUEight S.r.l.
Headquarters: Via C. Monteverdi, 12 - 28100 Novara (NO) ITALY - Ph. +39 0321 611376
Manufacturing & Logistics: Via delle Vallogge di Sotto - 20010 Bernate Ticino (MI) - Italy Ph. +39 02 48403081
Registered Office: C.so F. Cavallotti, 31 - 28100 Novara (NO) ITALY - Fax +39 0321 684535
www.flueight.com ; info@flu8.com

Step 4. Unpack the belt carefully following the directions in the carton.

A. When handling metal belts wear cloth gloves.
B. Dents or creases can cause premature wear.

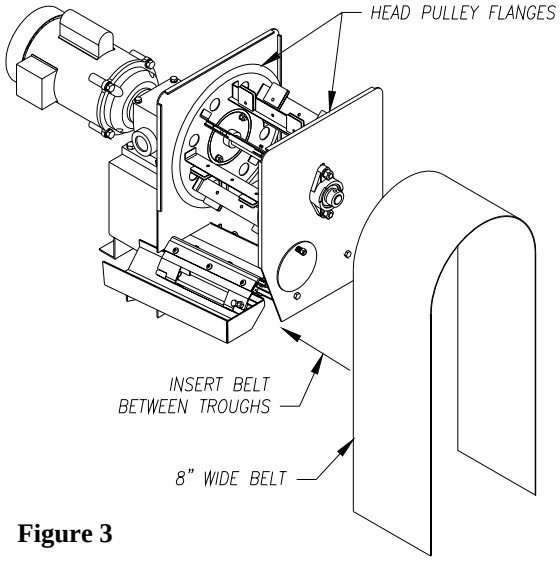
Step 5. Insert the belt between the troughs, lifting the belt over onto the head pulley between the head pulley flanges. **(See Fig. 3)**

Step 6. **(See Fig. 4)** If you have purchased the *Yoke and Tether* option continue with step 7.

Note: Whichever option you have, the tail pulley must be fully submerged below the surface.

Step 7. Place an "S" hook through the hole on the inside support angle, **(See Fig. 4)** and hook the last link of the chain onto the bottom loop of the "S" hook. Lower the tail pulley into the belt. The tail pulley is supported by the belt, not the chain. Make certain that the belt is taut by the weight of the tail pulley and that the chain is loose by two links. **Note:** Tail pulley must be fully submerged below the surface.

Step 8. Carefully turn the adjustment screw on the adjustable wiper blade so that the blade is gently touching the belt with even contact for the length of the blade. Do not set blade too tight. This could reduce the life expectancy of the belt. After this adjustment, tighten locknut securely.



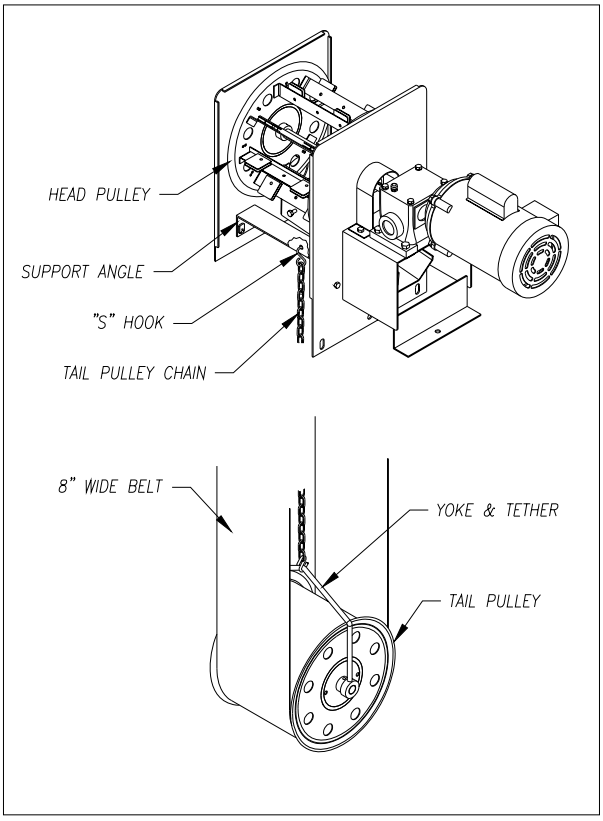


Figure 3

Step 9.

A. Remove the plastic protective plug from the gear reducer top and replace with breather plug supplied. **(SeeFig.5)**
The reducer has already been filled at the factory. Check and if necessary, refill with 600W viscosity oil for reducers up to the level plug

B. Motor/Gear Reducer Key Installation:

NOTE: Do Not use key provided with motor. Use only key provided with gear reducer.

1. Apply grease to motor shaft.
2. Place key FLUSH with end of motor shaft.
3. Carefully insert motor shaft into gear reducer. **DO NOT FORCE.**
4. If motor and gear reducer do not easily slide together, the key is binding. Repeat steps 1 & 2.
5. Bolt motor to gearbox with four bolts and lock washers provided.

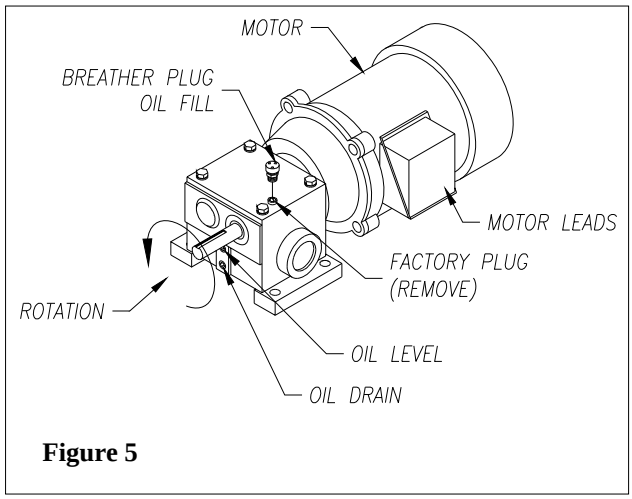

Figure 5

C. Connect motor leads to power so that the belt is carried downward through the wiper blades. (Rotation is in direction of the red arrow on the back of the base unit) **(See Fig. 5).**

Step 10. Leveling the Belt (See Fig. 6)

Be sure the unit is as level as possible. Unit should not be tilted side to side, nor front to rear. Turn motor on and observe the unit. The belt should run without rubbing on the flanges of the head pulley. If the belt is rubbing, unit can be adjusted by turning the leveling cam located on the inside bottom of the inboard plate **(See Fig. 6)**. The cam must be turned slowly, and observe the belt after each 1/16th of a turn.

After belt is running smoothly between the head pulley flanges, tighten down the three mounting bolts on the flat mount plate (flat mount).

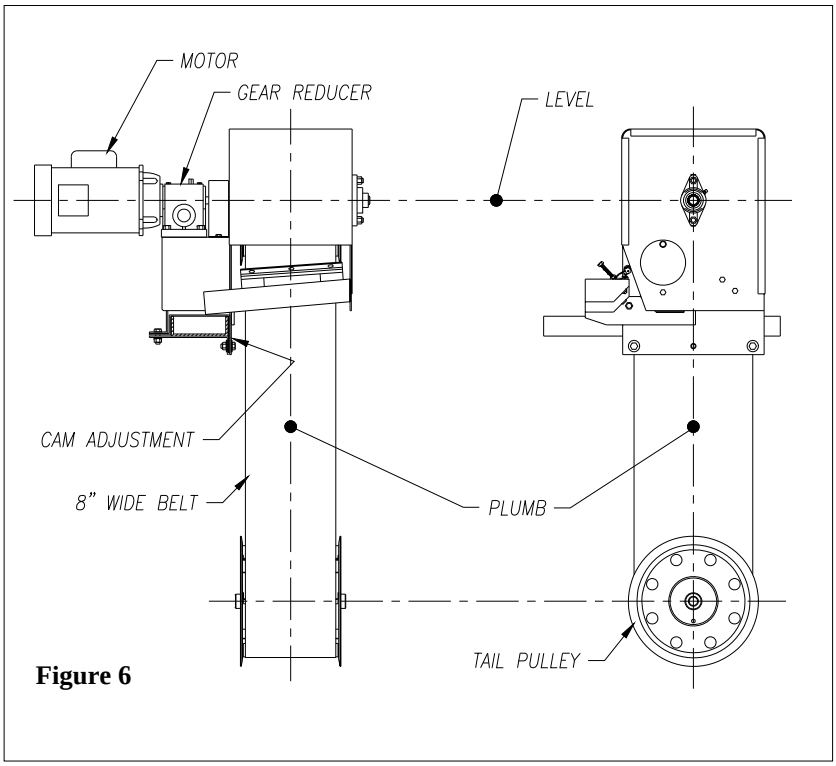

Figure 6

Step 13. Place the guard back into place.

3.2 General Maintenance

1. Check magnetized head pulley for buildup of any metallic parts and clean if necessary.
2. Clean or flush discharge hose and discharge troughs to remove accumulated sludge or waste.
3. Check belt condition for evidence of wear or cracks and replace if necessary. Make certain belt is running near center of head pulley and tail pulley, and not touching the outer plates.
4. Check oil level in the gear reducer, and follow gear reducer maintenance.
5. Fitting on 3/4" flange bearing (Item #14 on parts list) should be greased at the same time (every 6-8 months) as changing the oil in the gear reducer.
6. Check wiper blades for wear and proper setting. Reset adjustable wiper for proper wiping action if necessary.
7. FLUEight Srl recommends keeping a spare belt and a set of wiper blades in stock.

3.2.1 Gear reducer Maintenance

For gear reducer use any brand of 600 weight oil

Oil Capacity is 3.1 ounces (88 gr).

Change oil after first 6 months. After 6-8 months thereafter.

May operate at 205°F (96°C).

Top plug should be removed (if not already done from step 9A) and replaced with breather plug (furnished with reducer).
Bottom plug is for drain.
Center plug is oil level. Fill to this point.
Bottom plug and center plug are located below output shaft.

IMPORTANT INSTALLATION NOTE:

Your Abanaki Model 8^2 Oil Skimmer picks up the majority of its oil on the downward side of the belt. When deciding on where to place your skimmer, locate the downward belt as far from any walls as possible. The face of the belt should be perpendicular to the face of the wall as shown. Keeping the downward belt towards an open side of the tank will help with belt pickup of any oil.

Installation and Operating Manual

BALDOR • RELIANCE

April 2019

MN408 April 2019

Any trademarks used in this manual are the property of their respective owners.

Important:
Be sure to check www.baldor.com to download the latest version of this manual in Adobe Acrobat PDF format.

Note! The manufacturer of these products, Baldor Electric Company became ABB Motors and Mechanical Inc. on March 1, 2018. Nameplates, Declaration of Conformity and other collateral material may contain the company name of Baldor Electric Company and the brand names of Baldor-Dodge and Baldor-Reliance until such time as all materials have been updated to reflect our new corporate identity.

Section 1

General Information

Overview

This manual contains general procedures that apply to Baldor Motor products. Be sure to read and understand the Safety Notice statements in this manual. For your protection, do not install, operate or attempt to perform maintenance procedures until you understand the Warning and Caution statements.
A Warning statement indicates a possible unsafe condition that can cause harm to personnel.
A Caution statement indicates a condition that can cause damage to equipment.

Important: **This instruction manual is not intended to include a comprehensive listing of all details for all procedures required for installation, operation and maintenance. This manual describes general guidelines that apply to most of the motor products shipped by Baldor. If you have a question about a procedure or are uncertain about any detail, Do Not Proceed. Please contact your Baldor distributor for more information or clarification.**

Before you install, operate or perform maintenance, become familiar with the following:

- NEMA Publication MG-2, Safety Standard for Construction and guide for Selection, Installation and Use of Electric Motors and Generators.
- IEC 34–1 Electrical and IEC72–1 Mechanical specifications
- ANSI C51.5, the National Electrical Code (NEC) and local codes and practices.

Limited Warranty

www.baldor.com/support/warranty_standard.asp

Safety Notice: **This equipment contains high voltage! Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt installation, operation and maintenance of electrical equipment. Be sure that you are completely familiar with NEMA publication MG-2, safety standards for construction and guide for selection, installation and use of electric motors and generators, the National Electrical Code and local codes and practices. Unsafe installation or use can cause conditions that lead to serious or fatal injury. Only qualified personnel should attempt the installation, operation and maintenance of this equipment.**

WARNING: **Do not touch electrical connections before you first ensure that power has been disconnected. Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt the installation, operation and maintenance of this equipment.**

WARNING: **Disconnect all electrical power from the motor windings and accessory devices before disassembly of the motor. Electrical shock can cause serious or fatal injury.**

WARNING: **Be sure the system is properly grounded before applying power. Do not apply AC power before you ensure that all grounding instructions have been followed. Electrical shock can cause serious or fatal injury. National Electrical Code and Local codes must be carefully followed.**

WARNING: **Avoid extended exposure to machinery with high noise levels. Be sure to wear ear protective devices to reduce harmful effects to your hearing.**

WARNING: **Surface temperatures of motor enclosures may reach temperatures which can cause discomfort or injury to personnel accidentally coming into contact with hot surfaces. When installing, protection should be provided by the user to protect against accidental contact with hot surfaces. Failure to observe this precaution could result in bodily injury.**

WARNING: **This equipment may be connected to other machinery that has rotating parts or parts that are driven by this equipment. Improper use can cause serious or fatal injury. Only qualified personnel should attempt to install operate or maintain this equipment.**

WARNING: **Do not by-pass or disable protective devices or safety guards. Safety features are designed to prevent damage to personnel or equipment. These devices can only provide protection if they remain operative.**

WARNING: **Avoid the use of automatic reset devices if the automatic restarting of equipment can be hazardous to personnel or equipment.**

WARNING: **Be sure the load is properly coupled to the motor shaft before applying power. The shaft key must be fully captive by the load device. Improper coupling can cause harm to personnel or equipment if the load decouples from the shaft during operation.**

WARNING: **UL Listed motors must only be serviced by UL Approved Authorized Baldor Service Centers if these motors are to be returned to a hazardous and/or explosive atmosphere.**

WARNING: **Thermostat contacts automatically reset when the motor has slightly cooled down. To prevent injury or damage, the control circuit should be designed so that automatic starting of the motor is not possible when the thermostat resets.**

WARNING: **Use proper care and procedures that are safe during handling, lifting, installing, operating and maintaining operations. Improper methods may cause muscle strain or other harm.**

WARNING: **Pacemaker danger – Magnetic and electromagnetic fields in the vicinity of current carrying carrying conductors and permanent magnet motors can result result in a serious health hazard to persons with cardiac pacemakers, metal implants, and hearing aids. To avoid risk, stay way from the area surrounding a permanent magnet motor.**

WARNING: **Before performing any motor maintenance procedure, be sure that the equipment connected to the motor shaft cannot cause shaft rotation. If the load can cause shaft rotation, disconnect the load from the motor shaft before maintenance is performed. Unexpected mechanical rotation of the motor parts can cause injury or motor damage.**

Continued on next page.

Safety Notice Continued

WARNING: **Do not use non UL/CSA listed explosion proof motors in the presence of flammable or combustible vapors or dust. These motors are not designed for atmospheric conditions that require explosion proof operation.**

WARNING: **Motors that are to be used in flammable and/or explosive atmospheres must display the UL label on the nameplate along with CSA listed logo. Specific service conditions for these motors are defined in NFPA 70 (NEC) Article 500.**

WARNING: **Guards must be installed for rotating parts such as couplings, pulleys, external fans, and unused shaft extensions, should be permanently guarded to prevent accidental contact by personnel. Accidental contact with body parts or clothing can cause serious or fatal injury.**

WARNING: **Depending on operating conditions, sound levels for electric motors may exceed 70 dB. Protective measures such as hearing protection may be needed when in close proximity to a motor in operation.**

Caution: **To prevent premature equipment failure or damage, only qualified maintenance personnel should perform maintenance.**

Caution: **Do not over tension belts. Excess tension may damage the motor or driven equipment.**

Caution: **Do not over–lubricate motor as this may cause premature bearing failure.**

Caution: **Do not lift the motor and its driven load by the motor lifting hardware. The motor lifting hardware is adequate for lifting only the motor. Disconnect the load (gears, pumps, compressors, or other driven equipment) from the motor shaft before lifting the motor.**

Caution: **If eye bolts are used for lifting a motor, be sure they are securely tightened. The lifting direction should not exceed a 20 ° angle from the shank of the eye bolt or lifting lug. Excessive lifting angles can cause damage.**

Caution: **To prevent equipment damage, be sure that the electrical service is not capable of delivering more than the maximum motor rated amps listed on the rating plate.**

Caution: **If a HI POT test (High Potential Insulation test) must be performed, follow the precautions and procedure in NEMA MG1 and MG2 standards to avoid equipment damage.**

Caution: **The space heaters are designed to operate at or below the maximum surface temperature stated on the nameplate. If the marked ambient and/or voltage are exceeded this maximum surface temperature can be exceeded and can damage the motor windings. If applied in a division 2 or zone 2 environment this excessive temperature may cause ignition of hazardous materials.**

Caution: **Shaker Duty motors must be properly lubricated prior to Start Up to prevent damage. See Section 3.**

If you have any questions or are uncertain about any statement or procedure, or if you require additional information please contact your Baldor distributor or an Authorized Baldor Service Center.

Receiving

Each Baldor Electric Motor is thoroughly tested at the factory and carefully packaged for shipment. When you receive your motor, there are several things you should do immediately.

1. Observe the condition of the shipping container and report any damage immediately to the commercial carrier that delivered your motor.
2. Verify that the part number of the motor you received is the same as the part number listed on your purchase order.

Handling

The motor should be lifted using the lifting lugs or eye bolts provided.

Caution: **Do not lift the motor and its driven load by the motor lifting hardware. The motor lifting hardware is adequate for lifting only the motor. Disconnect the load (gears, pumps, compressors, or other driven equipment) from the motor shaft before lifting the motor.**

1. Use the lugs or eye bolts provided to lift the motor. Never attempt to lift the motor and additional equipment connected to the motor by this method. The lugs or eye bolts provided are designed to lift only the motor. Never lift the motor by the motor shaft or the hood of a WPII motor.
2. To avoid condensation inside the motor, do not unpack until the motor has reached room temperature. (Room temperature is the temperature of the room in which it will be installed). The packing provides insulation from temperature changes during transportation.
3. When lifting a WPII (Weather Proof Type 2) motor, do not lift the motor by inserting lifting lugs into holes on top of the cooling hood. These lugs are to be used for hood removal only. A spreader bar should be used to lift the motor by the cast lifting lugs located on the motor frame.
4. If the motor must be mounted to a plate with the driven equipment such as pump, compressor etc., it may not be possible to lift the motor alone. For this case, the assembly should be lifted by a sling around the mounting base. The entire assembly can be lifted as an assembly for installation. Do not lift the assembly using the motor lugs or eye bolts provided. Lugs or eye bolts are designed to lift motor only. If the load is unbalanced (as with couplings or additional attachments) additional slings or other means must be used to prevent tipping. In any event, the load must be secure before lifting. If the load is unbalanced (as with couplings or additional attachments) additional slings or other means must be used to prevent tipping. In any event, the load must be secure before lifting.

Storage

Storage requirements for motors and generators that will not be placed in service for at least six months from date of shipment.

Improper motor storage will result in seriously reduced reliability and failure. An electric motor that does not experience regular usage while being exposed to normally humid atmospheric conditions is likely to develop rust in the bearings or rust particles from surrounding surfaces may contaminate the bearings. The electrical insulation may absorb an excessive amount of moisture leading to the motor winding failure.

A wooden crate "shell" should be constructed to secure the motor during storage. This is similar to an export box but the sides & top must be secured to the wooden base with lag bolts (not nailed as export boxes are) to allow opening and reclosing many times without damage to the "shell".

Minimum resistance of motor winding insulation is 5 Meg ohms or the calculated minimum, which ever is greater. Minimum resistance is calculated as follows: Rm = kV + 1

where: (Rm is minimum resistance to ground in Meg–Ohms and kV is rated nameplate voltage defined as Kilo–Volts.)

Example: For a 480VAC rated motor Rm =1.48 meg–ohms (use 5 M Ω).

For a 4160VAC rated motor Rm = 5.16 meg–ohms.

Preparation for Storage

1. Some motors have a shipping brace attached to the shaft to prevent damage during transportation. The shipping brace, if provided, must be removed and stored for future use. The brace must be reinstalled to hold the shaft firmly in place against the bearing before the motor is moved.
2. Store in a clean, dry, protected warehouse where control is maintained as follows:
   a. Shock or vibration must not exceed 2 mils peak-to-peak maximum at 60 hertz, to prevent the bearings from brinelling. If shock or vibration exceeds this limit vibration isolation pads must be used.
   b. Storage temperatures of 10 ºC (50 ºF) to 49 ºC (120 ºF) must be maintained.
   c. Relative humidity must not exceed 60%.
   d. Motor space heaters (when present) are to be connected and energized whenever there is a possibility that the storage ambient conditions will reach the dew point. Space heaters are optional.

Note: Remove motor from containers when heaters are energized, reprotect if necessary.

3. Measure and record the resistance of the winding insulation (dielectric withstand) every 30 days of storage.
   a. If motor insulation resistance decreases below the minimum resistance, contact your Baldor District office.
   b. Place new desiccant inside the vapor bag and re–seal by taping it closed.
   c. If a zipper–closing type bag is used instead of the heat–sealed type bag, zip the bag closed instead of taping it. Be sure to place new desiccant inside bag after each monthly inspection.
   d. Place the shell over the motor and secure with lag bolts.
4. Where motors are mounted to machinery, the mounting must be such that the drains and breathers are fully operable and are at the lowest point of the motor. Vertical motors must be stored in the vertical position. Storage environment must be maintained as stated in step 2.
5. Motors with anti–friction bearings are to be greased at the time of going into extended storage with periodic service as follows:
   a. Motors marked "Do Not Lubricate" on the nameplate do not need to be greased before or during storage.
   b. Ball and roller bearing (anti–friction) motor shafts are to be rotated manually every 3 months and greased every 6 months in accordance with the Maintenance section of this manual.
   c. Sleeve bearing (oil lube) motors are drained of oil prior to shipment. The oil reservoirs must be refilled to the indicated level with the specified lubricant, (see Maintenance). The shaft should be rotated monthly by hand at least 10 to 15 revolutions to distribute oil to bearing surfaces.
   d. "Provisions for oil mist lubrication" – These motors are packed with grease. Storage procedures are the same as paragraph 5b.
   e. "Oil Mist Lubricated" – These bearings are protected for temporary storage by a corrosion inhibitor. If stored for greater than 3 months or outdoor storage is anticipated, connected to the oil mist system while in storage. If this is not possible, add the amount of grease indicated under "Standard Condition" in Section 3, then rotate the shaft 15 times by hand.

6. All breather drains are to be fully operable while in storage (drain plugs removed). The motors must be stored so that the drain is at the lowest point. All breathers and automatic “T” drains must be operable to allow breathing and draining at points other than through the bearings around the shaft. Vertical motors should be stored in a safe stable vertical position.
7. Coat all external machined surfaces with a rust preventing material.
   An acceptable product for this purpose is Exxon Rust Ban # 392.
8. Carbon brushes should be lifted and held in place in the holders, above the commutator, by the brush holder fingers. The commutator should be wrapped with a suitable material such as cardboard paper as a mechanical protection against damage.

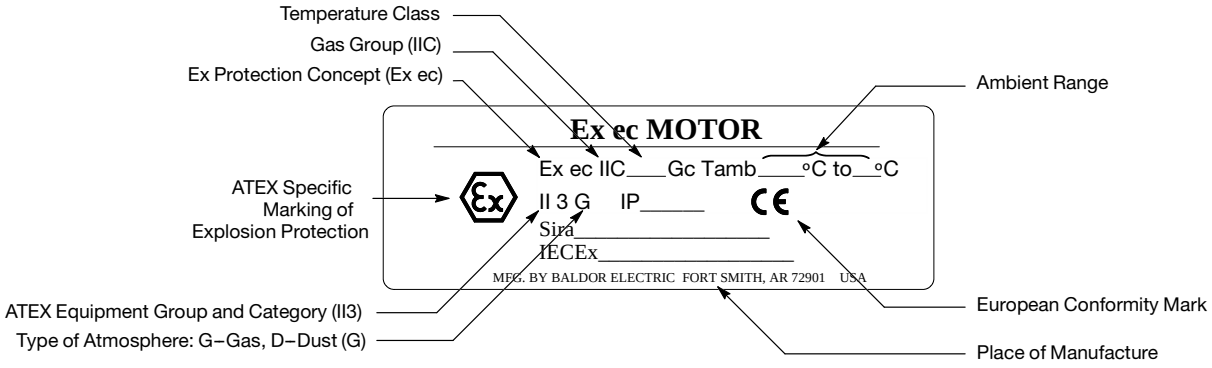
Non–Regreaseable Motors

Non–regreasable motors with “Do Not Lubricate” on the nameplate should have the motor shaft rotated 15 times to redistribute the grease within the bearing every 3 months or more often.

All Other Motor Types

Before storage, the following procedure must be performed.

1. Remove the grease drain plug, if supplied, (opposite the grease fitting) on the bottom of each bracket prior to lubricating the motor.
2. The motor with regreasable bearing must be greased as instructed in Section 3 of this manual.
3. Replace the grease drain plug after greasing.
4. The motor shaft must be rotated a minimum of 15 times after greasing.
5. Motor Shafts are to be rotated at least 15 revolutions manually every 3 months and additional grease added every nine months (see Section 3) to each bearing.
6. Bearings are to be greased at the time of removal from storage.



Removal From Storage

1. Remove all packing material.
2. Measure and record the electrical resistance of the winding insulation resistance meter at the time of removal from storage. The insulation resistance must not be less than 50% from the initial reading recorded when the motor was placed into storage. A decrease in resistance indicates moisture in the windings and necessitates electrical or mechanical drying before the motor can be placed into service. If resistance is low, contact your Baldor District office.
3. Regrease the bearings as instructed in Section 3 of this manual.
4. Reinstall the original shipping brace if motor is to be moved. This will hold the shaft firmly against the bearing and prevent damage during movement.

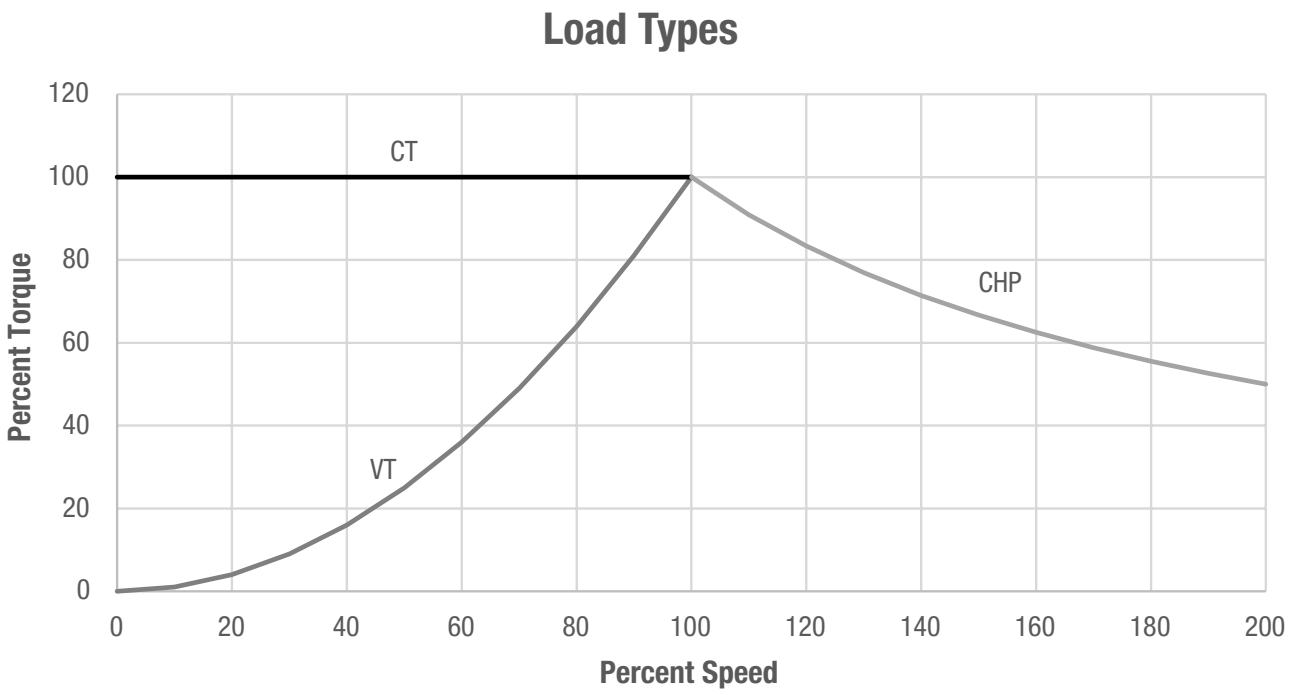
Equipment Marking for IEC Certified Product

IEC certified products have special markings that identify the protection concept and environment requirements. An example is shown in Figure 1-1.

Figure 1-1 IEC Certified Product Markings

Specific Conditions of Use:

If the motor certificate number is followed by the symbol "X", this indicates that the motor has specific conditions of use which are indicated on the certificate. It is necessary to review the product certification certificate in conjunction with this instruction manual.



Operation On Frequency Converters:

If the motor is evaluated for operation with an adjustable speed drive, the type of converter (for example PWM for Pulse Width Modulated) and safe speed ranges (for example 0- 120Hz) will be specified in the certification documents or on motor nameplates. It is necessary to consult the adjustable speed drive manual for proper set up. IECEx Certificates are available online at www.iecex.com

Unit Conversions	
Inches to Millimeters	Inches x 25.4 = mm
Millimeters to Inches	mm x .03937 = Inches
Horsepower to Kilowatts	Hp x .746 = Kw
Kilowatts to Horsepower	Kw x 1.341 = Hp
Pounds to Kilograms	Lbs x .454 = Kg
Kilograms to Pounds	Kg x 2.205 = Lbs

Typical Speed vs Torque Curves are shown in Figure 1-2. For values relative to your specific motor, consult the motor nameplate marking.

Figure 1-2 Typical Speed vs Torque Curves

EMC Compliance Statement for European Union

The motors described in this instruction manual are designed to comply 2014/30/EU. These motors are commercial in design and not intended for residential use. When used with converters, please consult converter manufacturers literature regarding recommendations on cable types, cable shielding, cable shielding termination, connection recommendations and any filters which may be recommended for EMC compliance. For additional information, consult Baldor MN1383.

Section 2

Installation & Operation

Overview

Installation should conform to the National Electrical Code as well as local codes and practices. When other devices are coupled to the motor shaft, be sure to install protective devices to prevent future accidents. Some protective devices include, coupling, belt guard, chain guard, shaft covers etc. These protect against accidental contact with moving parts. Machinery that is accessible to personnel should provide further protection in the form of guard rails, screening, warning signs etc.

Location

It is important that motors be installed in locations that are compatible with motor enclosure and ambient conditions. Improper selection of the motor enclosure and ambient conditions can lead to reduced operating life of the motor.

For Group I Mining Motors where breather drains are used specified, Breather drain shall be mounted or protected in installation such that it is guarded from direct impact."

Proper ventilation for the motor must be provided. Obstructed airflow can lead to reduction of motor life.

1. **Open Drip–Proof/WPI** motors are intended for use indoors where atmosphere is relatively clean, dry, well ventilated and non–corrosive.
2. **Totally Enclosed and WPII** motors may be installed where dirt, moisture or dust are present and in outdoor locations.

Severe Duty, IEEE 841 and Washdown Duty enclosed motors are designed for installations with high corrosion or excessive moisture conditions. These motors should not be placed into an environment where there is the presence of flammable or combustible vapors, dust or any combustible material, unless specifically designed for this type of service. IEEE841 motors are suitable for application in Class I Division 2 and Class I Zone 2 areas on sine wave power in accordance with the applicable codes and standards.

Hazardous Locations are those where there is a risk of ignition or explosion due to the presence of combustible gases, vapors, dust, fibers, or flyings. Facilities requiring special equipment for hazardous locations are typically classified in accordance with local requirements. In the US market, guidance is provided by the National Electric Code.

EMC Compliance Statement for European Union

The motors described in this instruction manual are designed to comply 2014/30/EU . These motors are commercial in design and not intended for residential use.

Mounting Location

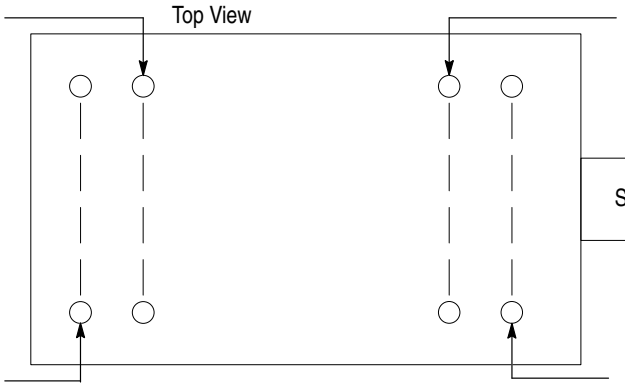
The motor should be installed in a location compatible with the motor enclosure and specific ambient. To allow adequate air flow, the following clearances must be maintained between the motor and any obstruction:

Table 2-1 Enclosure Clearance

TEFC / TENV (IC0141) Enclosures	
Fan Cover Air Intake	180 – 210T Frame 1" (25mm)
Fan Cover Air Intake	250 – 449T Frame 4" (100mm)
	IEC 112 – 132 1" (25mm)
	IEC 160 – 280 4" (100mm)
Exhaust	Envelope equal to the P Dimension on the motor dimension sheet
OPEN/Protected Enclosures	
Bracket Intake	Same as TEFC
Frame Exhaust	Exhaust out the sides envelope A minimum of the P dimension plus 2" (50mm) Exhaust out the end same as intake.

The motor must be securely installed to a rigid foundation or mounting surface to minimize vibration and maintain alignment between the motor and shaft load. Failure to provide a proper mounting surface may cause vibration, misalignment and bearing damage.

Foundation caps and sole plates are designed to act as spacers for the equipment they support. If these devices are used, be sure that they are evenly supported by the foundation or mounting surface.



When installation is complete and accurate alignment of the motor and load is accomplished, the base should be grouted to the foundation to maintain this alignment.

The standard motor base is designed for horizontal or vertical mounting. Adjustable or sliding rails are designed for horizontal mounting only. Consult your Baldor distributor or authorized Baldor Service Center for further information.

Frame Mounting Holes

Some motors have standardized frames containing 6 or 8 mounting holes. 6 hole frames are not suitable for field reversal of mounting from F–1 to F–2, etc. Figure 2-1 indicates the proper mounting holes to use.

Figure 2-1 6 & 8 Hole Motor Frame Mounting

Caution: **Do not lift the motor and its driven load by the motor lifting hardware. The motor lifting hardware is adequate for lifting only the motor. Disconnect the load (gears, pumps, compressors, or other driven equipment) from the motor shaft before lifting the motor.**

In the case of assemblies on a common base, any lifting means provided on the motor should not be used to lift the assembly and base but, rather, the assembly should be lifted by a sling around the base or by other lifting means provided on the base. Assure lifting in the direction intended in the design of the lifting means. Likewise, precautions should be taken to prevent hazardous overloads due to deceleration, acceleration or shock forces.

Alignment

Accurate alignment of the motor with the driven equipment is extremely important. The pulley, sprocket, or gear used in the drive should be located on the shaft as close to the shaft shoulder as possible. It is recommended to heat the pulley, sprocket, or gear before installing on the motor shaft. Forcibly driving a unit on the motor shaft will damage the bearings.

1. Direct Coupling
   For direct drive, use flexible couplings if possible. Consult the drive or equipment manufacturer for more information. Mechanical vibration and roughness during operation may indicate poor alignment. Use dial indicators to check alignment. The space between coupling hubs should be maintained as recommended by the coupling manufacturer.
2. End-Play Adjustment
   The axial position of the motor frame with respect to its load is also extremely important. The standard motor bearings are not designed for excessive external axial thrust loads. Improper adjustment will cause failure.
3. Pulley Ratio
   The best practice is to not exceed an 8:1 pulley ratio.

Caution: **Do not over tension belts. Excess tension may damage the motor or driven equipment.**

4. Belt Drive
   Align sheaves carefully to minimize belt wear and axial bearing loads (see End-Play Adjustment). Belt tension should be sufficient to prevent belt slippage at rated speed and load. However, belt slippage may occur during starting.

Doweling & Bolting

After proper alignment is verified, dowel pins should be inserted through the motor feet into the foundation. This will maintain the correct motor position should motor removal be required. (Baldor•Reliance motors are designed for doweling.)

1. Drill dowel holes in diagonally opposite motor feet in the locations provided.
2. Drill corresponding holes in the foundation.
3. Ream all holes.
4. Install proper fitting dowels.
5. Mounting bolts must be carefully tightened to prevent changes in alignment.

Use a flat washer and lock washer under each nut or bolt head to hold the motor feet secure.

Flanged nuts or bolts may be used as an alternative to washers.

WARNING: **Guards must be installed for rotating parts such as couplings, pulleys, external fans, and unused shaft extensions, should be permanently guarded to prevent accidental contact by personnel. Accidental contact with body parts or clothing can cause serious or fatal injury.**

Guarding

Guards must be installed for rotating parts such as couplings, pulleys, external fans, and unused shaft extensions. This is particularly important where the parts have surface irregularities such as keys, key ways or set screws. Some satisfactory methods of guarding are:

1. Covering the machine and associated rotating parts with structural or decorative parts of the driven equipment.
2. Providing covers for the rotating parts. Covers should be sufficiently rigid to maintain adequate guarding during normal service.

Power Connection

Motor and control wiring, overload protection, disconnects, accessories and grounding should conform to the National Electrical Code and local codes and practices.

For ExnA hazardous location motors, it is a specific condition of use that all terminations in a conduit box be fully insulated. Fully insulated and lugged terminations must be bolted and provided with lock washer to prevent rotation. Flying leads must be insulated with two full wraps of electrical grade insulating tape or heat shrink tubing.

Grounding

In the USA consult the National Electrical Code, Article 430 for information on grounding of motors and generators, and Article 250 for general information on grounding. In making the ground connection, the installer should make certain that there is a solid and permanent metallic connection between the ground point, the motor or generator terminal housing, and the motor or generator frame. In non–USA locations consult the appropriate national or local code applicable.

Motors with resilient cushion rings usually must be provided with a bonding conductor across the resilient member. Some motors are supplied with the bonding conductor on the concealed side of the cushion ring to protect the bond from damage. Motors with bonded cushion rings should usually be grounded at the time of installation in accordance with the above recommendations for making ground connections. When motors with bonded cushion rings are used in multimotor installations employing group fusing or group protection, the bonding of the cushion ring should be checked to determine that it is adequate for the rating of the branch circuit over current protective device being used.

There are applications where grounding the exterior parts of a motor or generator may result in greater hazard by increasing the possibility of a person in the area simultaneously contacting ground and some other nearby live electrical parts of other ungrounded electrical equipment. In portable equipment it is difficult to be sure that a positive ground connection is maintained as the equipment is moved, and providing a grounding conductor may lead to a false sense of security.

Select a motor starter and over current protection suitable for this motor and its application. Consult motor starter application data as well as the National Electric Code and/or other applicable local codes.

For motors installed in compliance with IEC requirements, the following minimum cross sectional area of the protective conductors should be used:

Crosssectional area of phase conductors, *S*	Minimum crosssectional area of the corresponding protective conductor, S_p
mm2	mm2
6	6
10	10
16	16
25	25
35	25
50	25
70	35
95	50
120	70
150	70

Equipotential bonding connection shall made using a conductor with a cross-sectional area of at least 4 mm^2.

Conduit Box For ease of making connections, an oversize conduit box is provided. Most conduit boxes can be rotated 360 ° in 90 ° increments. In the case that a conduit box needs to be adjusted, remove conduit box mounting screws. Rotate conduit box in 90 ° increments to desired location. Reinsert mounting screws and tighten to grade 2 torque.

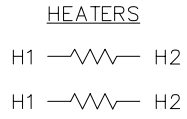
Auxiliary conduit boxes are provided on some motors for accessories such as space heaters, RTD's etc.

AC Power Motors with flying lead construction must be properly terminated and insulated.

Connect the motor leads as shown on the connection diagram located on the name plate or inside the cover on the conduit box. Be sure the following guidelines are met:

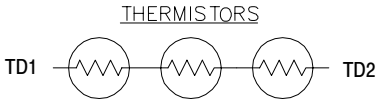
1. AC power is within ±10% of rated voltage with rated frequency. (See motor name plate for ratings).

OR



2. AC power is within ±5% of rated frequency with rated voltage.

OR



3. A combined variation in voltage and frequency of ±10% (sum of absolute values) of rated values, provided the frequency variation does not exceed ±5% of rated frequency.

Performance within these voltage and frequency variations are shown in Figure 2-3.

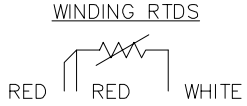


Figure 2-2 Accessory Connections

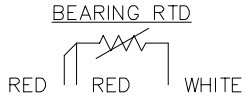

One heater is installed in each end of motor.
Leads for each heater are labeled H1 & H2.
(Like numbers should be tied together).

Three thermistors are installed in windings and tied in series.
Leads are labeled TD1 & TD2.

Winding RTDs are installed in windings (2) per phase.
Each set of leads is labeled 1TD1, 1TD2, 1TD3, 2TD1, 2TD2, 2TD3 etc.

* One bearing RTD is installed in Drive endplate (PUEP), leads are labeled RTDDE.
* One bearing RTD is installed in Opposite Drive endplate (FREP), leads are labeled RTDODE.
* Note RTD may have 2−Red/1−White leads; or 2−White/1−Red Lead.

Rotation

All three phase motors are reversible. To reverse the direction of rotation, disconnect and lock out power and interchange any two of the three line leads for three phase motors. For single phase motors, check the connection diagram to determine if the motor is reversible and follow the connection instructions for lead numbers to be interchanged. Not all single phase motors are reversible.

Adjustable Frequency Power Inverters used to supply adjustable frequency power to induction motors produce wave forms with lower order harmonics with voltage spikes superimposed. Turn–to–turn, phase–to–phase, and ground insulation of stator windings are subject to the resulting dielectric stresses. Suitable precautions should be taken in the design of these drive systems to minimize the magnitude of these voltage spikes. Consult the drive instructions for maximum acceptable motor lead lengths, and proper grounding.

Note: Main power leads for CE Marked Motors may be marked U,V,W – for standard configurations, please consult connection diagrams.

Caution: **The space heaters are designed to operate at or below the maximum surface temperature stated on the nameplate. If the marked ambient and/or voltage are exceeded this maximum surface temperature can be exceeded and can damage the motor windings. If applied in a division 2 or zone 2 environment this excessive temperature may cause ignition of hazardous materials.**

Figure 2-3 Typical Motor Performance VS Voltage Variations

Initial Lubrication

Baldor•Reliance motors are shipped from the factory with the bearings properly packed with grease and ready to operate. Where the unit has been subjected to extended storage (6 months or more) the bearings should be relubricated (regreasable type) prior to starting. When motors are equipped for oil mist lubrication refer to the instruction manual for installation, operation, and maintenance of oil mist lubrication systems.

Caution: **Shaker Duty motors must be properly lubricated prior to Start Up to prevent damage. See Section 3.**

First Time Start Up

Be sure that all power to motor and accessories is off. Be sure the motor shaft is disconnected from the load and will not cause mechanical rotation of the motor shaft.

1. Make sure that the mechanical installation is secure. All bolts and nuts are tightened etc.
2. If motor has been in storage or idle for some time, check winding insulation integrity.
3. Inspect all electrical connections for proper termination, clearance, mechanical strength and electrical continuity.
4. Be sure all shipping materials and braces (if used) are removed from motor shaft.
5. Manually rotate the motor shaft to ensure that it rotates freely.
6. Replace all panels and covers that were removed during installation.
7. Momentarily apply power and check the direction of rotation of the motor shaft.
8. If motor rotation is wrong, be sure power is off and change the motor lead connections. Verify rotation direction before you continue.
9. Start the motor and ensure operation is smooth without excessive vibration or noise. If so, run the motor for 1 hour with no load connected.
10. After 1 hour of operation, disconnect power and connect the load to the motor shaft. Verify all coupling guards and protective devices are installed. Ensure motor is properly ventilated.

11. If motor is totally enclosed fan–cooled or non–ventilated it is recommended that condensation drain plugs, if present, be removed. These are located in the lower portion of the end–shields. Totally enclosed fan–cooled “XT” motors are normally equipped with automatic drains which may be left in place as received.

Coupled Start Up

This procedure assumes a coupled start up. Also, that the first time start up procedure was successful.

1. Check the coupling and ensure that all guards and protective devices are installed.
2. Check that the coupling is properly aligned and not binding.
3. The first coupled start up should be with no load. Apply power and verify that the load is not transmitting excessive vibration back to the motor though the coupling or the foundation.
   Vibration should be at an acceptable level.
4. Run for approximately 1 hour with the driven equipment in an unloaded condition.

The equipment can now be loaded and operated within specified limits. Do not exceed the name plate ratings for amperes for steady continuous loads.

Jogging and Repeated Starts

Repeated starts and/or jogs of induction motors generally reduce the life of the motor winding insulation. A much greater amount of heat is produced by each acceleration or jog than by the same motor under full load. If it is necessary to repeatedly start or jog the motor, it is advisable to check the application with your local Baldor distributor or Baldor Service Center.

Heating - Duty rating and maximum ambient temperature are stated on the motor name plate.
Do not exceed these values. If there is any question regarding safe operation, contact your local Baldor distributor or Baldor Service Center.

Hazardous Locations

Hazardous locations are those where there is a risk of ignition or explosion due to the presence of combustible gases, vapors, dust, fibers or flyings.

Selection

Facilities requiring special equipment for hazardous locations are typically classified in accordance with local requirements. In the US market, guidance is provided by the National Electric Code. In international hazardous location areas, guidance for gas / vapor / mist classification is given in IEC60079–14, or for dust in IEC61241–14. This classification process lets the installer know what equipment is suitable for installation in that environment, and identifies what the maximum safe temperature or temperature class is required.
It is the customer or users responsibility to determine the area classification and select proper equipment.

Areas are classified with respect to risk and exposure to the hazard. In the US market, areas are typically classified as follows Class, Division, Group and Temperature Class. In some newer installations in the US and in most international markets, areas are classified in Zones.

Protection Concepts

Class I Division 1 / Zone 1 [Equipment Group I (mining) or II (surface), Equipment Protection Level (EPL) Gb, Mb]

Baldor offers a range of motors suitable for installation in a Division 1 or Zone 1 environment.
These motors are known as explosion proof or flameproof.
Motors that are explosion proof or flameproof use specially machined flameproof joints between the end bell or bracket and the frame, as well as along the rotating shaft and at connection box covers and entries.
The fit of these flameproof joints are designed to contain the combustion or quench the flame of an explosive gas atmosphere prior to it exiting the motor. These flameproof joints have lengths and widths selected and tested based on the gas group present in the atmosphere. Baldor•Reliance motors are typically designed to meet Class I (Division 1) Group C and D (explosion proof) or Ex d IIB (flameproof).

An application note regarding equipment applied in accordance with the US National Electric Code (NFPA 70–2008) – according to Article 500.8(C) Marking, sub clause (2) in the fine print note, it is noted that Equipment not marked to indicate a division is suitable for both Division 1 and Division 2 locations.
These motors are not gas tight. To the contrary, this protection concept assumes that due to the normal heating and cooling cycle of motor operation that any gas present will be drawn into the motor. Since flameproof or explosion proof motors are designed to contain the combustion and extinguish any flame transmission, for this protection concept, only external surface temperatures are of concern. Thermal limiting devices such as thermostats, thermistors or RTDs may be provided on these motors to limit the external surface temperature during overload conditions.

When explosion proof or flameproof motors are provided with intrinsically safe sensors, the integrity of that system relies upon the proper application and selection of barriers and cables as described in the sensor manufacturers control drawing. The control drawing will be shipped with the motor, and it is important that those instructions be provided to the equipment installer.

If thermostats are provided as a condition of certification, it is the installer's responsibility to make sure that these devices are properly connected to a suitable switching device. The ATEX directive requires that motor shutdown on thermal trip be accomplished without an intermediate software command. Where intermediate circuitry is involved the circuit shall fall within the scope of a safety, controlling and regulating device as defined in article 1(2) of European Directive 2014/34/EU, and shall be covered by an appropriate EC Type Examination Certificate.

Flameproof motors, internationally referred to as Ex d use a protection concept similar to that used in Class I Division 1 motors, with minor differences in the flameproof joints and cable entry designs. Flameproof and explosion proof motors are both type tested. Representative motors are connected to a reference gas and ignited in laboratory conditions to verify that the flame is not transmitted outside the motor enclosure and to determine the maximum internal pressure encountered.

Explosion proof and Flame proof motors shipped without a conduit box require use of a certified box of suitable dimensions and that is appropriate for the classification. Openings in connection boxes must be closed with suitably certified and dimensioned device.

Hazardous location motors equipped with NPT pipe nipples are designed and built such that the pipe nipple is securely attached to the motor frame. This is accomplished externally by interference between the threads as well as tack welding. The conduit box is securely attached to the pipe nipple at the factory per:

1. Standard Commercial NPT & Explosion Proof IEC/ATEX parts : L-1 gauging notch +/- 1 thread (ref. ANSI/ASME B1.20.1 and Clarification Sheet ExNB/98/06/010/CS) Note: Clarification Sheet ExNB/98/06/010/CS provides inspection criteria to meet (6 threads minimum per engineering part drawing for ATEX parts).
2. Explosion Proof UL conduit boxes & MSHA parts: L-1 gauging notch "+1 min to + 3 1/2 max threads. Note: Provides inspection criteria to meet (5 threads minimum per engineering part drawing for MSHA parts and meet UL 1203 requirement for L-1 gauging notch flush to + 3 1/2 max threads).

This allows the end user to position the conduit box according to the application then secure when in place. For obvious reasons having the conduit box snug prior to affixing to the pipe nipple is preferable. However, the guidance in numbers 1 and 2 above can be used in determining thread engagement.

Note: In the United States most non-mining applications have rigid conduit for cabling, therefore not tack welding the conduit box to the pipe nipple is standard. In markets outside the United States, flexible conduit/cabling are common and end users should take note to secure the conduit box to the pipe nipple once in position. Further, the flexible leads should be secured to inhibit forces acting on the conduit box.

Class I Division 2 / Zone 2 Ex nA, [Equipment Protection Level (EPL) Gc]

This protection concept relies on having no sources of ignition present such as arcing parts or hot surfaces. For this protection concept, internal temperatures as well as external temperatures are considered. In many cases, the internal temperatures are higher than the external temperatures and therefore become the limiting factor in determination of temperature code designation. In these applications, it is very important to use a motor that has been evaluated thermally for use with an inverter or converter, if variable speed operation is desired. Thermostats used for Class I Division 2 and Ex nA motors are used to protect the motor only. For motors using flying lead construction, it is important to use connection lugs and insulate with heat shrink tubing or a double wrap of insulation grade electrical tape to avoid the risk of spark or ignition.

Class II Division 1 / Zone 21 [Equipment Group III, Equipment Protection Level (EPL) Db]

This area classification is one where the risk of ignitable concentrations of dust is present at all or some of the time. The protection concepts used for Class II Division 1 is similar to flamepath, except with additional dust exclusion paths designed for the rotating shaft. In the international designations, this concept is referred to as dust ignition proof or Ex tD. External surface temperature remains the limiting factor. Thermal limiting devices such as thermostats, thermistors or RTDs may be provided on these motors to limit the external surface temperature during overload conditions. If thermostats are provided as a condition of certification, it is the installer's responsibility to make sure that these devices are properly connected to a suitable switching device.

Note: In the North American area classification system, Class III exists for fibers and flyings.
In the IEC designation, both dusts and flyings are absorbed into Group III.

Class II Division 2 / Zone 22 [Equipment Group III, Equipment Protection Level (EPL) Dc]

This area classification is one where the risk of exposure to ignitable concentrations of dust are not likely to occur under normal operating conditions and relies heavily on the housekeeping practices within the installation.

Sine Wave Power Operation for Division 1 or 2 and Zone 1 or 2 and Zone 21 or 22 Hazardous Location.

These motors are designed to operate at or below the maximum surface temperature (or T–Code) stated on the nameplate. Failure to operate the motor properly can cause this maximum surface temperature to be exceeded. If applied in a Division 1 or 2 / Zone 1 or 2 and Zone 21 or 22 environment, this excessive temperature may cause ignition of hazardous materials. Operating the motor at any of the following conditions can cause the marked surface temperature to be exceeded.

1. Motor load exceeding service factor nameplate value
2. Ambient temperatures above nameplate value
3. Voltages above or below nameplate value
4. Unbalanced voltages
5. Loss of proper ventilation
6. Altitude above 3300 feet / 1000 meters
7. Severe duty cycles of repeated starts
8. Motor stall
9. Motor reversing
10. Single phase operation of polyphase equipment
11. Variable frequency operation

Variable Frequency Power Operation for Division 1 or 2 and Zone 1 or 2 and Zone 21 or 22

Hazardous Location (motors with maximum surface temperature listed on the nameplate).
Only motors with nameplates marked for use on inverter (variable frequency) power, and labeled for specific hazardous areas may be used in those hazardous areas on inverter power. The motor is designed to operate at or below the maximum surface temperature (or T–Code) stated on the nameplate.
Failure to operate the motor properly can cause this maximum surface temperature to be exceeded.

If applied in a Division 1 or 2 / Zone 1 or 2 and Zone 21 or 22 environment, this excessive temperature may cause ignition of hazardous materials. Operating the motor at any of the following conditions can cause the marked surface temperature to be exceeded.

1. Motor load exceeding service factor nameplate value
2. Ambient temperature above nameplate value
3. Voltage (at each operating frequency) above or below rated nameplate value
4. Unbalanced voltages
5. Loss of proper ventilation
6. Operation outside of the nameplate speed / frequency range
7. Altitudes above 3300 feet / 1000 meters
8. Single phase operation of polyphase equipment
9. Unstable current wave forms
10. Lower than name plate minimum carrier frequency

Thermal Limiting
Thermal limiting devices are temperature sensing control components installed inside the motor to limit the internal temperature of the motor frame by interrupting the circuit of the holding coil of the magnetic switch or contactor. They are required for most Division 1 and Zone 1 applications. For Division 2 or Zone 2 applications, motors should be selected that preclude running temperatures from exceeding the ignition temperatures for the designated hazardous material. In Division 2 or Zone 2 classified locations, thermal limiting devices should only be used for winding protection and not considered for limiting all internal motor temperatures to specific ignition temperatures.

Equipotential Bonding and Shaft Current Reduction
Larger motors (ie WP construction) may require proper bonding between motor enclosures and covers to avoid the risk of stray currents during start up. Fastening methods and bonding straps must not be modified. Bearing currents can exist in some motors for both line–fed and inverter–fed applications. Larger line–fed motors may require at least one insulated bearing to prevent a flow of current through the bearings. Do not defeat such insulation whether the motor is line–fed or inverter–fed applications. Inverter–fed motors may require additional bearing insulation or even a shaft brush. Do not defeat such features. When the motor and the coupled load are not on a common conductive baseplate, it may also be necessary to electrically bond together the stationary parts of the motor and the coupled equipment.

Repair of Motors used in Hazardous Locations

Repair of hazardous certified motors requires additional information, skill, and care. It is the customer's responsibility to select service shops with proper qualifications to repair hazardous location motors. Contact the manufacture for additional repair details. Use only original manufacturer's parts.

Repair of Explosion Proof or Flame Proof Motors Class I Division 1 and Zone 1

In the North American market, recertification programs are offered by Underwriters Laboratories and Canadian Standards Association which allow authorized service shops to mark the rebuilt motors as certified. In the international markets using IEC based requirements, repair should be undertaken only after consulting IEC60079–19 Explosive Atmospheres–Part 19 Equipment repair, overhaul and reclamation. If use of a certified repair facility is desired, consult the IECEX Repair Scheme at http://www.iecex.com/service_facilities.htm

Explosion proof and flameproof motors achieve their safety based on the mechanical construction – flameproof joints and bearing clearance, and the electrical design including any thermal limiting devices. If it is necessary to repair a flameproof or explosion proof motor, it is critical that the mechanical flameproof joints be maintained. Consult Baldor Electric Company for flameproof joint construction details.
Use only Baldor•Reliance supplied parts. Baldor does not recommend reclamation of parts.
Since this protection method also relies on temperature being maintained, make sure that any rewinding uses the original electrical designs, including any thermal protection that may be present.

Repair of Dust Ignition Proof Motors – Class II Division 1 and 2, Zone 21 and 22.

For Dust Ignition Proof, proper sealing is required. Do not modify the motor construction to add any additional opening, and ensure that proper sealing is maintained in the connection box and at the shaft seal. Since this protection method also relies on temperature being maintained, make sure that any rewinding uses the original electrical designs, including any thermal protection that may be present

Repair of Class I Division 2 and Zone 2 motors

For Division 2 and Zone 2, the internal and external temperatures are of concern. Since this protection method also relies on temperature being maintained, make sure that any rewinding uses the original electrical designs, including any thermal protection that may be present. Use only Baldor replacement thermostats, if provided.

Section 3

Maintenance & Troubleshooting

WARNING: UL and EX Listed motors must only be serviced by UL or EX Approved Authorized Baldor Service Centers if these motors are to be returned to a hazardous and/or explosive atmosphere.

General Inspection

Inspect the motor at regular intervals, approximately every 500 hours of operation or every 3 months, whichever occurs first. Keep the motor clean and the ventilation openings clear. The following steps should be performed at each inspection:

WARNING: Do not touch electrical connections before you first ensure that power has been disconnected. Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt the installation, operation and maintenance of this equipment.

1. Check that the motor is clean. Check that the interior and exterior of the motor is free of dirt, oil, grease, water, etc. Oily vapor, paper pulp, textile lint, etc. can accumulate and block motor ventilation. If the motor is not properly ventilated, overheating can occur and cause early motor failure.
2. Perform a dielectric with stand test periodically to ensure that the integrity of the winding insulation has been maintained. Record the readings. Immediately investigate any significant decrease in insulation resistance.
3. Check all electrical connectors to be sure that they are tight.

Relubrication & Bearings

Bearing grease will lose its lubricating ability over time, not suddenly. The lubricating ability of a grease (over time) depends primarily on the type of grease, the size of the bearing, the speed at which the bearing operates and the severity of the operating conditions. Good results can be obtained if the following recommendations are used in your maintenance program.

Type of Grease A high grade ball or roller bearing grease should be used. Baldor motors are pregreased, normally with Polyrex EM (Exxon Mobil) or as stated on the nameplate.
Do not mix greases unless compatibility has been checked and verified.

Ball Bearing Motors

Operating Temperature –25 ºC (–15 ºF) to 50 ºC (120 ºF)

EXXON	POLYREX EM (Standard on Baldor motors)
EXXON	UNIREX N2
EXXON	BEACON 325
CHEVRON OIL	SRI NO. 2 (Compatible with Polyrex EM)
CHEVRON OIL	BLACK PEARL
TEXACO, INC.	PREMIUM RB
TEXACO, INC.	POLYSTAR
AMOCO	RYKON # 2
PENNZOIL	PENNZLUBE EM–2
DARMEX	DARMEX 707
DARMEX	DARMEX 711
PETRO–CANADA	PEERLESS LLG
SHELL OIL	DOLIUM BRB

Minimum Starting Temperature –60 ºC (–76 ºF)

SHELL OIL CO.	AEROSHELL 7 (Standard on Baldor motors)
MOBIL	MOBIL 28
MOBIL	MOBILITH SHC 100 (Low Temperature – Arctic Duty)

Roller Bearing Motors

Operating Temperature –25 ºC (–15 ºF) to 50 ºC (120 ºF)

TEXACO, INC.	PREMIUM RB
MOBIL	MOBILITH SHC 220 (Standard on Baldor motors)
CHEVRON OIL	BLACK PEARL

Relubrication Intervals

Recommended relubrication intervals are shown in Table 3-1. It is important to realize that the recommended intervals of Table 3-2 are based on average use.

Refer to additional information contained in Tables 3-2, 3-3 and 3-4.

Table 3-1 Relubrication Intervals *

NEMA / (IEC) Frame Size	Rated Speed - RPM					
	10000	**6000**	**3600**	**1800**	**1200**	**900**
Up to 210 incl. (132)	**	2700 Hrs.	5500 Hrs.	12000 Hrs.	18000 Hrs.	22000 Hrs.
Over 210 to 280 incl. (180)		**	3600 Hrs.	9500 Hrs.	15000 Hrs.	18000 Hrs.
Over 280 to 360 incl. (225)		**	* 2200 Hrs.	7400 Hrs.	12000 Hrs.	15000 Hrs.
Over 360 to 449 incl. (315)		**	*2200 Hrs.	3500 Hrs.	7400 Hrs.	10500 Hrs.

* Relubrication intervals are for ball bearings.
For vertically mounted motors and roller bearings, divide the relubrication interval by 2.

** For motors operating at speeds greater than 3600 RPM, contact Baldor for relubrication recommendations.

Table 3-2 Service Conditions

Severity of Service	Hours per day of Operation	Ambient Temperature Maximum	Atmospheric Contamination
Standard	8	40 ºC	Clean, Little Corrosion
Severe	16 Plus	50 ºC	Moderate dirt, Corrosion
Extreme	16 Plus	>50 ºC* or Class H Insulation	Severe dirt, Abrasive dust, Corrosion, Heavy Shock or Vibration
Low Temperature		<–29 ºC **	

* Special high temperature grease is recommended (Dow Corning DC44). Note that Dow Corning DC44 grease does not mix with other grease types. Thoroughly clean bearing & cavity before adding grease.

** Special low temperature grease is recommended (Aeroshell 7).

Table 3-3 Relubrication Interval Multiplier

Severity of Service	Multiplier
Standard	1.0
Severe	0.5
Extreme	0.1
Low Temperature	1.0

Some motor designs use different bearings on each motor end. This is normally indicated on the motor nameplate. In this case, the larger bearing is installed on the motor Drive endplate. For best relubrication results, only use the appropriate amount of grease for each bearing size (not the same for both).

Table 3-4 Bearings Sizes and Types

Frame Size NEMA (IEC)	Bearing Description (These are the "Large" bearings (Shaft End) in each frame size)			
	Bearing	Weight of Grease to add * oz (Grams)	Volume of grease to be added	
			in^3	teaspoon
56 to 140 (90)	6203	0.08 (2.4)	0.15	0.5
140 (90)	6205	0.15 (3.9)	0.2	0.8
180 (100–112)	6206	0.19 (5.0)	0.3	1.0
210 (132)	6307	0.30 (8.4)	0.6	2.0

* Weight in grams = .005 DB of grease to be added

Note: Not all bearing sizes are listed. For intermediate bearing sizes, use the grease volume for the next larger size bearing.

Caution: **To avoid damage to motor bearings, grease must be kept free of dirt. For an extremely dirty environment, contact your Baldor distributor or an authorized Baldor Service Center for additional information.**

Relubrication Procedure Be sure that the grease you are adding to the motor is compatible with the grease already in the motor. Consult your Baldor distributor or an authorized service center if a grease other than the recommended type is to be used.

Caution: **Do not over–lubricate motor as this may cause premature bearing failure.**

With Grease Outlet Plug

1. With the motor stopped, clean all grease fittings with a clean cloth.
2. Remove grease outlet plug.

Caution: **Over–lubricating can cause excessive bearing temperatures, premature lubrication breakdown and bearing failure.**

3. Add the recommended amount of grease.
4. Operate the motor for 15 minutes with grease plug removed. This allows excess grease to purge.
5. Re-install grease outlet plug.

Without Grease Provisions

Note: Only a Baldor authorized and UL or CSA certified service center can disassemble a UL/CSA listed explosion proof motor to maintain it's UL/CSA listing.

1. Disassemble the motor.
2. Add recommended amount of grease to bearing and bearing cavity. (Bearing should be about 1/3 full of grease and outboard bearing cavity should be about 1/2 full of grease.)
3. Assemble the motor.

Sample Relubrication Determination

Assume - NEMA 286T (IEC 180), 1750 RPM motor driving an exhaust fan in an ambient temperature of 43 °C and the atmosphere is moderately corrosive.

1. Table 3-2 list 9500 hours for standard conditions.
2. Table 3-3 classifies severity of service as "Severe".
3. Table 3-5 shows that 1.2 in^3 or 3.9 teaspoon of grease is to be added.

Note: Smaller bearings in size category may require reduced amounts of grease.

Shaker Duty Motors only

Caution: **Shaker Duty motors must be properly lubricated prior to Start Up to prevent damage. See Table 3-6.**

Lubrication should be performed before Start Up and at regular maintenance intervals. Follow these recommendations to ensure proper lubrication.

Recommended Lubricant

For ambient temperatures between –15 °F to 120 °F the following lubricants are recommended: Mobil PolyrexEM, Texaco Premium RB, Exxon Unirex N–2.

Do not mix greases unless compatibility has been checked and verified.

Table 3-5 Lubrication Volume

NEMA Frame Size	Volume in Cubic Inches					
	Normal Duty		Severe Duty		Extreme Duty	
	Start Up	Relub	Start Up	Relub	Start Up	Relub
184TY	1.4	0.5	1.4	0.5	2.7	0.5
215TY	1.6	0.5	1.6	0.5	4.5	1
256TY	7	1			11	2
286TY	9	1			15	3

Lubrication Frequency

Normal Duty 8 hours per day (16 hours per day in a clean environment). Lubricate every 2 months.

Severe Duty 16 hours per day or more in a dirty environment (corrosive atmosphere, chemical fumes, acids, alkalies or extreme high humidity). Lubricate every month or 700 hours of operation.

Extreme Duty operation in extremely dirty or dusty environments and high ambient temperatures exceeding 104 °F (40 °C). Lubricate twice a month or 350 hours of operation.

Lubrication Procedure

1. Locate the grease inlet and outlet. Clean the areas.
2. Remove the plug(s) and install a grease fitting in the inlet if grease fitting is not already installed.
3. Add the recommended amount of lubricant.
4. Run the motor for two hours with the outlet plug removed.
5. Install outlet plug.

Note: To loosen hardened grease it may be necessary to insert a rod or wire into the grease inlet and outlet holes.

Table 3-6 Troubleshooting Chart

Symptom	Possible Causes	Possible Solutions
Motor will not start	Usually caused by line trouble, such as, single phasing at the starter.	Check source of power. Check overloads, fuses, controls, etc.
Excessive humming	High Voltage. Eccentric air gap.	Check input line connections. Have motor serviced at local Baldor service center.
Motor Over Heating	Overload. Compare actual amps (measured) with nameplate rating.	Locate and remove source of excessive friction in motor or load. Reduce load or replace with motor of greater capacity.
	Single Phasing.	Check current at all phases (should be approximately equal) to isolate and correct the problem.
	Improper ventilation.	Check external cooling fan to be sure air is moving properly across cooling fins. Excessive dirt build-up on motor. Clean motor.
	Unbalanced voltage.	Check voltage at all phases (should be approximately equal) to isolate and correct the problem.
	Rotor rubbing on stator.	Check air gap clearance and bearings. Tighten “Thru Bolts”.
	Over voltage or under voltage.	Check input voltage at each phase to motor.
	Open stator winding.	Check stator resistance at all three phases for balance.
	Grounded winding.	Perform dielectric test and repair as required.
	Improper connections.	Inspect all electrical connections for proper termination, clearance, mechanical strength and electrical continuity. Refer to motor lead connection diagram.
Bearing Over Heating	Misalignment.	Check and align motor and driven equipment.
	Excessive belt tension.	Reduce belt tension to proper point for load.
	Excessive end thrust.	Reduce the end thrust from driven machine.
	Excessive grease in bearing.	Remove grease until cavity is approximately 3/4 filled.
	Insufficient grease in bearing.	Add grease until cavity is approximately 3/4 filled.
	Dirt in bearing.	Clean bearing cavity and bearing. Repack with correct grease until cavity is approximately 3/4 filled.
Vibration	Misalignment.	Check and align motor and driven equipment.
	Rubbing between rotating parts and stationary parts.	Isolate and eliminate cause of rubbing.
	Rotor out of balance.	Have rotor balance checked are repaired at your Baldor Service Center.
	Resonance.	Tune system or contact your Baldor Service Center for assistance.
Noise	Foreign material in air gap or ventilation openings.	Remove rotor and foreign material. Reinstall rotor. Check insulation integrity. Clean ventilation openings.
Growling or whining	Bad bearing.	Replace bearing. Clean all grease from cavity and new bearing. Repack with correct grease until cavity is approximately 3/4 filled.

Suggested bearing and winding RTD setting guidelines for Non–Hazardous Locations ONLY

Most large frame AC Baldor motors with a 1.15 service factor are designed to operate below a Class B (80 ºC) temperature rise at rated load and are built with a Class H winding insulation system. Based on this low temperature rise, RTD (Resistance Temperature Detectors) settings for Class B rise should be used as a starting point. Some motors with 1.0 service factor have Class F temperature rise.

The following tables show the suggested alarm and trip settings for RTDs. Proper bearing and winding RTD alarm and trip settings should be selected based on these tables unless otherwise specified for specific applications.

If the driven load is found to operate well below the initial temperature settings under normal conditions, the alarm and trip settings may be reduced so that an abnormal machine load will be identified.

The temperature limits are based on the installation of the winding RTDs imbedded in the winding as specified by NEMA. Bearing RTDs should be installed so they are in contact with the outer race on ball or roller bearings or in direct contact with the sleeve bearing shell.

Table 3-7 Winding RTDs – Temperature Limit In ºC (40 ºC Maximum Ambient)

Motor Load (Typical Design)	Class B Temp Rise ≤ 80 ºC		Class F Temp Rise ≤ 105 ºC		Class H Temp Rise ≤ 125 ºC	
	Alarm	Trip	Alarm	Trip	Alarm	Trip
≤ Rated Load	130	140	155	165	175	185
Rated Load to 1.15 S.F.	140	150	160	165	180	185

Note: • Winding RTDs are factory production installed, not from Mod–Express.

When Class H temperatures are used, consider bearing temperatures and relubrication requirements.

Table 3-8 Bearing RTDs – Temperature Limit In oC (40 ºC Maximum Ambient)

Bearing Type Oil or Grease	Anti–Friction		Sleeve	
	Alarm	Trip	Alarm	Trip
Standard*	95	100	85	95
High Temperature**	110	115	105	110

Notes: * Bearing temperature limits are for standard design motors operating at Class B temperature rise.

** High temperature lubricants include some special synthetic oils and greases.

Greases that may be substituted that are compatible with Polyrex EM (but considered as “standard” lubricants include the following:

– Texaco Polystar – Rykon Premium #2 – Chevron SRI #2

– Mobilith SHC–100 – Pennzoil Pennzlube EM–2 – Chevron Black Pearl

– Darmex 707 – Darmex 711 – Petro–Canada Peerless LLG

See the motor nameplate for replacement grease or oil recommendation.

Contact Baldor application engineering for special lubricants or further clarifications.

Notes

Notes

Section 4

Appendix - IEC 60079 Series

INFORMATION REQUIRED PER IEC 60079-0:2017 Ed7

All *italicized* information below is quoted from the standard, clause 30.

Clause 30 (instructions) – Instructions are provided with each motor, the most recent version of this manual can be download at baldor.com.

Instructions for purposes of this standard consists of the following that are shipped with your motor in the literature package:

- Instruction Manual MN408
- Ex Certificates applicable for your motor
- Nameplate marking photos for your motor

Clause 30.1 (general)

The instructions prepared by the manufacturer shall include the following particulars as a minimum.

Marking

A recapitulation of the information with which the equipment is marked, except for the serial number (see Clause 29), together with any appropriate additional information to facilitate maintenance (for example, address of the importer, repairer, etc.)

A copy of the nameplates is included in the literature package and is shipped with each motor. These instructions are used for a range of mining motors. An example of typical certification marking is shown in Section 1. For motor specific information, please refer to the certification nameplate photos, electrical rating information and any specific conditions conveyed in the motor marking such as but not limited to ambient range, water flow, converter set up parameters and refer to the data package shipped with the product.

on-site assembling:

Not typically required.

installation and erection:

iii) guidance for the selection of flameproof entry devices for termination compartments with reference pressure greater than ...1 333 kPa for Group I and 2 000 kPa for Group II .

The reference pressure encountered in this Group I range of motors is below 1 333 kPa and is below 2 000 kPA for the Group II range of motors.

adjustment and parameter setting

If operated on a converter, refer to nameplate marking for set-up parameters.

putting into service - of the equipment / of the whole installation:

i) information about verifications / tests prior to (first) use

Refer to Section 2, Installation and Operation

ii) detailed information about any special installation requirements for the Type of Protection(s) employed

For flanged joints, inspect with feeler gauge 0,40mm maximum

Use and setting-up;

Ratings such as electrical values, ambient temperatures and pressures, maximum surface temperatures and other limit values related to a designated use are included on the product nameplate photos and in the product data package..

- ***maintenance;***

ii) Information such as cleaning, oil level check or recalibration requirements;

Information on bearing inspection is in the Maintenance Section 3

iii) Requirements for the maintenance of the explosion protection.

Flameproof joints should be inspected during repair and overhaul contact manufacturer for schedule drawings if needed for repair.

- repair

i) Repair should be conducted in accordance with the requirements given in IEC 60079-19

Refer to Repair of Motors used in Hazardous Locations

Information related to the fitting or removal of parts / components; As each motor design is unique, it is necessary to Contact the manufacture for additional repair details. Use only original manufacturer's parts.

ii) information related to the fitting or removal of parts / components

Contact ABB regarding any spare parts.

iii) Information about spare parts

Contact ABB regarding any spare parts.

iv) Requirements for a documentation of such repairs.

As any repair is undertaken after consultation with IEC60079-19, the documentation requirements for the repair in this standard apply.

- taking out of service and dismantling

i) Use appropriate lock out tag out procedures to prevent restart and prior to making or breaking any electrical connection.

- ***where applicable, Specific Conditions of Use according to 29.3 e)***

As Specific Conditions of Use may vary with each certificate, if Specific Conditions are applied, the certificate is shipped with each motor forming part of the Instructions. Refer to Marking and Acceptance section for an explanation of the "X" suffix to certificate numbers.

Clause 30.3 (electrical machines)

In addition to the information required according to 30.1, the following additional information shall be prepared for electrical machines, as applicable:

machines intended to be supplied by a converter

For speed torque information on motors intended to be supplied by converter, consult motor nameplate.

bearing lubrication requirements for both commissioning and maintaining;

Instructions for lubrication are included in the Bearing Maintenance Section. Only use ABB recommended grease or contact ABB Motors and Mechanical Inc., product support team for guidance on equivalents suitable for hazardous locations.

the permitted axial and radial loading of the shaft;

Table 4-1 Table to Address Permissible Radial and Axial Shaft Loads

AC Motors		
Frame Size	Permissible Radial Shaft Load (kN)*	Permissible Axial Shaft Thrust (kN)*
150	0.60	0.67
188	0.70	0.67
210	0.80	0.67
X215TCZ	0.90	0.67
240	0.95	0.67
XRL25OAY	4.30	1.60
XRL25OAY	3.80	1.50
XRL25OAY	11.60	15.00
250	1.00	0.67
0280	1.00	1.00
X286TCZ	1.40	1.00
320	1.60	1.00
X326TCZ	1.70	1.00
350	1.90	1.00
360	2.00	1.00
400	4.50	1.00
440	4.50	3.00
470	4.80	3.00
500	5.00	3.00
580	7.50	4.00
Furnace Fan Ex ec Motors		
Frame Size	Permissible Radial Shaft Load (kN)*	Permissible Axial Shaft Thrust (kN)*
326TY	5.9	2.2
Medium AC Ex d Motors (at 1800 RPM L10 of 100,000 hours)		
Frame Size	Permissible Radial Shaft Load (kN)*	Permissible Axial Shaft Thrust (kN)*
180	.5	--
210	.7	--
250	1.6	--
280	1.8	--
320	2.0	--
360	2.6	--
400	3.3	--
440	2.8	--

DC Motors		
Frame Size	Permissible Radial Shaft Load (kN)*	Permissible Axial Shaft Thrust (kN)*
41-6,9	2.00	1.00
48-9,12	2.00	1.00
51-7,11,15	2.00	1.60
51-9	2.00	1.60

*Permissible shaft loads are for specified frame size mounted horizontally and are calculated for an extended service life of 17,500 operating hours of bearing according to DIN ISO 281. Consult engineering for application specific solutions that require larger permissible shaft loads than those provided in this table. This table assumes pure radial loading for permissible radial shaft loads and pure axial loading for permissible axial shaft thrust.

- ***the thermal expansion of the shaft and housing under rated conditions***

  Maintain minimum clearances necessary to accommodate thermal growth of up to 3mm of the frame and up to 5mm (8mm for Furnace Fan Motor Designs) of the shaft during design operating conditions. Consult engineering for application specific solutions where these minimum clearances are not permissible.

- ***any necessary maintenance of the protection provided by the manufacturer against stray circulating currents in the bearings or shafts.***

  Ensure that the motor is properly earthed and bonded. For motors operated by converter, consult converter manufacturers instructions relative to cable recommendations.

- ***any necessary protection of the bearings from vibration, including during transportation, storage, or standby service;***
  Protection of bearings from vibration during storage and transportation are addressed in General. Bearings requiring blocking are blocked during shipment.

- ***guidance on maintenance and replacement intervals for bearings based on the operating conditions.***

  Instructions for lubrication are included in the Bearing Maintenance Section

INFORMATION REQUIRED PER IEC 60079-1:2014

If it is necessary to repair a flameproof or explosion proof motor, it is critical that the mechanical flameproof joints be maintained. Consult ABB Motors and Mechanical Inc., product support team for flameproof joint construction details. Use only Baldor/Reliance supplied parts. ABB does not recommend reclamation of Baldor/Reliance parts.

1 Hazard messages

This document uses the following criteria for hazard messages based on ANSI standards Z535.6-2011 (R2017).

⚠ DANGER

Serious injury or death will occur if a hazardous situation is not avoided.

⚠ WARNING

Serious injury or death could occur if a hazardous situation is not avoided.

⚠ CAUTION

Minor or moderate injury will or could occur if a hazardous situation is not avoided.

NOTICE

Data loss, property damage, hardware damage, or software damage can occur if a situation is not avoided. There is no credible risk of physical injury.

Physical access

⚠ WARNING

Unauthorized personnel can potentially cause significant damage and/or misconfiguration of end users' equipment. Protect against all intentional or unintentional unauthorized use.

Physical security is an important part of any security program and fundamental to protecting your system. Restrict physical access to protect users' assets. This is true for all systems used within the facility.

1.1 Safety messages

⚠ WARNING

General hazards

Failure to follow these instructions could result in death or serious injury.

Read this manual before working with the product. For personal and system safety, and for optimum product performance, make sure you thoroughly understand the contents before installing, using, or maintaining this product.

Installation and servicing instructions are for use by qualified personnel only. Do not perform any servicing other than that contained in the operating instructions, unless qualified.

Verify the installation is completed safely and is consistent with the operating environment.

Do not substitute factory components with non-factory components. Substitution of components may impair Intrinsic Safety.

Do not perform any services other than those contained in this manual.

Process leaks may result in death or serious injury.

Mishandling products exposed to a hazardous substance may result in death or serious injury.

The electrode compartment may contain line pressure; it must be depressurized before the cover is removed.

If the product being returned was exposed to a hazardous substance as defined by OSHA, a copy of the required Safety Data Sheet (SDS) for each hazardous substance identified must be included with the returned goods.

The products described in this document are NOT designed for nuclear-qualified applications. Using non-nuclear qualified products in applications that require nuclear-qualified hardware or products may cause inaccurate readings. For information on Emerson nuclear-qualified products, contact your local sales representative.

⚠ WARNING

Explosion hazards

Failure to follow these instructions could cause an explosion, resulting in death or serious injury.

If installed in explosive atmospheres (hazardous areas, classified areas, or an “Ex” environment), it must be assured that the device certification and installation techniques are suitable for that particular environment.

Do not remove transmitter covers in explosive atmospheres when the circuit is live. Both transmitter covers must be fully engaged to meet explosion-proof requirements.

Do not disconnect equipment when a flammable or combustible atmosphere is present.

Before connecting a HART-based communicator in an explosive atmosphere, make sure the instruments in the loop are installed in accordance with intrinsically safe or nonincendive field wiring practices.

Do not connect a Rosemount transmitter to a non-Rosemount sensor that is located in an explosive atmosphere. The transmitter has not been evaluated for use with other manufacturers' magnetic flowmeter sensors in hazardous (Ex or Classified) areas. Special care should be taken by the end-user and installer to ensure the transmitter meets the safety and performance requirements of the other manufacturer’s equipment.

Follow national, local, and plant standards to properly earth ground the transmitter and sensor. The earth ground must be separate from the process reference ground.

Flow meters ordered with non-standard paint options or non-metallic labels may be subject to electrostatic discharge. To avoid electrostatic charge build-up, do not rub the flow meter with a dry cloth or clean with solvents.

⚠ WARNING

Electrical hazards

Failure to follow these instructions could cause damaging and unsafe discharge of electricity, resulting in death or serious injury.

Follow national, local, and plant standards to properly earth ground the transmitter and sensor. The earth ground must be separate from the process reference ground.

Disconnect power before servicing circuits.

Allow ten minutes for charge to dissipate prior to removing electronics compartment cover. The electronics may store energy in this period immediately after power is removed.

Avoid contact with leads and terminals. High voltage that may be present on leads could cause electrical shock.

Flow meters ordered with non-standard paint options or non-metallic labels may be subject to electrostatic discharge. To avoid electrostatic charge build-up, do not rub the flow meter with a dry cloth or clean with solvents.

NOTICE

Damage hazards

Failure to follow these instructions could result in damage or destruction of equipment.

The sensor liner is vulnerable to handling damage. Never place anything through the sensor for the purpose of lifting or gaining leverage. Liner damage may render the sensor inoperable.

Metallic or spiral-wound gaskets should not be used as they will damage the liner face of the sensor. If spiral wound or metallic gaskets are required for the application, lining protectors must be used. If frequent removal is anticipated, take precautions to protect the liner ends. Short spool pieces attached to the sensor ends are often used for protection.

Correct flange bolt tightening is crucial for proper sensor operation and life. All bolts must be tightened in the proper sequence to the stated torque specifications. Failure to observe these instructions could result in severe damage to the sensor lining and possible sensor replacement.

In cases where high voltage/high current are present near the meter installation, ensure proper protection methods are followed to prevent stray electricity from passing through the meter. Failure to adequately protect the meter could result in damage to the transmitter and lead to meter failure.

Completely remove all electrical connections from both sensor and transmitter prior to welding on the pipe. For maximum protection of the sensor, consider removing it from the pipeline.

Do not connect mains or line power to the magnetic flow tube sensor or to the transmitter coil excitation circuit.

2 Introduction

2.1 System description

The flowmeter consists of a sensor and a transmitter. The sensor is installed in-line with the process piping; the transmitter can be integrally mounted to the sensor or remotely mounted away from the sensor.

Figure 2-1: Integral field mount transmitter

Figure 2-2: Remote field mount transmitter

There are three Rosemount flow sensors available.

Figure 2-3: 8705 Flanged sensor

Figure 2-4: 8711 Wafer sensor

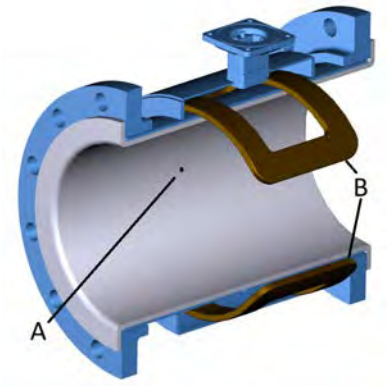

Figure 2-5: 8721 Hygienic sensor

The flow sensor contains two magnetic coils located on opposite sides of the sensor. Two electrodes, located perpendicular to the coils and opposite each other, make contact with the liquid. The transmitter energizes the coils and creates a magnetic field. A conductive liquid moving through the magnetic field generates an induced voltage at the electrodes. This voltage is proportional to the flow velocity. The transmitter converts the voltage detected by the electrodes into a flow reading. A cross-sectional view is show in Figure 2-6.

Figure 2-6: (8705) Sensor cross section

B. Coils

2.2 Product recycling/disposal

Recycling of equipment and packaging should be taken into consideration and disposed of in accordance with local and national legislation/regulations.

3 Sensor Installation

This chapter provides instructions for handling and installing the flow sensor with or without an integrally mounted transmitter.

Related information

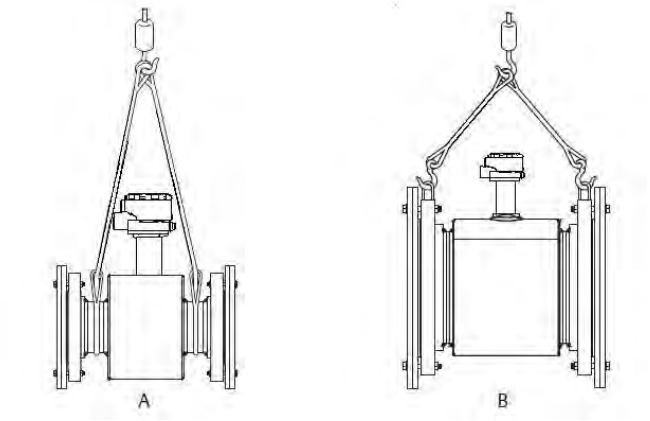
Remote Transmitter Installation

3.1 Handling and Lifting Safety

⚠ CAUTION

To reduce the risk of personal injury or damage to equipment, follow all lifting and handling instructions.

- Handle all parts carefully to prevent damage. Whenever possible, transport the system to the installation site in the original shipping container.
- PTFE-lined sensors are shipped with end covers that protect flange sealing surfaces from both mechanical damage and normal unrestrained distortion. Remove the end covers just before installation.
- Keep the shipping plugs in the conduit ports until you are ready to connect and seal them. Appropriate care should be taken to prevent water ingress.
- The sensor should be supported by the pipeline. Pipe supports are recommended on both the inlet and outlet sides of the sensor pipeline. There should be no additional support attached to the sensor.
- Use proper PPE (Personal Protection Equipment) including safety glasses and safety shoes.
- Do not lift the meter by holding the electronics housing or junction box.
- The sensor liner is vulnerable to handling damage. Never place anything through the sensor for the purpose of lifting or gaining leverage. Liner damage can render the sensor useless.
- Do not drop the device from any height.



3.1.1 Lifting lugs

⚠ CAUTION

If provided, use the lifting lugs on each flange to handle the flow meter when it is transported and lowered into place at the installation site. If lifting lugs are not provided, the flow meter must be supported with a lifting sling on each side of the housing.

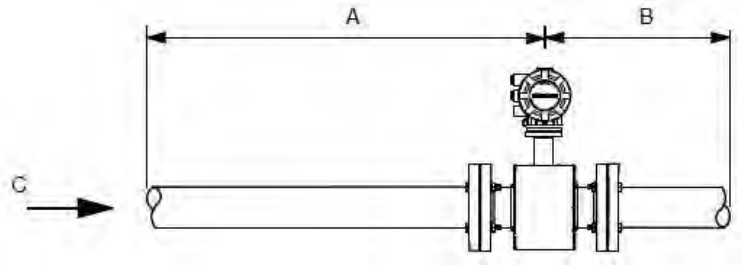
- Standard pressure 3 inch through 36 inch flanged magnetic flow meters come with lifting lugs.
- High pressure (above 600#) 1 inch through 24 inch flanged magnetic flow meters come with lifting lugs.
- Wafers and sanitary magnetic flow meters do not come with lifting lugs.

Figure 3-1: Example lifting without and with lifting lugs

A. Without lifting lugs
B. With lifting lugs

3.2 Location and Position

3.2.1 Environmental considerations



To ensure maximum transmitter life, avoid extreme temperatures and excessive vibration. Typical problem areas include the following:

- High-vibration lines with integrally mounted transmitters
- Tropical/desert installations in direct sunlight
- Outdoor installations in arctic climates

3.2.2 Upstream and downstream piping

To ensure specified accuracy over widely varying process conditions, it is recommended to install the sensor with a minimum of five straight pipe diameters upstream and two pipe diameters downstream from the electrode plane.

Figure 3-2: Upstream and downstream straight pipe diameters

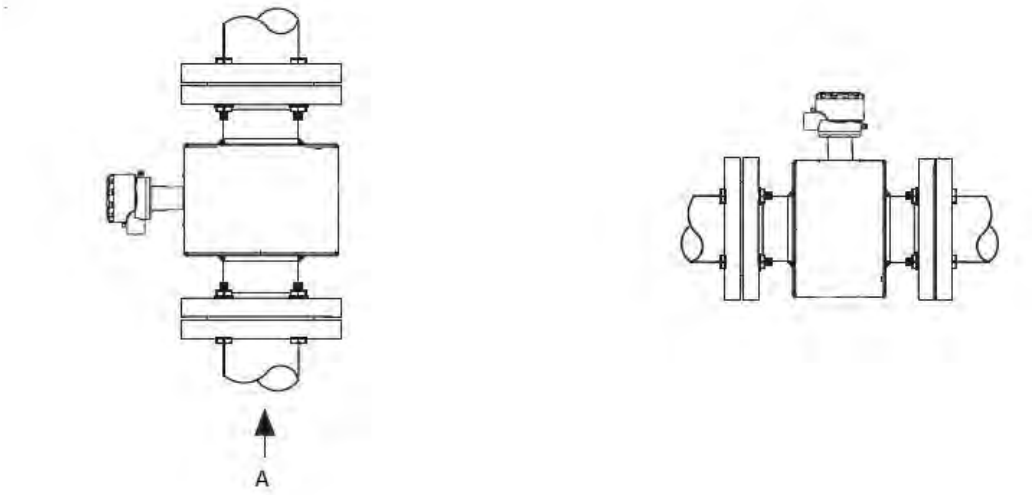
A. Five pipe diameters (upstream)
B. Two pipe diameters (downstream)
C. Flow direction

Installations with reduced upstream and downstream straight runs are possible. In reduced straight run installations, the meter may not meet accuracy specifications. Reported flow rates will still be highly repeatable.

3.2.3 Flow direction

The sensor should be mounted so that the arrow points in the direction of flow.

Figure 3-3: Flow direction arrow

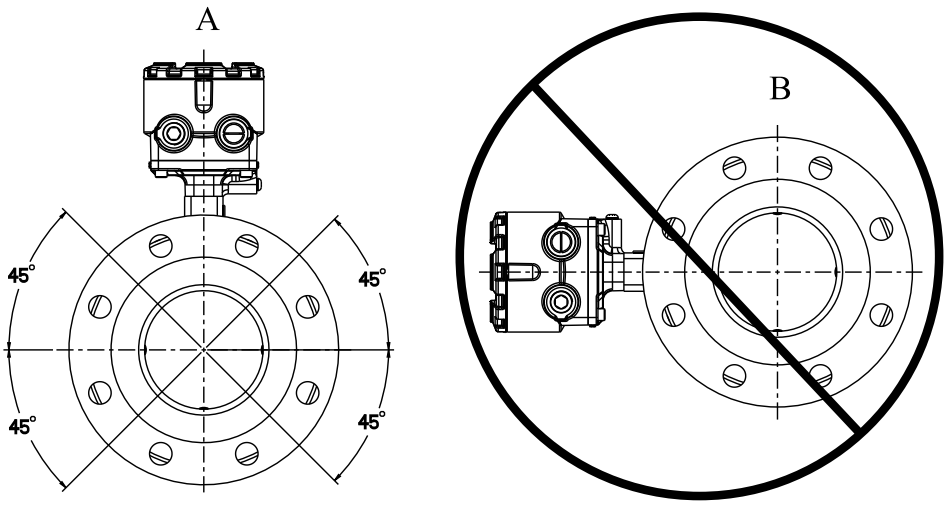


3.2.4 Sensor piping location and orientation

The sensor should be installed in a location that ensures it remains full during operation. Depending on where it is installed, orientation must also be considered.

- Vertical installation with upward process fluid flow keeps the cross-sectional area full, regardless of flow rate.
- Horizontal installation should be restricted to low piping sections that are normally full.

Figure 3-4: Sensor orientation



A. Flow direction

3.2.5 Transmitter or remote junction box rotation

To rotate housing, disconnect the interconnecting cables from the electronics board inside the transmitter housing prior to rotation.

3.2.6 Electrode orientation

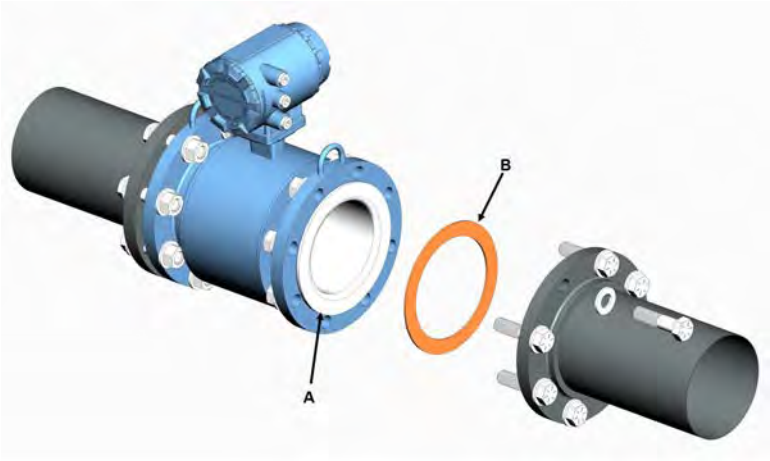
The electrodes in the sensor are properly oriented when the two measurement electrodes are in the 3 and 9 o'clock positions or within 45 degrees from the horizontal, as shown on the left side of Figure 3-5. Avoid any mounting orientation that positions the top of the sensor at 90 degrees from the vertical position as shown on the right of Figure 3-5.

A. Correct orientation
B. Incorrect orientation

The sensor may require a specific orientation to comply with Hazardous Area T-code rating. Refer to the appropriate reference manual for any potential restrictions.

3.3 Sensor Installation

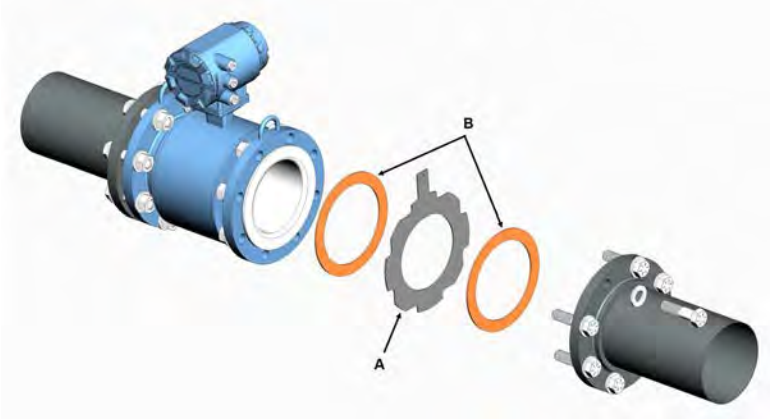
3.3.1 Flanged sensors



Gaskets

- It is the responsibility of the customer to provide an appropriate gasket for their installation.
- The gasket material must be compatible with the process fluid and process conditions. See note below for more information regarding suitable gasket materials.
- If no ground rings or lining protectors are being used, a gasket is required at each process connection. See Figure 3-6.
- If using grounding ring(s), a gasket is required on each side of each grounding ring. See Figure 3-7.
- If using lining protectors, a gasket is required between each lining protector and each process connection. See Figure 3-8 and Figure 3-9.

Note



- Metallic or spiral wound gaskets should not be used in contact with the liner face. **They will damage the liner face**. If metallic or spiral wound gaskets are required for the application, then lining protectors must be used.
- Examples of non-metallic gasket materials that will not damage the liner face are rubber, fiber, or PTFE.
- Flat ring gasket types are suitable for raised-face (RF) flanges. Full-face gasket types are suitable for flat-face (FF) flanges. Full-face gaskets may be used with raised-face flanges.

Figure 3-6: Flanged Gasket Placement with no Grounding Ring(s) or Lining Protector(s)

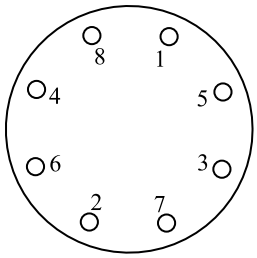
B. Customer supplied gasket (x1 per lining protector)
C. Lining protector fastening screws — DO NOT REMOVE the screws or the lining protector.

Figure 3-9: Flanged Gasket Placement with Machined Stamped Lining Protector(s)

A. Machined lining protector
B. Customer supplied gasket (x1 per lining protector)
C. Lining protector fastening screws — DO NOT REMOVE the screws or the lining protector.

Bolts

Note
Do not bolt one side at a time. Tighten both sides simultaneously. Example:



1. Snug upstream
2. Snug downstream
3. Tighten upstream (20%)
4. Tighten downstream (20%)

Do not snug and tighten the upstream side and then snug and tighten the downstream side. Failure to alternate between the upstream and downstream flanges when tightening bolts may result in liner damage.

Suggested torque values by sensor line size and liner type are listed in Table 3-2 for ASME B16.5 flanges and Table 3-3 or Table 3-4 for EN flanges. Consult the factory if the flange rating of the sensor is not listed. Tighten flange bolts on the upstream side of the sensor in the incremental sequence shown in Figure 3-10 to 20% of the suggested torque values. Repeat the process on the downstream side of the sensor. For sensors with greater or fewer flange bolts, tighten the bolts in a similar crosswise sequence. Repeat this entire tightening sequence at 40%, 60%, 80%, and 100% of the suggested torque values.

If leakage occurs at the suggested torque values, the bolts can be tightened in additional 10% increments until the joint stops leaking, or until the measured torque value reaches the maximum torque value of the bolts. Practical consideration for the integrity of the liner often leads to distinct torque values to stop leakage due to the unique combinations of flanges, bolts, gaskets, and sensor liner material.

Check for leaks at the flanges after tightening the bolts. Failure to use the correct tightening methods can result in severe damage. While under pressure, sensor materials may deform over time and require a second tightening 24 hours after the initial installation.

Prior to installation, identify the lining material of the flow sensor to ensure the suggested torque values are applied.

3.3.2 Wafer sensors

When installing wafer sensors, there are several components that must be included and requirements that must be met.

Figure 3-11: Wafer sensors installation components and assembly requirements

A. Ground ring (optional)
B. Customer supplied gaskets
C. Spacer installation (horizontal meters)
D. Spacer installation (vertical meters)
E. O-ring
F. Installation studs, nuts, and washers (optional)
G. Wafer alignment spacer
H. Flow

Gaskets

The sensor requires a gasket at each process connection. The gasket material selected must be compatible with the process fluid and operating conditions. Gaskets are required on each side of a grounding ring. See Figure 3-11.

Note
Metallic or spiral-wound gaskets should not be used as they will damage the liner face of the sensor.

Alignment spacers

On 1.5 inch through 8 inch (40 through 200 mm) line sizes, alignment spacers are **required** to ensure proper centering of the wafer sensor between the process flanges. To order an Alignment Spacer Kit (quantity 3 spacers), use p/n 08711-3211-xxxx, where xxxx equals the dash number shown in Table 3-5.

Table 3-5: Alignment spacers

Dash-no. (-xxxx)	Line size		Flange rating
	(in)	(mm)	
0A15	1.5	40	JIS 10K-20K

RA80	8	200	AS40871-PN16
RC20	2	50	AS40871-PN21/35
RC30	3	80	AS40871-PN21/35
RC40	4	100	AS40871-PN21/35
RC60	6	150	AS40871-PN21/35
RC80	8	200	AS40871-PN21/35

Studs

Wafer sensors require threaded studs. See Figure 3-12 for torque sequence. Always check for leaks at the flanges after tightening the flange bolts. All sensors require a second tightening 24 hours after initial flange bolt tightening.

Table 3-6: Stud specifications

Nominal sensor size	Stud specifications
0.15–1-in. (4–25 mm)	316 SST ASTM A193, Grade B8M, Class 1 threaded mounted studs
1½–8-in. (40–200 mm)	CS, ASTM A193, Grade B7, threaded mounting studs

Installation

Procedure

1. Insert studs for the bottom side of the sensor between the pipe flanges and center the alignment spacer in the middle of the stud. See Figure 3-11 for the bolt hole locations recommended for the spacers provided. Stud specifications are listed in Table 3-6.
2. Place the sensor between the flanges. Make sure the alignment spacers are properly centered on the studs. For vertical flow installations slide the o-ring over the stud to keep the spacer in place. See Figure 3-11. Ensure the spacers match the flange size and class rating for the process flanges. See Table 3-5.
3. Insert the remaining studs, washers, and nuts.
4. Tighten to the torque specifications shown in Table 3-7. Do not over-tighten the bolts or the liner may be damaged.

Table 3-7: Rosemount 8711 torque specifications

Size code	Line size	Pound-feet	Newton-meter
15F	0.15 inch (4 mm)	5	7
30F	0.30 inch (8 mm)	5	7
005	½ inch (15 mm)	5	7
010	1 inch (25 mm)	10	14
015	1.5 inch (40 mm)	15	20
020	2 inch (50 mm)	25	34
030	3 inch (80 mm)	40	54
040	4 inch (100 mm)	30	41
060	6 inch (150 mm)	50	68
080	8 inch (200 mm)	70	95

3.3.3 Sanitary sensors

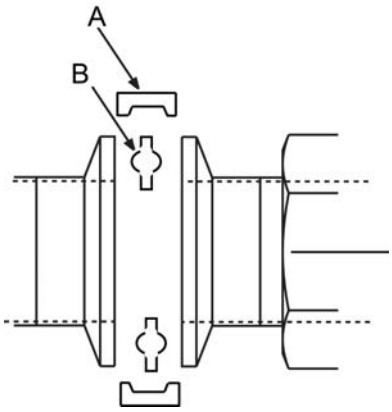
IDF Fitting

The 8721 uses an IDF (international dairy federation) style fitting to connect the process connection fitting to the meter body.

IDF Sanitary fitting torque

Hand tighten IDF nut to approximately 50 in-lbs [5 ½ Newton-meters (N-m)] of torque. Re-tighten after a few minutes until there are no leaks (up to 130 in-lbs [14 ½ Newton-meters (N-m)] of torque). Fittings that continue to leak at a higher torque may be distorted or damaged.

Note
Gaskets are supplied between the IDF fitting and the process connection fitting, such as a Tri-Clamp fitting, on all Rosemount 8721 Sanitary sensors except when the process connection fittings are not supplied and the only connection type is an IDF fitting.



Gaskets

The sensor requires a gasket at each of its connections to adjacent devices or piping. The gasket material selected must be compatible with the process fluid and operating conditions.

Alignment and clamping of user-supplied clamp

Standard plant practices should be followed when installing a magmeter with sanitary fittings. Unique torque values and bolting techniques are not required.

Figure 3-13: Sanitary sensor gasket and clamp alignment

A. User-supplied clamp
B. User-supplied gasket

3.4 Process reference connection

The figures shown in this section illustrate best practice installations for process reference connections only. For installations in conductive, unlined pipe it may be acceptable to use one ground ring or one lining protector to establish a process reference connection. Earth safety ground is also required as part of this installation, but is not shown in the figures. Follow national, local, and plant electrical codes for safety ground.

Use Table 3-8 to determine which process reference option to follow for proper installation.

Table 3-8: Process reference options

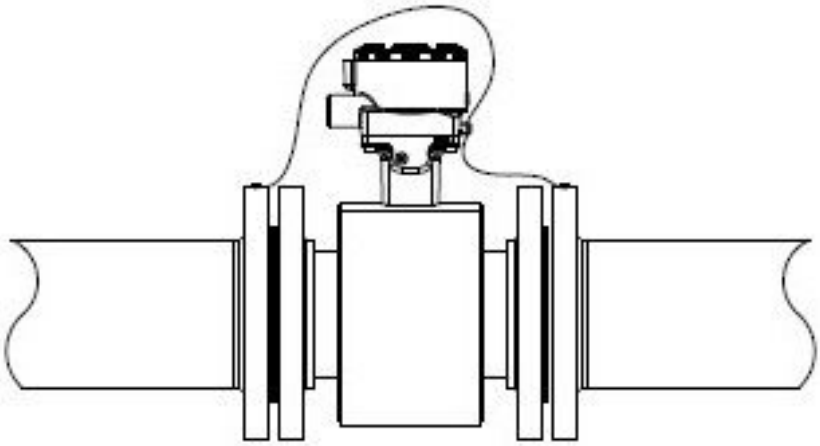
Type of pipe	Grounding straps	Grounding rings	Reference electrode	Lining protectors
Conductive unlined pipe	See Figure 3-14	See Figure 3-15	See Figure 3-17	See Figure 3-15

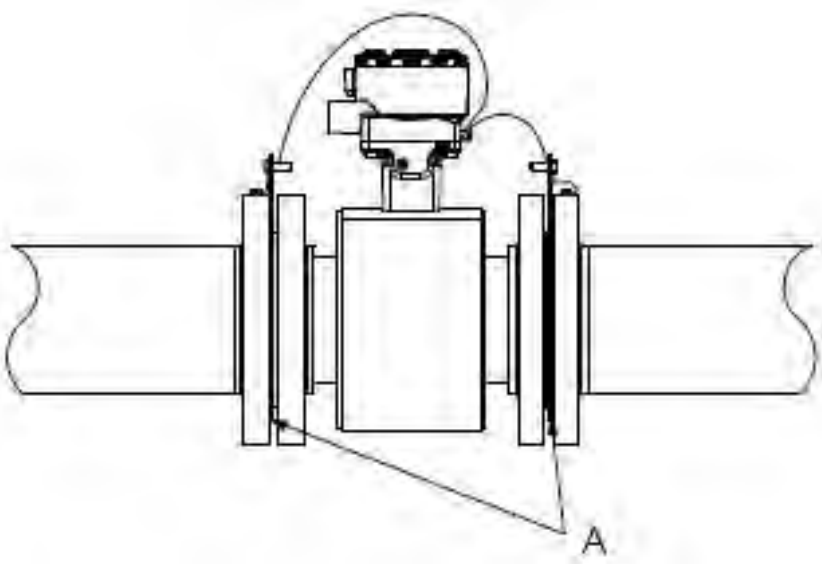
Table 3-8: Process reference options *(continued)*

Type of pipe	Grounding straps	Grounding rings	Reference electrode	Lining protectors
Conductive lined pipe	Insufficient grounding	See Figure 3-15	See Figure 3-14	See Figure 3-15
Non-conductive pipe	Insufficient grounding	See Figure 3-16	Not recommended	See Figure 3-16

Note
For line sizes 10-inch and larger, the ground strap may come attached to the sensor body near the flange. See Figure 3-18.

Figure 3-14: Grounding straps in conductive unlined pipe or reference electrode in lined pipe





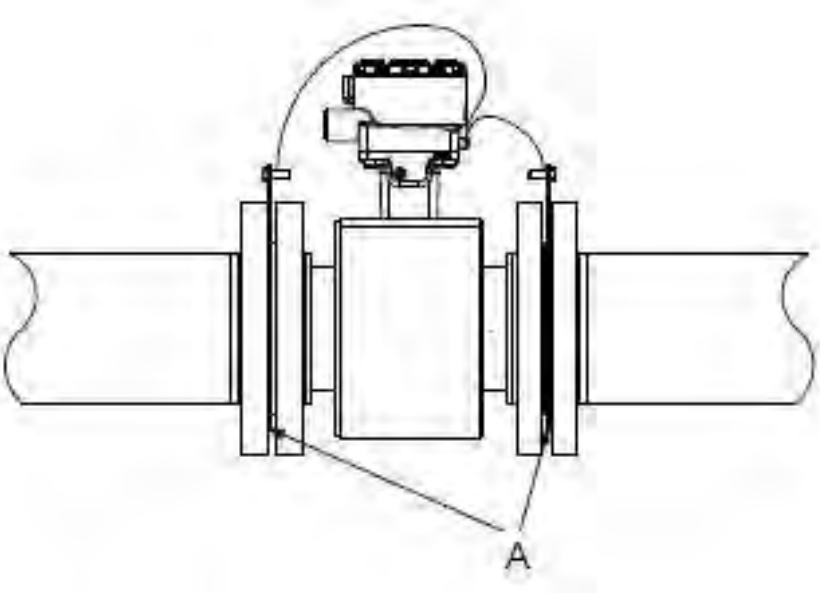


Figure 3-15: Grounding with grounding rings or lining protectors in conductive pipe

A. Grounding rings or lining protectors

Figure 3-16: Grounding with grounding rings or lining protectors in non-conductive pipe

4 Remote Transmitter Installation

This chapter provides instructions for installing and wiring a remotely mounted transmitter.

Related information

Sensor Installation

4.1 Pre-installation

Before installing the transmitter, there are several pre-installation steps that should be completed to make the installation process easier:

- Identify options and configurations that apply to your application
- Set the hardware switches if necessary
- Consider mechanical, electrical, and environmental requirements

Note
Refer to Product specifications for more detailed requirements.

Identify options and configurations

The typical transmitter installation includes a device power connection, a 4-20mA output connection, and sensor coil and electrode connections. Other applications may require one or more of the following configurations or options

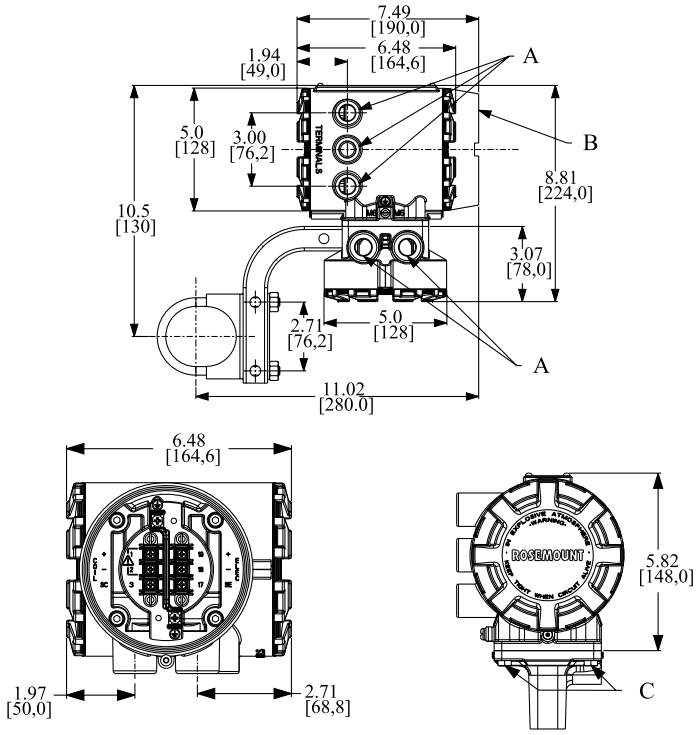
- Pulse output
- Discrete input/discrete output
- HART multidrop configuration

Hardware switches

The transmitter may have up to four user-selectable hardware switches. These switches set the alarm mode, internal/external analog power, internal/external pulse power, and transmitter security. The standard configuration for these switches when shipped from the factory is as follows:

Table 4-1: Hardware switch default settings

Setting	Factory configuration
Alarm mode	High
Internal/external analog power	Internal
Internal/external pulse power	External
Transmitter security	Off



The analog power switch and pulse power switches are not available when ordered with intrinsically safe output, ordering code B.

In most cases, it is not necessary to change the setting of the hardware switches. If the switch settings need to be changed, refer to Hardware switches.

Be sure to identify any additional options and configurations that apply to the installation. Keep a list of these options for consideration during the installation and configuration procedures.

Mechanical considerations

The mounting site for the transmitter should provide enough room for secure mounting, easy access to conduit entries, full opening of the transmitter covers, and easy readability of the Local Operator Interface (LOI) screen (if equipped).

A. Conduit entry ½–14 NPT or M20
B. LOI cover
C. Mounting screws

Electrical considerations

Before making any electrical connections to the transmitter, consider national, local, and plant electrical installation requirements. Be sure to have the proper power supply, conduit, and other accessories necessary to comply with these standards.

The transmitter requires external power. Ensure access to a suitable power source.

Table 4-2: Electrical Data

Rosemount 8732EM Flow Transmitter	
Power input	AC power: 90–250VAC, 0.45A, 40VA
	Standard DC power: 12–42VDC, 1.2A, 15W
	Low power DC: 12–30VDC, 0.25A, 3W

Table 4-2: Electrical Data *(continued)*

Rosemount 8732EM Flow Transmitter	
Pulsed circuit	Internally powered (Active): Outputs up to 12VDC, 12.1mA, 73mW Externally powered (Passive): Input up to 28VDC, 100mA, 1W
4-20mA output circuit	Internally Powered (Active): Outputs up to 25mA, 24VDC, 600mW Externally Powered (Passive): Input up to 25mA, 30VDC, 750mW
Um	250V
Coil excitation output	500mA, 40V max, 9W max

Environmental considerations

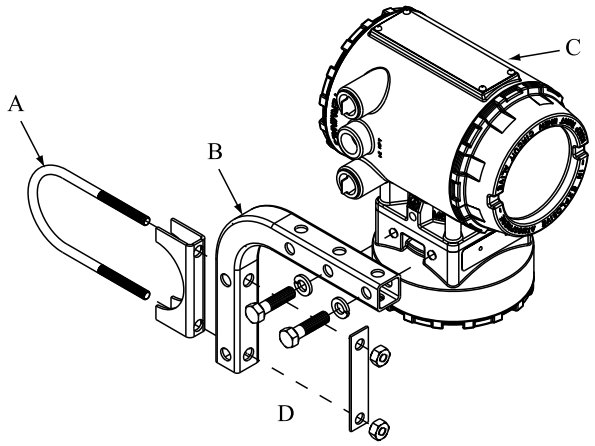
To ensure maximum transmitter life, avoid extreme temperatures and excessive vibration. Typical problem areas include the following:

- High-vibration lines with integrally mounted transmitters
- Tropical or desert installations in direct sunlight
- Outdoor installations in arctic climates

Remote mounted transmitters may be installed in the control room to protect the electronics from the harsh environment and to provide easy access for configuration or service.

Table 4-3: Transmitter housing environmental ratings

Type	**Rating**
Ingress protection	IP66, IP69
NEMA	4X
Pollution Degree	2
Maximum altitude rating	• 13,123 ft (4000 m) at rated input power voltage (90–250 VAC) • 16,404 ft (5000 m) at maximum input power voltage of 150 VAC



Note
For complete environmental and other specifications, see Product specifications.

4.2 Transmitter symbols

Caution symbol — check product documentation	
	

4.3 Mounting

Remote-mount transmitters are shipped wth a mounting bracket for use on a 2-in. pipe or a flat surface.

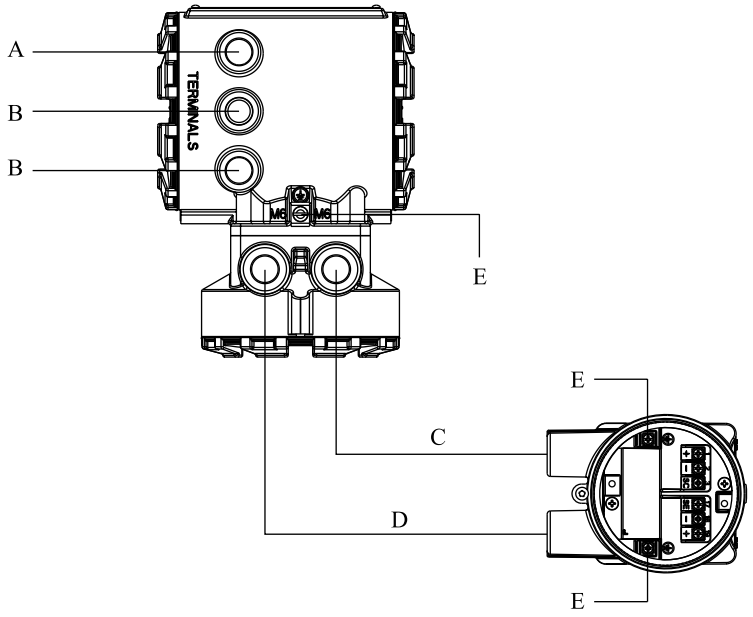
A. U-bolt
B. Mounting bracket
C. Transmitter
D. Fasteners (example configuration)

Procedure

1. Assemble the hardware as needed to accommodate the mounting configuration.
2. Secure the transmitter to the mounting hardware.

Postrequisites

The LOI/Display can be rotated in 90 degree increments up to 180 degrees if desired. Do not rotate more than 180 degrees in any one direction.



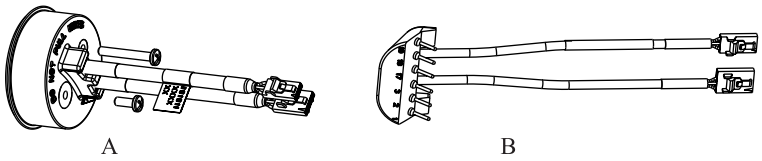
4.4 Wiring

4.4.1 Conduit entries and connections

Transmitter conduit entry ports can be ordered with ½"-14NPT or M20 female threaded connections. Conduit connections should be made in accordance with national, local, and plant electrical codes. Unused conduit entries should be sealed with the appropriate certified plugs. The plastic shipping plugs do not provide ingress protection.

4.4.2 Conduit requirements

- For installations with an intrinsically safe electrode circuit, a separate conduit for the coil cable and the electrode cable may be required. Refer to Product certifications.
- For installations with non-intrinsically safe electrode circuit, or when using the combination cable, a single dedicated conduit run for the coil drive and electrode cable between the sensor and the remote transmitter may be acceptable. Removal of the barriers for intrinsic safety isolation is permitted for non-intrinsically safe electrode installations.
- Bundled cables from other equipment in a single conduit are likely to create interference and noise in the system. See Figure 4-3.
- Electrode cables should not be run together in the same cable tray with power cables.
- Output cables should not be run together with power cables.
- Select conduit size appropriate to feed cables through to the flowmeter.



A. Power
B. Output
C. Coil
D. Electrode
E. Safety ground

4.4.3 Sensor to transmitter wiring

Integral mount transmitters

Integral mount transmitters ordered with a sensor will be shipped assembled and wired at the factory using an interconnecting cable. Use only the factory supplied cable provided

with the instrument. For replacement transmitters use the existing interconnecting cable from the original assembly. Replacement cables, if applicable, are available (see Figure 4-4).

A. Socket module 08732-CSKT-0001
B. IMS cable 08732-CSKT-0004

Remote mount transmitters

Remote cable kits are available as individual component cables or as a combination coil/electrode cable. They can be ordered directly using the kit numbers shown in Table 4-4, Table 4-5, and Table 4-6. Equivalent Alpha cable part numbers are also provided as an alternative. To order cable, specify length as quantity desired. Equal length of component cables is required.

Examples:

- 25 feet = Qty (25) 08732-0065-0001
- 25 meters = Qty (25) 08732-0065-0002

Table 4-4: Component cable kits - standard temperature (-20°C to 75°C)

Cable kit #	Description	Individual cable	Alpha p/n
08732-0065-0001 (feet)	Kit, component cables, Std temp (includes Coil and Electrode)	Coil Electrode	2442C 2413C
08732-0065-0002 (meters)	Kit, component cables, Std temp (includes Coil and Electrode)	Coil Electrode	2442C 2413C
08732-0065-0003 (feet)	Kit, component cables, Std temp (includes Coil and I.S. Electrode)	Coil Instrinsically Safe Blue Electrode	2442C Not available
08732-0065-0004 (meters)	Kit, component cables, Std temp (includes Coil and I.S. Electrode)	Coil Instrinsically Safe Blue Electrode	2442C Not available

Table 4-5: Component cable kits - extended temperature (-50°C to 125°C)

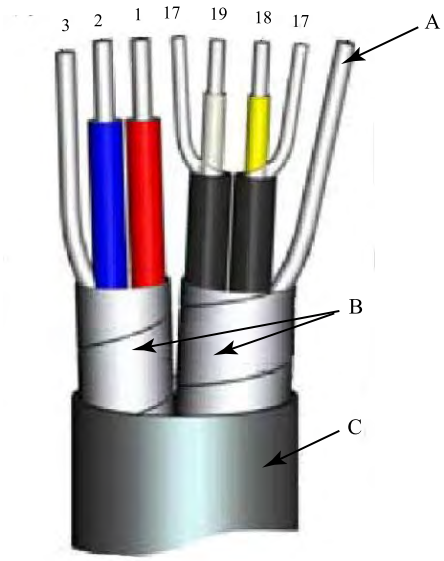
08732-0065-1004 (meters)	Kit, Component Cables, Ext Temp. (includes Coil and I.S. Electrode)	Coil Intrinsically Safe Blue Electrode	Not available Not available

Table 4-6: Combination cable kits - coil and electrode cable (-20°C to 80°C)

Cable kit #	Description
08732-0065-2001 (feet)	Kit, Combination Cable, Standard
08732-0065-2002 (meters)	
08732-0065-3001 (feet)	Kit, Combination Cable, Submersible (80°C dry/60°C Wet) (33ft Continuous)
08732-0065-3002 (meters)	

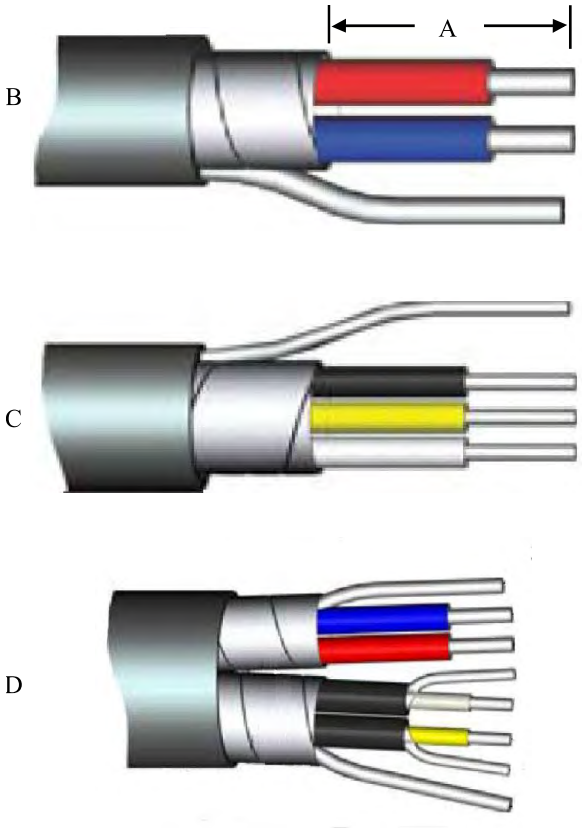


Cable requirements

Shielded twisted pairs or triads must be used. For installations using the individual coil drive and electrode cable, see Figure 4-5. Cable lengths should be limited to less than 500 feet (152 m). Consult factory for length between 500–1000 feet (152–304 m). Equal length cable is required for each. For installations using the combination coil drive/electrode cable, see Figure 4-6. Combination cable lengths should be limited to less than 330 feet (100 m).

A. Coil drive
B. Electrode
C. Twisted, stranded, insulated 14 AWG conductors
D. Drain
E. Overlapping foil shield
F. Outer jacket
G. Twisted, stranded, insulated 20 AWG conductors

- 1 = Red
- 2 = Blue
- 3 = Drain
- 17 = Black
- 18 = Yellow
- 19 = White



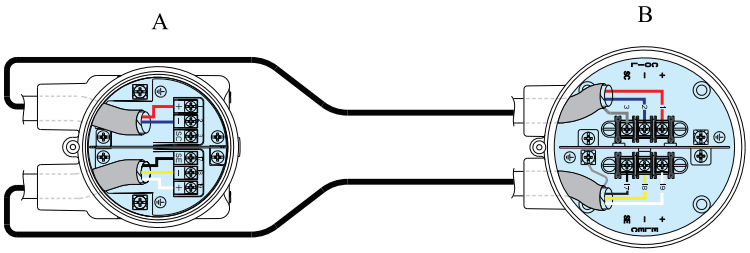
A. Electrode shield drain
B. Overlapping foil shield
C. Outer jacket

- 1 = Red
- 2 = Blue
- 3 = Drain
- 17 = Reference
- 18 = Yellow
- 19 = White

Cable preparation

Prepare the ends of the coil drive and electrode cables as shown in Figure 4-7. Remove only enough insulation so that the exposed conductor fits completely under the terminal connection. Best practice is to limit the unshielded length (D) of each conductor to less than one inch. Excessive removal of insulation may result in an unwanted electrical short to the transmitter housing or other terminal connections. Excessive unshielded length, or failure to connect cable shields properly, may also expose the unit to electrical noise, resulting in an unstable meter reading.

A. Unshielded length
B. Coil
C. Electrode
D. Combination



⚠ WARNING

Shock hazard! Potential shock hazard across remote junction box terminals 1 and 2 (40V).

⚠ WARNING

Explosion hazard! Electrodes exposed to process. Use only compatible transmitter and approved installation practices. For process temperatures greater than 284°F (140°C), use a wire rated for 257°F (125°C).

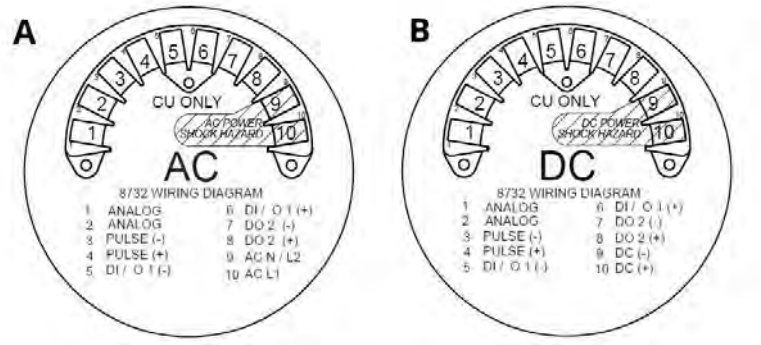
Remote junction box terminal blocks

A. Sensor
B. Transmitter

Note
Junction box appearance and configuration may vary, but terminal numbering is consistent for all junction box types.

Table 4-7: Sensor/transmitter wiring

Wire color	Sensor terminal	Transmitter terminal
Red	1	1
Blue	2	2
Coil drain	3 or float	3
Black	17	17
Yellow	18	18
White	19	19
	⏚	⏚



Note
For hazardous locations, refer to Product certifications.

4.4.4 Power and I/O terminal blocks

Remove the back cover of the transmitter to access the terminal block.

Note
To connect pulse output and/or discrete input/output, and for installations with intrinsically safe outputs, refer to Product certifications.

Figure 4-9: Terminal blocks

A. AC version
B. DC version

Table 4-8: Power and I/O terminals

Terminal number	AC version	DC version
1	Analog (mA output)	Analog (mA output)
2	Analog (mA output)	Analog (mA output)
3	Pulse (–)	Pulse (–)
4	Pulse (+)	Pulse (+)
5(1)	Discrete I/O 1 (–)	Discrete I/O 1 (–)
6(1)	Discrete I/O 1 (+)	Discrete I/O 1 (+)
7(1)	Discrete Out 2 (–)	Discrete Out 2 (–)
8(1)	Discrete Out 2 (+)	Discrete Out 2 (+)
9	AC (Neutral)/L2	DC (–)
10	AC L1	DC (+)

(1) Only available with ordering code AX.

4.4.5 Powering the transmitter

Before connecting power to the transmitter, be sure to have the necessary electrical supplies and required power source:

- The AC powered transmitter requires 90–250V AC (50/60Hz).
- The DC (standard) powered transmitter requires 12–42V DC.
- The DC **low power** transmitter requires 12–30V DC.

Wire the transmitter according to national, local, and plant electrical requirements.

If installing in a hazardous location, verify that the meter has the appropriate hazardous area approval. Each meter has a hazardous area approval tag attached to the top of the transmitter housing.

Supply wire requirements

Use 10–18 AWG wire rated for the proper temperature of the application. For wire 10–14 AWG, use lugs or other appropriate connectors. For connections in ambient temperatures above 122 °F (50 °C), use a wire rated for 194 °F (90 °C). For DC powered transmitters with extended cable lengths, verify that there is a minimum of 12 VDC at the terminals of the transmitter with the device under load.

Electrical disconnect requirements

Connect the device through an external disconnect or circuit breaker per national and local electrical code.

Overcurrent protection

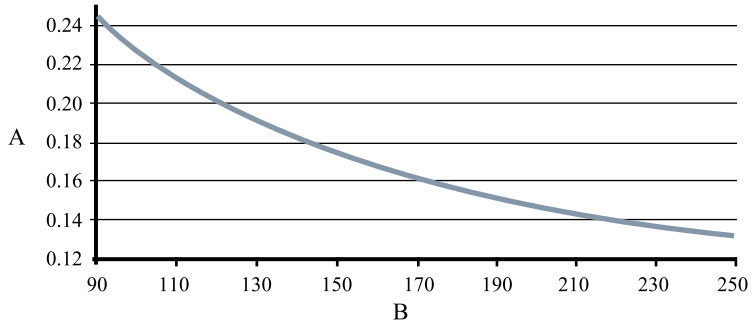
The transmitter requires overcurrent protection of the supply lines. Fuse rating and compatible fuses are shown in Line power fuses.

Installation category

The installation category for the transmitter is OVERVOLTAGE CAT II.

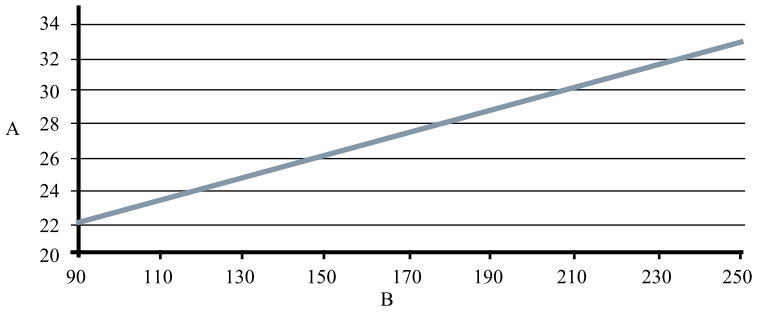
AC power system installation requirements

Neutral-earth power requirements



The power system must have a neutral that is locally bonded to earth, or provide both line to earth and neutral to earth voltage limitation of no more than 250 VAC.

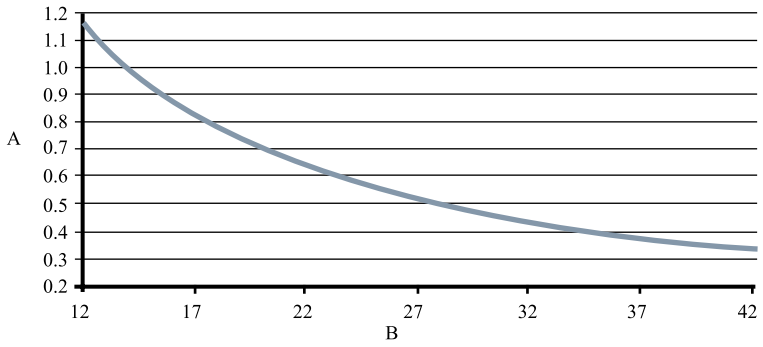
Power line impedance



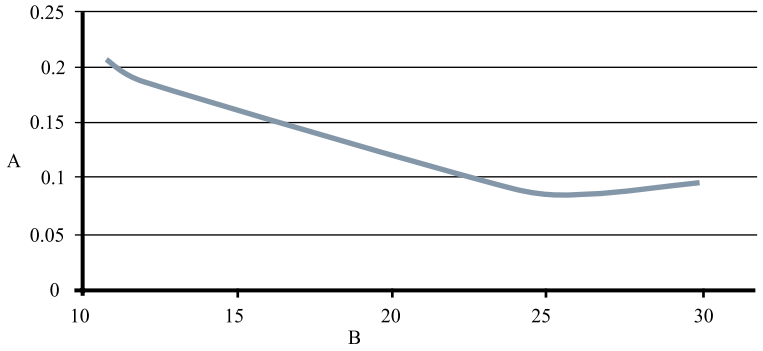
Sources of inductance on the AC power system, such as isolation transformers, must be limited to less than 1 mH at 120 VAC, and 2 mH at 240 VAC.

AC power supply requirements

Units powered by 90 - 250VAC have the following power requirements. Peak inrush is 35.7A at 250VAC supply, lasting approximately 1ms. Inrush for other supply voltages can be estimated with: Inrush (Amps) = Supply (Volts) / 7.0



A. Supply current (amps)
B. Power supply (VAC)



A. Apparent power (VA)
B. Power supply (VAC)

DC power supply requirements

Standard DC units powered by 12VDC power supply may draw up to 1.2A of current steady state. Low power DC units may draw up to 0.25A of current steady state. Peak inrush is 42A at 42VDC supply, lasting approximately 1ms. Inrush for other supply voltages can be estimated with: Inrush (Amps) = Supply (Volts) / 1.0

A. Supply current (amps)
B. Power supply (VDC)

A. Supply current (amps)
B. Power supply (VDC)

Table 4-9: Fuse requirements

Power system	Power supply	Fuse rating	Manufacturer
AC power	90–250VAC	2 Amp quick acting	Bussman AGC2 or equivalent
DC power	12–42VDC	3 Amp quick acting	Bussman AGC3 or equivalent
DC low power	12–30VDC	3 Amp quick acting	Bussman AGC3 or equivalent

Power terminals

For AC powered transmitter (90–250VAC, 50/60 Hz):

- Connect AC Neutral to terminal 9 (AC N/L2) and AC Line to terminal 10 (AC/L1).

For DC powered transmitter:

- Connect negative to terminal 9 (DC -) and positive to terminal 10 (DC +).
- DC powered units may draw up to 1.2A.

Cover jam screw

For flow meters shipped with a cover jam screw, the screw should be installed after the instrument has been wired and powered up. Follow these steps to install the cover jam screw:

1. Verify the cover jam screw is completely threaded into the housing.
2. Install the housing cover and verify the cover is tight against the housing.
3. Using a 2.5 mm hex wrench, loosen the jam screw until it contacts the transmitter cover.
4. Turn the jam screw an additional ½ turn counterclockwise to secure the cover.

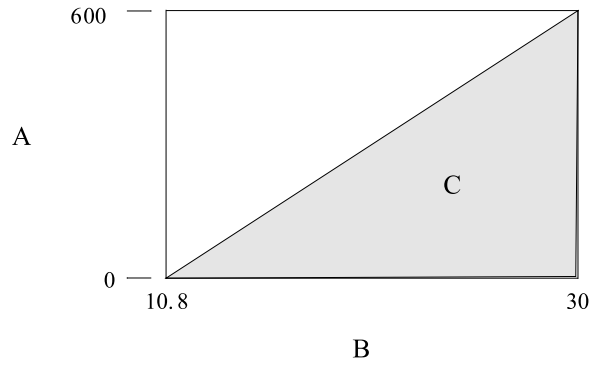
   Note
   Application of excessive torque may strip the threads.

5. Verify the cover cannot be removed.

4.4.6 Analog output

The analog output signal is a 4-20 mA current loop. Depending on the IS output option, the loop can be powered internally or externally via a hardware switch located on the front of the electronics stack. The switch is set to internal power when shipped from the factory. For units with a display, the LOI must be removed to change switch position. Intrinsically safe analog output requires a shielded twisted pair cable. For HART communication, a minimum resistance of 250 ohms is required. It is recommended to use individually shielded twisted pair cable. The minimum conductor size is 24 AWG (0.51 mm) diameter for cable runs less than 5,000 feet (1,500 m) and 20 AWG (0.81 mm) diameter for longer distances.

Note
For more information about the analog output characteristics, see Output signals.



A. Terminal #2
B. Terminal #1

Table 4-10: Terminal assignment by power source type

Power source	Terminal #1	Terminal #2
Internal	4–20 mA negative (–)	4–20 mA positive (+)
External	4–20 mA positive (+)	4–20 mA negative (–)

Table 4-11: Terminal assignment by power source type

Power source	Terminal #7	Terminal #8
Internal	4–20 mA negative (–)	4–20 mA positive (+)
External	4–20 mA positive (+)	4–20 mA negative (–)

A. Load (ohms)
B. Power supply (volts)
C. Operating region

- R_{max} = 31.25 (V_{ps}–10.8)
- V_{ps} = power supply voltage (volts)
- R_{max} = maximum loop resistance (ohms)

5 Basic Configuration

Once the flow meter is installed and power has been supplied, the transmitter must be configured using the LOI, if equipped, or a configuration tool, such as ProLink III Software, AMS Device Manager, or AMS Trex Device Communicator. Configuration settings are saved in nonvolatile memory within the transmitter. Descriptions of more advanced functions are included in Advanced Configuration Functionality.

5.1 Cover jam screw

For flow meters shipped with a cover jam screw, the screw should be installed after the instrument has been wired and powered up. Follow these steps to install the cover jam screw:

Procedure

1. Verify the cover jam screw is completely threaded into the housing.
2. Install the housing cover and verify the cover is tight against the housing.
3. Using a 2.5 mm hex wrench, loosen the jam screw until it contacts the transmitter cover.
4. Turn the jam screw an additional ½ turn counterclockwise to secure the cover.

   Note
   Application of excessive torque may strip the threads.

5. Verify the cover cannot be removed.

5.2 Basic Setup

Tag

Tag is the quickest and shortest way of identifying and distinguishing between transmitters. Transmitters can be tagged according to the requirements of your application. HART Rev 5 supports 8 character short tag. HART Rev 7 supports 8 character short tag and 32 character long tag.

Calibration number

The sensor calibration number is a 16-digit number generated at the factory during flow calibration, is unique to each sensor, and is located on the sensor nameplate.

Flow units (PV)

The flow units variable specifies the format in which the flow rate will be displayed. Units should be selected to meet your particular metering needs. See Measurement units.

Line size

The line size (sensor size) must be set to match the actual sensor connected to the transmitter. The size must be specified in inches.

Upper range value (URV)

The URV sets the 20 mA point for the analog output. This value is typically set to full-scale flow. The units that appear will be the same as those selected under the flow units

parameter. The URV may be set between –39.3 ft/s to 39.3 ft/s (–12 m/s to 12m/s). There must be at least 1 ft/s (0.3 m/s) span between the URV and LRV.

Note
If entering a negative number, the minus sign must be entered in the furthest left position on the LOI.

Lower range value (LRV)

The LRV sets the 4 mA point for the analog output. This value is typically set to zero flow. The units that appear will be the same as those selected under the flow units parameter. The LRV may be set between –39.3 ft/s to 39.3 ft/s (–12 m/s to 12m/s). There must be at least 1 ft/s (0.3 m/s) span between the URV and LRV.

Note
If entering a negative number, the minus sign must be entered in the furthest left position on the LOI.

5.3 Local operator interface (LOI)

To activate the optional LOI, press the DOWN arrow.

Use the UP, DOWN, LEFT(E), and RIGHT arrows to navigate the menu structure.

A complete map of the LOI menu structure is shown in LOI Menu trees.

The display can be locked to prevent unintentional configuration changes. The display lock can be activated through a HART communication device, or by holding the UP arrow for three seconds and then following the on-screen instructions.

5.4 Other configuration tools

Table 5-1 shows the approximate category or location of basic setup parameters for typical configuration tools.

Table 5-1: Approximate setup category/locations for typical configuration tools

Function	Category/Location
Flow Units	**Basic Setup**
PV Upper Range Value (URV)	**Basic Setup → AO**
PV Lower Range Value (LRV)	**Basic Setup → AO**
Calibration Number	**Basic Setup → Setup**
Line Size	**Basic Setup → Setup**
Tag	**Device Info → Identification**
Long Tag	**Device Info → Identification**

5.5 Measurement units

6 Advanced installation details

6.1 Hardware switches

Non Intrinsically Safe; Output code A

The electronics are equipped with four user-selectable hardware switches. These switches set the Alarm Mode, Internal/External Analog Power, Transmitter Security, and Internal/External Pulse Power.

Intrinsically Safe; Output code B

The electronics are equipped with two user-selectable hardware switches. These switches set the Alarm Mode and Transmitter Security. The Analog Power and Pulse Power are internally set and only available as External.

6.1.1 Alarm mode

If an event occurs that would trigger an alarm in the electronics, the analog output will be driven high or low, depending on the switch position. The switch is set in the HIGH position when shipped from the factory. Refer to Table 8-1 and Table 8-2 for analog output values of the alarm.

6.1.2 Transmitter security

The **SECURITY** switch allows the user to lock out any configuration changes attempted on the transmitter.

- When the security switch is in the **ON** position, the configuration can be viewed but no changes can be made.
- When the security switch is in the **OFF** position, the configuration can be viewed and changes can be made.

The switch is in the **OFF** position when the transmitter is shipped from the factory.

Note
The flow rate indication and totalizer functions remain active when the **SECURITY** switch is in either position.

6.1.3 Internal/external analog power (Output option code A)

Note
With output option code B, the analog output can only be externally powered and there is no **ANALOG** switch.

The 4–20 mA loop can be powered internally by the transmitter or externally by an external power supply. The **ANALOG** switch determines the source of the 4–20 mA loop power.

- When the switch is in the **INTERNAL** position, the 4–20 mA loop is powered internally by the transmitter.
- When the switch is in the **EXTERNAL** position, a 10-30 VDC external power supply is required. For more information about 4–20 mA external power, see Analog output.

The switch is in the **INTERNAL** position when the transmitter is shipped from the factory.

Note
External power is required for multidrop configurations.

6.1.4 Internal/external pulse power (Output option code A)

Note
With output option code B, the pulse output can only be externally powered and there is no **PULSE** switch.

The pulse loop can be powered internally by the transmitter or externally or by an external power supply. The **PULSE** switch determines the source of the pulse loop power.

- When the switch is in the **INTERNAL** position, the pulse loop is powered internally by the transmitter.
- When the switch is in the **EXTERNAL** position, a 5–28 VDC external supply is required. For more information about pulse external power, see Connect pulse output.

The switch is in the **EXTERNAL** position when the transmitter is shipped from the factory.

6.1.5 Changing hardware switch settings

Note
The hardware switches are located on the top side of the electronics board and changing their settings requires opening the electronics housing. If possible, carry out these procedures away from the plant environment in order to protect the electronics.

Figure 6-1: Electronics Stack and Hardware Switches

Procedure

1. Place the control loop into manual control.
2. Disconnect power to the transmitter
3. Remove the electronics compartment cover.

   If the cover has a cover jam screw, this must be loosened prior to removal of the cover.
4. Remove the LOI/Display, if applicable.
5. Identify the location of each switch (see Figure 6-1).
6. Change the setting of the desired switches with a small, non-metallic tool.
7. Replace the LOI/Display, if applicable.
8. Replace the electronics compartment cover.

   If the cover has a cover jam screw, this must be tightened to comply with installation requirements. See Cover jam screw for details on the cover jam screw.
9. Return power to the transmitter and verify the flow measurement is correct.
10. Return the control loop to automatic control.

6.2 Pulse output and discrete input/outputs

There are three additional loop connections available on the Transmitter:

- Pulse output - used for external or remote totalization (see Pulse output).
- Discrete I/O Channel 1 can be configured as discrete input or discrete output (see Discrete input/output).
- Discrete I/O Channel 2 can be configured as discrete output only (see Discrete input/output).

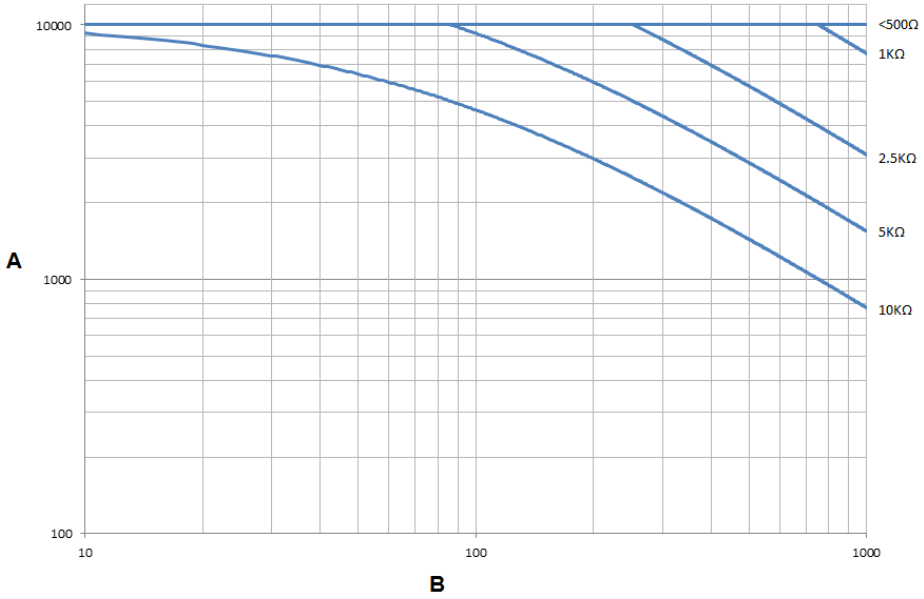
6.2.1 Connect pulse output

The pulse output function provides a galvanically isolated frequency signal that is proportional to the flow through the sensor. The signal is typically used in conjunction with an external totalizer or control system.

Note

- With output option code A, the pulse output can be internally or externally powered, and the **PULSE** switch must be set accordingly (the default setting is **EXTERNAL**).
- With output option code B, the pulse output can only be externally powered and there is no **PULSE** switch. See Internal/external pulse power (Output option code A).

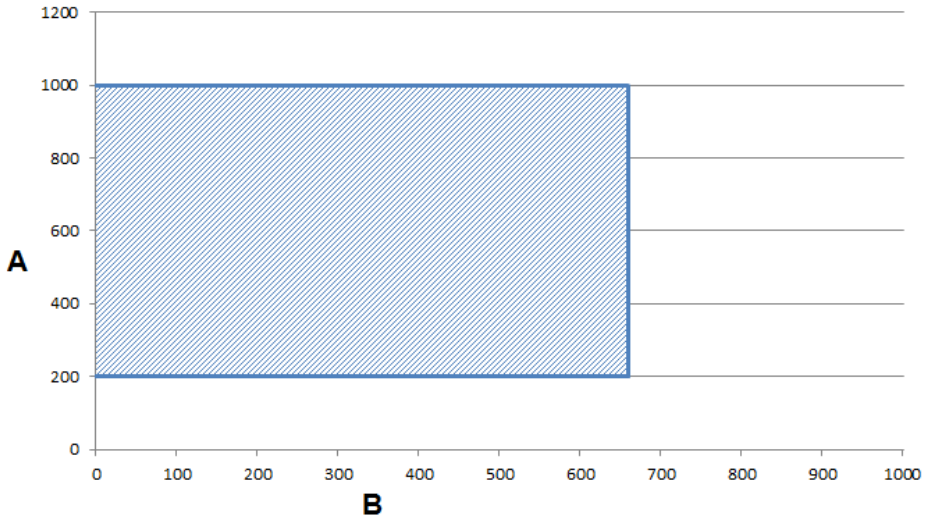
External power supply



For an externally powered pulse output, the following requirements apply:

- Supply voltage: 5 to 28 VDC
- Maximum current: 100 mA
- Maximum power: 1.0 W
- Load resistance: 200 to 10k Ohms (typical value 1k Ohms). Refer to the figure indicated:

Output option code	Supply voltage	Resistance vs cable length
A	5-28 VDC	See Figure 6-2
B	5 VDC	See Figure 6-3
B	12 VDC	See Figure 6-4
B	24 VDC	See Figure 6-5



- Pulse mode: Fixed pulse width or 50% duty cycle
- Pulse duration: 0.1 to 650 ms (adjustable)
- Maximum pulse frequency:
  - Output option code A is 10,000 Hz
  - Output option code B is 5000 Hz
- FET switch closure: solid state switch

Figure 6-2: Output Option Code A—Maximum Frequency vs. Cable Length

A. Frequency (Hz)
B. Cable length (feet)

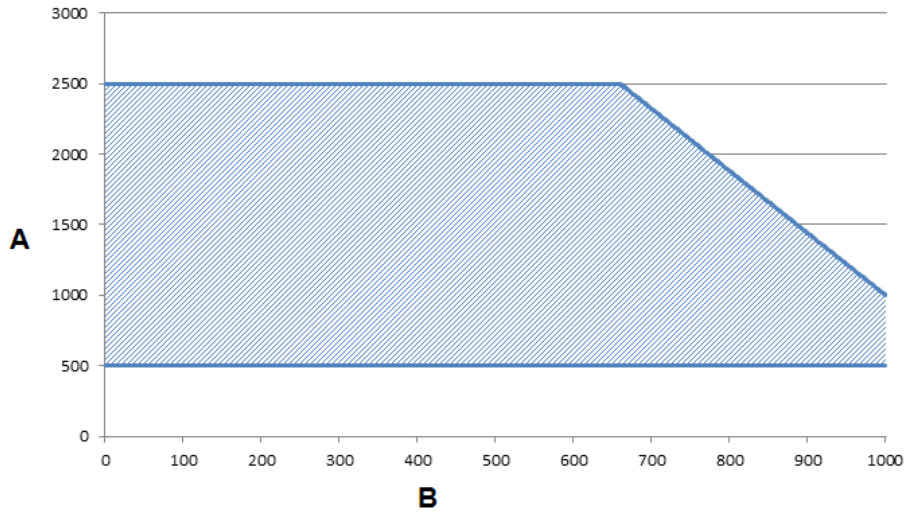


Figure 6-3: Output Option Code B—VDC Supply

A. Resistance (Ω)
B. Cable length (feet)

At 5000 Hz operation with a 5 VDC supply, pull-up resistances of 200 to 1000 Ohms allow cable lengths up to 660 ft (200 m).

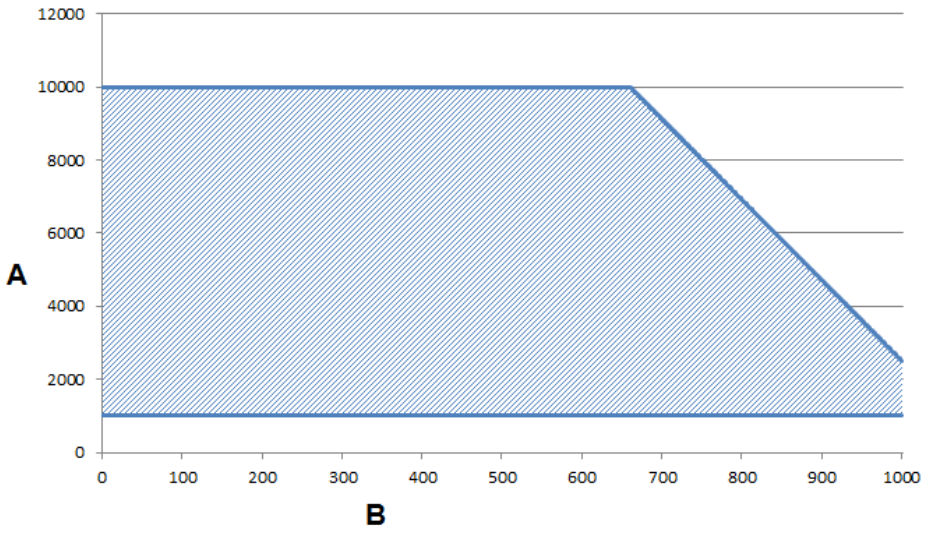

Figure 6-4: Output Option Code B—2 VDC Supply

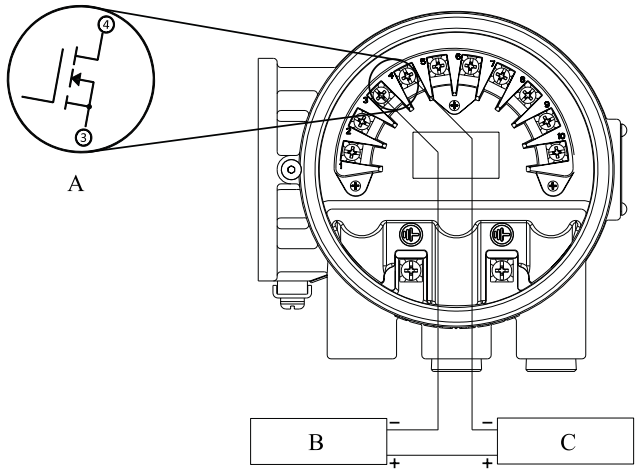
A. Resistance (Ω)
B. Cable length (feet)

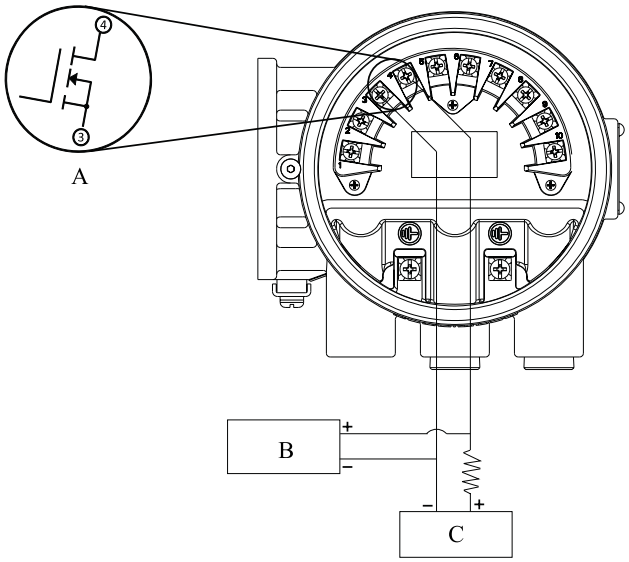
At 5000 Hz operation with a 12 VDC supply, pull-up resistances of 500 to 2500 Ohms allow cable lengths up to 660 ft (200 m). Resistances from 500 to 1000 Ohms allow a cable length of 1000 ft (330 m).

Figure 6-5: Output Option Code B—24 VDC Supply



A. Resistance (Ω)
B. Cable length (feet)

At 5000 Hz operation with a 24 VDC supply, pull-up resistances of 1000 to 10,000 Ohms allow cable lengths up to 660 ft (200 m). Resistances from 1000 to 2500 Ohms allow a cable length of 1000 ft (330 m).

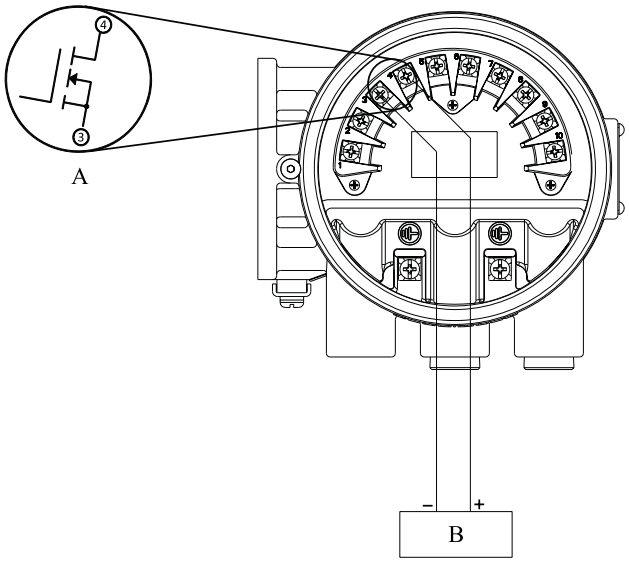


Connecting an external power supply

Note
Total loop impedance must be sufficient to keep loop current below maximum rating. A resistor can be added in the loop to raise impedance.

Figure 6-6: Connecting an electromechanical totalizer/counter with external power

A. Schematic showing FET between terminal 3 and 4
B. 5–24 VDC power supply
C. Electro-mechanical counter



A. Schematic showing FET between terminal 3 and 4
B. Electronic counter
C. 5–24 VDC power supply

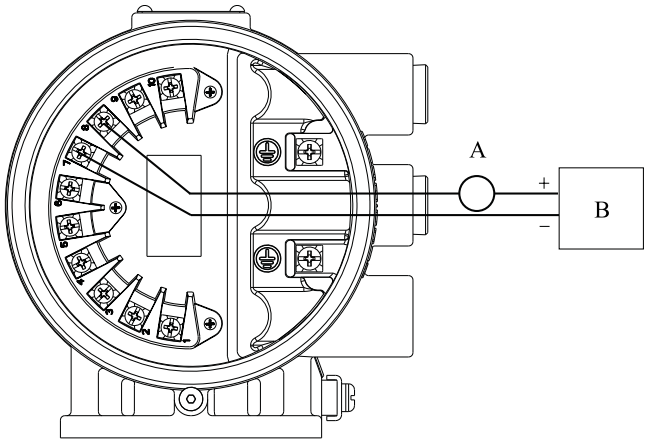
Procedure

1. Ensure the power source and connecting cable meet the requirements outlined previously.
2. Turn off the transmitter and pulse output power sources.
3. Run the power cable to the transmitter.
4. Connect - DC to terminal 3.
5. Connect + DC to terminal 4.

Internal power supply

For an internally powered pulse output, the supply voltage from the transmitter can be up to 12 VDC. Connect the transmitter directly to the counter as shown. Internal pulse power can only be used with an electronic totalizer or counter and cannot be used with an electromechanical counter.

A. Schematic showing FET between terminal 3 and 4
B. Electronic counter



Procedure

1. Turn off the transmitter.
2. Connect wires from the counter to the transmitter as shown.

6.2.2 Connect discrete output

The discrete output control function can be configured to drive an external signal to indicate zero flow, reverse flow, empty pipe, diagnostic status, flow limit, or transmitter status. The following requirements apply:

- Supply Voltage: 5 to 28 VDC
- Maximum Voltage: 28 VDC at 240 mA
- Switch Closure: solid state relay

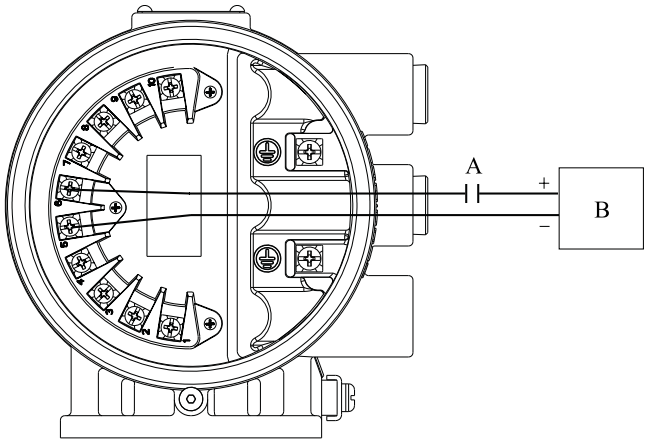
A. Control relay or input
B. 5–28 VDC power supply

Note
Total loop impedance must be sufficient to keep loop current below maximum current rating. A resistor can be added in the loop to raise impedance.

For discrete output control, connect the power source and control relay to the transmitter. To connect external power for discrete output control, complete the following steps:

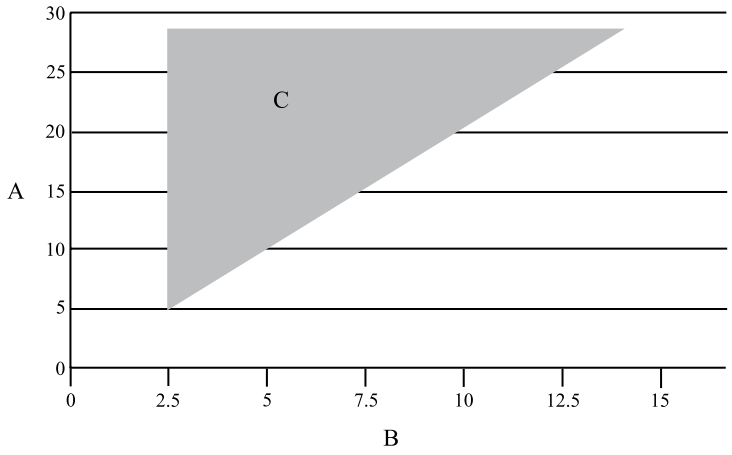
Procedure

1. Ensure the power source and connecting cable meet the requirements outlined previously.
2. Turn off the transmitter and discrete power sources.
3. Run the power cable to the transmitter.
4. Connect the DC power supply to the transmitter as shown.



6.2.3 Connect discrete input

- For HART version 5.4 firmware, the discrete input can provide positive zero return (PZR) or net totalizer reset.
- For HART version 5.5 or 7.1 firmware, the discrete input can provide positive zero return (PZR) or reset totalizer (A, B, C, or all totals).



Note
If a particular totalizer is configured to be not resettable, the totalizer will not be reset with this function.

The following requirements apply:

- Supply voltage: 5 VDC to 28 VDC
- Current: 1.5 mA to 20 mA
- Input Impedance: 2.5 k plus 1.2 V diode drop. See Figure 6-11.

A. Relay contactor control system output
B. 5–28 VDC power supply

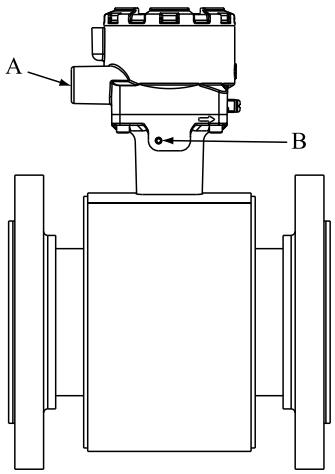
A. Supply voltage
B. series resistance $\Omega_{in} + \Omega_{ext}$ (KΩ)

To connect the discrete input, complete the following steps.

Procedure

1. Ensure the power source and connecting cable meet the requirements outlined previously.
2. Turn off the transmitter and discrete power sources.
3. Run the power cable to the transmitter.
4. Connect the wires to the transmitter as shown.

6.3 Coil housing configuration



The coil housing provides physical protection of the coils and other internal components from contamination and physical damage that might occur in an industrial environment. The coil housing is an all-welded and gasket-free design.

The 8705 model is available in four coil housing configurations. Configurations are identified by the M0, M1, M2, or M4 options codes found in the model number. The 8711 and 8721 models are only available in one coil housing coil configuration; a separate option code is not available.

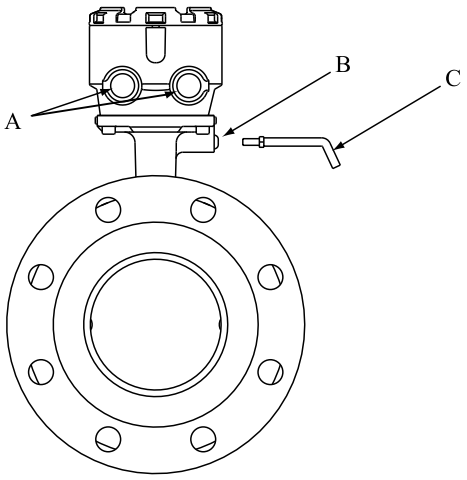
6.3.1 Standard coil housing configuration

The standard coil housing configuration is a factory sealed all-welded enclosure and is available for the following models (see Figure 6-12):

- 8705 with option code M0 - 8705xxxxxxxxM0
- 8711 with option code M/L - 8711xxxxxxM/L
- 8721 with option code R/U - 8721xxxxxxR/U

A. Conduit connection
B. No relief port (welded shut or absent)

6.3.2 Process leak protection (option M1)



The sensor is available with process leak detection through the use of a threaded connection and pressure relief valve (PRV). This coil housing configuration is a factory sealed all-welded enclosure. The M1 configuration is available for the 8705 only.

- 8705 with option code M1 - 8705xxxxxxxxM1

A PRV can be installed in the threaded connection to prevent possible over-pressuring of the coil housing caused by a primary seal failure. The PRV is capable of venting fugitive emissions when pressure inside the coil housing exceeds five psi. Additional piping may be connected to the PRV to drain any process leakage to a safe location (see Figure 6-13).

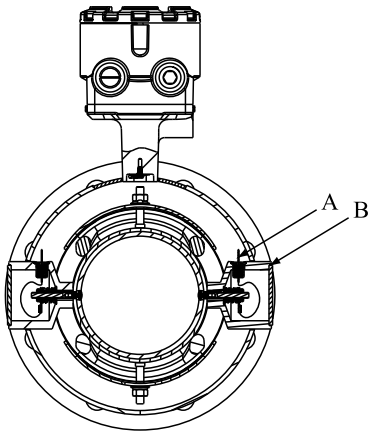
In the event of a primary seal failure, this configuration will not protect the coils or other internal components of the sensor from exposure to the process fluid.

Note
The PRV is supplied with the meter to be installed by the customer. Installation of the PRV and any associated piping must be performed in accordance with environmental and hazardous area requirements.

A. Conduit connection
B. M6 threaded pressure relief port with removable cap screw
C. Optional: Use relief port to plumb to safe area (supplied by user).

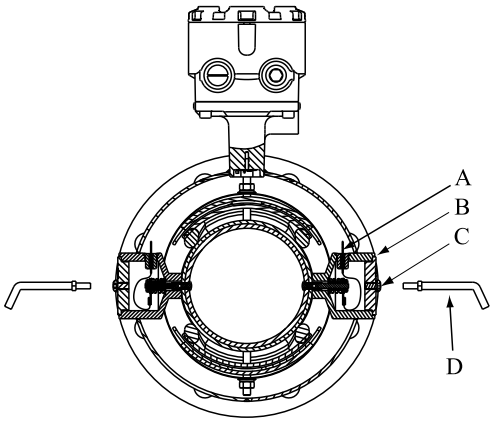
6.3.3 Process leak containment (Option M2 or M4)

The sensor is available with process leak containment. The coil housing configuration is a factory sealed all-welded enclosure with the addition of sealed electrode compartments. The M2/M4 configuration is available for the 8705 only.



- 8705 with option code M2/M4 - 8705xxxxxxxxM2/M4

This configuration divides the coil housing into separate compartments, one for each electrode and one for the coils. In the event of a primary seal failure, the fluid is contained in the electrode compartment. The sealed electrode compartment prevents the process fluid from entering the coil compartment where it may damage the coils and other internal components. The electrode compartments are designed to contain the process fluid up to a maximum pressure of 740 psig.

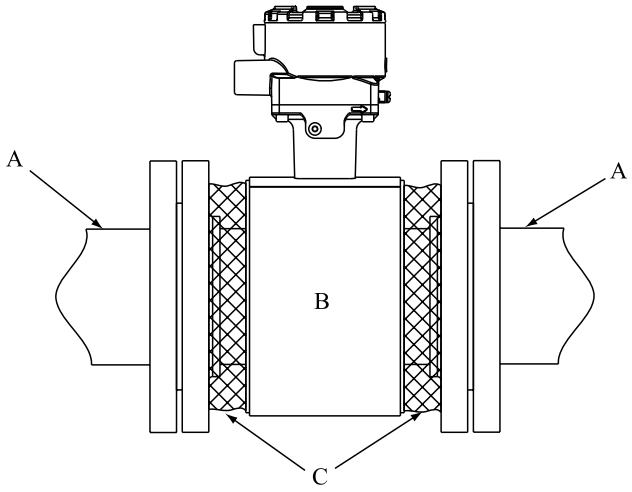


- Code M2 - sealed, welded coil housing with separate sealed and welded electrode compartments (see Figure 6-14).
- Code M4 - sealed, welded coil housing with separate sealed and welded electrode compartments with a threaded port on the electrode tunnel cap, capable of venting fugitive emissions (see Figure 6-15).

Note
To properly vent process fluid from the electrode compartment to a safe location, additional piping is required and must be installed by the user. Installation of any associated piping must be performed in accordance with environmental and hazardous

area requirements. In the event of primary seal failure, the electrode compartment may be pressurized. Use caution when removing the cap screw.

A. 2x fused glass seal
B. 2x sealed electrode compartment



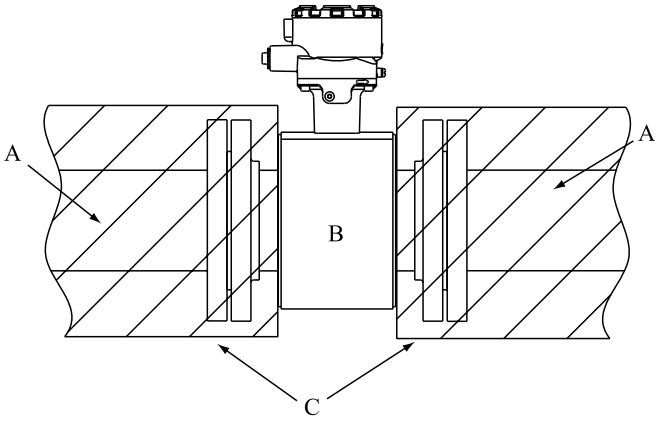
A. 2x fused glass seal
B. 2x sealed electrode compartment
C. M6 threaded pressure relief port with removable cap screw
D. Optional: Use relief port to plumb to safe area (supplied by user).

6.3.4 Higher temperature applications and sensor insulation best practices

Insulation of the magnetic flowmeter sensor is not typically recommended. However, in applications with higher temperature process fluids (above 150°F / 65°C), plant safety, sensor reliability, and sensor longevity can be improved with careful attention to proper insulation.

Procedure

1. In applications where process fluid permeation of the liner has been observed or may be expected, the rate of permeation can be reduced by decreasing the temperature gradient between the process fluid and the outside of the meter body. In these applications only the space between the process flanges and the coil housing should be insulated (see Figure 6-16).



A. Process piping
B. Coil housing
C. Insulation

2. When insulation of the magnetic flowmeter sensor is required due to plant safety standards designed to protect personnel from contact burns, extend the insulation up to the coil housing, covering both ends of the sensor and flanges (Figure 6-17).

   The insulation should NOT cover the coil housing or the terminal junction box. Insulating the coil housing and the terminal junction box can result in overheating of the coil compartment and terminals, resulting in erratic/erroneous flow readings and potential damage or failure of the meter.

Figure 6-17: Insulating a Rosemount Magnetic Flowmeter for Safety/Plant

A. Process piping
B. Coil housing
C. Insulation

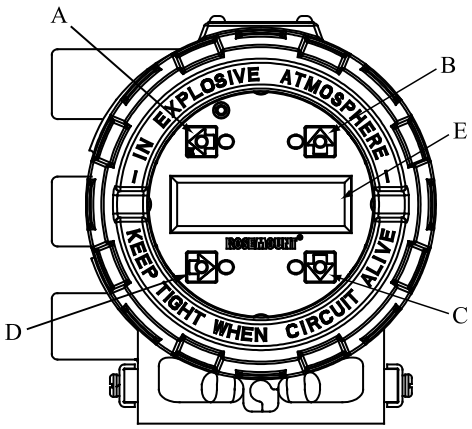
7 Operation

7.1 Introduction

The transmitter features a full range of software functions, transmitter configurations, and diagnostic settings. These features can be accessed through the Local Operator Interface (LOI), a Field Communicator, AMS® Device Manager, ProLink III software, or a host control system. Configuration variables may be changed at any time; specific instructions are provided through on-screen instructions.

This section covers the basic features of the LOI (optional) and provides general instructions on how to navigate the configuration menus using the optical buttons. The section also covers the use of a Field Communicator and provides menu trees to access each function. For detailed LOI configuration refer to Configure LOI/Display.

7.2 Local operator interface (LOI)



The optional LOI provides a communications center for the transmitter.

The LOI allows an operator to:

- Change transmitter configuration
- View flow and totalizer values
- Start/stop and reset totalizer values
- Run diagnostics and view the results
- Monitor transmitter status

7.2.1 Basic features

The basic features of the LOI include a display window and four navigational arrow keys.

A. ***LEFT*** *(E) key*
B. ***UP*** *key*
C. ***DOWN*** *key*
D. ***RIGHT*** *key*
E. Display window

To access the LOI, press the DOWN arrow one time. Use the UP, DOWN, LEFT, and RIGHT arrows to navigate the menu structure. A map of the LOI menu structure is shown in LOI Menu trees.

7.2.2 Data entry

The LOI keypad does not have alphanumeric keys. Alphanumeric and symbolic data is entered by the following procedure. Use the steps below to access the appropriate functions.

Procedure

1. ⬆ ⬇ ⬅ ➡ to navigate the menu (LOI Menu trees) and access the appropriate alphanumeric parameter.
2. ⬆ ⬇ ➡ to begin editing the parameter.
   - ⬅ to go back without changing the value.
   - For numerical data, scroll through the digits 0-9, decimal point, and dash.
   - For alphabetical data, scroll through the letters of the alphabet A-Z, digits 0-9, and the symbols ?, &, +, -, *, /, $, @,%, and the blank space.
3. ➡ ⬆ ⬇ to select the value.

   ➡ to wrap around and arrive at the character you want to change.
4. ⬅ when all changes are complete to save the entered values.
5. ⬅ again to navigate back to the menu tree.

7.2.3 Data entry examples

Parameter values are classified as *table values* or *select values*.

Table values They are available from a predefined list for parameters such as line size or flow units.

Select values Integers, floating point numbers, or character strings that are entered one character at a time using the arrow keys for parameters such as PV URV and calibration number.

Table value example

Setting the sensor size:

Procedure

1. key to access the menu. See LOI Menu trees.
2. to select line size from the basic setup menu.
3. to increase/decrease the sensor size.
4. .
5. again.

After a moment, the LOI will display VALUE STORED SUCCESSFULLY and then display the selected value.

Select value example

Changing the upper range limit:

Procedure

1. key to access the menu. See LOI Menu trees.
2. to select **PV URV** from the basic setup menu.
3. to position the cursor.
4. to set the number.
5. Repeat Step 3 and Step 4 .
6. again.

After a moment, the LOI will display VALUE STORED SUCCESSFULLY and then display the selected value.

7.2.4 Dynamic variable display pause

To make dynamically changing variables easier to read and record, a pause feature has been built into the LOI.

When viewing a dynamic variable (such as a totalizer value) from the view variable screen, to pause the display value. To return the screen to the dynamic display mode, .

Note
It is important to note this feature pauses only the display. While the display is paused, the transmitter continues to measure all variables dynamically, and continues to increment the totalizer.

7.2.5 Totalizer functionality

Totalizer selection

Procedure

- to access the LOI menu structure. The first option is the totalizers. Under this section, you can view and configure the totalizers.

See Totalizer for more information on the totalizer functionality.

Start all / Stop all

Totalizers can be started or stopped simultaneously. See Totalizer. They cannot be started and stopped individually.

Reset totalizer

The totalizers can be configured to be reset through the LOI. They can be reset individually, or simultaneously through a global command. For details on configuring the reset functionality and on resetting the totalizers, refer to Totalizer.

7.2.6 Display lock

The transmitter has display lock functionality to prevent unintentional configuration changes. The display can be locked manually or configured to automatically lock after a set period of time. When locked, the LOI will display the flow screen.

Manual display lock

To activate, hold the UP arrow for 3 seconds and follow the on-screen instructions. When the display lock is activated, a lock symbol will appear in the lower right hand corner of the display. To deactivate, hold the UP arrow for 3 seconds and follow the on-screen instructions. When the display lock is deactivated, the lock symbol will no longer appear in the lower right hand corner of the display.

Auto display lock

The transmitter can be configured to automatically lock the LOI. Follow the instructions below to access configuration.

Procedure

1. to access the menu. See LOI Menu trees.
2. Scroll to and select **LOI Config** from the Detailed Setup menu.
3. to highlight **Disp Auto Lock** to enter the menu.
4. to select the auto lock time.
5. .
6. .

After a moment, the LOI will display VALUE STORED SUCCESSFULLY and then display the selected value.

7.2.7 Security

The transmitter uses two types of protection to prevent users from making changes to the transmitter configuration. Only one security setting is needed to be ON to prevent changes, both security settings need to be OFF to allow changes.

Write protect

Read-only informational variable that reflects the setting of the hardware security switch. If Write Protect is ON, configuration data are protected and cannot be changed from the LOI , a HART-based communicator or control system. If Write Protect is OFF, configuration data may be changed.

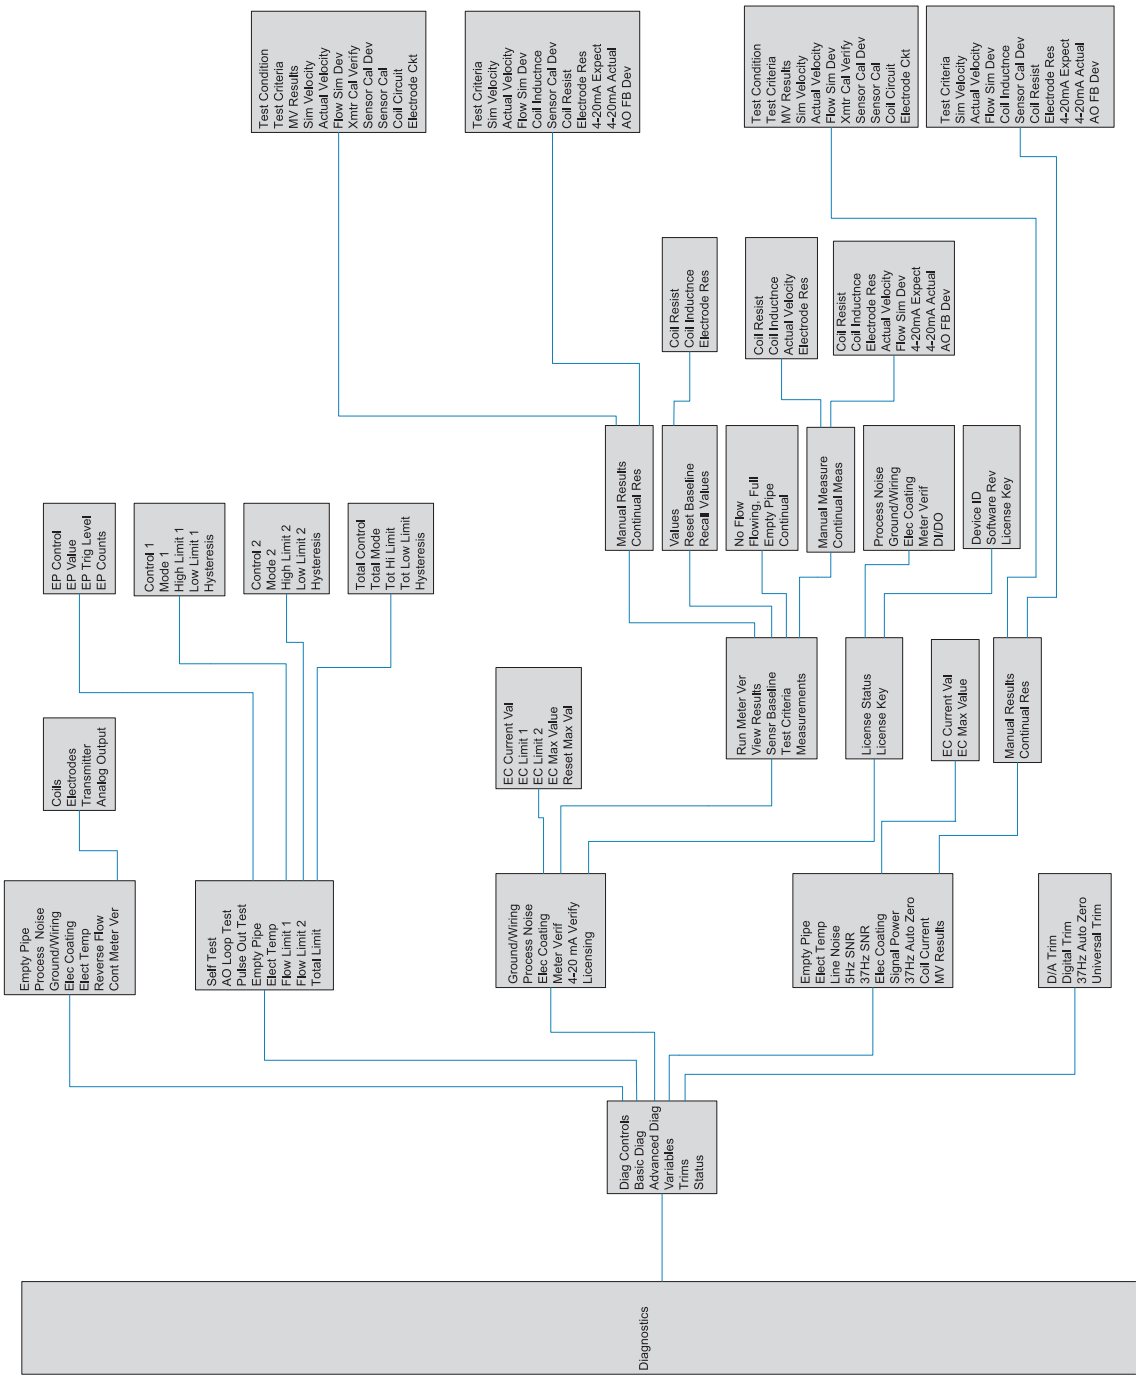
HART Lock (HART 7 only)

This variable reflects the setting of the software security. It can be set to Temporary (turned off by power cycle or Device Reset) or Permanent Lock. If HART Lock is ON, configuration data are protected and cannot be changed from the LOI or a HART-based communicator or control system. If HART Lock is OFF, configuration data may be changed.

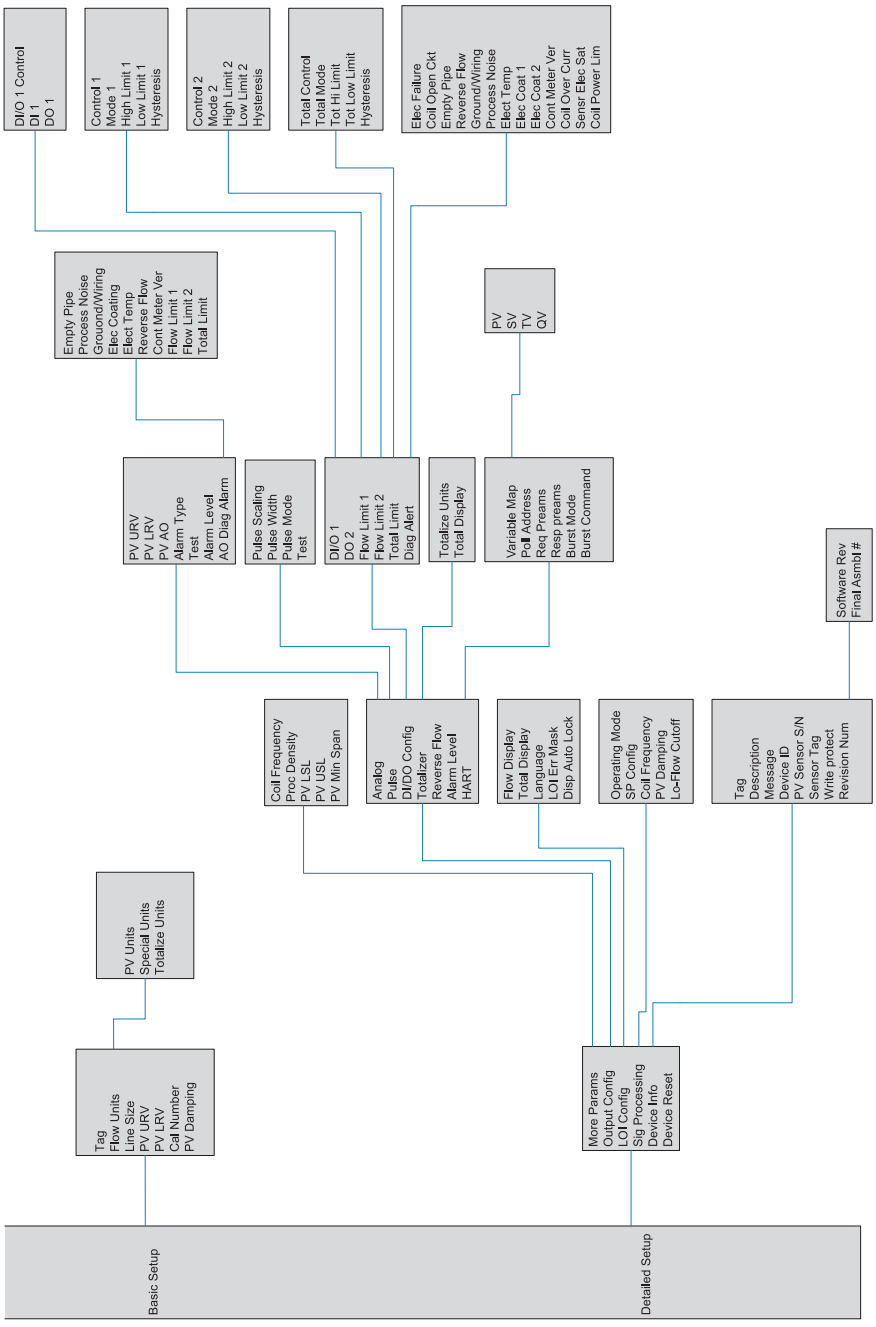
7.2.8 Locate device

For HART 7 devices with LCD displays, enabling Locate Device displays the characters "0-0-0-0-0-0-0-0-" on the LCD display. This allows for easy field identification of the device during commissioning or service.

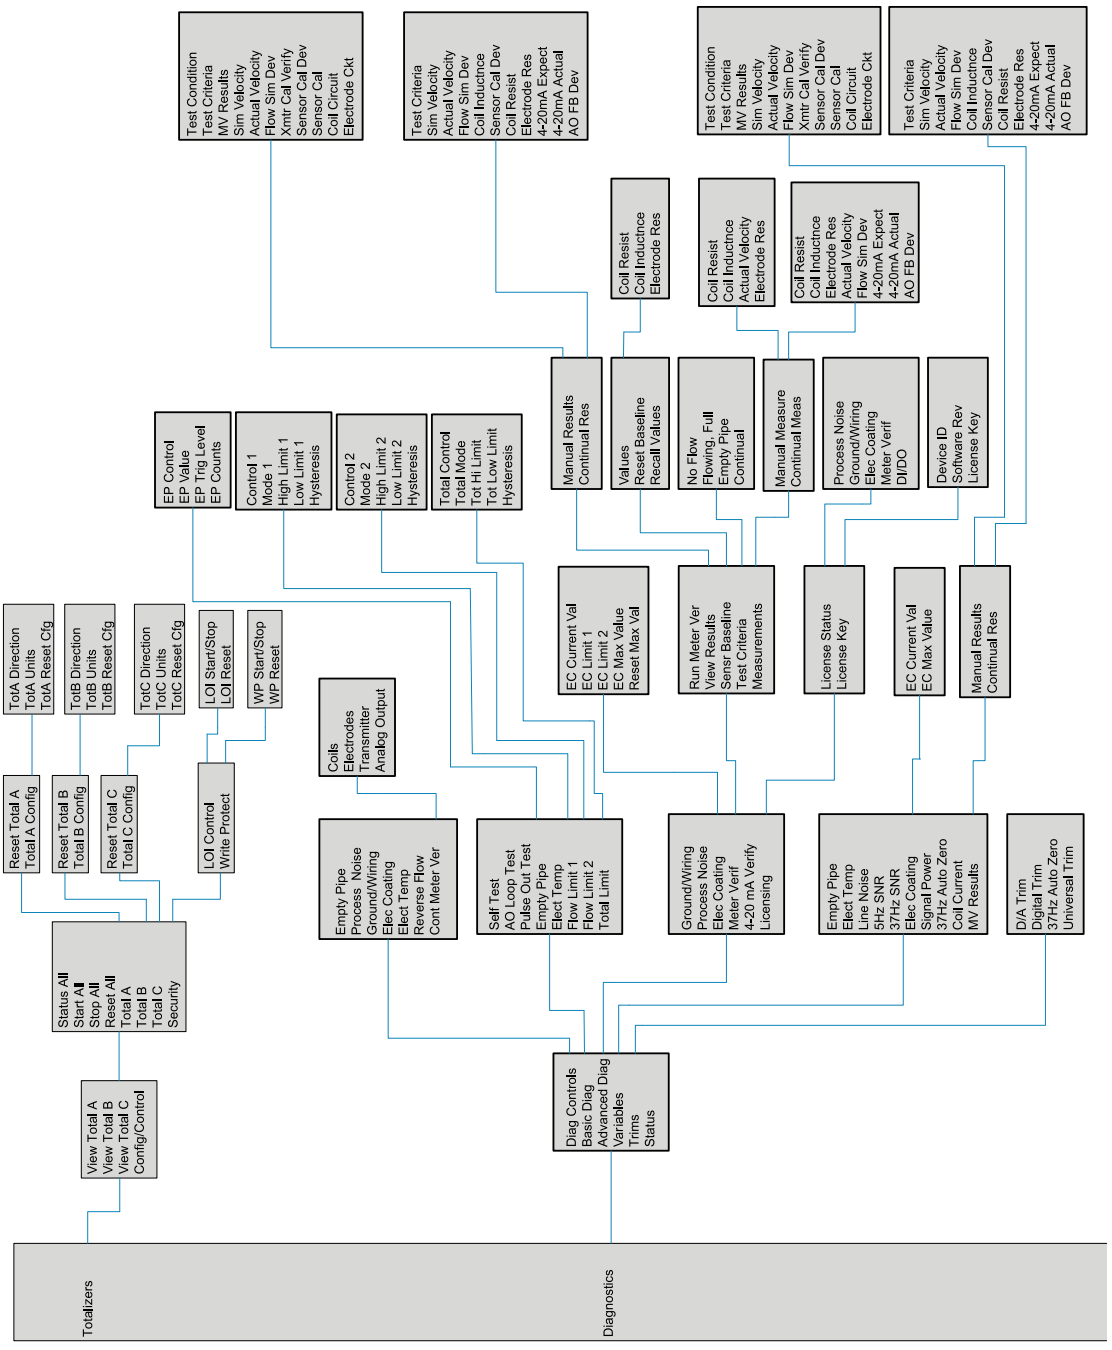
7.2.9 Diagnostic messages



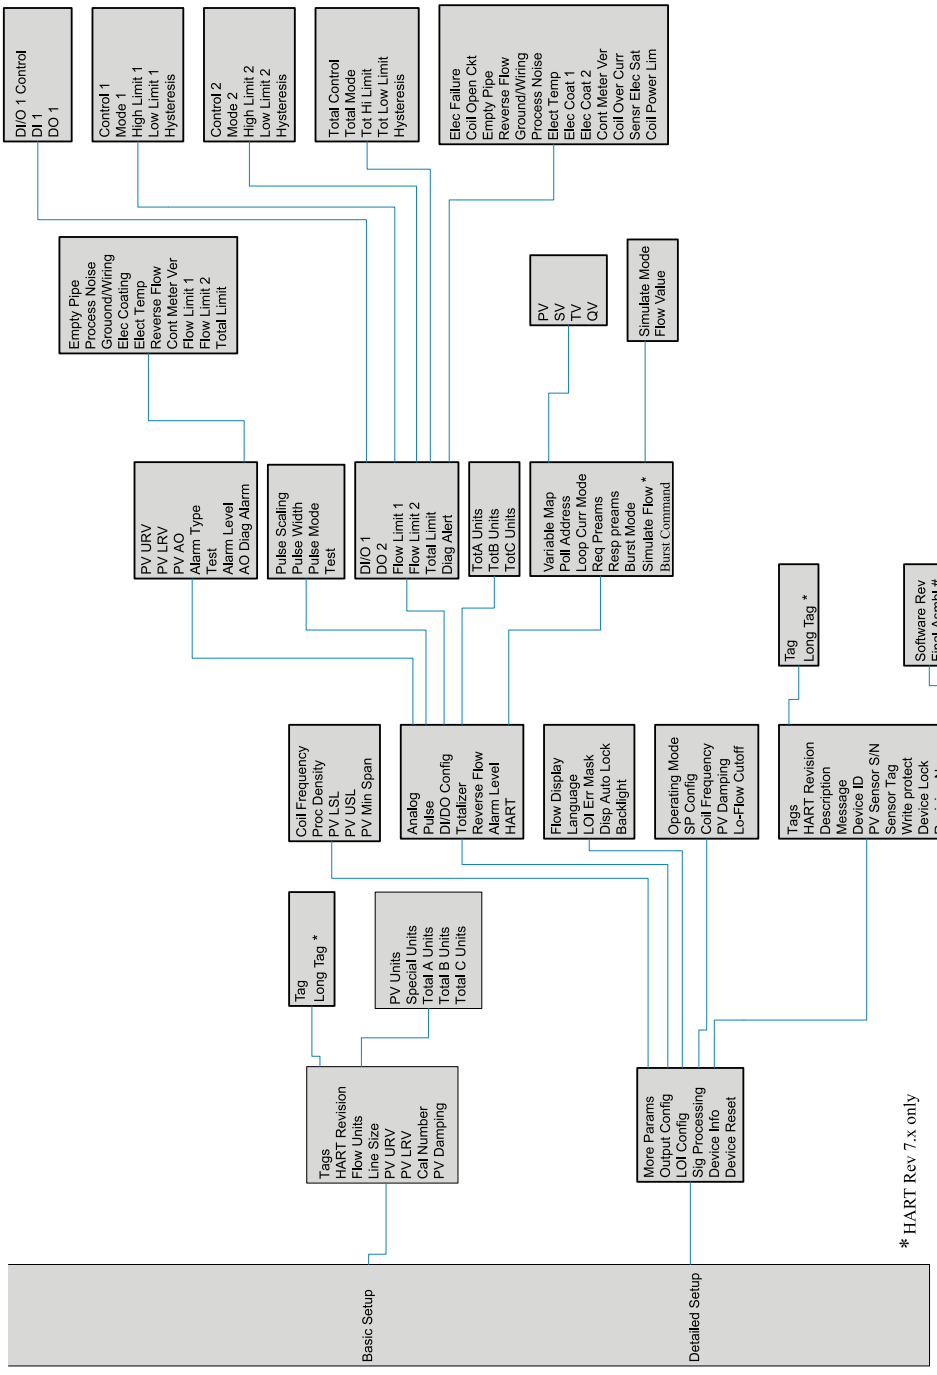
Diagnostic messages may appear on the LOI. See Advanced Diagnostics Configuration for a complete list of messages, potential causes, and corrective actions for these messages.



7.2.10 Display symbols



When certain transmitter functions are active, a symbol will appear in the lower-right corner of the display. The possible symbols include the following:



Display Lock	
Totalizer	
Reverse flow	
Continuous meter verification

7.3 Field Communicator interface

The transmitter can be configured with a Field Communicator using HART® Protocol gaining access to the software functions, transmitter configurations, and diagnostic

settings. Refer to the Field Communicator Manual for detailed instructions on how to connect to the device.

7.3.1 Field Communicator user interface

The device driver uses conditional formatting menus. If the diagnostic is not active, the diagnostic will not be displayed as a menu item in the Field Communicator, and menu trees will be resequenced accordingly.

The device dashboard interface is shown in Figure 7-6. The corresponding menu trees are shown in Field Communicator menu trees .

Figure 7-6: Device Dashboard Interface

8 Advanced Configuration Functionality

8.1 Introduction

This section contains information for advanced configuration parameters.

The software configuration settings for the transmitter can be accessed through a HART®-based communicator, Local Operator Interface (LOI), AMS, or through a control system. Before operating the transmitter in an actual installation, you should review all of the factory set configuration data to ensure that they reflect the current application.

8.2 Configure outputs

LOI menu path	**Detailed Setup → Output Config**

The configure outputs functionality is used to configure advanced features that control the analog, pulse, auxiliary, and totalizer outputs of the transmitter.

8.2.1 Analog output

LOI menu path	**Detailed Setup → Output Config → Analog**

The analog output function is used to configure all of the features of the 4-20 mA output.

Upper range value

LOI menu path	**Detailed Setup → Output Config → Analog → PV URV**

The *upper range value* (URV) sets the 20 mA point for the analog output. This value is typically set to full-scale flow. The units that appear will be the same as those selected under the units parameter. The URV may be set between –39.3 ft/s to 39.3 ft/s (–12 m/s to 12 m/s) or the equivalent range based on the selected flow units. There must be at least 1 ft/s (0.3 m/s) span or equivalent between the URV and LRV.

Note
If entering a negative number, the minus sign must be entered in the furthest left position on the LOI.

Lower range value

LOI menu path	**Detailed Setup → Output Config, → Analog → PV LRV**

The *lower range value* (LRV) sets the 4 mA point for the analog output. This value is typically set to zero flow. The units that appear will be the same as those selected under the units parameter. The LRV may be set between –39.3 ft/s to 39.3 ft/s (–12 m/s to 12 m/s) or the equivalent range based on the selected flow units. There must be at least 1 ft/s (0.3 m/s) span or equivalent between the URV and LRV.

Note
If entering a negative number, the minus sign must be entered in the furthest left position on the LOI.

Alarm type

LOI menu path	**Detailed Setup → Output Config → Analog → Alarm Type**

The analog output alarm type displays the position of the alarm switch on the electronics board. There are two available positions for this switch:

- High
- Low

Alarm level

LOI menu path	**Detailed Setup → Output Config → Analog → Alarm Level**

The alarm level configuration will drive the transmitter to preset values if an alarm occurs. There are two options:

- Rosemount Alarm and Saturation Values (see table Table 8-1 for specific values)
- NAMUR-Compliant Alarm and Saturation Values (see Table 8-2 for specific values)

Table 8-1: Rosemount Values

Level	4-20 mA saturation	4-20 mA alarm
Low	3.9 mA	3.75 mA
High	20.8 mA	22.5 mA

Table 8-2: NAMUR Values

Level	4-20 mA saturation	4-20 mA alarm
Low	3.8 mA	3.5 mA
High	20.5 mA	22.6 mA

AO diagnostic alarm

LOI menu path	**Detailed Setup → Output Config → Analog → AO Diag Alarm**

There are diagnostics that, when under active conditions, do not drive the analog output to alarm level. The AO diagnostic alarm menu enables selection of these diagnostics to be associated with an analog alarm. If any of the selected diagnostics are active, it will cause the analog output to go to the configured alarm level. For a list of diagnostic alarms that can be configured to drive an analog alarm, see Table 8-3.

Table 8-3: Analog Alarm Diagnostic Options

Diagnostic(1)	Description
Empty Pipe	Drive to an alarm state when empty pipe is detected.
Reverse Flow	Drive to an alarm state when reverse flow is detected.
Grounding / Wiring Fault	Drive to an alarm state when grounding or wiring fault is detected.
High Process Noise	Drive to an alarm state when the transmitter detects high levels of process noise.
Electronics Temperature Out of Range	Drive to an alarm state when the temperature of the electronics exceeds allowable limits
Electrode Coating Limit 2	Drive to an alarm state when electrode coating reaches a point where it impacts the flow measurement
Totalizer Limit 1	Drive to an alarm state when the totalizer value exceeds the parameters set in the totalizer limit configuration (see page 5-x for more details on this functionality)
Flow Limit 1	Drive to an alarm state when the flow rate exceeds the parameters set in the flow limit 1 configuration (see page 5-x for more details on this functionality)
Flow Limit 2	Drive to an alarm state when the flow rate exceeds the parameters set in the flow limit 2 configuration (see page 5-x for more details on this functionality)
Continuous Meter Verification	Drive to an alarm state when the continuous meter verification diagnostic detects a failure of one of the tests

(1) See Troubleshooting for more details on each of the diagnostics

8.2.2 Pulse output

LOI menu path	**Detailed Setup → Output Config → Pulse**

Under this function the pulse output of the transmitter can be configured.

Pulse scaling

LOI menu path	**Detailed Setup → Output Config → Pulse → Pulse Scaling**

Transmitter may be commanded to supply a specified frequency between 1 pulse/ day at 39.37 ft/sec (12 m/s) to 10,000 Hz at 1 ft/sec (0.3 m/s).

Note
The maximum pulse scaling frequency for transmitters with an intrinsically safe output is 5000 Hz.

Note
Line size, special units, and density must be selected prior to configuration of the pulse scaling factor.

The pulse output scaling equates one transistor switch closure pulse to a selectable number of volume units. The volume unit used for scaling pulse output is taken from the numerator of the configured flow units. For example, if gal/min had been chosen when selecting the flow unit, the volume unit displayed would be gallons.

Note
The pulse output scaling is designed to operate between 0 and 10,000 Hz. The minimum conversion factor value is found by dividing the minimum span (in units of volume per second) by 10,000 Hz.

When selecting pulse output scaling, the maximum pulse rate is 10,000 Hz. With the 10 percent over range capability, the absolute limit is 11,000 Hz. For example, if you want the transmitter to pulse every time 0.01 gallons pass through the sensor, and the flow rate is

$$\frac{10{,}000\ gal}{1\ min} \times \frac{1\ min}{(60\ sec)} \times \frac{1\ pulse}{0.01\ gal} = 16{,}666.7\ Hz$$

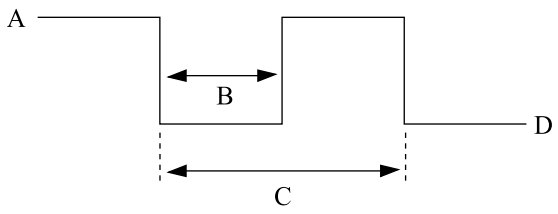
The best choice for this parameter depends upon the required resolution, the number of digits in the totalizer, the extent of range required, and the maximum frequency limit of the external counter.

Pulse factor units

LOI menu path	**Detailed Setup → Output Config → Pulse → Units**

The pulse factor unit assigns the unit of measure to the pulse scaling factor. The default read-only value is the unit of measure from the configured flow units. For example, if gal/min is selected when configuring the flow units, the pulse factor unit will be gallons.

Pulse width



LOI menu path	**Detailed Setup → Output Config → Pulse → Pulse Width**

The factory default pulse width is 0.5 ms.

The width, or duration, of the pulse can be adjusted to match the requirements of different counters or controllers (see Figure 8-1). These are typically lower frequency applications (< 1000Hz). The transmitter will accept values from 0.1 ms to 650 ms.

For frequencies higher than 1000Hz, it is recommended to set the pulse mode to 50% duty cycle by setting the pulse mode to frequency output.

The pulse width will limit the maximum frequency output, If the pulse width is set too wide (more than 1/2 the period of the pulse) the transmitter will limit the pulse output. See example below.

A. Open
B. Pulse width
C. Period
D. Closed

Example

If pulse width is set to 100 ms, the maximum output is 5Hz; for a pulse width of 0.5 ms, the maximum output would be 1000Hz (at the maximum frequency output there is a 50% duty cycle).

Pulse width	Minimum period (50% duty cycle)	Maximum frequency
100 ms		$\frac{1\ cycle}{200\ ms} = 5\ Hz$
0.5 ms		$\frac{1\ cycle}{1.0\ ms} = 1000\ Hz$

To achieve the greatest maximum frequency output, set the pulse width to the lowest value that is consistent with the requirements of the pulse output power source, pulse driven external totalizer, or other peripheral equipment.

The maximum flow rate is 10,000 gpm. Set the pulse output scaling such that the

$$Pulse\ Scaling = 0.0167\ \frac{gal}{pulse}$$

Note
Changes to pulse width are only required when there is a minimum pulse width required for external counters, relays, etc.

The external counter is ranged for 350 gpm and pulse is set for one gallon. Assuming the

$$Frequency = \frac{Flow\ Rate\ (gpm)}{(60\ \frac{sec}{min}) \times (pulse\ scaling\ \frac{gal}{pulse})}$$

$$Pulse\ Scaling = \frac{350\ gpm}{(60\ \frac{sec}{min}) \times\ 1\ \frac{gal}{pulse}}$$

$$Frequency = 5.833\ Hz$$

The upper range value (20mA) is 3000 gpm. To obtain the highest resolution of the pulse

$$Frequency = \frac{Flow\ Rate\ (gpm)}{(60\ \frac{sec}{min}) \times (pulse\ scaling\ \frac{gal}{pulse})}$$

$$Pulse\ Scaling = \frac{3{,}000\ gpm}{(60\ \frac{sec}{min}) \times 10{,}000\ Hz}$$

Pulse mode

LOI menu path	**Detailed Setup → Output Config → Pulse → Pulse Mode**

The pulse mode configures the frequency output of the pulse. It can be set to either 50% duty cycle, or fixed. There are two options that pulse mode can be configured to:

- Pulse Output (user defines a fixed pulse width)
- Frequency Output (pulse width automatically set to 50% duty cycle)

To use pulse width settings, pulse mode must be set to pulse output. Frequency output is not available with Intrinsically Safe output, option code B.

8.2.3 Totalizer

The totalizer provides the total amount of fluid that has passed through the meter. There are three available totalizers: Total A, Total B, and Total C. They can be independently configured for one of the following options:

- Net - increments with forward flow and decrements with reverse flow (reverse flow must be enabled).
- Reverse total - will only increment with reverse flow if reverse flow is enabled
- Forward total - will only increment with forward flow

All totalizer values will be reset if **line size** is changed. This will happen even if the totalizer reset control is set to **non-resettable**.

The totalizers have the capability to increment the total to a maximum value of 50 feet per second of flow (or the volumetric equivalent) for a period of 20 years before roll-over occurs.

View Totals

LOI menu path	Totalizer A: **Totalizers → View Total A** Totalizer B: **Totalizers → View Total B** Totalizer C: **Totalizers → View Total C**

Displays the current value for each totalizer and shows the totalizer incrementing/decrementing based on totalizer configuration and flow direction.

Configure totalizers

LOI menu path	**Totalizers → Config/Control**

Totalizer direction

LOI menu path	Totalizer A: **Totalizers** → **Config/Control** → **Total A** → **Total A Config** → **Direction** Totalizer B: **Totalizers** → **Config/Control** → **Total B** → **Total B Config** → **Direction** Totalizer C: **Totalizers** → **Config/Control** → **Total C** → **Total C Config** → **Direction**

Configure the direction for the totalizers as either Net, Forward, or Reverse.

Totalizer units

LOI menu path	Totalizer A: **Totalizers** → **Config/Control** → **Total A** → **Total A Config** → **TotA Units** Totalizer B: **Totalizers** → **Config/Control** → **Total B** → **Total B Config** → **TotB Units** Totalizer C: **Totalizers** → **Config/Control** → **Total C** → **Total C Config** → **TotC Units**

Configure the units for totalizers.

Table 8-4: Totalizer units

Volume units		**Mass units**		**Other units**	
LOI	**Units**	**LOI**	**Units**	**LOI**	**Units**
gal	Gallons	KG	Kilograms	ft	Feet
l	Liters	Mton	Metric tons	m	Meters
Igal	Imperial gallons	lb	Pounds	Special	Special Units(1)
m3	Cubic meters	Ston	Short tons		
B42	Barrels (42 gallonsJ)				
ft3	Cubic feet				
cm3	Cubic centimeters				
B31	Barrels (31 gallons)				
Mgal	Million gallons				

(1) See Configure special units.

Reset configuration

LOI menu path	Totalizer A: **Totalizers** → **Config/Control** → **Total A** → **Total A Config** → **TotA Reset Config** Totalizer B: **Totalizers** → **Config/Control** → **Total B** → **Total B Config** → **TotB Reset Config** Totalizer C: **Totalizers** → **Config/Control** → **Total C** → **Total C Config** → **TotC Reset Config**

Configure if the totalizer is non-resettable, or if it can be reset through the reset commands.

Reset individual totalizer

LOI menu path	Totalizer A: **Totalizers** → **Config/Control** → **Total A** → **Reset Total A** Totalizer B: **Totalizers** → **Config/Control** → **Total B** → **Reset Total B** Totalizer C: **Totalizers** → **Config/Control** → **Total C** → **Reset Total C**

Independently reset the totalizers. This requires the reset option to be configured as resettable.

Reset all totalizers

LOI menu path	**Totalizers** → **Config/Control** → **Reset All**

This global command will reset totalizer values to zero for all totalizers that have been configured as resettable.

Totalizer security

LOI menu path	**Totalizers** → **Config/Control** → **Security**

Configure totalizer security capabilities for the Local Operator Interface and write protection.

LOI control

LOI menu path	**Totalizers** → **Config/Control** → **Security** → **LOI Control**

Configure the ability to start, stop, and reset the totalizers through the LOI.

LOI totalizer start/stop

LOI menu path	**Totalizers** → **Config/Control** → **Security** → **LOI Control** → **LOI Start/Stop**

Enable/disable the ability to start or stop totalizers through the LOI.

LOI totalizer reset

LOI menu path	**Totalizers** → **Config/Control** → **Security** → **LOI Control** → **LOI Reset**

Enable/disable the ability to reset the totalizers through the LOI.

Totalizer write protection

LOI menu path	**Totalizers** → **Config/Control** → **Security** → **Write Protect**

In addition to controlling the LOI capability to start/stop and reset the totalizers, specific write protect functionality can also be configured adding an additional level of security to the totalizers.

Start/stop write protect

LOI menu path	**Totalizers** → **Config/Control** → **Security** → **Write Protect** → **WP Start/Stop**

Configure write protection on the ability to start or stop the totalizers. This is a global command and applies to all totalizers.

Reset write protect

LOI menu path	**Totalizers → Config/Control → Security → Write Protect → WP Reset**

Configure write protection on the ability to reset the totalizers. This is a global command and applies to all totalizers.

8.2.4 Discrete input/output

This configuration option is only available if the auxiliary output suite (option code AX) was ordered. The auxiliary output suite provides two channels for control.

- For HART version 5.5 or 7.1 firmware, the discrete input can provide positive zero return (PZR) or reset totalizer (A, B, C, or all totals).

  Note
  If a particular totalizer is configured to be not resettable, the totalizer will not be reset with this function.

- The discrete output control function can be configured to drive an external signal to indicate zero flow, reverse flow, empty pipe, diagnostic status, flow limit, or transmitter status.

A complete list and description of the available auxiliary functions is provided below.

Discrete input options (Channel 1 only)

PZR (Positive Zero Return)	When conditions are met to activate the input, the transmitter will force the output to zero flow.
Net Total Reset	When conditions are met to activate the input, the transmitter will reset the net total value to zero.

Discrete output options

Reverse Flow	The output will activate when the transmitter detects a reverse flow condition.
Zero Flow	The output will activate when a no flow condition is detected.
Transmitter Fault	The output will activate when a transmitter fault condition is detected.
Empty Pipe	The output will activate when the transmitter detects an empty pipe condition.
Flow Limit 1	The output will activate when the transmitter measures a flow rate that meets the conditions established for the flow limit 1 alert.
Flow Limit 2	The output will activate when the transmitter measures a flow rate that meets the conditions established for the flow limit 2 alert.
Diagnostic Status Alert	The output will activate when the transmitter detects a condition that meets the configured criteria of the diagnostic status alert.
Total Limit	The output will activate when the transmitter Totalizer A value meets the conditions established for the total limit alert.

Channel 1

Channel 1 can be configured as either a discrete input (DI) or as a discrete output (DO).

DI/O 1 control

LOI menu path	**Detailed Setup → Output Config → DI/DO Config → DI/O 1 → DI/O 1 Control**

This parameter configures the auxiliary output channel 1. It controls whether channel 1 will be a discrete input or discrete output on terminals 5(-) and 6(+).

Note
The transmitter must have been ordered with the auxiliary output suite (option code AX) to have access to this functionality.

Discrete input 1

LOI menu path	**Detailed Setup → Output Config → DI/DO Config → DI/O 1 → DI 1**

This parameter displays the configuration for channel 1 when used as a discrete input.

Discrete output 1

LOI menu path	**Detailed Setup → Output Config → DI/DO Config → DI/O 1 → DO 1**

This parameter displays the configuration for channel 1 when used as a discrete output.

Channel 2

Channel 2 is available as discrete output only.

Discrete output 2

LOI menu path	**Detailed Setup → Output Config → DI/DO Config → DO 2**

This parameter displays the configuration for channel 2.

Flow limit (1 and 2)

There are two configurable flow limits. Configure the parameters that will determine the criteria for activation of a HART alert if the measured flow rate falls within a set of configured criteria. This functionality can be used for operating simple batching operations or generating alerts when certain flow conditions are met. This parameter can be configured as a discrete output if the transmitter was ordered with the auxiliary output suite (option code AX) and the outputs are enabled. If a discrete output is configured for flow limit, the discrete output will activate when the conditions defined under mode configuration are met. See Mode below.

Control

LOI menu path	Flow 1: **Detailed Setup → Output Config → DI/DO Config → Flow Limit 1 → Control 1** Flow 2: **Detailed Setup → Output Config → DI/DO Config → Flow Limit 2 → Control 2**

This parameter turns the flow limit HART alert ON or OFF.

ON The transmitter will generate a HART alert when the defined conditions are met. If a discrete output is configured for flow limit, the discrete output will activate when the conditions for mode are met.

OFF The transmitter will not generate an alert for the flow limit.

Mode

LOI menu path	Flow 1: **Detailed Setup** → **Output Config** → **DI/DO Config** → **Flow Limit 1** → **Mode 1** Flow 2: **Detailed Setup** → **Output Config** → **DI/DO Config** → **Flow Limit 2** → **Mode 2**

The mode parameter sets the conditions under which the flow limit HART alert will activate. High and low limits exist for each channel and can be configured independently.

> High limit	The HART alert will activate when the measured flow rate exceeds the high limit set point.
< Low limit	The HART alert will activate when the measured flow rate falls below the low limit set point.
In range	The HART alert will activate when the measured flow rate is between the high limit and low limit set points.
Out of range	The HART alert will activate when the measured flow rate exceeds the high limit set point or falls below the low limit set point.

High limit

LOI menu path	Flow 1: **Detailed Setup** → **Output Config** → **DI/DO Config** → **Flow Limit 1** → **High Limit 1** Flow 2: **Detailed Setup** → **Output Config** → **DI/DO Config** → **Flow Limit 2** → **High Limit 2**

Set the flow rate value that corresponds to the high limit set point for the flow limit alert.

Low limit

LOI menu path	Flow 1: **Detailed Setup** → **Output Config** → **DI/DO Config** → **Flow Limit 1** → **Low Limit 1** Flow 2: **Detailed Setup** → **Output Config** → **DI/DO Config** → **Flow Limit 2** → **Low Limit 2**

Set the flow rate value that corresponds to the low limit set point for the flow limit alert.

Flow limit hysteresis

LOI menu path	Flow 1: **Detailed Setup** → **Output Config** → **DI/DO Config** → **Flow Limit 1** → **Hysteresis** Flow 2: **Detailed Setup** → **Output Config** → **DI/DO Config** → **Flow Limit 2** → **Hysteresis**

Set the hysteresis band for the flow limit to determine how quickly the transmitter comes out of alert status. The hysteresis value is used for both flow limit 1 and flow limit 2. Changing this parameter under the configuration parameters for one channel will cause it to also change in the other channel.

Total limit

Configure the parameters that will determine the criteria for activating a HART alert if Totalizer A falls within a set of configured criteria. This functionality can be used for operating simple batching operations or generating alerts when certain localized values are met. This parameter can be configured as a discrete output if the transmitter was ordered with auxiliary outputs enabled (option code AX). If a digital output is configured for total limit, the digital output will activate when the conditions for total mode are met.

Total control

LOI menu path	**Detailed Setup → Output Config → DI/DO Config → Total Limit → Total Control**

This parameter turns the total limit HART alert ON or OFF.

ON The transmitter will generate a HART alert when the defined conditions are met.

OFF The transmitter will not generate a HART alert for the total limit.

Total mode

LOI menu path	**Detailed Setup → Output Config → DI/DO Config → Total Limit → Total Mode**

The total mode parameter sets the conditions under which the total limit HART alert will activate. High and low limits exist for each channel and can be configured independently.

> High limit The HART alert will activate when the totalizer value exceeds the high limit set point.

< Low limit The HART alert will activate when the totalizer value falls below the low limit set point.

In range The HART alert will activate when the totalizer value is between the high limit and low limit set points.

Out of range The HART alert will activate when the totalizer value exceeds the high limit set point or falls below the low limit set point.

Total high limit

LOI menu path	**Detailed Setup → Output Config → DI/DO Config → Total Limit → Tot Hi Limit**

Set Totalizer A to a value that corresponds to the high limit set point for the total high limit alert.

Total low limit

LOI menu path	**Detailed Setup → Output Config → DI/DO Config → Total Limit → Tot Low Limit**

Set the net total value that corresponds to the low limit set point for the total low limit alert.

Total limit hysteresis

LOI menu path	**Detailed Setup → Output Config → DI/DO Config → Total Limit → Hysteresis**

Set the hysteresis band for the total limit to determine how quickly the transmitter comes out of alert status.

Diagnostic status alert

LOI menu path	**Detailed Setup → Output Config → DI/DO Config → Diag Alert**

The diagnostic status alert is used to turn on or off the diagnostics that will cause this alert to activate.

ON The diagnostic status alert will activate when a transmitter detects a diagnostic designated as ON.

OFF The diagnostic status alert will not activate when diagnostics designated as OFF are detected.

Alerts for the following diagnostics can be turned ON or OFF:

- Electronics Failure
- Coil Open Circuit
- Empty Pipe
- Reverse Flow
- Ground/Wiring Fault
- High Process Noise
- Electronics Temperature Out of Range
- Electrode Coat Limit 1
- Electrode Coat Limit 2
- Continuous Meter Verification

8.3 Configure HART

The transmitter has four HART variables available as outputs. The variables can be configured for dynamic readings including flow, total, and diagnostic values. The HART output can also be configured for burst mode or multi-drop communication if required.

8.3.1 Variable mapping

LOI menu path	**Detailed Setup → Output Config → HART → Variable Map**

Variable mapping allows configuration of the variables that are mapped to the secondary, tertiary and quaternary variables. The primary variable is fixed to output flow and cannot be configured.

Primary variable (PV)

LOI menu path	**Detailed Setup → Output Config → HART → Variable Map → PV**

The primary variable is configured for flow. This variable is fixed and cannot be configured. The primary variable is tied to the analog output.

Secondary variable (SV)

LOI menu path	**Detailed Setup → Output Config → HART → Variable Map → SV**

The secondary variable maps the second variable of the transmitter. This variable is a HART only variable and can be read from the HART signal with a HART enabled input card, or can be burst for use with a HART Tri-Loop to convert the HART signal to an analog output. Options available for mapping to this variable can be found in Available Variables.

Tertiary variable (TV)

LOI menu path	**Detailed Setup → Output Config → HART → Variable Map → TV**

The tertiary variable maps the third variable of the transmitter. This variable is a HART only variable and can be read from the HART signal with a HART enabled input card, or can be burst for use with a HART Tri-Loop to convert the HART signal to an analog output. Options available for mapping to this variable can be found in Available Variables.

Quaternary variable (QV)

LOI menu path	**Detailed Setup → Output Config → HART → Variable Map → QV**

The quaternary variable maps the fourth variable of the transmitter. This variable is a HART only variable and can be read from the HART signal with a HART enabled input card, or can be burst for use with a HART Tri-Loop™ to convert the HART signal to an analog output. Options available for mapping to this variable can be found in Available Variables.

Available Variables

- Flow Rate
- Pulse Output
- Totalizer A
- Totalizer B
- Totalizer C
- Electronics Temperature
- Line Noise
- 5 Hz SNR
- 37 Hz SNR
- Signal Power
- Empty Pipe Value
- Transmitter Velocity Deviation
- Electrode Coating Value
- Electrode Resistance
- Coil Resistance Value
- Coil Inductance Value
- Coil Baseline Deviation
- Analog Output Feedback Deviation
- Coil Current

8.3.2 Poll address

LOI menu path	**Detailed Setup → Output Config → HART → Poll Address**

Poll address enables the transmitter to be used in point-to-point mode or multi-drop mode. When in multi-drop mode, the poll address is used to identify each meter on the multi-drop line.

The transmitter poll address is set to zero at the factory, allowing standard operation in a point-to-point manner with a 4–20 mA output signal. To activate multi-drop communication:

- HART 5: The transmitter poll address must be changed to a non-zero integer (1-15). This change fixes the analog output current to 4 mA and disables the failure mode alarm signal.
- HART 7: The transmitter poll address must be changed to a non-zero integer (1-63).
- HART 7: The Loop Current Mode may need to be set to ON to fix the output current to 4 mA, or it can be set to OFF if a 4–20 mA output is desired. See Loop current mode.

8.3.3 Loop current mode

LOI menu path	**Detailed Setup → Output Config → HART → Loop Curr Mode**

Available on HART 7 through the LOI only.

When loop current mode is set to **ON**, the analog output current tracks with changes in PV. When loop current mode is **OFF**, the analog output current is fixed at 4 mA.

8.3.4 HART revision

Transmitter electronics supporting software revision v5.4 have a fixed HART 5 menu configuration. Transmitter electronics supporting software revision v5.5 or v7.1 can be configured for either HART 5 or HART 7 menu configurations.

Universal revision

Read-only informational variable that reflects the setting of the HART revision in the transmitter.

Change HART revision

On enabled devices, this function allows the user to change between HART 5 or HART 7.

8.3.5 Burst mode

LOI menu path	**Detailed Setup → Output Config → HART → Burst Mode**

The transmitter includes a burst mode function that can be enabled to broadcast the primary variable or all dynamic variables approximately three to four times per second. Burst mode is a specialized function used in very specific applications. The burst mode function enables you to select the variables that are broadcast while in the burst mode.

Burst mode enables you to set the burst mode as **OFF** or **ON**:

- **OFF** - Turns burst mode off; no data are broadcast over the loop
- **ON** - Turns burst mode on; data selected under burst option are broadcast over the loop

Additional burst mode capabilities, not visible from the LOI, are available through a HART host.

Burst option (burst command)—HART 5 only

LOI menu path	**Detailed Setup → Output Config → HART → Burst Command**

Burst option enables you to select the variable(s) that is broadcast during the transmitter burst. Choose one of the following options:

- 1; PV; Primary Variable - Selects the primary variable

- 2; % range/current; Percent of Range and Loop Current - Selects the variable as percent of range and analog output
- 3; Process vars/crnt; All Variables and Loop Current - Selects all variables and analog output
- 110; Dynamic vars; Dynamic Variables - Burst all dynamic variables in the transmitter

Request preambles

LOI menu path	**Detailed Setup → Output Config → HART → Req Preams**

Request preambles is the number of preambles required by the transmitter for HART communications.

Response preambles

LOI menu path	**Detailed Setup → Output Config → HART → Resp Preams**

Response preambles is the number of preambles sent by the transmitter in response to any host request.

8.4 Configure LOI/Display

8.4.1 Flow and totalizer display

LOI menu path	**Detailed Setup → LOI Config → Flow Display**

Use flow display to configure the parameters that will appear on the LOI flowrate screen. The flowrate screen displays two lines of information. Choose one of the following options:

- Flowrate, % of Span
- Flow, Total A
- % Span, Total A
- Flow, Total B
- % Span, Total B
- Flow, Total C
- % Span, Total C

8.4.2 Language

LOI menu path	**Detailed Setup → LOI Config → Language**

Use language to configure the display language shown on the LOI. Choose one of the following options:

- English
- Spanish
- Portuguese
- German

- French

8.4.3 Display lock

LOI menu path	**Detailed Setup → LOI Config → Disp Auto Lock**

The transmitter has display lock functionality to prevent unintentional configuration changes. The display can be locked manually or configured to automatically lock after a set period of time.

- OFF (default)
- 1 Minute
- 10 Minutes

The display is always locked on the flow screen.

8.4.4 Error mask

LOI menu path	**Detailed Setup → LOI Config → LOI Err Mask**

Use LOI error mask to turn off the analog output power error message (AO No Power). This may be desired if the analog output is not being used.

8.4.5 Backlight control

LOI menu path	**Detailed Setup → LOI Config → Backlight**

To conserve power, the LOI backlight can be configured to automatically turn off after a set amount of time without keypad activity.

- Always OFF (default for low power)
- 10 Seconds
- 20 Seconds
- 30 Seconds
- Always ON (default)

8.5 Additional parameters

The following parameters may be required for detailed configuration settings based on your application.

8.5.1 Coil drive frequency

LOI menu path	**Detailed Setup → More Params → Coil Frequency**

Use coil drive frequency to change the pulse rate of the coils.

- 5 Hz - The standard coil drive frequency is 5 Hz, which is sufficient for nearly all applications.

- 37 Hz - If the process fluid causes a noisy or unstable output, increase the coil drive frequency to 37.5 Hz. If the 37 Hz mode is selected, perform the auto zero function for optimum performance.

Note
37 Hz coil drive frequency should not be used for sensor sizes larger than 20-inch.

See Auto zero.

8.5.2 Process density

LOI menu path	**Detailed Setup → More Params → Proc Density**

Use the process density value to convert from a volumetric flow rate to a mass flow rate using the following equation:

Qm = Qv x p

Where:

Qm is the mass flow rate

Qv is the volumetric flow rate, and

p is the fluid density

8.5.3 Reverse flow

LOI menu path	**Detailed Setup → Output Config → Reverse Flow**

Use reverse flow to enable or disable the transmitter's ability to read flow in the opposite direction of the flow direction arrow (see Flow direction). This may occur when the process has bi-directional flow, or when either the electrode wires or the coil wires are reversed (see Troubleshooting Remote wiring). This also enables the totalizer to count in the reverse direction.

8.5.4 Low flow cutoff

LOI menu path	**Detailed Setup → Sig Processing → Lo-Flow Cutoff**

Low flow cutoff allows the user to set a low flow limit to be specified. The analog output signal is driven to 4mA for flow rates below the set point. The low flow cutoff units are the same as the PV units and cannot be changed. The low flow cutoff value applies to both forward and reverse flows.

8.5.5 PV (flow) damping

LOI menu path	**Detailed Setup → Sig Processing → Damping**

Primary variable damping allows selection of a response time, in seconds, to a step change in flow rate. It is most often used to smooth fluctuations in output.

8.5.6 Signal processing

The transmitter contains several advanced functions that can be used to stabilize erratic outputs caused by process noise. The signal processing menu contains this functionality.

If the 37 Hz coil drive mode has been set, and the output is still unstable, the damping and signal processing function should be used. It is important to set the coil drive mode to 37 Hz first, so the loop response time is not increased.

The transmitter provides for a very easy and straightforward start-up, and also incorporates the capability to deal with difficult applications that have previously manifested themselves in a noisy output signal. In addition to selecting a higher coil drive frequency (37 Hz vs. 5 Hz) to isolate the flow signal from the process noise, the microprocessor can actually scrutinize each input based on three user-defined parameters to reject the noise specific to the application.

See Digital Signal Processing for the detailed description of how the signal processing works.

8.6 Configure special units

Special units are used when the application requires units that are not included in the flow units available from the device. Refer to Measurement units for a complete list of the available units.

8.6.1 Base volume unit

LOI menu path	**Basic Setup → Flow Units → Special Units → Base Vol Units**

Base volume unit is the unit from which the conversion is being made. Set this variable to the appropriate option.

8.6.2 Conversion factor

LOI menu path	**Basic Setup → Flow Units → Special Units → Conv Factor**

The special units conversion factor is used to convert base units to special units. For a straight conversion of units from one unit of measure to a different unit of measure, the conversion factor is the number of base units in the new unit.

Example: If you are converting from gallons to barrels and there are 31 gallons in a barrel, the conversion factor is 31.

8.6.3 Base time unit

LOI menu path	**Basic Setup → Flow Units → Special Units → Base Time Unit**

Base time unit provides the time unit from which to calculate the special units.For example, if your special units is a volume per minute, select minutes.

8.6.4 Special volume unit

LOI menu path	**Basic Setup → Flow Units → Special Units → Volume Unit**

Special volume unit enables you to display the volume unit format to which you have converted the base volume units.

Example: If the special units are abc/min, the special volume variable is abc. The volume units variable is also used in totalizing the special units flow.

8.6.5 Special flow rate unit

LOI menu path	**Basic Setup → Flow Units → Special Units → Rate Unit**

Flow rate unit is a format variable that provides a record of the units to which you are converting. The Handheld Communicator will display a special units designator as the units format for your primary variable. The actual special units setting you define will not appear. Four characters are available to store the new units designation. The LOI will display the four character designation as configured.

Example: To display flow in acre-feet per day, and acre-foot is equal to 43560 cubic feet, the procedure would be:

1. Set the volume unit to ACFT.
2. Set the base volume unit to ft3.
3. Set the conversion factor to 43560.
4. Set the time base unit to Day.
5. Set the flow rate unit to AF/D.

9 Advanced Diagnostics Configuration

9.1 Introduction

Rosemount magnetic flowmeters provide device diagnostics that detect and warn of abnormal situations throughout the life of the meter—from installation to maintenance and meter verification. With Rosemount magnetic flowmeter diagnostics enabled, plant availability and throughput can be improved, and costs through simplified installation, maintenance and troubleshooting can be reduced.

Table 9-1: Basic diagnostics availability

Diagnostic name	Diagnostic category	Product capability
Tunable Empty Pipe	Process	Standard
Electronics Temperature	Maintenance	Standard
Coil Fault	Maintenance	Standard
Transmitter Fault	Maintenance	Standard
Reverse Flow	Process	Standard
Electrode Saturation	Process	Standard
Coil Current	Maintenance	Standard
Coil Power	Maintenance	Standard
Grounding and Wiring Fault	Installation	Standard

Table 9-2: Advanced diagnostics availability

Diagnostic name	Diagnostic category	Product capability
High Process Noise	Process	Suite 1 (DA1)
Coated Electrode Detection	Process	Suite 1 (DA1)
Commanded Meter Verification	Meter Health	Suite 2 (DA2)
Continuous Meter Verification	Meter Health	Suite 2 (DA2)
4-20 mA Loop Verification	Installation	Suite 2 (DA2)

9.2 Licensing and enabling

All advanced diagnostics are licensed by ordering option code DA1, DA2, or both. In the event that a diagnostic option is not ordered, advanced diagnostics can be licensed in the field through the use of a license key. Each transmitter has a unique license key specific to the diagnostic option code. A trial license is also available to enable the advanced diagnostics. This temporary functionality will be automatically disabled after 30-days or when power to the transmitter is cycled, whichever occurs first. This trial code can be used a maximum of three times per transmitter. See the detailed procedures below for entering the license key and enabling the advanced diagnostics. To obtain a permanent or trial license key, contact an Emerson representative.

9.2.1 Licensing the diagnostics

Procedure

1. Power up the transmitter.
2. Verify the software version is 4.4 software or later.

LOI menu path	**Detailed Setup → Device Info → Revision Num → Software Num**

3. Determine the Device ID.

LOI menu path	**Detailed Setup → Device Info → Device ID**

4. Obtain a license key from an Emerson representative.
5. Enter license key.

LOI menu path	**Diagnostics → Advanced Diag → Licensing → License Key → License Key**

9.3 Tunable empty pipe detection

The tunable empty pipe detection provides a means of minimizing issues and false readings when the pipe is empty. This is most important in batching applications where the pipe may run empty with some regularity. If the pipe is empty, this diagnostic will activate, set the flow rate to 0, and deliver an alert.

Turning empty pipe on/off

LOI menu path	**Diagnostics → Diag Controls → Empty Pipe**

The tunable empty pipe detection diagnostic can be turned on or off as required by the application. The empty pipe diagnostic is shipped turned “On” by default.

9.3.1 Tunable empty pipe parameters

The tunable empty pipe diagnostic has one read-only parameter, and two parameters that can be custom configured to optimize the diagnostic performance.

Empty pipe (EP) value

LOI menu path	**Diagnostics → Variables → Empty Pipe**

This parameter shows the current empty pipe value. This is a read-only value. This number is a unit-less number and is calculated based on multiple installation and process variables such as sensor type, line size, process fluid properties, and wiring. If the empty pipe value exceeds the empty pipe trigger level for a specified number of updates, then the empty pipe diagnostic alert will activate.

Empty pipe (EP) trigger level

LOI menu path	**Diagnostics → Basic Diag → Empty Pipe → EP Trig Level**

Limits: 3 to 2000

Empty pipe trigger level is the threshold limit that the empty pipe value must exceed before the empty pipe diagnostic alert activates. The default setting from the factory is 100.

Empty pipe (EP) counts

LOI menu path	**Diagnostics → Basic Diag → Empty Pipe → EP Counts**

Limits: 2 to 50

Empty pipe counts is the number of consecutive updates that the transmitter must receive where the empty pipe value exceeds the empty pipe trigger level before the empty pipe diagnostic alert activates. The default setting from the factory is 5.

9.3.2 Optimizing tunable empty pipe

The tunable empty pipe diagnostic is set at the factory to properly diagnose most applications. If this diagnostic activates, the following procedure can be followed to optimize the empty pipe diagnostic for the application.

Procedure

1. Record the empty pipe value with a full pipe condition.

   Example

   Full reading = 0.2

2. Record the empty pipe value with an empty pipe condition.

   Example

   Empty reading = 80.0

3. Set the empty pipe trigger level to a value between the full and empty readings.

   For increased sensitivity to empty pipe conditions, set the trigger level to a value closer to the full pipe value.

   Example

   Set the trigger level to 25.0

4. Set the empty pipe counts to a value corresponding to the desired sensitivity level for the diagnostic.

   For applications with entrained air or potential air slugs, less sensitivity may be desired.

   Example

   Set the counts to 10

9.4 Electronics temperature

The transmitter continuously monitors the temperature of the internal electronics. If the measured electronics temperature exceeds the operating limits of –40 to 140 °F (–40 to 60 °C) the transmitter will go into alarm and generate an alert.

9.4.1 Turning electronics temperature on/off

LOI menu path	**Diagnostics → Diag Controls → Elect Temp**

The electronics temperature diagnostic can be turned on or off as required by the application.The electronics temperature diagnostic will be turned on by default.

9.4.2 Electronics temperature parameters

The electronics temperature diagnostic has one read-only parameter. It does not have any configurable parameters.

LOI menu path	**Diagnostics → Variables → Elect Temp**

This parameter shows the current temperature of the electronics. This is a read-only value.

9.5 Ground/wiring fault detection

The transmitter continuously monitors signal amplitudes over a wide range of frequencies. For the ground/wiring fault detection diagnostic, the transmitter specifically looks at the signal amplitude at frequencies of 50 Hz and 60 Hz which are the common AC cycle frequencies found throughout the world. If the amplitude of the signal at either of these frequencies exceeds 5 mV, that is an indication that there is a ground or wiring issue and that stray electrical signals are getting into the transmitter. The diagnostic alert will activate indicating that the ground and wiring of the installation should be carefully reviewed.

The ground/wiring fault detection diagnostic provides a means of verifying installations are done correctly. If the installation is not wired or grounded properly, this diagnostic will activate and deliver an alert. This diagnostic can also detect if the grounding is lost over-time due to corrosion or another root cause.

9.5.1 Turning ground/wiring fault on/off

LOI menu path	**Diagnostics → Diag Controls → Ground/Wiring**

The ground/wiring fault detection diagnostic can be turned on or off as required by the application. If the advanced diagnostics suite 1 (DA1 Option) was ordered, then the ground/wiring fault detection diagnostic will be turned on. If DA1 was not ordered or licensed, this diagnostic is not available.

9.5.2 Ground/wiring fault parameters

The ground/wiring fault detection diagnostic has one read-only parameter. It does not have any configurable parameters.

Line noise

LOI menu path	**Diagnostics → Variables → Line Noise**

The line noise parameter shows the amplitude of the line noise. This is a read-only value. This number is a measure of the signal strength at 50/60 Hz. If the line noise value exceeds 5 mV, then the ground/wiring fault diagnostic alert will activate.

9.6 High process noise detection

The high process noise diagnostic detects if there is a process condition causing an unstable or noisy reading that is not an actual flow variation. A common cause of high process noise is slurry flow, like pulp stock or mining slurries. Other conditions that cause this diagnostic to activate are high levels of chemical reaction or entrained gas in the liquid. If unusual noise or flow variation is seen, this diagnostic will activate and deliver an alert. If this situation exists and is left without remedy, it will add additional uncertainty and noise to the flow reading.

9.6.1 Turning high process noise on/off

LOI menu path	**Diagnostics → Diag Controls → Process Noise**

The high process noise diagnostic can be turned on or off as required by the application. If the advanced diagnostics suite 1 (DA1 Option) was ordered, then the high process noise diagnostic will be turned on. If DA1 was not ordered or licensed, this diagnostic is not available.

9.6.2 High process noise parameters

The high process noise diagnostic has two read-only parameters. It does not have any configurable parameters. This diagnostic requires that flow be present in the pipe and the velocity be greater than1 ft/s (0.3 m/s).

5 Hz signal to noise ratio (SNR)

LOI menu path	**Diagnostics → Variables → 5Hz SNR**

This parameter shows the value of the signal to noise ratio at the coil drive frequency of 5 Hz. This is a read-only value. This number is a measure of the signal strength at 5 Hz relative to the amount of process noise. If the transmitter is operating in 5 Hz mode, and the signal to noise ratio remains below 25 for one minute, then the high process noise diagnostic alert will activate.

37 Hz signal to noise ratio (SNR)

LOI menu path	**Diagnostics → Variables → 37Hz SNR**

This parameter shows the current value of the signal to noise ratio at the coil drive frequency of 37 Hz. This is a read-only value. This number is a measure of the signal strength at 37 Hz relative to the amount of process noise. If the transmitter is operating in 37 Hz mode, and the signal to noise ratio remains below 25 for one minute, then the high process noise diagnostic alert will activate.

9.7 Coated electrode detection

The coated electrode detection diagnostic provides a means of monitoring insulating coating buildup on the measurement electrodes. If coating is not detected, buildup over time can lead to a compromised flow measurement. This diagnostic can detect if the electrode is coated and if the amount of coating is affecting the flow measurement. There are two levels of electrode coating.

- Limit 1 indicates when coating is starting to occur, but has not compromised the flow measurement.
- Limit 2 indicates when coating is affecting the flow measurement and the meter should be serviced immediately.

9.7.1 Turning coated electrode detection on/off

LOI menu path	**Diagnostics → Diag Controls → Elec Coating**

The coated electrode detection diagnostic can be turned on or off as required by the application. If the advanced diagnostics suite 1 (DA1 option) was ordered, then the coated electrode detection diagnostic will be turned on. If DA1 was not ordered or licensed, this diagnostic is not available.

9.7.2 Coated electrode parameters

The coated electrode detection diagnostic has four parameters. Two are read-only and two are configurable parameters. The electrode coating parameters need to be initially monitored to accurately set the electrode coating limit levels for each application.

Electrode coating (EC) value

LOI menu path	**Diagnostics → Advanced Diag → Elec Coating → EC Current Val**

The electrode coating value reads the value of the coated electrode detection diagnostic.

Electrode coating (EC) level 1 limit

LOI menu path	**Diagnostics → Advanced Diag → Elec Coat → EC Limit 1**

Set the criteria for the electrode coating limit 1 which indicates when coating is starting to occur, but has not compromised the flow measurement. The default value for this parameter is 1000 k Ohm.

Electrode coating (EC) level 2 limit

LOI menu path	**Diagnostics → Advanced Diag → Elec Coat → EC Limit 2**

Set the criteria for the electrode coating limit 2 which indicates when coating is affecting the flow measurement and the meter should be serviced immediately. The default value for this parameter is 2000 k Ohm.

Maximum electrode coating (EC)

LOI menu path	**Diagnostics → Advanced Diag → Elec Coat → EC Max Value**

The maximum electrode coating value reads the maximum value of the coated electrode detection diagnostic since the last maximum value reset.

Clear maximum electrode value

LOI menu path	**Diagnostics → Advanced Diag → Elec Coat → Reset Max Val**

Use this method to reset the maximum electrode coating value.

9.8 4-20 mA loop verification

The 4-20 mA loop verification diagnostic provides a means of verifying the analog output loop is functioning properly. This is a manually initiated diagnostic test. This diagnostic checks the integrity of the analog loop and provides a health status of the circuit. If the verification does not pass, this will be highlighted in the results given at the end of the check.

The 4-20 mA loop verification diagnostic is useful for testing the analog output when errors are suspected. The diagnostic tests the analog loop at five different mA output levels:

- 4 mA
- 12 mA
- 20 mA
- Low alarm level
- High alarm level

9.8.1 Initiating 4-20 mA loop verification

LOI menu path	**Diagnostics → Advanced Diag → 4-20mA Verify → 4-20mA Verify**

The 4–20 mA loop verification diagnostic can be initiated as required by the application. If Smart Meter Verification Professional (DS1 Option) was ordered, then the 4–20 mA loop verification diagnostic will be available. If DA2 was not ordered or licensed, this diagnostic is not available.

9.8.2 4-20 mA loop verification parameters

The 4-20 mA loop verification diagnostic has five read-only parameters plus an overall test result. It does not have any configurable parameters.

4-20 mA loop verification test result

LOI menu path	**Diagnostics → Advanced Diag → 4-20mA Verify → View Results**

Shows the results of the 4-20 mA loop verification test as either passed or failed.

4 mA measurement

LOI menu path	N/A

Shows the measured value of the 4 mA loop verification test.

12 mA measurement

LOI menu path	N/A

Shows the measured value of the 12 mA loop verification test.

20 mA measurement

LOI menu path	N/A

Shows the measured value of the 20 mA loop verification test.

Low alarm measurement

LOI menu path	N/A

Shows the measured value of the low alarm verification test.

High alarm measurement

LOI menu path	N/A

Shows the measured value of the high alarm verification test.

9.9 Smart Meter Verification

The Smart Meter Verification diagnostic provides a means of verifying the flowmeter is within calibration without removing the sensor from the process. This diagnostic test provides a review of the transmitter and sensor's critical parameters as a means to document verification of calibration. The results of this diagnostic provide the deviation amount from expected values and a pass/fail summary against user-defined criteria for the application and conditions. The Smart Meter Verification diagnostic can be configured to run continuously in the background during normal operation, or it can be manually initiated as required by the application.

9.9.1 Sensor baseline parameters

The Smart Meter Verification diagnostic functions by taking a baseline sensor signature and then comparing measurements taken during the verification test to these baseline results.

The sensor signature describes the magnetic behavior of the sensor. Based on Faraday's law, the induced voltage measured on the electrodes is proportional to the magnetic field strength. Thus, any changes in the magnetic field will result in a calibration shift of the sensor. Having the transmitter take an initial sensor signature when first installed will provide the baseline for the verification tests that are done in the future. There are three specific measurements that are stored in the transmitter's non-volatile memory that are used when performing the calibration verification.

Coil circuit resistance

LOI menu path	**Diagnostics → Advanced Diag → Meter Verif → Sensr Baseline → Values → Coil Resist**

The coil resistance is a measurement of the coil circuit health. This value is used as a baseline to determine if the coil circuit is still operating correctly.

Coil inductance (signature)

LOI menu path	**Diagnostics → Advanced Diag → Meter Verif → Sensr Baseline → Values → Coil Inductnce**

The coil inductance is a measurement of the magnetic field strength. This value is used as a baseline to determine if a sensor calibration shift has occurred.

Electrode circuit resistance

LOI menu path	**Diagnostics → Advanced Diag → Meter Verif → Sensr Baseline → Values → Electrode Res**

The electrode circuit resistance is a measurement of the electrode circuit health. This value is used as a baseline to determine if the electrode circuit is still operating correctly.

9.9.2 Establishing the sensor baseline

The first step in running the Smart Meter Verification test is establishing the reference baseline that the test will use as the baseline for comparison. This is accomplished by having the transmitter take a baseline of the sensor.

Reset baseline (re-signature meter)

LOI menu path	**Diagnostics → Advanced Diag → Meter Verif → Sensr Baseline → Reset Baseline**

Having the transmitter take an initial sensor baseline when first installed will provide the comparison point for the verification tests that are done in the future. The sensor baseline should be taken during the start-up process when the transmitter is first connected to the sensor, with a full line, and ideally with no flow in the line. Running the sensor baseline procedure when there is flow in the line is permissible, but this may introduce some noise into the electrode circuit resistance measurement. If an empty pipe condition exists, then the sensor baseline should only be run for the coils.

Note
For high temperature applications, it is a best practice to take the sensor baseline when the process fluid and sensor have reached their normal operating temperature if that will be operating condition during test measurements.

Once the sensor baseline process is complete, the measurements taken during this procedure are stored in non-volatile memory to prevent loss in the event of a power interruption to the meter. This initial sensor signature is required for both manual and continuous Smart Meter Verification.

Recall values (recall last saved)

LOI menu path	**Diagnostics → Advanced Diag → Meter Verif → Sensr Baseline → Recall Values**

In the event that the sensor baseline was reset accidentally or incorrectly, this function will restore the previously saved sensor baseline values.

9.9.3 Smart Meter Verification test criteria

The Smart Meter Verification diagnostic provides the ability to customize the test criteria to which the verification must be tested. The test criteria can be set for each of the flow conditions discussed above.

No flow limit

LOI menu path	**Diagnostics → Advanced Diag → Meter Verif → Test Criteria → No Flow**

Set the test criteria for the no flow condition. The factory default for this value is set to five percent with limits configurable between one and ten percent. This parameter applies to manually initiated test only.

Flowing full limit

LOI menu path	**Diagnostics → Advanced Diag → Meter Verif → Test Criteria → Flowing, Full**

Set the test criteria for the flowing, full condition. The factory default for this value is set to five percent with limits configurable between one and ten percent. This parameter applies to manually initiated tests only.

Empty pipe limit

LOI menu path	**Diagnostics → Advanced Diag → Meter Verif → Test Criteria → Empty Pipe**

Set the test criteria for the empty pipe condition. The factory default for this value is set to five percent with limits configurable between one and ten percent. This parameter applies to manually initiated test only.

Continuous limit

LOI menu path	**Diagnostics → Advanced Diag → Meter Verif → Test Criteria → Continual**

Set the test criteria for the continuous Smart Meter Verification diagnostic. The factory default for this value is set to five percent with limits configurable between two and ten percent. If the tolerance band is set too tightly, under empty pipe conditions or noisy flowing conditions, a false failure of the transmitter test may occur.

9.10 Run commanded Smart Meter Verification

LOI menu path	**Diagnostics → Advanced Diag → Meter Verif → Run Meter Ver**

The Smart Meter Verification diagnostic will be available if the Smart Meter Verification Professional (DA2) was ordered. If DA2 was not ordered or licensed, this diagnostic will not be available. This method will initiate the commanded meter verification test.

9.10.1 Test conditions

LOI menu path	**Diagnostics → Advanced Diag → Meter Verif → Run Meter Ver → Test Condition**

Smart Meter Verification can be initiated under three possible test conditions. This parameter is set at the time that the sensor baseline or Smart Meter Verification test is manually initiated.

No flow Run the Smart Meter Verification test with a full pipe and no flow in the line. Running the Smart Meter Verification test under this condition provides the most accurate results and the best indication of magnetic flowmeter health.

Flowing full Run the Smart Meter Verification test with a full pipe and flow in the line. Running the Smart Meter Verification test under this condition provides the ability to verify the magnetic flowmeter health without shutting down the process flow in applications when a shutdown is not possible. Running the diagnostic under flowing conditions can cause a false test failure if there is significant process noise present.

Empty pipe Run the Smart Meter Verification test with an empty pipe. Running the Smart Meter Verification test under this condition provides the ability to verify the magnetic flowmeter health with an empty pipe. Running the verification diagnostic under empty pipe conditions will not check the electrode circuit health.

9.10.2 Test scope

LOI menu path	**Diagnostics → Advanced Diag → Meter Verif → Run Meter Ver → Test Scope**

The commanded Smart Meter Verification test can be used to verify the entire flowmeter installation or individual parts such as the transmitter or sensor. This parameter is set at the time that the Smart Meter Verification test is manually initiated. There are three test scopes from which to choose.

All Run the Smart Meter Verification test and verify the entire flowmeter installation. This parameter results in the diagnostic performing the transmitter calibration verification, sensor calibration verification, coil health check, and electrode health check. Transmitter calibration and sensor calibration are verified to the percentage associated with the test condition selected when the test was initiated. This setting applies to manually initiated tests only.

Transmitter Run the Smart Meter Verification test on the transmitter only. This results in the verification test only checking the transmitter calibration to the limits of the test criteria selected when the verification test was initiated. This setting applies to manually initiated tests only.

Sensor (coils and electrodes) Run the Smart Meter Verification test on the sensor only. This results in the verification test checking the sensor calibration to the limits of the test criteria selected when the Smart Meter Verification test was initiated, verifying the coil circuit health, and the electrode circuit health. This setting applies to manually initiated tests only.

9.11 Continuous Smart Meter Verification

Continuous Smart Meter Verification can be used to monitor and verify the health of the flowmeter system. The continuous Smart Meter Verification will not report results until 30 minutes after powering up to ensure the system is stable and to avoid false failures.

9.11.1 Test scope

Continuous Smart Meter Verification can be configured to monitor the sensor coils, electrodes, analog output, and transmitter calibration, All of these parameters can be individually enabled or disabled. These parameters apply to continuous Smart Meter Verification only.

Coils

LOI menu path	**Diagnostics → Diag Controls → Cont Meter Ver → Coils**

Continuously monitor the sensor coil circuit by enabling this continuous Smart Meter Verification parameter.

Electrodes

LOI menu path	**Diagnostics → Diag Controls → Cont Meter Ver → Electrodes**

Continuously monitor the electrode resistance by enabling this continuous Smart Meter Verification parameter.

Transmitter

LOI menu path	**Diagnostics → Diag Controls → Cont Meter Ver → Transmitter**

Continuously monitor the transmitter calibration by enabling this continuous Smart Meter Verification parameter.

Analog output

LOI menu path	**Diagnostics → Diag Controls → Cont Meter Ver → Analog Output**

Continuously monitor the analog output signal by enabling this continuous Smart Meter Verification parameter.

9.12 Smart Meter Verification test results

If the Smart Meter Verification test is initiated by command, the transmitter will make several measurements to verify the transmitter calibration, sensor calibration, coil circuit health, and electrode circuits health. The results of these tests can be reviewed and recorded on the Table 9-3 form. Print the "Commanded Calibration Verification Results" form and enter the test results as you view them. The completed form can be used to validate that the meter is within the required calibration limits to comply with governmental regulatory agencies.

Depending on the method used to view the results, they will be displayed in either a menu structure, as a method, or in the report format. When using the LOI, the parameters are viewed as a method using the left arrow key to cycle through the results.

Table 9-3: Manual Smart Meter Verification Test Parameters

	Parameter	LOI menu path (Diagnostics → Variables → MV Results → Manual Results)
1	Test Condition	Test Condition
2	Test Criteria	Test Criteria
3	8714 Test Result	MV Results
4	Simulated Velocity	Sim Velocity
5	Actual Velocity	ActualVelocity
6	Velocity Deviation	Flow Sim Dev
7	Xmtr Cal Test Result	Xmtr Cal Verify
8	Sensor Cal Deviation	Sensor Cal Dev
9	Sensor Cal Test Result	Sensor Cal
10	Coil Circuit Test Result	Coil Circuit
11	Electrode Circuit Test Result	Electrode Ckt

Table 9-4: Continuous Smart Meter Verification Test Parameters

	Parameter	LOI menu path (Diagnostics → Variables → MV Results → Continual Res)
1	Continuous Limit	Test Criteria
2	Simulated Velocity	Sim Velocity
3	Actual Velocity	ActualVelocity
4	Velocity Deviation	Flow Sim Dev
5	Coil Signature	Coil Inductnce
6	Sensor Cal Deviation	Sensor Cal Dev
7	Coil Resistance	Coil Resist
8	Electrode Resistance	Electrode Res
9	mA Expected	4–20 mA Expect
10	mA Actual	4–20 mA Actual
11	mA Deviation	AO FB Dev

9.13 Smart Meter Verification measurements

The Smart Meter Verification test will make measurements of the coil resistance, coil inductance, and electrode resistance and compare these values to the values taken during the sensor baseline process to determine the sensor calibration deviation, the coil circuit health, and the electrode circuit health. In addition, the measurements taken by this test can provide additional information when troubleshooting the meter.

Coil circuit resistance

LOI menu path	Manual: **Diagnostics → Advanced Diag → Meter Verif → Measurements → Manual Measure → Coil Resist** Continuous: **Diagnostics → Advanced Diag → Meter Verif → Measurements → Continual Meas → Coil Resist**

The coil circuit resistance is a measurement of the coil circuit health. This value is compared to the coil circuit resistance signature measurement taken during the sensor baseline process to determine coil circuit health. This value can be continuously monitored using continuous Smart Meter Verification.

Coil inductance (signature)

LOI menu path	Manual: **Diagnostics → Advanced Diag → Meter Verif → Measurements → Manual Measure → Coil Inductance** Continuous: **Diagnostics → Advanced Diag → Meter Verif → Measurements → Continual Meas → Coil Inductance**

The coil inductance is a measurement of the magnetic field strength. This value is compared to the coil inductance signature measurement taken during the sensor baseline process to determine sensor calibration deviation. This value can be continuously monitored using continuous Smart Meter Verification.

Electrode circuit resistance

LOI menu path	Manual: **Diagnostics** → **Advanced Diag** → **Meter Verif** → **Measurements** → **Manual Measure** → **Electrode Res** Continuous: **Diagnostics** → **Advanced Diag** → **Meter Verif** → **Measurements** → **Continual Meas** → **Electrode Res**

The electrode circuit resistance is a measurement of the electrode circuit health. This value is compared to the electrode circuit resistance signature measurement taken during the sensor baseline process to determine electrode circuit health. This value can be continuously monitored using continuous Smart Meter Verification.

Actual velocity

LOI menu path	Manual: **Diagnostics** → **Advanced Diag** → **Meter Verif** → **Measurements** → **Manual Measure** → **ActualVelocity** Continuous: **Diagnostics** → **Advanced Diag** → **Meter Verif** → **Measurements** → **Continual Meas** → **ActualVelocity**

The actual velocity is a measurement of the simulated velocity signal. This value is compared to the simulated velocity to determine transmitter calibration deviation. This value can be continuously monitored using continuous Smart Meter Verification.

Flow simulation deviation

LOI menu path	Manual: → **Diagnostics** → **Variables** → **MV Results** → **Manual Results** → **Flow Sim Dev** Continuous: → **Diagnostics** → **Variables** → **MV Results** → **Continual Res** → **Flow Sim Dev**

The flow simulation deviation is a measurement of the percent difference between the simulated velocity and the actual measured velocity from the transmitter calibration verification test. This value can be continuously monitored using continuous Smart Meter Verification.

4-20 mA expected value

LOI menu path	Manual: **Diagnostics** → **Advanced Diag** → **4-20 mA Verify** → **View Results**
	Continuous: **Diagnostics** → **Advanced Diag** → **Meter Verif** → **Measurements** → **Continual Meas** → **4-20 mA Expect**

The 4-20 mA expected value is the simulated analog signal used for the 4-20 mA meter verification test. This value is compared to the actual analog signal to determine analog output deviation. This value can be continuously monitored using continuous Smart Meter Verification.

4-20 mA actual value

LOI menu path	Manual: **Diagnostics** → **Advanced Diag** → **4-20 mA Verify** → **View Results** Continuous: **Diagnostics** → **Advanced Diag** → **Meter Verif** → **Measurements** → **Continual Meas** → **4-20 mA Actual**

The 4-20 mA actual value is the measured analog signal used for the 4-20 mA meter verification test. This value is compared to the simulated analog signal to determine analog output deviation. This value can be continuously monitored using continuous Smart Meter Verification.

4-20 mA deviation

LOI menu path	Manual: **Diagnostics** → **Advanced Diag,** → **4-20 mA Verify** → **View Results** Continuous: **Diagnostics** → **Advanced Diag** → **Meter Verif** → **Measurements** → **Continual Meas** → **AO FB Dev**

The 4-20 mA deviation is a measurement of the percent difference between the simulated analog signal and the actual measured analog signal from the analog output verification test. This value can be continuously monitored using continuous Smart Meter Verification.

9.14 Optimizing the Smart Meter Verification

The Smart Meter Verification diagnostic can be optimized by setting the test criteria to the desired levels necessary to meet the compliance requirements of the application. The following examples below will provide some guidance on how to set these levels.

Example 1 An effluent meter must be certified annually to comply with environmental regulations. This example regulation requires that the meter be certified to five percent. Since this is an effluent meter, shutting down the process may not be viable. In this instance the Smart Meter Verification test will be performed under flowing conditions. Set the test criteria for flowing, full to five percent to meet the requirements of the governmental agencies.

Example 2 A pharmaceutical company requires bi-annual verification of meter calibration on a critical feed line for one of their products. This is an internal standard, and the plant requires a calibration record be kept on-hand. Meter calibration on this process must meet two percent. The process is a batch process so it is possible to perform the calibration verification with the line full and with no flow. Since the Smart Meter Verification test can be run under no flow conditions, set the test criteria for no flow to two percent to comply with the necessary plant standards.

Example 3 A food and beverage company requires an annual calibration of a meter on a product line. The plant standard calls for the accuracy to be three percent or better. They manufacture this product in batches, and the measurement cannot be interrupted when a batch is in process. When the batch is complete, the line goes empty. Since there is no means of performing the Smart Meter Verification test while there is product in the line, the test must be performed under empty pipe conditions. The test criteria for empty pipe should be set to three percent, and it should be noted that the electrode circuit health cannot be verified.

9.14.1 Optimizing continuous Smart Meter Verification

For continuous Smart Meter Verification, there is only one test criteria value to configure, and it will be used for all flow conditions. The factory default is set to five percent to minimize the potential for false failures under empty pipe conditions. For best results, set the criteria to match the maximum value of the three test criteria set during commanded meter verification (no flow, flowing full, and empty pipe).

For example, a plant might set the following commanded meter verification test criteria: two percent for no flow, three percent for flowing full, and four percent for empty pipe. In this case, the maximum test criterion is four percent, so the test criteria for continuous Smart Meter Verification should be set to four percent. If the tolerance band is set too tightly, under empty pipe conditions or noisy flowing conditions, a false failure of the transmitter test may occur.

10 Digital Signal Processing

10.1 Introduction

Magmeters are used in applications that can create noisy flow readings. The transmitter has the capability to deal with difficult applications that have previously manifested themselves in a noisy output signal. In addition to selecting a higher coil drive frequency (37 Hz vs. 5 Hz) to isolate the flow signal from the process noise, the microprocessor has digital signal processing that is capable of rejecting the noise specific to the application. This section explains the different types of process noise, provides instructions for optimizing the flow reading in noisy applications, and provides a detailed description of the digital signal processing functionality.

10.2 Process noise profiles

1/f noise

This type of noise has higher amplitudes at lower frequencies, but generally degrades over increasing frequencies. Potential sources of 1/f noise include chemical mixing and slurry flow particles rubbing against the electrodes.

Spike noise

This type of noise generally results in a high amplitude signal at specific frequencies, which can vary depending on the source of the noise. Common sources of spike noise include chemical injections directly upstream of the flowmeter, hydraulic pumps, and slurry flows with low concentrations of particles in the stream. The particles bounce on the electrode generating a “spike” in the electrode signal. An example of this type of flow stream would be a recycle flow in a paper mill.

White noise

This type of noise results in a high amplitude signal that is relatively constant over the frequency range. Common sources of white noise include chemical reactions or mixing that occurs as the fluid passes through the flow meter and high concentration slurry flows where the particulates are constantly passing over the electrode head. An example of this type of flow stream would be a basis weight stream in a paper mill.

10.3 High process noise diagnostic

The transmitter continuously monitors signal amplitudes over a wide range of frequencies. For the high process noise diagnostic, the transmitter specifically looks at the noise amplitude adjacent to the Low and High coil drive frequencies. The noise values are used to calculate a signal-to-noise ratio for both drive frequencies. If the signal-to-noise ratio is less than 25 at the currently selected coil drive frequency, the high process noise diagnostic will trip, indicating that the flow signal may be compromised.

Related information

High process noise detection

10.4 Optimizing flow reading in noisy applications

If the flow reading is unstable, first check the wiring, grounding, and process reference associated with the magnetic flowmeter system. Ensure that the following conditions are met:

- Ground straps are attached to the adjacent flange or ground ring
- Grounding rings, lining protectors, or a process reference electrode are being used in lined or non-conductive piping

The causes of unstable transmitter output can usually be traced to extraneous voltages on the measuring electrodes. This “process noise” can arise from several causes including electrochemical reactions between the fluid and the electrode, chemical reactions in the process itself, free ion activity in the fluid, or some other disturbance of the fluid/electrode capacitive layer. In such noisy applications, an analysis of the frequency spectrum reveals process noise that typically becomes significant below 15 Hz.

In some cases, the effects of process noise may be sharply reduced by elevating the coil drive frequency above the 15 Hz region. Coil drive mode is selectable between the standard 5 Hz and the noise-reducing 37 Hz.

10.4.1 Coil drive frequency

LOI menu path	**Detailed Setup → Additional Params → Coil Drive Freq**

This parameter changes the pulse rate of the magnetic coils.

5 Hz

The standard coil drive frequency is 5 Hz, which is sufficient for nearly all applications.

37 Hz

If the process fluid causes a noisy or unstable flow reading, increase the coil drive frequency to 37 Hz. If the 37 Hz mode is selected, perform the auto zero function for optimum performance.

Note
37 Hz coil drive frequency mode should not be used for sensors larger than 20-inch.

10.4.2 Auto zero

LOI menu path	**Diagnostics → Trims → Auto Zero**

To ensure optimum accuracy when using 37 Hz coil drive mode, there is an auto zero function that should be initiated. When using 37 Hz coil drive mode it is important to zero the system for the specific application and installation.

The auto zero procedure should be performed only under the following conditions:

- With the transmitter and sensor installed in their final positions. This procedure is not applicable on the bench.
- With the transmitter in 37 Hz coil drive mode. Never attempt this procedure with the transmitter in 5 Hz coil drive mode.
- With the sensor full of process fluid at zero flow.

These conditions should cause an output equivalent to zero flow.

Set the loop to manual if necessary and begin the auto zero procedure. The transmitter completes the procedure automatically in about 90 seconds. A clock symbol will appear in the lower right-hand corner of the display to indicate that the procedure is running.

Note
Failure to complete an auto zero may result in a flow velocity error of 5 to10% at1 ft/s (0.3 m/s). While the output level will be offset by the error, the repeatability will not be affected.

10.4.3 Other signal processing tools

The transmitter contains several advanced functions that can be used to stabilize erratic outputs caused by process noise. The signal processing menu contains this functionality. If the 37 Hz coil drive frequency has been set, and the output is still unstable, the damping and signal processing function should be used. It is important to set the coil drive frequency to 37 Hz to increase the flow sampling rate. The transmitter provides an easy and straightforward start-up, and also incorporates the capability to deal with difficult applications that have previously manifested themselves in a noisy output signal. In addition to selecting a higher coil drive frequency (37 Hz vs. 5 Hz) to isolate the flow signal from the process noise, the microprocessor can scrutinize each input based on three user-defined parameters to reject the noise specific to the application.

Operating mode

LOI menu path	**Detailed Setup → Signal Processing → Operating Mode**

The operating mode should be used only when the signal is noisy and gives an unstable output. Filter mode automatically uses 37 Hz coil drive mode and activates signal processing at the factory set default values. When using filter mode, perform an auto zero with no flow and a full sensor. Either of the parameters, coil drive mode or signal processing, may still be changed individually. Turning signal processing off or changing the coil drive frequency to 5 Hz will automatically change the operating mode from filter mode to normal mode. This software technique, known as signal processing, “qualifies” individual flow signals based on historic flow information and three user-definable parameters, plus an on/off control. These parameters are described below.

Status

LOI menu path	**Detailed Setup → Signal Processing → Main Config DSP → Status**

Enable or disable the DSP capabilities. When ON is selected, the output is derived using a running average of the individual flow inputs. Signal processing is a software algorithm that examines the quality of the electrode signal against user-specified tolerances. The three parameters that make up signal processing (number of samples, maximum percent limit, and time limit) are described below.

Number of samples

LOI menu path	**Detailed Setup → Signal Processing → Main Config DSP → Samples**

The number of samples sets the amount of time that inputs are collected and used to calculate the average value. Each second is divided into tenths with the number of samples equaling the number of increments used to calculate the average. This parameter can be configured for an integer value between 1 and 125. The default value is 90 samples.

For example:

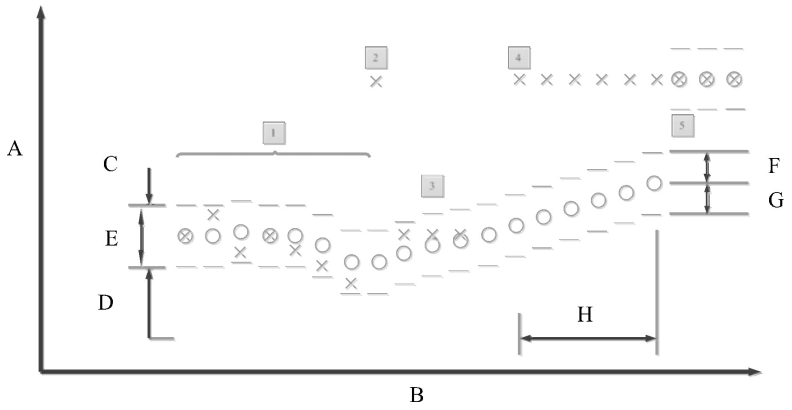
- A value of 1 averages the inputs over the past $^{1}/_{10}$ second

- A value of 10 averages the inputs over the past 1 second
- A value of 100 averages the inputs over the past 10 seconds
- A value of 125 averages the inputs over the past 12.5 seconds

Percent limit

LOI menu path	**Detailed Setup → Signal Processing → Main Config DSP → % Limit**

This parameter will set the tolerance band on either side of the running average, referring to percent deviation from the average. Values within the limit are accepted while value outside the limit are scrutinized to determine if they are a noise spike or an actual flow change. This parameter can be configured for an integer value between 0 and 100 percent. The default value is 2 percent.



Time limit

LOI menu path	**Detailed Setup → Signal Processing → Main Config DSP → Time Limit**

The time limit parameter forces the output and running average values to the new value of an actual flow rate change that is outside the percent limit boundaries. It thereby limits response time to flow changes to the time limit value rather than the length of the running average. If the number of samples selected is 100, then the response time of the system is 10 seconds. In some cases this may be unacceptable. Setting the time limit forces the transmitter to clear the value of the running average and re-establish the output and average at the new flow rate once the time limit has elapsed. This parameter limits the response time added to the loop. A suggested time limit value of two seconds is a good starting point for most applicable process fluids. This parameter can be configured for a value between 0.6 and 256 seconds. The default value is 2 seconds.

10.5 Explanation of signal processing algorithm

An example plotting flow rate versus time is given below to help visualize the signal processing algorithm.

A. Flow rate
B. Time (10 samples = 1 second)
C. Upper value
D. Lower value
E. Tolerance band
F. Maximum percent limit
G. Minimum percent limit
H. Time limit

- X = Input flow signal from sensor
- O = Average flow signals and transmitter output, determined by the number of samples parameter
- Tolerance band, determined by the percent limit parameter
- Upper value = average flow + [(percent limit/100) average flow]
- Lower value = average flow - [(percent limit/100) average flow]

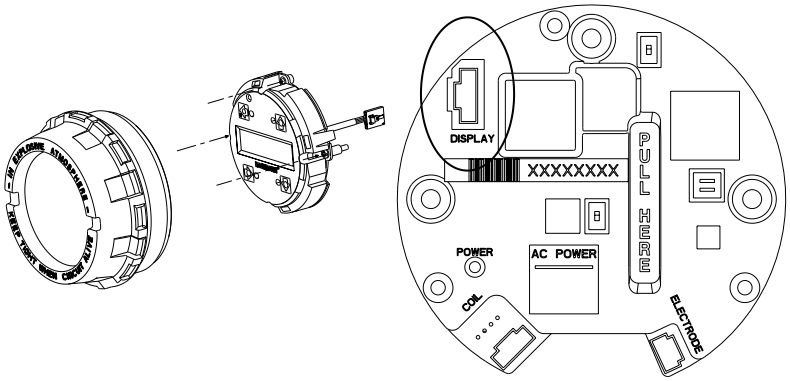
1. This scenario is that of a typical non-noisy flow. The input flow signal is within the percent limit tolerance band, therefore qualifying itself as a good input. In this case the new input is added directly into the running average and is passed on as a part of the average value to the output.
2. This signal is outside the tolerance band and therefore is held in memory until the next input can be evaluated. The running average is provided as the output.
3. The previous signal currently held in memory is simply rejected as a noise spike since the next flow input signal is back within the tolerance band. This results in complete rejection of noise spikes rather than allowing them to be “averaged” with the good signals as occurs in the typical damping circuits.
4. As in number 2 above, the input is outside the tolerance band. This first signal is held in memory and compared to the next signal. The next signal is also outside the tolerance band (in the same direction), so the stored value is added to the running average as the next input and the running average begins to slowly approach the new input level.
5. To avoid waiting for the slowly incrementing average value to catch up to the new level input, an algorithm is provided. This is the “time limit” parameter. The user

can set this parameter to eliminate the slow ramping of the output toward the new input level.

11 Maintenance

11.1 Introduction

This section covers basic transmitter maintenance. Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Read the following safety messages before performing any operation described in this section. Refer to these warnings when appropriate throughout this section.



11.2 Safety information

⚠ WARNING

Failure to follow these maintenance guidelines could result in death or serious injury.

- Installation and servicing instructions should be performed by qualified personnel only.
- Do not perform any servicing other than that contained in the operating instructions.
- Verify the operating environment of the sensor and transmitter is consistent with the appropriate hazardous area approval.
- Do not connect the transmitter to a non-Rosemount sensor that is located in an explosive atmosphere.
- Mishandling products exposed to a hazardous substance may result in death or serious injury.
- If the product being returned was exposed to a hazardous substance as defined by OSHA, a copy of the required Material Safety Data Sheet (MSDS) for each hazardous substance identified must be included with the returned goods.

11.3 Installing a LOI/Display

Procedure

1. If the transmitter is installed in a control loop, secure the loop.

2. Remove power from the transmitter.
3. Remove the cover on the electronics compartment of the transmitter housing. If the cover has a cover jam screw, loosen it before removing the cover.

   See Cover jam screw for details on the cover jam screw.

4. On the electronics stack, locate the serial connection labeled “DISPLAY”.

   See Figure 11-1.

5. Plug the serial connector from the back of the LOI/Display into the receptacle on the electronics stack.

   The LOI/Display can be rotated in 90 degree increments to provide the best viewing position. Rotate the LOI/Display to the desired orientation, taking care to not exceed 360 degrees of rotation. Exceeding 360 degrees of rotation could damage the LOI/Display cable and/or connector.

6. Once the serial connector is installed on the electronics stack, and the LOI/Display is oriented in the desired position, tighten the three mounting screws.
7. Install the extended cover with the glass viewing pane and tighten to metal-to-metal contact.

   If the cover has a cover jam screw, this must be tightened to comply with installation requirements. Return power to the transmitter and verify that it is functioning correctly and reporting the expected flow rate.

8. If installed in a control loop, return the loop to automatic control.

11.4 Replacing electronics stack

Prerequisites

Make sure that the existing electronics stack is the same as the replacement (Revision 4) electronics stack. There are two ways to make sure:

- Look at the complete transmitter model number. Current (Revision 4) electronics are only compatible with Models 8732E**M**. If your transmitter model number as shown on the model number tag is not 8732E**M**, you cannot use a Revision 4 board stack.
- Visually inspect the existing and new electronics stacks to ensure that they are physically alike. The current (Revision 4) version of the stack has its electrical connections in different locations from the older versions. Both are shown in Figure 11-2.

Note
You must open the housing and expose the electronics stack to inspect it (steps Step 1 through Step 5 below). Follow all applicable safety procedures and see Powering the transmitter for details on the covers.

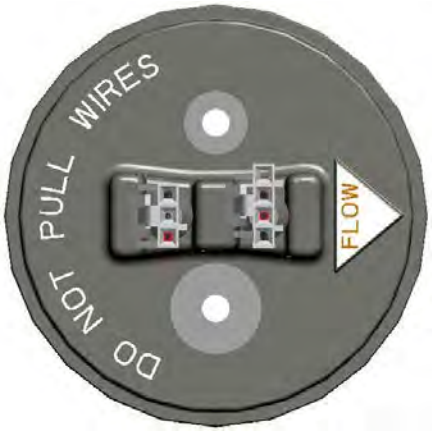
Figure 11-2: Electronics Stack Identification

A. Current (Revision 4) electronics stack.
B. Old electronics stack.

Procedure

1. If the transmitter is installed in a control loop, secure the loop.
2. Remove power from the transmitter.
3. Remove the LOI/Display-side cover of the transmitter.

   Note
   See Powering the transmitter for details on the covers.



4. Remove the three screws that hold the LOI/Display to the electronics stack.
5. Carefully unplug the LOI/Display connector and remove and set aside the LOI/Display.
6. Carefully unplug the coil and electrode connectors.
7. Remove the three screws that secure the electronics stack into the housing.
8. Carefully pull out the electronics stack by the handle marked **PULL HERE**.
9. Remove the screws from the old electronics stack and insert them into the new electronics stack.
10. Hold the new electronics stack by the handle and carefully insert it into the housing, making certain that the screw holes and electrical connectors are in proper alignment to seat the stack.
11. Securely tighten the three electronics stack screws into the housing.
12. Plug in the coil and electrode connectors.
13. Replace the LOI/Display and refasten the three screws to secure it to the electronics stack.
14. Reinstall the LOI/Display-side cover of the transmitter and tighten it to ensure the housing is properly sealed to meet ingress protection requirements.
15. Return power to the transmitter and verify that it is functioning correctly and reporting the expected flow rate.
16. If installed in a control loop, return the loop to automatic control.

11.5 Replacing a socket module/terminal block

The socket module connects the sensor adapter to the transmitter. There are two versions of the socket module - one for integral mount transmitters and one for remote mount transmitters. The socket module is a replaceable component.

To remove the socket module, loosen the two mounting screws and pull up on the socket module from the base. When removing the socket module, do not pull on the wires. See Figure 11-3.

Figure 11-3: Socket Module Warning

11.5.1 Replacing an integral mount socket module

Prerequisites

The integral mount socket module is shown in Figure 11-4. To gain access to the socket module, the transmitter must be removed from the sensor adapter.

Figure 11-4: Socket Module—Integral Mount

Removing an integral mount socket module

Procedure

1. Disconnect power.
2. Remove electronics cover to gain access to the coil and electrode cables.
3. If the transmitter has a LOI/Display, it will need to be removed to gain access to the coil and electrode cables.
4. Disconnect the coil and electrode cables.
5. Remove the four transmitter mounting bolts.
6. Lift the transmitter off of the sensor adapter.
7. To remove the socket module, loosen the two mounting screws and pull up on the socket module from the base.
8. When removing the socket module, do not pull on the wires.

   See Figure 11-3.

Installing an integral mount socket module

Procedure

1. To insert a new integral mount socket module, press the base into its keyed position and tighten the two mounting screws.
2. The coil and electrode cables are fed through the bottom opening of the transmitter and plugged into the face of the electronics.
3. The coil and electrode cables are keyed so they will only fit into their dedicated location.
4. If the transmitter has a LOI/Display, it will need to be removed to access the coil and electrode ports.
5. Once the connections are made, the transmitter can be secured to the sensor adapter using the four mounting bolts.

11.5.2 Replacing a terminal block socket module

Prerequisites

Note
This section only applies to sensors with Kx approval codes.

The terminal block socket module is shown in Figure 11-5. To gain access to the socket module, remove the junction box from the sensor adapter.

A. Mounting screws:
- *2X—standard*
- *4X—with I.S. divider*

Removing a terminal block socket module

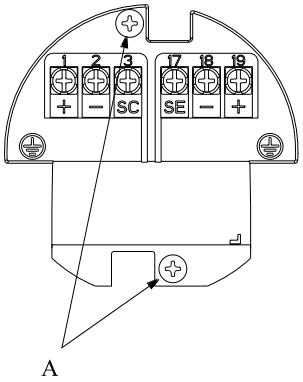
Procedure

1. Disconnect power to the transmitter and the remote cabling connected to the terminal block.
2. Remove the junction box cover to gain access to the remote cabling.
3. To disconnect the terminal block from the junction box housing, remove the two mounting screws and the two divider mounting screws (if applicable).
4. Pull up on the terminal block to expose the socket module base.
5. To remove the socket module, loosen the two mounting screws and pull up on the socket module from the base.
6. When removing the socket module, do not pull on the wires.

   See Figure 11-3.

Installing a terminal block socket module

Procedure



1. Insert the new terminal block socket module, press the base into its keyed position, and tighten the two mounting screws.
2. Connect the terminal block to the junction box housing by tightening the two mounting screws.

   Install the divider with the two mounting screws if applicable.
3. Reconnect remote cabling and power and replace junction box cover.

11.5.3 Replacing a terminal block with amp clips

Note
This section applies only to sensors with Nx approval codes or no hazardous area approval code for use in ordinary locations.

A. Mounting screws:
- *2X—standard*
- *4X—with I.S. divider*

Removing a terminal block

Procedure

1. Disconnect power to the transmitter.
2. Remove the junction box cover on the sensor to gain access to the remote cabling and disconnect the remote cabling connected to the terminal block.
3. To disconnect the terminal block from the junction box housing, remove the two mounting screws and the two divider mounting screws (if applicable).
4. Pull up on the terminal block to expose the connecting wires.
5. To remove the terminal block, unclip both wire connectors.

Installing a terminal block

Procedure

1. Clip the connecting wires to the back of the terminal block, the clips are different sizes and must be connected to their matching receptacle.
2. Connect the terminal block to the junction box housing by tightening the two mounting screws. Install the divider with the two mounting screws if applicable.
3. Reconnect remote cabling, replace the junction box cover on the sensor, and connect power.

11.6 Trims

LOI menu path	**Diagnostics → Trims**

Trims are used to calibrate the analog loop, calibrate the transmitter, re-zero the transmitter, and calibrate the transmitter with another manufacturer's sensor. Proceed with caution whenever performing a trim function.

11.6.1 D/A trim

LOI menu path	**Diagnostics → Trims → D/A Trim**

The D/A trim is used to calibrate the 4-20mA analog loop output from the transmitter. For maximum accuracy, the analog output should be trimmed for your system loop. Use the following steps to complete the output trim function.

Procedure

1. Set the loop to manual, if necessary.
2. Connect a precision ammeter in the 4-20mA loop.
3. Initiate the D/A trim function with the LOI.
4. Enter the 4mA meter value when prompted.
5. Enter the 20mA meter value when prompted.
6. Return the loop to automatic control, if necessary.

The 4-20mA trim is now complete. The D/A trim can be repeated to check the results. Alternatively, the analog output test can also be used to verify loop performance.

11.6.2 Scaled D/A trim

LOI menu path	**Diagnostics → Trims → Scaled D/A Trim**

A scaled D/A trim enables calibration of the flowmeter analog output using a different scale than the standard 4-20mA output scale. Non-scaled D/A trimming (described above), is typically performed using an ammeter where calibration values are entered in units of milliamperes. Scaled D/A trimming enables trimming of the flowmeter using a scale that may be more convenient based upon the method of measurement.

For example, it may be more convenient to make current measurements by direct voltage readings across the loop resistor. If the loop resistor is 500 ohms, and calibration of the meter will be done using voltage measurements across this resistor, the trim points can be rescaled from 4-20mA to 4-20mA x 500 ohm or 2-10VDC. Once the scaled trim points have been entered as 2 and 10, calibration of the flowmeter can be done by entering voltage measurements directly from the voltmeter.

11.6.3 Digital trim

LOI menu path	**Diagnostics → Trims → Digital Trim**

Digital trim is the function by which the factory calibrates the transmitter. This procedure is rarely needed by users. It is only necessary if the transmitter is suspected to be no longer accurate. A Rosemount 8714D Calibration Standard is required to complete a digital trim. Attempting a digital trim without a Rosemount 8714D Calibration Standard may result in

an inaccurate transmitter or an error message. The digital trim must be performed with the coil drive mode set to 5Hz and with a nominal sensor calibration number stored in the memory.

Note
Attempting a digital trim without a Rosemount 8714D Calibration Standard may result in an inaccurate transmitter, or a "DIGITAL TRIM FAILURE" message may appear. If this message occurs, no values were changed in the transmitter. Simply cycle power on the transmitter to clear the message.

To simulate a nominal sensor with the Rosemount 8714D Calibration Standard, change/verify the following parameters in the transmitter:

- Calibration Number-1000015010000000
- Units-ft/s
- PV URV-20mA = 30.00 ft/s
- PV LRV-4mA = 0 ft/s
- Coil Drive Frequency-5Hz

Before changing any of the configuration parameters, be sure to record the original values so that the transmitter can be returned to the original configuration prior to being placed back into operation. Failure to return the settings to the original configuration will result in incorrect flow and totalizer readings.

The instructions for changing the calibration number, units, PV URV, and PV LRV are located in Basic Setup. Instructions for changing the coil drive frequency can be found on Coil drive frequency.

Set the loop to manual (if necessary) and then complete the following steps:

Procedure

1. Power down the transmitter.
2. Connect the transmitter to a Rosemount 8714D Calibration Standard.
3. Power up the transmitter with the Rosemount 8714D connected and read the flow rate.

   The electronics need about a 5-minute warm-up time to stabilize.
4. Set the 8714D Calibration Standard to the 30 ft/s (9.1 m/s) setting.
5. The flow rate reading after warm-up should be between 29.97 (9.1 m/s) and 30.03 ft/s (9.2 m/s).
6. If the reading is within the range, return the transmitter to the original configuration parameters.
7. If the reading is not within this range, initiate a digital trim.

   The digital trim takes about 90 seconds to complete. No transmitter adjustments are required.

11.6.4 Universal trim

LOI menu path	**Diagnostics** → **Trims** → **Universal Trim**

The universal auto trim function enables the transmitter to calibrate sensors that were not calibrated at the factory. The function is activated as one step in a procedure known as in-process calibration. If a sensor has a 16-digit calibration number, in-process calibration is

not required. If it does not, or if the sensor is made by another manufacturer, complete the following steps for in-process calibration. Refer to Implementing a Universal Transmitter.

Procedure

1. Determine the flow rate of the process fluid in the sensor.

   Note
   The flow rate in the line can be determined by using another sensor in the line, by counting the revolutions of a centrifugal pump, or by performing a bucket test to determine how fast a given volume is filled by the process fluid.

2. Complete the universal auto trim function.

When the routine is completed, the sensor is ready for use.

11.7 Review

LOI menu path	**Device Setup** → **Review**

The transmitter includes a capability to review the configuration variable settings.

The flowmeter configuration parameters set at the factory should be reviewed to ensure accuracy and compatibility with the particular application of the flowmeter.

Note
If the LOI is used to review variables, each variable must be accessed as if changing its setting. The value displayed on the LOI screen is the configured value of the variable.

12 Troubleshooting

12.1 Introduction

This section covers basic transmitter and sensor troubleshooting. Problems in the magnetic flow meter system are usually indicated by incorrect output readings from the system, error messages, or failed tests. Consider all sources when identifying a problem in the system. If the problem persists, consult an Emerson Flow Representative to determine if the material should be returned to the factory. Emerson offers several diagnostics that aid in the troubleshooting process. Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Read the following safety messages before performing any operation described in this section. Refer to these warnings when appropriate throughout this section.

The transmitter performs self-diagnostics on the entire magnetic flow meter system: the transmitter, the sensor, and the interconnecting wiring. By sequentially troubleshooting each individual piece of the system, it becomes easier to identify the problem and make the appropriate adjustments.

If there are problems with a new installation, see Installation check and guide below for a quick guide to solve the most common problems. For existing installations, Table 12-7 lists the most common problems and corrective actions.

12.2 Safety information

⚠ WARNING

Failure to follow these troubleshotting guidelines could result in death or serious injury.

- Installation and servicing instructions should be performed by qualified personnel only.
- Do not perform any servicing other than that contained in the operating instructions.
- Verify that the operating environment of the sensor and transmitter is consistent with the appropriate hazardous area approval.
- Do not connect the transmitter to a non-Rosemount sensor that is located in an explosive atmosphere.
- Mishandling products exposed to a hazardous substance may result in death or serious injury.
- If the product being returned was exposed to a hazardous substance as defined by OSHA, a copy of the required Material Safety Data Sheet (MSDS) for each hazardous substance identified must be included with the returned goods.

12.3 Installation check and guide

Use this guide to check new installations of Rosemount magnetic flowmeter systems that appear to malfunction.

12.3.1 Transmitter

Checking the transmitter before applying power

Prerequisites

Before applying power to the magnetic flowmeter system, make the following transmitter checks:

Procedure

1. Record the transmitter model number and serial number.
2. Visually inspect the transmitter for any damage including the terminal block.
3. Verify the proper wiring connections have been made for the power and outputs.

Checking the transmitter after applying power

Prerequisites

Apply power to the magnetic flowmeter system before making the following transmitter checks:

Procedure

1. Check for an active error message or status alert. Refer to Diagnostic messages.
2. Verify the correct sensor calibration number is entered in the transmitter.

   The calibration number is listed on the sensor nameplate.
3. Verify the correct sensor line size is entered in the transmitter.

   The line size value is listed on the sensor nameplate.
4. Verify the analog range of the transmitter matches the analog range in the control system.
5. Verify the forced analog output and forced pulse output of the transmitter produces the correct output at the control system.
6. If desired, use a Rosemount 8714D Calibration Standard to verify the transmitter calibration.

12.3.2 Sensor

Prerequisites

Be sure that power to magnetic flowmeter system is removed before beginning the following sensor checks:

Procedure

1. Record the sensor model number and serial number.
2. Visually inspect the sensor for any damage including inside the remote junction box, if applicable.
3. For horizontal flow installations, ensure that the electrodes remain covered by process fluid.

   For vertical or inclined installations, ensure that the process fluid is flowing up into the sensor to keep the electrodes covered by process fluid.
4. Verify the flow arrow is pointing in the same direction as forward flow.

5. Ensure the grounding straps on the sensor are connected to grounding rings, lining protectors, or the adjacent pipe flanges. Improper grounding will cause erratic operation of the system.

   Sensors with a ground electrode will not require the grounding straps to be connected.

12.3.3 Remote wiring

Procedure

1. The electrode signal and coil drive wires must be separate cables unless Rosemount specified combo cable is used.

   See Sensor to transmitter wiring.

2. The electrode signal wire and coil drive wire must be twisted shielded cable. Rosemount recommends 20 AWG twisted shielded cable for the electrode signal and 14 AWG twisted shielded cable for the coil drive.

   See Sensor to transmitter wiring.

3. See Product certifications regarding wiring installation requirements.
4. See Wiring Diagrams for component wiring.
5. Verify there is minimal exposed wiring and shielding.

   Less than 1 inch (25 mm) is recommended.

6. Verify that the single conduit that houses both the electrode signal and coil drive cables do not contain any other wires, including wires from other magmeters.

Note
For installations requiring intrinsically safe electrodes, the signal and coil drive cables must be run in Individual conduits.

12.3.4 Process fluid

Procedure

1. The process fluid should have a minimum conductivity of 5 microSiemens/cm (5 micro mhos/cm).
2. The process fluid must be free of air and gas.
3. The sensor must be full of process fluid.
4. The process fluid must be compatible with the wetted materials - liner, electrodes, ground rings, and lining protectors.

   Refer to the *Rosemount™ Magnetic Flowmeter Material Selection Guide (00816-0100-3033)* Technical Note for details.

5. If the process is electrolytic or has cathodic protection, refer to the *Installation and Grounding of Magmeters in Typical and Special Applications (00840-2400-4727)* Technical Note for special installation requirements.

12.4 Diagnostic messages

Problems in the magnetic flowmeter system are usually indicated by incorrect output readings from the system, error messages, or failed tests. Consider all sources in identifying a problem in the system.

Table 12-1: Basic Diagnostic Messages

Error message	Potential cause	Corrective action
Empty Pipe	Empty pipe	None - message will clear when pipe is full
	Wiring error	Check that wiring matches appropriate wiring diagrams
	Electrode error	Perform sensor tests - see Installed sensor tests
	Conductivity less than 5 microSiemens per cm	Increase conductivity to greater than or equal to 5 microSiemens per cm
	Intermittent diagnostic	Adjust tuning of empty pipe parameters - see Troubleshooting empty pipe
Coil Open Circuit	Improper wiring	Check coil drive wiring and sensor coils. Perform sensor tests - see Installed sensor tests
	Other manufacturer's sensor	Change coil current to 75 mA - set calibration numbers to 10000550100000030
		Perform a universal auto-trim to select the proper coil current
	Electronics board failure	Replace electronics stack
	Coil circuit open fuse	Replace the sensor
Auto Zero Failure	Flow is not set to zero	Force flow to zero, perform auto zero trim
	Unshielded cable in use	Change wire to shielded cable
	Moisture problems	See Installed sensor tests
Auto-Trim Failure	No flow in pipe while performing Universal Auto Trim	Establish a known flow rate, and perform universal auto-trim calibration
	Wiring error	Check that wiring matches appropriate wiring diagrams - see Implementing a Universal Transmitter
	Flow rate is changing in pipe while performing Universal Auto-Trim routine	Establish a constant flow rate, and perform universal auto-trim calibration
	Flow rate through sensor is significantly different than value entered during Universal Auto-Trim routine	Verify flow in sensor and perform universal auto-trim calibration
	Incorrect calibration number entered into transmitter for Universal Auto-Trim routine	Replace sensor calibration number with 1000005010000000
	Wrong sensor size selected	Correct sensor size setting - see Basic Setup
	Sensor failure	Perform sensor tests - see Installed sensor tests
Electronics Failure	Electronics self check failure	Cycle power to see if diagnostic message clears
		Replace Electronics stack

Table 12-1: Basic Diagnostic Messages *(continued)*

Error message	Potential cause	Corrective action
Electronics Temp Fail	Ambient temperature exceeded the electronics temperature limits	Move transmitter to a location with an ambient temperature range of -40 to 140 °F (-40 to 60 °C)
Reverse Flow	Electrode or coil wires reverse	Verify wiring between sensor and transmitter
	Flow is reverse	Turn ON Reverse Flow Enable to read flow
	Sensor installed backwards	Install sensor correctly, or switch either the electrode wires (18 and 19) or the coil wires (1 and 2)
PZR Activated (Positive Zero Return)	External voltage applied to terminals 5 and 6	Remove voltage to turn PZR off
Pulse Out of Range	The transmitter is trying to generate a frequency greater than allowed	Standard pulse - increase pulse scaling to prevent pulse output from exceeding 11,000 Hz
		Intrinsically safe pulse - Increase pulse scaling to prevent pulse output from exceeding 5,500 Hz
		Pulse output is in fixed pulse mode and is trying to generate a frequency greater than the pulse width can support - see Pulse output
		Verify the sensor calibration number and line size are correctly entered in the electronics
Analog Out of Range	Flow rate is greater than analog output range	Reduce flow, adjust URV and LRV values
		Verify the sensor calibration number and line sizes are correctly entered in the electronics
Flow rate > 43 ft/sec	Flow rate is greater than 43 ft/sec	Lower flow velocity, increase pipe diameter
	Improper wiring	Check coil drive wiring and sensor coils
		Perform sensor tests - see Installed sensor tests
Digital Trim Failure (Cycle power to clear messages, no changes were made)	The calibrator (8714B/C/D) is not connected properly	Review calibrator connections
	Incorrect calibration number entered into transmitter	Replace sensor calibration number with 1000015010000000
	Calibrator is not set to 30 FPS	Change calibrator setting to 30 FPS
	Bad calibrator or calibrator cable	Replace calibrator and/or calibrator cable
Coil Over Current	Improper wiring	Check coil drive wiring and sensor coilsPerform sensor tests - see Installed sensor tests
	Transmitter failure	Replace the electronics stack
Coil Power Limit	Improper wiring	Check coil drive wiring and sensor coils.
		Perform sensor tests - see Installed sensor tests
	Incorrect calibration number	Verify configured calibration number matches sensor tag
	Transmitter connected to other manufacturer's sensor	Change coil current to 75 mA - set calibration number to 10000550100000030
		Perform a universal auto-trim to select the proper coil current
	Coil drive frequency set to 37 Hz	Sensor may not be compatible with 37 Hz. Switch coil drive frequency to 5 Hz.
	Sensor failure	Perform sensor tests - see Installed sensor tests

Table 12-1: Basic Diagnostic Messages *(continued)*

Error message	Potential cause	Corrective action
	Improper wiring	Check the analog loop wiring - see Analog output
No AO Power	No external loop power	Verify the analog power switch position (internal/ external)
		For externally powered loop, verify power supply requirements - see Powering the transmitter
	No loop resistance (open loop)	Install resistance across the analog output terminals
		Disable message using LOI Error Mask parameter
	Transmitter failure	Replace the electronics stack
Electrode Saturation	Improper wiring	See Wiring
	Improper process reference	See Process reference connection
	Improper earth grounding	Verify earth ground connections - see Wiring
	Application requires special transmitter	Replace transmitter with transmitter that includes special option F0100
LOI Comm Error/LOI Lost Sync	Electrical noise	Verify earth ground connections - see Wiring
	Extreme vibration	Relocate transmitter
	Transmitter failure	Cycle power. If error returns, replace board stack.
LOI Key Stuck	Debris on the LOI glass	Clean LOI glass of any debris
	Holding LOI key for more than 60 seconds	Lock LOI to prevent unintentional configuration changes - see Display lock
	High levels of electrical noise	Move transmitter away from other electrical equipment or cables
	Faulty LOI	Replace LOI

Table 12-2: Advanced Process Diagnostic Messages

Error message	Potential cause	Corrective action
Grounding/Wiring Fault	Improper installation of wiring	See Wiring
	Coil/electrode shield not connected	See Wiring
	Improper process grounding	See Process reference connection
	Faulty ground connection	Check wiring for corrosion, moisture in the terminal block -see Process reference connection
	Sensor not full	Verify sensor is full
		Enable empty pipe detection
High Process Noise	Slurry flows - mining/pulp stock	Decrease the flow rate below 10 ft/s (3 m/s)
		Complete the possible solutions listed under Troubleshooting high process noise
	Chemical additives upstream of the sensor	Move injection point downstream of the sensor or move the sensor to a new location
		Complete the possible solutions listed under Troubleshooting high process noise

Table 12-2: Advanced Process Diagnostic Messages *(continued)*

Error message	Potential cause	Corrective action
	Electrode not compatible with the process fluid	Refer to the *Rosemount™ Magnetic Flowmeter Material Selection Guide (00816-0100-3033)*
	Gas/air in line	Move the sensor to another location in the process line to ensure that it is full under all conditions
	Electrode coating	Enable coated electrode etection diagnostic
		Use bullet-nose electrodes
		Downsize sensor to increase flowrate above 3 ft/s (1 m/s)
		Periodically clean sensor
	Styrofoam or other insulating particles	Complete the possible solutions listed under Troubleshooting high process noise
		Consult factory
	Low conductivity fluids (below 10 microsiemens/cm)	Trim electrode and coil wires - see Sensor Installation
		Use integral mount transmitter
		Set coil drive frequency to 37Hz
Electrode Coating Level 1	Coating is starting to buildup on electrode and interfering with measurement signal	Schedule maintenance to clean electrode
		Use bullet nose electrodes
		Downsize sensor to increase flow rate above 3ft/s (1ms)
	Process fluid conductivity has changed	Verify process fluid conductivity
Electrode Coating Level 2	Coating has built-up on electrode and is interfering with measurement signal	Schedule maintenance to clean electrode
		Use bullet nose electrodes
		Downsize sensor to increase flow rate above 3ft/s (1ms)
	Process fluid conductivity has changed	Verify process fluid conductivity

Table 12-3: Advanced Meter Verification Messages

Error message	Potential cause	Corrective action
Meter Ver Failed	Transmitter calibration verification test failed	Verify pass/fail criteria
		Rerun Smart™ Meter Verification under no flow conditions
		Verify calibration using 8714D Calibration Standard
		Perform digital trim
		Replace electronics board
	Sensor calibration test failed	Verify pass/fail criteria
		Rerun Smart Meter Verification
		Perform sensor tests - see Installed sensor tests
	Sensor coil circuit test failed	Verify pass/fail criteria
		Rerun Smart Meter Verification

Table 12-3: Advanced Meter Verification Messages *(continued)*

Error message	Potential cause	Corrective action
		Perform sensor tests - see Installed sensor tests
	Sensor electrode circuit test failed	Verify electrode resistance has a baseline (signature) value from a full pipe baseline
		Verify test condition was selected properly
		Verify pass/fail criteria
		Rerun Smart Meter Verification
		Perform sensor tests - see Installed sensor tests
4-20 mA loop verification failed	Analog loop not powered	Check 4-20 mA internal/external loop power switch - see Internal/external analog power (Output option code A)
		Check external supply voltage to the transmitter
		Check for parallel paths in the current loop
	Transmitter failure	Perform transmitter self test
		Perform manual analog loop test and D/A trim if necessary
		Replace the electronics board
Continuous Meter Verification Error	Transmitter calibration verification test failed	Verify pass/fail criteria
		Run manual Smart Meter Verification under no flow conditions
		Verify calibration using 8714D Calibration Standard
		Perform digital trim
		Replace electronics stack
	Sensor calibration test failed	Run manual Smart Meter Verification
		Perform sensor tests - see Installed sensor tests
	Sensor coil circuit test failed	Run manual Smart Meter Verification
		Perform sensor tests - see Installed sensor tests
	Sensor electrode circuit test failed	Run manual Smart Meter Verification
		Perform sensor tests - see Installed sensor tests
		Verify electrode resistance has a signature value from a full pipe baseline
Simulated Velocity Out of Spec	Unstable flow rate during the verification test or noisy process	Run manual transmitter verification test with no flow and a full pipe
	Transmitter drift or faulty electronics	Verify transmitter electronics with 8714D Calibration Standard. The dial on the 8714D should be set to 30 ft/s (9.14 m/s). The transmitter should be set up with the nominal calibration number (1000015010000000) and 5 Hz coil drive frequency.
		Perform an electronics trim using the 8714D
		If the electronics trim doesn't correct the issue, replace the electronics

Table 12-3: Advanced Meter Verification Messages *(continued)*

Error message	Potential cause	Corrective action
Coil Resistance Out of Spec	Moisture in the terminal block of the sensor or shorted coil	Perform sensor tests - see Installed sensor tests
		If the problem persists, replace the sensor
Coil Signature Out of Spec	Moisture in the terminal block of the sensor or shorted coil	Perform sensor tests - see Installed sensor tests
		If the problem persists, replace the sensor
	Calibration shift caused by heat cycling or vibration	Perform sensor tests - see Installed sensor tests
		If the problem persists, replace the sensor
Electrode Resistance Out of Spec	Moisture in the terminal block of the sensor	Perform sensor tests - see Installed sensor tests
		If the problem persists, replace the sensor
	Electrode coating	Enable coated electrode detection diagnostic
		Use bullet-nose electrodes
		Downsize sensor to increases flowrate above 3 ft/s (1 m/s)
		Periodically clean sensor
	Shorted electrodes	Perform sensor tests - see Installed sensor tests
		If the problem persists, replace the sensor
Analog Output Out of Spec	Unstable flow rate during the verification test or noisy process	Run manual transmitter verification test with no flow and a full pipe
	Analog output is no longer within accuracy specifications	Check the analog loop wiring. Excessive loop resistance can cause an invalid test

12.4.1 Troubleshooting empty pipe

The following actions can be taken if empty pipe detection is unexpected:

Procedure

1. Verify the sensor is full.
2. Verify the sensor has not been installed with a measurement electrode at the top of the pipe.
3. Decrease the sensitivity by setting the empty pipe trigger level to a value of at least 20 counts above the empty pipe value read with a full pipe.
4. Decrease the sensitivity by increasing the empty pipe counts to compensate for process noise. The empty pipe counts is the number of consecutive empty pipe value readings above the empty pipe trigger level required to set the empty pipe diagnostic. The count range is 2-50, factory default set at 5.
5. Increase process fluid conductivity above 5 microsiemens/cm.
6. Properly connect the wiring between the sensor and the transmitter.
7. Perform the sensor electrical resistance tests. For more detailed information, consult Installed sensor tests.

12.4.2 Troubleshooting ground/wiring fault

If transmitter detects high levels (greater than 5mV) 50/60 Hz noise caused by improper wiring or poor process grounding:

Procedure

1. Verify the transmitter is earth grounded.
2. Connect ground rings, grounding electrode, lining protector, or grounding straps. Grounding diagrams can be found in Process reference connection.
3. Verify the sensor is full.
4. Verify wiring between sensor and transmitter is prepared properly. Shielding should be stripped back less than 1 inch (25 mm).
5. Use separate shielded twisted pairs for wiring between sensor and transmitter.
6. Properly connect the wiring between the sensor and the transmitter. Corresponding terminal block numbers in the sensor and transmitter must be connected.

12.4.3 Troubleshooting high process noise

Note
In applications where very high levels of noise are a concern, it is recommended that a dual-calibrated Rosemount High-Signal 8707 sensor be used. These sensors can be calibrated to run at lower coil drive current supplied by the standard Rosemount transmitters, but can also be upgraded by changing to the 8712H High-Signal transmitter.

Note
For more information about process noise, see Process noise profiles.

1/f noise

This type of noise can be mitigated by switching to the 37 Hz coil drive setting.

Spike noise

The type of noise can be mitigated by switching to the 37 Hz coil drive setting.

White noise

This type of noise can be mitigated by switching to the 37 Hz coil drive setting.

Noise ratio less than 25 in 5 Hz coil drive frequency mode

The transmitter detected high levels of process noise. If the signal to noise ratio is less than 25 in 5 Hz coil drive frequency mode, proceed with the following steps:

Procedure

1. Increase transmitter coil drive frequency mode to 37 Hz (refer to Coil drive frequency and, if possible, perform auto zero function. See Auto zero).
2. Verify sensor is electrically connected to the process with process reference electrode, grounding rings with grounding straps, or lining protector with grounding straps.
3. If possible, redirect chemical additions downstream of the magmeter.
4. Verify process fluid conductivity is above 5 microSiemens/cm.

Noise ratio less than less than 25 in 37 Hz coil drive frequency mode

If the signal to noise ratio is less than 25 in 37 Hz coil drive frequency mode, see Digital Signal Processing.

12.4.4 Troubleshooting coated electrode detection

In the event that electrode coating is detected, use the following table to determine the appropriate course of action.

Table 12-4: Troubleshooting the Electrode Coating Diagnostic

Error message	Potential causes of error	Steps to correct
Electrode Coating Level 1	• Insulating coating is starting to build up on the electrode and may interfere with the flow measurement signal • Process fluid conductivity has decreased to a level close to operational limits of the meter	• Verify process fluid conductivity • Schedule maintenance to clean the electrodes • Use bullet nose electrodes • Replace the meter with a smaller diameter meter to increase the flow velocity to above 3 ft/s (1 m/s)
Electrode Coating Level 2	• Insulating coating has built up on the electrodes and is interfering with the flow measurement signal • Process fluid conductivity has decreased to a level below the operational limits of the meter	• Verify process fluid conductivity • Schedule maintenance to clean the electrodes • Use bullet nose electrodes • Replace the meter with a smaller diameter meter to increase the flow velocity to above 3 ft/s (1 m/s)

12.4.5 Troubleshooting 4-20 mA loop verification

In the event that the 4-20 mA Loop Verification fails, use the following table to determine the appropriate course of action.

Table 12-5: Troubleshooting the Analog Loop Verification Diagnostic

Test	Potential cause	Corrective action
4-20 mA Loop Verification Failure	Analog loop not powered	Check analog loop wiring
		Check loop resistance
		Check analog loop power switch – see Internal/external analog power (Output option code A)
		Check external supply voltage to the transmitter
		Check for parallel paths in the current loop
	Analog drift	Perform D/A trim
	Transmitter failure	Perform transmitter self-test
		Perform manual analog loop test
		Contact an Emerson Flow representative

12.4.6 Troubleshooting the Smart Meter Verification test

If the Smart Meter Verification test fails, use the following table to determine the appropriate course of action. Begin by reviewing the Smart Meter Verification results to determine the specific test that failed.

Table 12-6: Troubleshooting the Smart Meter Verification diagnostic

Test	Potential cause	Corrective action
Transmitter Verification Test	• Unstable flow reading during the test • Noise in the process • Transmitter drift • Faulty electronics	• Rerun Smart Meter Verification under No Flow conditions • Check the transmitter calibration with the 8714D Calibration Standard • Perform a digital trim • Contact an Emerson Flow representative
Sensor Calibration Verification	• Moisture in the sensor terminal block • Calibration shift caused by heat cycling or vibration	• Rerun Smart Meter Verification • Perform the sensor checks detailed in Sensor troubleshooting • Remove the sensor and send back for evaluation and / or recalibration • Retake sensor baseline at operating temperature
Coil Circuit Health	• Moisture in the sensor terminal block • Shorted Coil • High temperature application • Long remote cable length	
Electrode Circuit Health	• Electrode resistance baseline was not taken after installation • Test condition was not selected properly • Moisture in the sensor terminal block • Coated electrodes • Shorted electrodes	

12.5 Basic troubleshooting

When troubleshooting a magnetic flow meter, it is important to identify the issue. Table 12-7 provides common symptoms displayed by a magnetic flow meter that is not functioning properly. This table provides potential causes and suggested corrective actions for each symptom.

Table 12-7: Common magnetic flow meter Issues

Symptom	Potential cause	Corrective action
Output at 0 mA	No power to transmitter	Check power source and connections to the transmitter
	Analog output improperly configured	Check the analog power switch position
		Verify wiring and analog power
	Electronics failure	Verify transmitter operation with an 8714D Calibration Standard; If it fails, replace the electronics stack
	Blown fuse	Check the fuse and replace with an appropriately rated fuse, if necessary
Output at 4 mA	Transmitter in multidrop mode	Configure Poll Address to 0 to take transmitter out of multidrop mode
	Low Flow Cutoff set too high	Configure Low Flow Cutoff to a lower setting or increase flow to a value above the low flow cutoff
	PZR Activated	Open PZR switch at terminals 5 and 6 to deactivate the PZR
	Flow is in reverse direction	Enable Reverse Flow function
	Shorted coil	Coil check – perform sensor test
	Empty pipe	Fill pipe
	Electronics failure	Verify transmitter operation with an 8714D Calibration Standard; If it fails, replace the electronics stack
	Fixed Current Mode is turned ON	Turn Fixed Current Mode OFF
Output will not reach 20 mA	Loop resistance is greater than 600 ohms	Reduce loop resistance to less than 600 ohms
		Perform analog loop test
	Insufficient supply voltage to analog output	Verify analog output supply voltage
		Perform analog loop test
Output at 20.8 mA	Transmitter not ranged properly	Reset the transmitter range values – see Basic Setup
		Check tube size setting in transmitter and make sure it matches the actual tube size – see Basic Setup
Output at alarm level	Electronics failure	Cycle power; If alarm is still present, verify transmitter operation with an 8714D Calibration Standard; If it fails, replace the electronics stack
	Open coil circuit	Check coil drive circuit connections at the sensor and at the transmitter
	Analog output diagnostic alarm is active	See AO diagnostic alarm
	Coil power or coil current is over limit	Check coil drive circuit connections at the sensor and at the transmitter
		Cycle power; If alarm is still present, verify transmitter operation with an 8714D Calibration Standard; If it fails, replace the electronics stack
Output at alarm level while connected to non-Rosemount sensor	Connected to incompatible sensor	See Implementing a Universal Transmitter

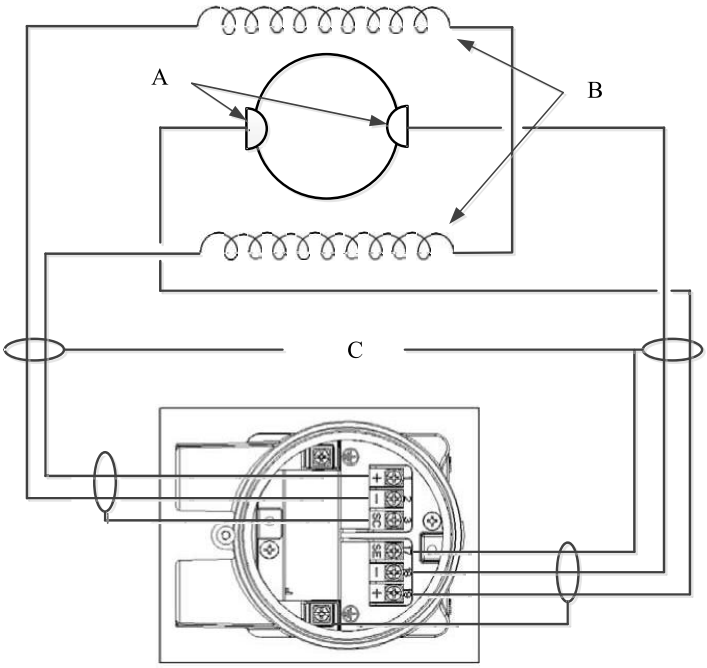
Table 12-7: Common magnetic flow meter Issues *(continued)*

Symptom	Potential cause	Corrective action
Pulse output at zero, regardless of flow	Wiring error	Check pulse output wiring at terminals 3 and 4 ; Refer to wiring diagram for pulse counter and pulse output; See Connect pulse output
	PZR activated	Remove signal at terminals 5 and 6 to deactivate the PZR
	No power to transmitter	Check pulse output wiring at terminals 3 and 4; Refer to wiring diagram for pulse counter and pulse output
		Power the transmitter
	Reverse flow	Enable Reverse Flow function
	Electronics failure	Verify transmitter operation with an 8714D Calibration Standard; If it fails, replace the electronics stack
	Pulse output incorrectly configured	Review configuration and correct as necessary
Communication problems with the Handheld Communicator	4–20 mA output configuration	Check analog power switch (internal/external); The Handheld Communicator requires a 4–20 mA output to function
	Communication interface wiring problems	Incorrect load resistance (250 Ohm minimum, 600 Ohm maximum)Check appropriate wiring diagram
	Low batteries in the Handheld Communicator	Replace the batteries in the Handheld Communicator – see the communicator manual for instructions
	Old revision of software in the Handheld Communicator	Consult your local sales office about updating to the latest revision of software
Error Messages on LOI or Handheld Communicator	Many possible causes depending upon the message	See Diagnostic messages
Discrete input does not register	Input signal does not provide enough counts	Verify that the discrete input provided meets the requirements in Connect discrete input
		Perform a loop test to validate the analog control loop
		Perform a D/A trim; This allows the calibration of the analog output with an external reference at operating endpoints of the analog output

Table 12-7: Common magnetic flow meter Issues *(continued)*

Symptom	Potential cause	Corrective action
Reading does not appear to be within rated accuracy	Transmitter, control system, or other receiving device not configured properly	Check all configuration variables for the transmitter, sensor, communicator, and/or control system
		Check these other transmitter settings: • Sensor calibration number • Units • Line size
		Perform a loop test to check the integrity of the circuit
	Electrode Coating	Enable Coated Electrode Detection diagnostic
		Use bullet-nose electrodes
		Downsize sensor to increase flow rate above 3 ft/s
		Periodically clean sensor
	Gas/air in line	Move the sensor to another location in the process line to ensure it is full under all conditions
	Moisture problem	Perform the sensor tests - see Installed sensor tests
	Insufficient upstream/downstream pipe diameter	Move sensor to a new location with 5 pipe diameters upstream and 2 pipe diameters downstream if possible
	Cables for multiple magmeters run through same conduit	Use dedicated conduit run for each sensor and transmitter
	Improper wiring	If electrode shield and electrode signal wires are switched, flow indication will be about half of what is expected; Check wiring diagrams
	Flow rate is below 1 ft/s (specification issue)	See accuracy specification for specific transmitter and sensor
	Auto zero was not performed when the coil drive frequency was changed from 5 Hz to 37 Hz	Verify the sensor is full, verify there is no flow, and perform the auto zero function
	Sensor failure–shorted electrode	Perform the sensor tests - see Installed sensor tests
	Sensor failure–shorted or open coil	Perform the sensor tests - see Installed sensor tests
	Transmitter failure	Verify transmitter operation with an 8714D Calibration Standard; If it fails, replace the electronics stack

Table 12-7: Common magnetic flow meter Issues *(continued)*



Symptom	Potential cause	Corrective action
Noisy Process	Chemical additives upstream of magnetic flowmeter	See Troubleshooting high process noise
		Move injection point downstream of magnetic flowmeter, or move magnetic flowmeter
		Set Coil Drive Frequency to High
	Sludge flows–mining/coal/sand/slurries (other slurries with hard particles)	Decrease flow rate below 10 ft/s
		Set Coil Drive Frequency to High
	Styrofoam or other insulating particles in process	See Troubleshooting high process noise
		Consult factory
		Set Coil Drive Frequency to High
	Electrode coating	Enable Coated Electrode Detection diagnostic
		Use a smaller sensor to increase flow rate above 3 ft/s
		Periodically clean sensor
	Gas/air in line	Move the sensor to another location in the process line to ensure it is full under all conditions
	Low conductivity fluids (below 5 microsiemens/cm)	Trim electrode and coil wires – see Sensor to transmitter wiring
		Keep flow rate below 3 FPS
		Use component cable - see Sensor to transmitter wiring
Noisy Process (cont.)	Low conductivity fluids (below 5 microsiemens/cm), (cont.)	Integral mount transmitter
Meter output is unstable	Low conductivity fluids (below 5 microsiemens/cm) combined with cable vibration or 60 Hz interference	Eliminate cable vibration
		Move cable to lower vibration run
		Tie down cable mechanically
		Trim electrode and coil wires - see Sensor to transmitter wiring
		Route cable line away from other equipment powered by 60 Hz
		Use component cable - see Sensor to transmitter wiring
	Electrode incompatibility	Check the Technical Data Sheet, Magnetic Flowmeter Material Selection Guide (document number 00816-0100-3033), for chemical compatibility with electrode material
	Improper grounding	Check ground wiring – see Process reference connection for wiring and grounding procedures
	High local magnetic or electric fields	Move magnetic flowmeter (20–25 ft away is usually acceptable)
	Control loop improperly tuned	Check control loop tuning
	Sticky valve (look for periodic oscillation of meter output)	Service valve

Table 12-7: Common magnetic flow meter Issues *(continued)*

Symptom	Potential cause	Corrective action
	Sensor failure	Perform the sensor tests (See Installed sensor tests)
	Analog output loop problem	Check that the 4–20 mA loop matches the digital value Perform analog output test
Meter output is unstable (cont.)	Low conductivity fluids (below 5 microsiemens/cm) combined with cable vibration or 60 Hz interference (cont.)	Use an integral mount

12.6 Sensor troubleshooting

This section describes manual tests that can be performed on the sensor to verify the health of individual components. The tests will require the use of a digital multimeter capable of measuring conductance in nanoSiemens and an LCR meter. A sensor circuit diagram is shown in Figure 12-1. The tests described below will check for continuity or isolation of the internal components of the sensor.

A. Electrodes
B. Coils
C. Sensor housing

12.6.1 Sensor adapter feed through pins

The sensor adapter is the part of the sensor that provides the internal connection feed-through wiring from the internal sensor components to the socket module connections. The top of the adapter has 10 pins - four pins for the coils, four pins for the electrodes,

and two pins for the process reference. Each connection point has two pins associated for redundant continuity. See Figure 12-2.

The best location for testing the sensor components is taking measurements directly on the feed-through pins. Direct measurement on the pins eliminates the possibility of an erroneous measurement caused by a bad socket module or remote wiring. The figure below shows the feed-through pin connections as they relate to the terminal connections described in the tests.

A. Electrode side
B. Coil side
C. Process reference
D. Orientation key

12.6.2 Socket module

The socket module connects the sensor adapter to the transmitter. There are two versions of the socket module—one for integral mount transmitters and one for remote mount transmitters. See Figure 12-3 and Figure 12-4. The socket module is a replaceable component. If test measurements taken through the socket module show a failure, remove the socket module and confirm measurements directly on the feed-through pins of the sensor adapter. To remove the socket module, refer to Maintenance.

Figure 12-3: Socket Module—Integral Mount

Figure 12-4: Remote Mount Socket Module

12.7 Installed sensor tests

If a problem with an installed sensor is identified, refer to Table 12-8 through Table 12-12 to assist in troubleshooting the sensor. Disconnect or turn off power to the transmitter before performing any of the sensor tests. Always check the operation of test equipment before each test.

If possible, take all readings from the preferred locations identified in Sensor adapter feed through pins, Sensor adapter direct lead pins, and Socket module. If the recommended locations in the sensor adapter are inaccessible, take measurements at the sensor terminal block or through remote cabling as close to the sensor as possible. Readings taken through remote cabling that is more than 100 feet (30 meters) in length may provide incorrect or inconclusive information and should be avoided.

The expected values in the test below assume the measurements have been taken directly at the pins.

Table 12-8: Test A. Sensor coil

Test conditions	Expected value	Potential cause	Corrective action
• Location: installed or uninstalled • Required equipment: multimeter • Measuring at connections: 1 and 2 = R	2Ω≤R≤18Ω	• Open or shorted coil	• Remove and replace sensor

Table 12-9: Test B: Shields to case

Test conditions	Expected value	Potential cause	Corrective action
• Location: installed or uninstalled • Required equipment: multimeter • Measuring at connections: — 17 and 3 — 3 and case ground — 17 and case ground	< 0.3Ω	• Moisture in terminal block • Leaky electrode • Process behind liner	• Clean terminal block • Remove sensor

Table 12-10: Test C. Coil to coil shield

Test conditions	Expected value	Potential cause	Corrective action
• Location: installed or uninstalled • Required equipment: multimeter • Measuring at connections: — 1 and 3 — 2 and 3	∞Ω (< 1nS)	• Process behind liner • Leaky electrode • Moisture in terminal block	• Remove sensor and dry • Clean terminal block • Confirm with sensor coil test

Table 12-11: Test D. Electrode to electrode shield

Test conditions	Expected value	Potential cause	Corrective action
• Location: installed • Required equipment: LCR (Set to Resistance and 120 Hz) • Measuring at connections: — 18 and 17 = R_1 — 19 and 17 = R_2	• R_1 and R_2 should be stable • $\lvert R_1 - R_2 \rvert \leq 300\Omega$	• Unstable R_1 or R_2 values confirm coated electrode • Shorted electrode • Electrode not in contact with process • Empty pipe • Low conductivity • Leaky electrode • Process reference ground not connected properly	• Remove coating from sensor wall • Use bullet-nose electrodes • Repeat measurement • Remove sensor and complete tests in Uninstalled sensor tests • Connect process reference ground per Process reference connection

Table 12-12: Test E. Electrode to Electrode

Test conditions	Expected value	Potential cause	Corrective action
• Location: installed • Required equipment: LCR (Set to Resistance and 120 Hz) • Measuring at connections: 18 and 19 — 18 and 17 = R_1 — 19 and 17 = R_2	Should be stable and same relative magnitude of R_1 and R_2 from Test D	• Unstable R_1 or R_2 values confirm coated electrode • Shorted electrode • Electrode not in contact with process • Empty pipe • Low conductivity • Leaky electrode • Process reference ground not connected properly	• Remove coating from sensor wall • Use bullet-nose electrodes • Repeat measurement • Remove sensor and complete tests in Uninstalled sensor tests • Connect process reference ground per Process reference connection

To test the sensor, a multimeter capable of measuring conductance in nanoSiemens is preferred. Conductance is the reciprocal of resistance.

Or:

$$1\ nanosiemens = \frac{1}{1\ gigaohm}$$

$$1\ nanosiemens = \frac{1}{1\ x\ 10^9\ ohm}$$

12.8 Uninstalled sensor tests

Sensor troubleshooting can also be performed on an uninstalled sensor. If test results from installed sensor tests are inconclusive, the next step is remove the sensor and perform the tests outlined in this section. Take measurements from the recommended terminal location, and directly on the electrode head inside the sensor. The measurement electrodes, 18 and 19, are on opposite sides in the inside diameter of the sensor.
If applicable, the third process reference electrode is between the two measurement electrodes.

The expected values in the test below assume the measurements have been taken directly at the pins.

Table 12-13: Test A. Terminal to front electrode

Test conditions	Expected value	Potential cause	Corrective action
• Location: uninstalled • Required equipment: Multimeter • 18 and electrode 18(1)	≤ 1 Ω	• Shorted electrode • Open electrode • Coated electrode	• Replace sensor • Remove coating from sensor wall

(1) When the connection head is in the vertical upright position and the flow arrow (see Flow direction) on the connection head flange points to the right, the front of the meter will be facing towards you. Electrode 18 is on the front of the meter. If you cannot determine the front of the meter, measure both electrodes. One electrode should result in an open reading, while the other electrode should be less than 0.3 ohm.

Table 12-14: Test B. Terminal to back electrode

Test conditions	Expected value	Potential cause	Corrective action
• Location: uninstalled • Required equipment: Multimeter • 19 and electrode 19(1)	≤ 1 Ω	• Shorted electrode • Open electrode • Coated electrode	• Replace sensor • Remove coating from sensor wall

(1) When the connection head is in the vertical upright position and the flow arrow (see Flow direction) on the connection head flange points to the right, the front of the meter will be facing towards you. Electrode 18 is on the front of the meter. If you cannot determine the front of the meter, measure both electrodes. One electrode should result in an open reading, while the other electrode should be less than 0.3 ohm.

Table 12-15: Test C. Terminal to reference electrode

Test conditions	Expected value	Potential cause	Corrective action
• Location: uninstalled • Required equipment: Multimeter • 17 and process reference electrode(1)	≤ 0.3 Ω	• Shorted electrode • Open electrode • Coated electrode	• Replace sensor • Remove coating from sensor wall

(1) Only valid if the sensor has a process reference electrode.

Table 12-16: Test D. Terminal to case ground

Test conditions	Expected value	Potential cause	Corrective action
• Location: uninstalled • Required equipment: Multimeter • 17 and safety ground	≤ 0.3 Ω	• Moisture in terminal block • Leaky electrode • Process behind liner	• Clean terminal block • Replace terminal block • Replace sensor

Table 12-17: Test E. Electrode to electrode shield

Test conditions	Expected value	Potential cause	Corrective action
• Location: uninstalled • Required equipment: Multimeter • 18 and 17 • 19 and 17	∞Ω (< 1 nS)	• Shorted electrode • Leaky electrode • Moisture in terminal block	• Replace sensor • Clean terminal block • Replace terminal block

Table 12-18: Test F. Electrode shield to coil

Test conditions	Expected value	Potential cause	Corrective action
• Location: uninstalled • Required equipment: Multimeter • 17 and 1	∞Ω (< 1 nS)	• Process in coil housing • Moisture in terminal block	• Replace sensor • Clean terminal block • Replace terminal block

A Product specifications

A.1 Rosemount 8700M Flowmeter Platform specifications

The tables below outline some of the basic performance, physical, and functional specifications of the Rosemount 8700M Magnetic Flowmeter Platform.

Table A-1: Rosemount 8732EM Transmitter Specifications

8732EM Transmitter		
	Model	8732EM
	Base accuracy(1)	0.25% Standard 0.15% High Accuracy Option
	Mounting	Integral or Remote
	Power supply	Global AC or DC
	User interface	LCD display with 4 Optical Switch LOI LCD display only No display
	Communication protocol	HART
	Diagnostics	Basic, DA1, DA2
	Sensor compatibility	All Rosemount plus other manufacturers
	Detailed specifications	Transmitter specifications
	Ordering information	Product Data Sheet

(1) For complete accuracy specifications, please refer to Transmitter functional specifications.

Table A-2: Rosemount Sensor Specifications

8705 Sensor		
	Style	Flanged
	Base accuracy(1)	0.25% Standard 0.15% High Accuracy Option
	Line sizes	½-in. to 36-in. (15 mm to 900 mm)
	Design features	Standard Process Design
	Detailed specifications	8705-M Flanged Sensor Specifications
	Ordering information	Product Data Sheet

Table A-2: Rosemount Sensor Specifications *(continued)*

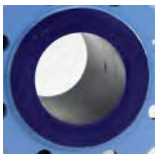
8711 Sensor		
	Style	Wafer
	Base accuracy(1)	0.25% Standard 0.15% High Accuracy Option
	Line sizes	1½ -in. to 8-in. (40 mm to 200 mm)
	Design features	Compact, Light Weight
	Detailed specifications	8711-M/L Wafer Sensor Specifications
	Ordering information	Product Data Sheet
8721 Sensor		
	Style	Hygienic (sanitary)
	Base accuracy(1)	0.5% Standard 0.25% High Accuracy Option
	Line sizes	½-in. to 4-in. (15 mm to 100 mm)
	Design features	3-A CIP/SIP
	Detailed specifications	8721 Hygienic (Sanitary) Sensor Specifications
	Ordering information	Product Data Sheet

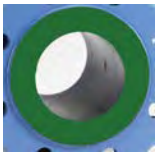
(1) For complete accuracy specifications, refer to the sensor's detailed specifications.

Table A-3: Lining Material Selection

Liner material	General characteristics
PFA, PFA+ 	Best chemical resistance
	Better abrasion resistance than PTFE
	Best high temperature capabilities
	Process temperature: -58 to 350 °F (-50 to 177 °C)
PTFE 	Highly chemical resistant
	Excellent high temperature capabilities
	Process temperature: -58 to 350 °F (-50 to 177 °C)
ETFE 	Excellent chemical resistance
	Better abrasion resistance than PTFE
	Process temperature: -58 to 300 °F (-50 to 149 °C)

Table A-3: Lining Material Selection *(continued)*





Liner material	General characteristics
Polyurethane 	Limited chemical resistance
	Excellent abrasion resistance for slurries with small and medium particles
	Process temperature: 0 to 140 °F (-18 to 60 °C)
	Typically applied in clean water
Neoprene 	Very good abrasion resistance for small and medium particles
	Better chemical resistance than polyurethane
	Typically applied in water with chemicals, and sea water
	Preferred liner for high pressure > ASME B16.5 Class 900
	Process temperature: 0 to 176 °F (-18 to 80 °C)
Linatex Rubber 	Limited chemical resistance especially in acids
	Very good abrasion resistance for large particles
	Softer material than polyurethane and neoprene
	Typically applied in mining slurries
	Process temperature: 0 to 158 °F (-18 to 70 °C)
Adiprene 	Ideal for applications with high salinity and/or hydrocarbon carryover
	Excellent abrasion resistance
	Typically used for Water Injection, Recovered Water, and Coal Gasification Slurries
	Preferred liner for high pressure > ASME B16.5 Class 900
	Process temperature: 0 to 200 °F (-18 to 93 °C)

Table A-4: Electrode Material

Electrode material	General characteristics
316L Stainless Steel	Good corrosion resistance
	Good abrasion resistance
	Not recommended for sulfuric or hydrochloric acids
Nickel Alloy 276 (UNS N10276)	Better corrosion resistance
	High strength
	Good in slurry applications
	Effective in oxidizing fluids
Tantalum	Excellent corrosion resistance
	Not recommended for hydrofluoric acid, fluorosilic acid, or sodium hydroxide
80% Platinum 20% Iridium	Best chemical resistance
	Expensive material
	Not recommended for aquaregia

Table A-4: Electrode Material *(continued)*

Electrode material	General characteristics
Titanium	Better chemical resistance
	Better abrasion resistance
	Good for sea water applications
	Not recommended for hydrofluoric or sulfuric acid
Tungsten Carbide coated	Limited chemical resistance
	Best abrasion resistance
	High concentration slurries
	Preferred electrode for oil and gas fracturing applications

Table A-5: Electrode Type

Electrode type	General characteristics
Standard Measurement	Lowest cost
	Good for most applications
Measurement + Reference Electrode (Also see Table A-6 and Table A-7 for grounding options and installation	Low cost grounding option especially for large line sizes
	If using a reference electrode, process fluid must have a minimum conductivity of 100 microSiemens/cm
	Not recommended for electrolytic or galvanic corrosion applications
Bulletnose	Extended head protrudes into the flow stream for self-cleaning
	Best option for coating processes
Flat Head	Low profile head
	Best option for abrasive slurries

Table A-6: Process Reference Options

Grounding options	General characteristics
No Grounding Options (grounding straps)	Acceptable for conductive unlined pipe
	Grounding straps provided at no cost
Reference Electrode	Same material as measurement electrodes
	Sufficient grounding option when process fluid conductivity is greater than 100 microSiemens/cm
	Not recommended in electrolysis applications, galvanic corrosion applications, applications where the electrodes may coat, or non-conductive pipe.

Table A-6: Process Reference Options *(continued)*

Grounding options	General characteristics
Grounding Rings	Low conductivity process fluids
	Cathodic or electrolysis applications that may have stray currents in or around the process
	Variety of materials for process fluid compatibility
Lining Protectors	Protect upstream edge of sensor from abrasive fluids
	Permanently installed on sensor
	Protect liner material from over torquing of flange bolts
	Provide ground path and eliminate need for grounding rings or reference electrode
	Required for applications where Flexitallic gaskets are used

Table A-7: Process Reference Installation

Type of pipe	Grounding straps	Grounding rings	Reference electrode	Lining protectors
Conductive unlined pipe	Acceptable	Not required	Not required	Not required
Conductive lined pipe	Not acceptable	Acceptable	Acceptable	Acceptable
Non-conductive pipe	Not acceptable	Acceptable	Not recommended	Acceptable

A.2 Transmitter specifications

A.2.1 Transmitter functional specifications

Sensor compatibility

Compatible with Rosemount 8705, 8711, and 8721 sensors. Compatible with AC and DC powered sensors of other manufacturers.

Transmitter coil drive current

500 mA

Flow rate range

Capable of processing signals from fluids with velocities between 0.04 and 39 ft/s (0.01 to 12 m/s) for both forward and reverse flow in all sensor sizes. Full scale continuously adjustable between –39 and 39 ft/s (–12 to 12 m/s).

Conductivity limits

Process liquid must have a conductivity of 5 microSiemens/cm (5 micromhos/cm) or greater.

Power supply

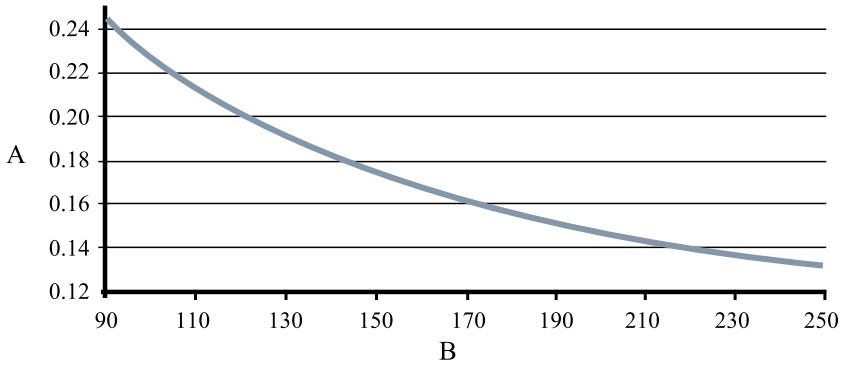
- 90 - 250 VAC @ 50/60 Hz

- 12 - 42 VDC
- 12 - 30 VDC

Line power fuses

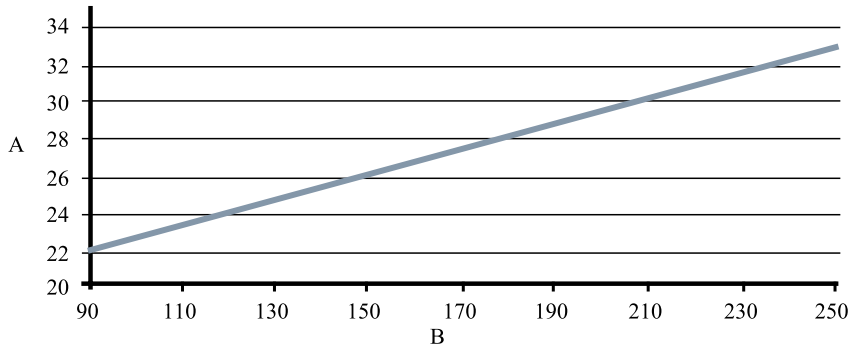
- 90 - 250 VAC systems:
  - 2 amp quick acting
  - Bussman AGC2 or equivalent
- 12 - 42 VDC systems
  - 3 amp quick acting
  - Bussman AGC3 or equivalent
- 12 - 30 VDC systems
  - 3 amp quick acting
  - Bussman AGC3 or equivalent

Power consumption



- 90 - 250 VAC: 40 VA maximum
- 12 - 42 VDC: 15 W maximum
- 12 - 30 VDC: 3 W maximum

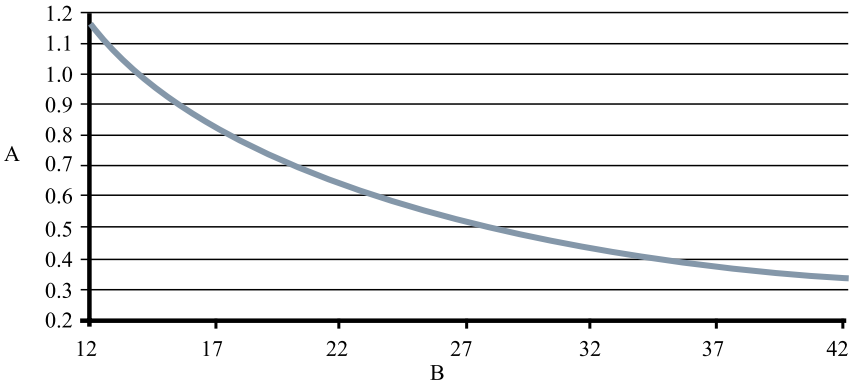
Switch-on current



- At 250 VAC: Maximum 35.7 A (< 5 ms)
- At 42 VDC: Maximum 42 A (< 5 ms)
- At 30 VDC: Maximum 42 A (< 5 ms)

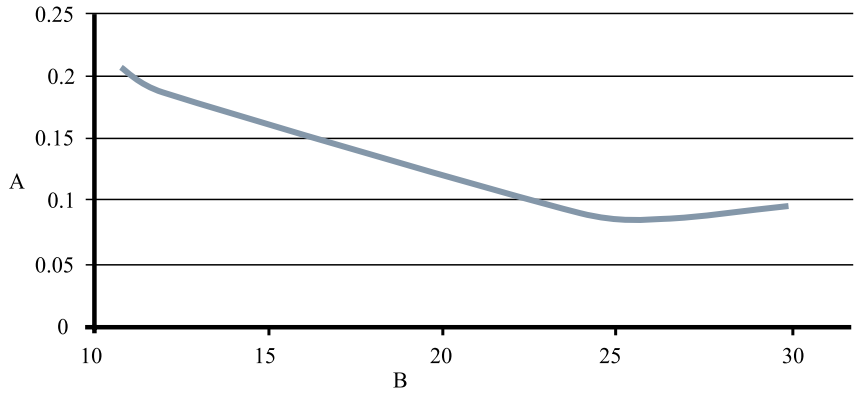
AC power supply requirements

Units powered by 90 - 250 VAC have the following power requirements. Peak inrush is 35.7 A at 250 VAC supply, lasting approximately 1 ms. Inrush for other supply voltages can be estimated with: Inrush (Amps) = Supply (Volts) / 7.0



A. Supply current (amps)
B. Power supply (VAC)

A. Apparent power (VA)
B. Power supply (VAC)



DC power supply requirements

Standard DC Units powered by 12 VDC power supply may draw up to 1.2 A of current steady state. Low power DC units may draw up to 0.25 A of current steady state. Peak inrush is 42 A at 42 VDC supply, lasting approximately 1 ms. Inrush for other supply voltages can be estimated with: Inrush (Amps) = Supply (Volts) / 1.0

A. Supply current (amps)
B. Power supply (VDC)

DC low power supply requirements

A. Supply current (amps)
B. Power supply (VDC)

Low power software option

This software option lowers the coil current from 500 mA to 75 mA in order to conserve power for applications in remote locations where power is scarce. The coils are still driven in a continuous manner optimizing measurement performance and providing access to all diagnostic capabilities. Because of the reduced coil current, flow measurement accuracy is reduced to 1% of rate for low power systems. Table A-8 shows the power consumption that can be expected for various configurations. Due to the reduced coil current, sensor size is limited to a maximum line size of 10-in. (250 mm).

The low power option is available for integral mount with DC power only (option code 3) and output code B (4-20 mA/HART/Pulse). To ensure the sensor will support the low power functionality, option code D3 for a low power calibration must appear in the sensor model number.

Sample model numbers for a low power system are:

`8732EMT3M1N6M4DA1DA2`

`8705DHA020D7M0N6B3D3`

Table A-8: Low power consumption

Output code	Power consumption	Flow accuracy	Measurement range
Output Code B Utilize Pulse Output Only	2 Watts Maximum	1% of Rate	0.04 fps to 39 fps 0.01 m/s to 12 m/s
Output Code B Utilize Pulse and Analog Output	3 Watts Maximum	1% of Rate	0.04 fps to 39 fps 0.01 m/s to 12 m/s
Output code M Utilizing Modbus RS-485 and Pulse Output	4 Watts Maximum	1% of Rate	0.04 fps to 39 fps 0.01 m/s to 12 m/s

Ambient temperature limits

- Operating:
  - –58 to 140 °F (–50 to 60 °C) without LOI/Display
  - –4 to 140 °F (–20 to 60 °C) with LOI/Display
  - The LOI/Display will not be visible at temperatures below –4 °F (–20 °C).
- Storage:
  - –58 to 185 °F (–50 to 85 °C) without LOI/Display
  - –22 to 176 °F (–30 to 80 °C) with LOI/Display

Humidity limits

0–95% RH to 140 °F (60 °C)

Altitude limits

AC Input Voltage: Maximum 250 VAC – Up to 2000 meters (6,500 feet)

AC Input Voltage: Maximum 150 VAC – Up to 4000 meters (13,000 feet)

DC Input Voltage: No altitude limit

Transient protection rating

Built in transient protection that conforms to:

- IEC 61000-4-4 for burst currents
- IEC 61000-4-5 for surge currents
- IEC 611185-2.2000, Class 3 up to 2 kV and up to 2 kA protection

Turn-on time

- 5 minutes to rated accuracy from power up
- 5 seconds from power interruption

Start-up time

50ms from zero flow

Low flow cut-off

Adjustable between 0.01 and 38.37 ft/s (0.003 and 11.7 m/s). Below selected value, output is driven to the zero flow rate signal level.

Overrange capability

Signal output will remain linear until 110% of upper range value or 44 ft/s (13 m/s). The signal output will remain constant above these values. Out of range message displayed on LOI/Display and the Field Communicator.

Damping

Adjustable between 0 and 256 seconds

A.2.2 Advanced diagnostics capabilities

Basic

- Self test
- Transmitter faults

- Analog output test
- Pulse output test
- Tunable empty pipe
- Reverse flow
- Ground/wiring fault
- Coil circuit fault
- Electronics temperature

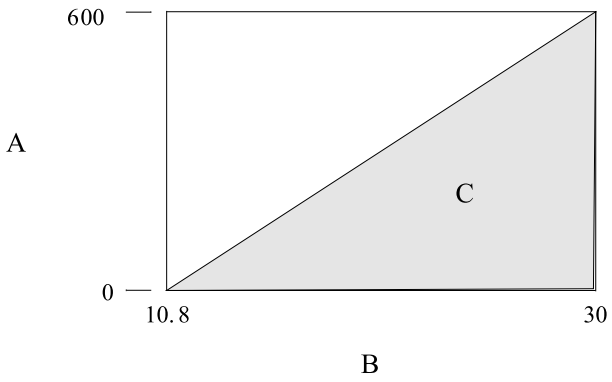
Process diagnostics (DA1)

- High process noise
- Electrode coating diagnostic

Smart Meter Verification (DA2)

- Smart Meter Verification (continuous or commanded)
- 4-20 mA loop verification(1)

A.2.3 Output signals



Analog output adjustment (2)

4–20 mA, switch-selectable as internally or externally powered.

Analog loop load limitations

- Internally powered 24 VDC max, 500 ohms max loop resistance
- Externally powered 10.8 - 30 VDC max.
- Loop resistance is determined by the voltage level of the external power supply at the transmitter terminals:

(1) Available with HART output only.
(2) For transmitters with intrinsically safe outputs (option code B), power must be supplied externally.

A. Load (ohms)
B. Power supply (volts)
C. Operating region

- R_{max} = 31.25 (V_{ps}–10.8)
- V_{ps} = power supply voltage (volts)
- Rmax = maximum loop resistance (ohms)

The analog output is automatically scaled to provide 4 mA at lower range value and 20 mA at upper range value. Full scale continuously adjustable between -39 and 39 ft/s (-12 to 12 m/sec), 1 ft/s (0.3 m/s) minimum span.

HART Communications is a digital flow signal. The digital signal is superimposed on the 4–20 mA signal and is available for the control system interface. A minimum of 250 ohms loop resistance is required for HART communications.

Analog alarm mode

High or low alarm signal is user-selectable via the Alarm switch on the front of the electronics. NAMUR-compliant alarm limits are software configurable and can be preset via CDS (C1). Individual diagnostic alarms are also software configurable. Alarms will drive the analog signal to the following mA values.

Low	3.75 mA	Requires CDS (C1)
High	22.60 mA	Factory default
NAMUR Low	3.5 mA	Requires CDS (C1)
NAMUR High	22.6 mA	Requires CDS (C1)

Scalable pulse frequency adjustment

- 0-10,000 Hz, switch-selectable as internally or externally powered [(3)]
- Pulse value can be set to equal desired volume in selected engineering units
- Pulse width adjustable from 0.1 to 650 ms
- Internally powered: Outputs up to 12 VDC[(4)]
- Externally powered: Input 5 - 28 VDC

Output testing

Analog output test [(4)]	Transmitter may be commanded to supply a specified current between 3.5 and 23 mA.
Pulse output test	Transmitter may be commanded to supply a specified frequency between 1 and 10,000 Hz.[(3)]

Optional discrete output function (AX option)

Externally powered at 5 - 28 VDC, 240 mA max, solid state switch closure to indicate either:

Reverse flow	Activates switch closure output when reverse flow is detected.
Zero flow	Activates switch closure output when flow goes to 0 ft/s or below low flow cutoff.
Empty pipe	Activates switch closure output when an empty pipe condition is detected.
Transmitter faults	Activates switch closure output when a transmitter fault is detected.
Flow limit 1, flow limit 2	Activates switch closure output when the transmitter measures a flow rate that meets the conditions established for this alert. There are two independent flow limit alerts that can be configured as discrete outputs.
Totalizer limit	Activates switch closure output when the transmitter measures a total flow that meets the conditions established for this alert.
Diagnostic status	Activates switch closure output when the transmitter detects a condition that meets the configured criteria of this output.

Optional discrete input function (AX option)

Externally powered at 5 - 28 VDC, 1.4 - 20 mA to activate switch closure to indicate either:

Reset Totalizer A (or B or C)	Resets Totalizer A (or B or C) value to zero.
Reset All Totals	Resets all totalizer values to zero.
Positive Zero Return (PZR)	Forces outputs of the transmitter to zero flow.

Security lockout

Security lockout switch on the electronics board can be set to deactivate all LOI and HART-based communicator functions to protect configuration variables from unwanted or accidental change.

(3) For transmitters with intrinsically safe outputs (option code B), frequency range is limited to 0-5000 Hz and must be powered externally.
(4) For transmitters with intrinsically safe outputs (option code B), power must be supplied externally.

LOI lockout

The display can be manually locked to prevent unintentional configuration changes. The display lock can be activated through a HART communication device, or by holding the UP arrow for 3 seconds and then following the on-screen instructions. When the display lock is activated, a lock symbol will appear in the lower right hand corner of the display. To deactivate the display lock, hold the UP arrow for 3 seconds and follow the on-screen instructions.

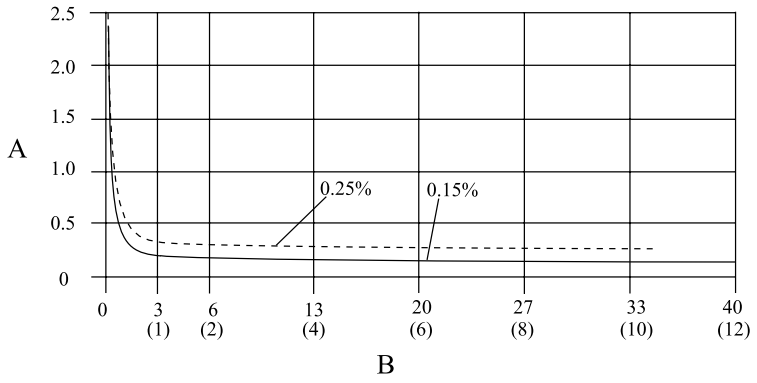
Display auto lock can be configured from the LOI with the following settings: OFF, 1 Minute, or 10 Minutes.

Sensor compensation

Rosemount sensors are calibrated in a flow lab at the factory and are assigned a calibration number. The calibration number must be entered into the transmitter, enabling interchangeability of sensors without calculations or a compromise in standard accuracy.

Transmitters and other manufacturers' sensors can be calibrated at known process conditions or at the Rosemount NIST-Traceable Flow Facility. Transmitters calibrated on site require a two-step procedure to match a known flow rate. This procedure can be found in the operations manual.

A.2.4 Performance specifications

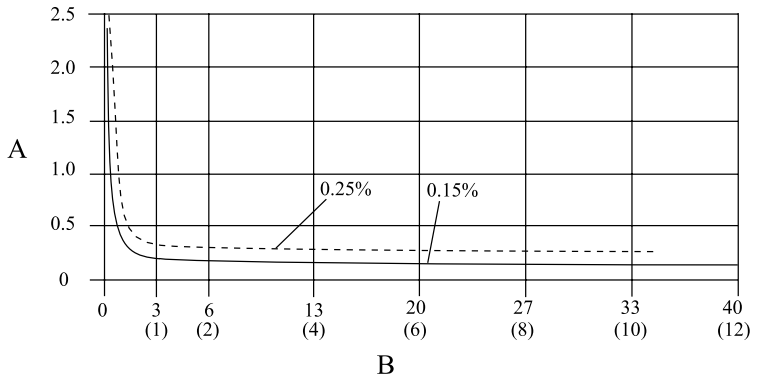


System specifications are given using the frequency output and with the unit at reference conditions.

Accuracy

Includes the combined effects of linearity, hysteresis, and repeatability.

Rosemount 8705-M Sensor

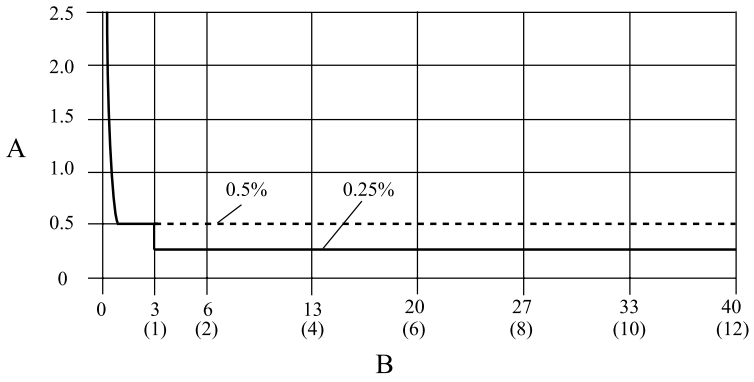


- Standard system accuracy:
  - ±0.25% of rate ±1.0 mm/sec from 0.04 to 6 ft/s (0.01 to 2 m/s)
  - ±0.25% of rate ±1.5 mm/sec above 6 ft/s (2 m/s)
- Optional high accuracy:[5]
  - ±0.15% of rate ±1.0 mm/sec from 0.04 to 13 ft/s (0.01 to 4 m/s)
  -

A. Percentage of rate
B. Velocity in ft/s (m/s)

Rosemount 8711-M/L Sensor

- Standard system accuracy:
  - ±0.25% of rate ±2.0 mm/sec from 0.04 to 39 ft/s (0.01 to 12 m/s)
- Optional high accuracy:
  - ±0.15% of rate ±1.0 mm/sec from 0.04 to 13 ft/s (0.01 to 4 m/s)
  -



A. Percentage of rate
B. Velocity in ft/s (m/s)

(5) For sensor sizes greater than 12 in. (300 mm), the high accuracy is ±0.25% of rate from 3 to 39 ft/sec (1 to 12 m/sec).

Rosemount 8721 Sensor

- Standard system accuracy:
  - ±0.5% of rate ±1.5 mm/s from 0.04 to 1.0 ft/s (0.01 and 0.3 m/s)
  - ±0.5% of rate from 1 to 39 ft/s (0.3 to 12 m/s)
- Optional high accuracy:
  -

A. Percentage of rate
B. Velocity in ft/s (m/s)

Other manufacturers' sensors

- When calibrated in the Rosemount Flow Facility, system accuracies as good as 0.5% of rate can be attained.
- There is no accuracy specification for other manufacturers' sensors calibrated in the process line.

Analog output effects

Analog output has the same accuracy as frequency output plus an additional ±4 µ A at room temperature.

Repeatability	±0.1% of reading
Response time (analog output)	20 ms max response time to step change in input
Stability	±0.1% of rate over six months
Ambient temperature effect	±0.25% change over operating temperature range

A.2.5 8732 Field mount transmitter physical specifications

Materials of construction

Standard housing	Low copper aluminum Type 4X and IEC 60529 IP66/67/68/69[(1)]
Paint	Polyurethane coat (1.8 to 2.2 mils thick)

Cover gasket	Aluminum housing: Buna-N 316 SST housing: Silicone

(1) For applications where the transmitter may be submerged, even temporarily, contact Emerson Flow Technical Support for details.

Electrical connections

Conduit entries	Available in ½ inch NPT or M20. See ordering table footnotes for details.
Terminal block screws	6-32 (No. 6) suitable for up to 14 AWG wire
Safety grounding screws	External stainless assembly, M5; internal 8-32 (No. 8)

Vibration rating

Integral mount	2G per IEC 61298
Remote mount	5G per IEC 61298

Dimensions

See Product Data Sheet.

Weight

Field mount transmitter only	Aluminum	Approximately 7 lbs. (3.2 kg)

Add 1 pound (0.5 kg) for LOI/Display.

A.3 8705-M Flanged Sensor Specifications

A.3.1 Functional specifications

Service

Conductive liquids and slurries

Line sizes

½ inch to 36 inch (15 mm to 900 mm)

Sensor coil resistance

2 - 20 Ω

Interchangeability

Rosemount 8705-M sensors are interchangeable with 8712EM and 8732EM transmitters. System accuracy is maintained regardless of line size or optional features. Each sensor nameplate has a sixteen-digit calibration number that can be entered into a transmitter during configuration.

Upper range limit

39.37 ft/s (12 m/s)

Ambient temperature limits

- –20 to 140 °F (–29 to 60 °C) standard carbon steel housing design
- –58 to 140 °F (–50 to 60 °C) with "SH" all stainless housing design[6]

Pressure limits

See Process temperature limits.

Vacuum limits

PTFE lining	Full vacuum to +350 °F (+177 °C) through 4-in. (100 mm) line sizes. Consult an Emerson Flow representative for vacuum applications with line sizes of 6 inches (150 mm) or larger.
All other standard sensor lining materials	Full vacuum to maximum material temperature limits for all available line sizes.

Submergence protection IP68

The remote mount sensor is rated IP68 for continuous submergence. Tested to a depth of 33 ft (10 m) for a period of 48 hours. IP68 rating requires that the transmitter must be remote mount. Installer must use IP68 approved cable glands, conduit connections, and/or conduit plugs.

Conductivity limits

Process liquid must have a conductivity of 5 microSiemens/cm or greater. Consult an Emerson Flow representative for conductivity less than 5 microSiemens/cm.

Process temperature limits

PTFE lining	–58 to +350 °F (–50 to +177 °C)
ETFE lining	–58 to +300 °F (–50 to +149 °C)
PFA and PFA+ lining	–58 to +350 °F (–50 to +177 °C)
Polyurethane lining	0 to +140 °F (–18 to +60 °C)
Neoprene lining	0 to +176 °F (–18 to +80 °C)
Linatex lining	0 to +158 °F (–18 to +70 °C)
Adiprene lining	0 to +200 °F (–18 to +93 °C)

Notes

- Carbon steel flanges for PED have a minimum process temperature limit of 32 °F (0 °C).

(6) Not available for Class/Div approval codes N5, N6, K5, KU.

- Sensors ordered with hazardous location ratings may have different maximum process temperature limits. The sensors must be installed and used as directed by the installation drawing number noted on the serial nameplate.

Table A-9: Temperature vs. Pressure Limits for ASME B16.5 class flanges [1]

Sensor temperature vs. pressure limits for ASME B16.5 class flanges (up to 36 inch line sizes)[2]

A.3.2 Physical specifications

Emerson Rosemount magnetic flow meters are designed to the standards defined in ASME B31.3. This standard is used as the basis for all of our other pressure vessel certifications such as CRN and PED.

Non-wetted materials

Sensor Pipe	Type 304/304L SST or Type 316/316L SST
Flanges[1]	Flat-Face (FF) and Raised-Face (RF)
Coil housing	Rolled carbon steel or 300 series stainless steel
Remote junction box	Painted aluminum
Paint	Polyurethane coat (2.6 mils or greater)
Optional coil housing	316/316L unpainted, option code SH
Optional remote junction box	316/316L, unpainted, option code SJ; included with option code SH

(1) Ambient temperature low limit for A105 carbon steel is –20 °F (–29 °C) per ANSI B16.5. For colder ambient environments, stainless steel flanges must be used.

Process-wetted materials

Flanges[1]	Ring Type Joint (RTJ)
Lining	PTFE, ETFE, PFA, Polyurethane, Neoprene, Linatex, Adiprene, PFA+
Electrodes	316L SST, Nickel Alloy 276 (UNS N10276), Tantalum, 80% Platinum-20% Iridium, Titanium

(1) Ambient temperature low limit for A105 carbon steel is –20 °F (–29 °C) per ANSI B16.5. For colder ambient environments, stainless steel flanges must be used.

Flat-faced flanges

Sensors ordered with flat-faced flanges and Neoprene or Linatex liners are manufactured with the liner extending to the outer dimension of the flange. All other liner selections extend to the diameter of raised face dimension and create a raised surface on the flange face.

Process connections

ASME B16.5	• Class 150 and Class 300: ½ inch to 24 inch (15 mm to 600 mm) • Class 600: ½ inch to 24 inch (15 mm to 600 mm)(1) • Class 900: 1 inch to 12 inch (25 mm to 300 mm)(2) • Class 1500: 1½ inch to 12 inch (40 mm to 300 mm)(2) • 1½ inch to 6 inch (40 mm to 150 mm)(2)
ASME B16.47	• Class 150: 30 inch to 36 inch (750 mm to 900 mm) • Class 300: 30 inch to 36 inch (750 mm to 900 mm)
AWWA C207	• Class D: 30 inch and 36 inch (750 mm and 900 mm)
MSS SP44	• Class 150: 30 inch to 36 inch (750 mm to 900 mm)
EN 1092-1	• PN10: 200 mm to 900 mm (8 inch to 36 inch) • PN16: 100 mm to 900 mm (4 inch to 36 inch) • PN25: 200 mm to 900 mm (8 inch to 36 inch) • PN40: 15 mm to 900 mm (½ inch to 36 inch)
AS2129	• Table D and Table E: 15 mm to 900 mm (½ inch to 36 inch)
AS4087	• PN16, PN21, PN35: 50 mm to 600 mm (2 inch to 24 inch)
JIS B2220	• 10K, 20K, 40K: 15 mm to 200 mm (½ inch to 8 inch)

(1) For PTFE, PFA, PFA+, and ETFE, maximum working pressure is derated to 1000 psig.
(2) For Class 900 and higher flange ratings, liner selection is limited to resilient liners.

Electrical connections

Conduit entries	Available with ½ inch NPT and M20
Terminal block screws	6-32 (No. 6) suitable for up to 14 AWG wire
Safety grounding screws	External stainless assembly, M5; internal 8-32 (No. 8)

Process reference electrode (optional)

A process reference electrode can be installed similarly to the measurement electrodes through the sensor lining. It will be made of the same material as the measurement electrodes.

Grounding rings (optional)

Grounding rings can be installed between the flange and the sensor face on both ends of the sensor. Single ground rings can be installed on either end of the sensor. They have an I.D. slightly larger than the sensor I.D. and an external tab to attach ground straps. Grounding rings are available in 316L SST, Nickel Alloy 276 (UNS N10276), titanium, and tantalum. See Product Data Sheet.

Lining protectors (optional)

Lining protectors can be installed between the flange and the sensor face on both ends of the sensor. The leading edge of lining material is protected by the lining protector; lining protectors cannot be removed once they are installed. Lining protectors are available in 316L SST, Nickel Alloy 276 (UNS N10276), and titanium. See Product Data Sheet.

A.4 8711-M/L Wafer Sensor Specifications

A.4.1 Functional specifications

Service

Conductive liquids and slurries

Line sizes

1.5-in. to 8-in. (40 mm to 200 mm)

Sensor coil resistance

10 - 18 Ω

Interchangeability

Rosemount 8711-M/L Sensors are interchangeable with 8712EM and 8732EM Transmitters. System accuracy is maintained regardless of line size or optional features. Each sensor nameplate has a sixteen-digit calibration number that can be entered into a transmitter during configuration.

Upper range limit

39.37 ft/s (12 m/s)

Process temperature limits

ETFE lining	-20 to 300 °F (–29 to 149 °C)
PTFE lining	-20 to 350 °F (-29 to 177 °C)

Ambient temperature limits

–20 to 140 °F (–29 to 60 °C)

Maximum safe working pressure at 100 °F (38 °C)

ETFE lining	Full vacuum to 740 psi (5.1 MPa)
PTFE lining	• Line sizes 1.5-in. (40 mm) through 4-in. (100 mm); Full vacuum to 740 psi (5.1 MPa) • Consult Technical Support for vacuum applications with line sizes of 6-in. (150 mm) or larger

Submergence protection IP68

The remote mount sensor is rated IP68 for continuous submergence. Tested to a depth of 33 ft (10 m) for a period of 48 hours. IP68 rating requires that the transmitter must be remote mount. Installer must use IP68 approved cable glands, conduit connections, and/or conduit plugs.

Conductivity limits

Process liquid must have a minimum conductivity of 5 microSiemens/cm (5 micromhos/cm) or greater for 8711.

A.4.2 Physical specifications

Non-wetted materials

Sensor body	• 303 SST • CF3M or CF8M • Type 304/304L
Coil housing	Rolled carbon steel
Remote junction box	Painted aluminum
Paint	Polyurethane coat (2.6 mils or greater)

Process-wetted materials

Lining	PTFE, ETFE
Electrodes	316L SST, Nickel Alloy 276 (UNS N10276), Tantalum, 80% Platinum—20% Iridium, Titanium

Electrical connections

Conduit entries	Available with 1/2 inch NPT and M20. See ordering table footnotes for details
Terminal block screws	6-32 (No. 6) suitable for up to 14 AWG wire
Safety grounding screws	External stainless assembly, M5; internal 8-32 (No. 8)

Process reference electrode (optional)

A process reference electrode can be installed similarly to the measurement electrodes through the sensor lining. It will be made of the same material as the measurement electrodes.

Grounding rings (optional)

Grounding rings can be installed between the flange and the sensor face on both ends of the sensor. They have an I.D. slightly smaller than the sensor I.D. and an external tab to attach ground wiring. Grounding rings are available in 316L SST, Nickel Alloy 276 (UNS N10276), titanium, and tantalum. See Product Data Sheet.

Dimensions

A.5 8721 Hygienic (Sanitary) Sensor Specifications

A.5.1 Functional specifications

Service

Conductive liquids and slurries

Line sizes

1/2 -in. to 4-in. (15 mm to 100 mm)

Sensor coil resistance

5 -10 Ω

Interchangeability

Rosemount 8721 sensors are interchangeable with Rosemount 8712EM and 8732EM transmitters. System accuracy is maintained regardless of line size or optional features. Each sensor label has a 16 digit calibration number that can be entered into the transmitter during configuration.

Conductivity limits

Process liquid must have a minimum conductivity of 5 microSiemens/cm (5 micromhos/cm) or greater. Excludes the effect of interconnecting cable length in remote mount transmitter installations.

Flow rate range

Capable of processing signals from fluids that are traveling between 0.04 and 39 ft/s (0.01 to 12 m/s) for both forward and reverse flow in all sensor sizes. Full scale continuously adjustable between –39 and 39 ft/s (–12 to 12 m/s).

Sensor ambient temperature limits

14 to 140 °F (–15 to 60 °C)

Process temperature limits

PFA lining -20 to 350 °F (-29 to 177 °C)

Table A-12: Pressure limits

Line size	Max working pressure	CE mark max. working pressure
1/2 -in. (15 mm)	300 psi (20.7 bar)	300 psi (20.7 bar)
1-in. (25 mm)	300 psi (20.7 bar)	300 psi (20.7 bar)
1 1/2 -in. (40 mm)	300 psi (20.7 bar)	300 psi (20.7 bar)
2-in. (50 mm)	300 psi (20.7 bar)	300 psi (20.7 bar)
2 1/2 -in. (65 mm)	300 psi (20.7 bar)	240 psi (16.5 bar)
3 -in. (80 mm)	300 psi (20.7 bar)	198 psi (13.7 bar)
4-in. (100 mm)	210 psi (14.5 bar)	148 psi (10.2 bar)

Vacuum limits

Full vacuum at maximum lining material temperature; consult Technical Support.

Submergence protection IP68

The remote mount 8721 sensor is rated IP68 for submergence to a depth of 33 ft (10 m) for a period of 48 hours. IP68 rating requires that the transmitter must be remote mount. Installer must use IP68 approved cable glands, conduit connections, and/or conduit plugs.

A.5.2 Physical specifications

Mounting

Integrally mounted transmitters are factory-wired and do not require interconnecting cables. The transmitter can rotate in 90° increments. Remote-mounted transmitters require only a single conduit connection to the sensor.

Non-wetted materials

Sensor	304 Stainless Steel (wrapper), 304 Stainless Steel (pipe)
Terminal junction box	Low copper aluminumOptional: 304 Stainless Steel

Process wetted materials (sensor)

Liner	PFA with Ra < 32µ in. (0.81 µm)
Electrodes	• 316L SST with Ra < 15µ in. (0.38 µm) • Nickel Alloy 276 (UNS N10276) with Ra < 15µ in. (0.38 µm) • 80% Platinum-20% Iridium with Ra < 15µ in. (0.38 µm)

Process connections

The Rosemount 8721 Sanitary Sensor is designed using a standard IDF fitting as the basis for providing a flexible, hygienic interface for a variety of process connections. The Rosemount 8721 Sensor has the threaded or “male” end of the IDF fitting on the ends of the base sensor. The sensor can be directly connected with user supplied IDF fittings and gaskets. If other process connections are needed, the IDF fittings and gaskets can be provided and welded directly into the sanitary process tubing, or can be supplied with adapters to standard Tri Clamp process connections. All connections are PED compliant for group 2 fluids.

Tri Clamp sanitary coupling	• IDF Sanitary Coupling (screw type) • IDF specification per BS4825 part 4 • ANSI Weld Nipple • DIN 11850 Weld Nipple • DIN 11851 (Imperial and Metric) • DIN 11864-1 form A • DIN 11864-2 form A • SMS 1145 • Cherry-Burrell I-Line

Process connection material

- 316L Stainless Steel with Ra < 32µ in. (0.81µm)
- Optional Electropolished Surface Finish with Ra < 15µ in. (0.38µ m)

Process connection gasket material

- Silicone
- EPDM
- Viton

Electrical connections

Conduit entries	½ -in. NPT standard, M20 adapters
Terminal block screws	M3
Safety grounding screws	External stainless assembly, M5; internal 6-32 (No. 6)

Dimensions

See Product Data Sheet.

Weight

Table A-13: 8721 Sensor Weight

Line size	Sensor only	008721-0350 Tri Clamp fitting (Each)
1/2 -in. (15 mm)	4.84 lbs (2.20 kg)	0.58 lbs (0.263 kg)
1-in. (25 mm)	4.52 lbs (2.05 kg)	0.68 lbs (0.309 kg)
1 1/2 -in. (40 mm)	5.52 lbs (2.51 kg)	0.88 lbs (0.400 kg)
2-in. (50 mm)	6.78 lbs (3.08 kg)	1.30 lbs (0.591 kg)
2 1/2 -in. (65 mm)	8.79 lbs (4.00 kg)	1.66 lbs (0.727 kg)
3 -in. (80 mm)	13.26 lbs (6.03 kg)	2.22 lbs (1.01 kg)
4-in. (100 mm)	21.04 lbs (9.56 kg)	3.28 lbs (1.49 kg)

Aluminum remote junction box	• Approximately 1 lb. (0.45 kg) • Paint - Polyurethane (1.3 to 5 mils)
SST remote junction box	• Approximately 2.5 lbs. (1.13 kg) • Unpainted

D Implementing a Universal Transmitter

D.1 Safety messages

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Please read the following safety messages before performing any operation described in this section.

⚠ WARNING

The transmitter has not been evaluated for use with other manufacturers' magnetic flowmeter sensors in hazardous (Ex or Classified) areas. Special care should be taken by the end-user and installer that the transmitter meets the safety and performance requirements of the other manufacturer’s equipment.

D.2 Universal capability

The transmitter has the ability to drive other manufacturers' sensors. In addition to providing a flow measurement, all diagnostic functionality is available. This capability can provide additional information about the installation, the process, and the health of the sensor. Universal capabilities enable a common maintenance practice for all magnetic flowmeter installations and help reduce spares inventory of magnetic flowmeter transmitters.

This section provides wiring diagrams for connecting the transmitter to other manufacturers' sensors, and describes how to configure the universal capabilities.

D.3 Three step process

There are three steps to implementing a universal transmitter:

Procedure

1. Review the existing application. Verify that the existing sensor is in good working order, and that it is compatible with a universal transmitter.

   Locate the wiring diagram (in this Appendix) that applies to your sensor. While the Universal transmitter may be able to drive the existing sensor, if the sensor is not in good working order, the universal transmitter may not function correctly.

2. Connect the universal transmitter to the existing sensor using the appropriate wiring diagram from this appendix.

   If the sensor you are using is not listed in this appendix, contact Rosemount technical support for more details on the application of the universal capabilities.

3. Configure the transmitter following the guidelines in Operation and Advanced Configuration Functionality, setting up parameters as needed.

   One of the key configuration parameters is the sensor calibration number. There are several methods to determine the calibration number, but the most common method will be to use the universal trim capability. This functionality is detailed in

this appendix. Accuracy of the meter when the universal trim is used to determine the calibration number will be dependent on the accuracy of the known flow rate used in the trim process.

In addition to the universal trim, there are two other methodologies for determining a calibration number for the sensor:

Method 1: Have the sensor sent to a Rosemount service center for determination of a calibration number compatible with the universal transmitter. This is the most accurate method for determining the calibration number and will provide a ±0.5% of rate measurement accuracy from 3 to 40 fps (1-10 m/s).

Method 2: Involves the conversion of the existing sensor calibration number / meter factors to an equivalent Rosemount 16-digit calibration number. Accuracy of the meter using this methodology is estimated to be in the range of 2-3%. Contact the Rosemount technical support for more information on this method or to determine a calibration number for the existing sensor.

Once these steps are completed, the meter will begin measuring flow. Verify the measured flow rate is within the expected range and that the output correctly corresponds to the measured flow rate. Also verify the reading in the control system matches the reading at the transmitter. Once these items have been verified, the loop can be placed into automatic control as needed.

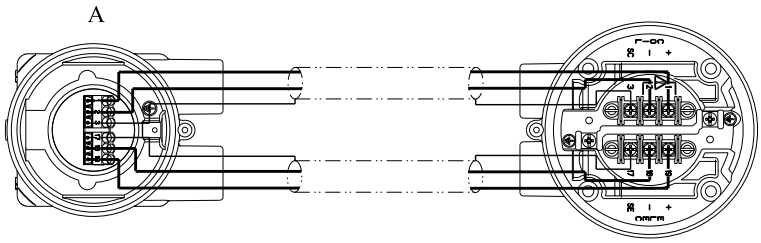
D.3.1 Universal trim

The universal auto trim function enables the transmitter to determine a calibration number for sensors that were not calibrated at the factory. See Universal trim.

D.4 Wiring the universal transmitter

The wiring diagrams in this section illustrate the proper connections between the transmitter and most sensors currently on the market. Specific diagrams are included for most models, and where information for a particular model of a manufacturer is not available, a generic drawing pertaining to that manufacturer's sensors is provided. If the manufacturer for the existing sensor is not included, see the drawing for generic connections.

Any trademarks used herein regarding sensors not manufactured by Rosemount are owned by the particular manufacturer of the sensor.



D.5 Rosemount sensors

D.5.1 8705/8707/8711/8721 Sensors to 8732 Transmitter

To connect a Rosemount 8705/8707/8711/8721 Sensor to a Rosemount 8732 Transmitter, connect coil drive and electrode cables as shown in Figure D-1.

⚠ CAUTION

Do not connect mains or line power to the magnetic flowtube sensor or to the transmitter coil excitation circuit.

A. Rosemount 8732 transmitter

Table D-1: Rosemount 8705/8707/8711/8721 Sensor Wiring Connections

D.5.2 8705 M and 8711 M/L Sensors to 8732EM Transmitter

To connect a Rosemount 8705 M or 8711 M/L Sensor to a Rosemount 8732EM Transmitter, connect coil drive and electrode cables as shown in Figure D-2.

⚠ CAUTION

Do not connect mains or line power to the magnetic flowtube sensor or to the transmitter coil excitation circuit.

A. Rosemount 8732 transmitter

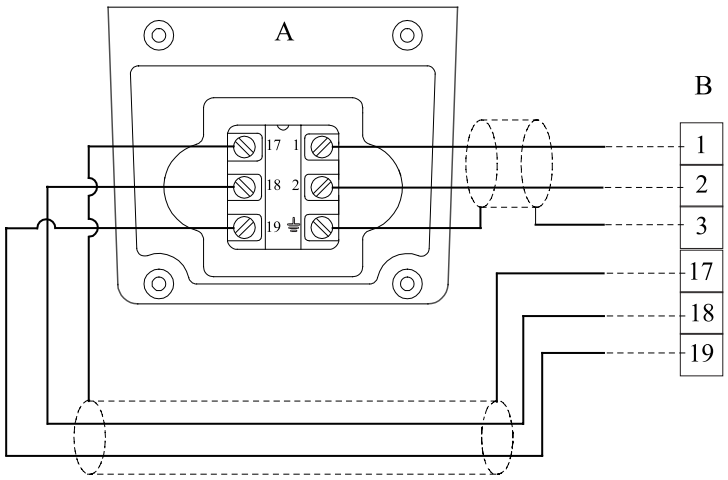
19	19 / +



D.5.3 8701 sensor to 8732 transmitter

To connect a Rosemount 8701 sensor to a Rosemount 8732 Transmitter, connect coil drive and electrode cables as shown in Figure D-3 .

⚠ CAUTION

Do not connect mains or line power to the magnetic flowtube sensor or to the transmitter coil excitation circuit.

D.5.4 Connecting sensors of other manufacturers

Prerequisites

Before connecting another manufacturer's sensor to the transmitter, it is necessary to perform the following functions.

⚠ CAUTION

Do not connect mains or line power to the magnetic flowtube sensor or to the transmitter coil excitation circuit.

Procedure

1. Turn off the AC power to the sensor and transmitter.

   ⚠ CAUTION

   Failure to do so could result in electrical shock or damage to the transmitter.

2. Verify the coil drive cables between the sensor and the transmitter are not connected to any other equipment.
3. Label the coil drive cables and electrode cables for connection to the transmitter.
4. Disconnect the wires from the existing transmitter.
5. Remove the existing transmitter and then mount the new transmitter.

   See Remote Transmitter Installation.

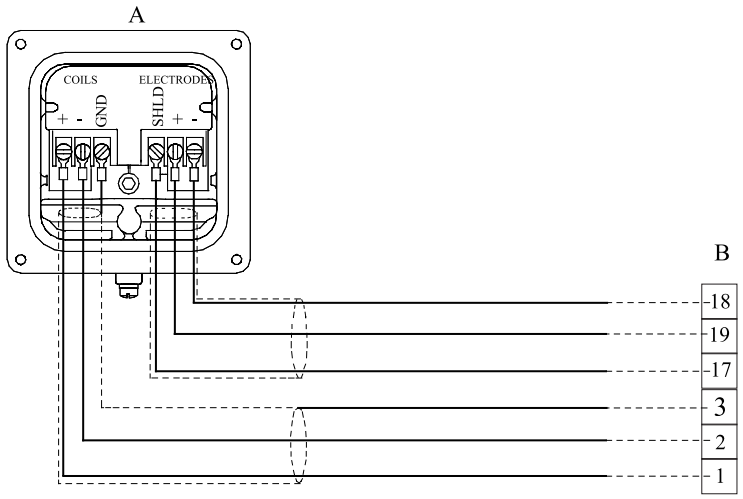
6. Verify the sensor coil is configured for series connection.

   Other manufacturers sensors may be wired in either a series or parallel circuit. All Rosemount magnetic sensors are wired in a series circuit. (Other manufacturers AC sensors (AC coils) wired for 220 V operation are typically wired in parallel and must be rewired in series.)

7. Use the manufacturer's recommended test procedure for verification of sensor condition to verify the sensor is in good working condition. Perform the basic checks:
   a) Check the coils for shorts or open circuits.
   b) Check the sensor liner for wear or damage.
   c) Check the electrodes for shorts, leaks, or damage.
8. Connect the sensor to the transmitter in accordance with reference wiring diagrams.

   See Wiring Diagrams for specific drawings.

9. Connect and verify all connections between the sensor and the transmitter, then apply power to the transmitter.
10. Perform the Universal Auto Trim function.



D.6 Brooks sensors

D.6.1 Model 5000 sensor to 8732 Transmitter

To connect a Model 5000 sensor to a Rosemount 8732 Transmitter, connect coil drive and electrode cables as shown in Figure D-4.

⚠ CAUTION

Do not connect mains or line power to the magnetic flowtube sensor or to the transmitter coil excitation circuit.

A. Brooks Model 5000
B. Rosemount 8732 transmitter

Note
Refer to Figure D-1 for actual terminal block configuration drawing.

Table D-4: Brooks Model 5000 Sensor Wiring Connections

18	ELECTRODES (-)
19	ELECTRODES (+)

D.6.2 Model 7400 sensor to 8732 Transmitter

To connect a Model 7400 sensor to a Rosemount 8732 Transmitter, connect coil drive and electrode cables as shown in Figure D-5.

⚠ CAUTION

Do not connect mains or line power to the magnetic flowtube sensor or to the transmitter coil excitation circuit.

A. Brooks Model 7400
B. Rosemount 8732 transmitter

Note
Refer to Figure D-1 for actual terminal block configuration drawing.

D.7 Endress and Hauser sensors

D.7.1 Endress and Hauser sensor to 8732 Transmitter

To connect an Endress and Hauser sensor to a Rosemount 8732 Transmitter, connect coil drive and electrode cables as shown in Figure D-6.

⚠ CAUTION

Do not connect mains or line power to the magnetic flowtube sensor or to the transmitter coil excitation circuit.

A. Endress and Hauser sensors
B. Rosemount 8732 transmitter
C. Coils
D. Electrodes

Note
Refer to Figure D-1 for actual terminal block configuration drawing.

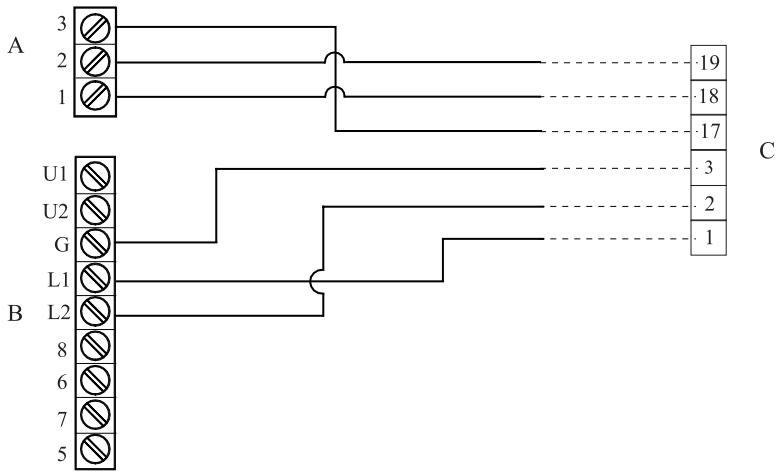
D.8 Fischer and Porter sensors



D.8.1 Model 10D1418 sensor to 8732 Transmitter

To connect a Model 10D1418 sensor to a Rosemount 8732 Transmitter, connect coil drive and electrode cables as shown in Figure D-7.

⚠ CAUTION

Do not connect mains or line power to the magnetic flowtube sensor or to the transmitter coil excitation circuit.

D.8.2 Model 10D1419 sensor to 8732 Transmitter

To connect a Model 10D1419 sensor to a Rosemount 8732 Transmitter, connect coil drive and electrode cables as shown in Figure D-8.

⚠ CAUTION

Do not connect mains or line power to the magnetic flowtube sensor or to the transmitter coil excitation circuit.

Figure D-8: Wiring Diagram for Fischer and Porter Sensor Model 10D1419 and

D.10 Kent Veriflux VTC sensor

D.10.1 Veriflux VTC sensor to 8732 Transmitter

To connect a Veriflux VTC sensor to a Rosemount 8732 Transmitter, connect coil drive and electrode cables as shown in Figure D-17.

⚠ CAUTION

Do not connect mains or line power to the magnetic flowtube sensor or to the transmitter coil excitation circuit.

A. Electrode connections
B. Coil connections

Note
Refer to Figure D-1 for actual terminal block configuration drawing.

D.16 Generic manufacturer sensor to 8732 Transmitter

D.16.1 Identify the terminals

Prerequisites

First check the sensor manufacturer's manual to identify the appropriate terminals. Otherwise, perform the following procedure.

Identify coil and electrode terminals

Procedure

1. Select a terminal and touch an ohmmeter probe to it.
2. Touch the second probe to each of the other terminals and record the results for each terminal.
3. Repeat the process and record the results for every terminal.

Coil terminals will have a resistance of approximately 3-300 ohms.

Electrode terminals will have an open circuit.

Identify a chassis ground

Procedure

1. Touch one probe of an ohmmeter to the sensor chassis.
2. Touch the other probe to the each sensor terminal and the record the results for each terminal.

The chassis ground will have a resistance value of one ohm or less.

D.16.2 Wiring connections

Procedure

⚠ CAUTION

Do not connect mains or line power to the magnetic flowtube sensor or to the transmitter coil excitation circuit.

1. Connect the electrode terminals to Rosemount 8732 terminals 18 and 19. The electrode shield should be connected to terminal 17.
2. Connect the coil terminals to Rosemount 8732 terminals 1, 2, and 3.
3. If the Rosemount 8732 Transmitter indicates a reverse flow condition, switch the coil wires connected to terminals 1 and 2.

- Asia Pacific- 65 777 8211

North American Response Center

Equipment service needs.

- 1-800-654-7768 (24 hours a day — includes Canada)
- Outside of these areas, contact your local Emerson representative.

⚠ WARNING

Failure to follow safe installation and servicing guidelines could result in death or serious injury.

Ensure the transmitter is installed by qualified personnel and in accordance with applicable code of practice.

Use the equipment only as specified in this manual. Failure to do so may impair the protection provided by the equipment.

Do not perform any services other than those contained in this manual unless you are qualified.

⚠ WARNING

Explosions could result in death or serious injury.

Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

Before connecting a handheld communicator in an explosive atmosphere, ensure that the instruments are installed in accordance with intrinsically safe or non-incendive field wiring practices.

Do not remove the gauge cover in explosive atmospheres when the circuit is alive.

To prevent ignition of flammable or combustible atmospheres, disconnect power before servicing.

⚠ WARNING

Process leaks could result in death or serious injury.

Ensure that the transmitter is handled carefully. If the process seal is damaged, gas might escape from the tank if the transmitter head is removed from the probe.

⚠ WARNING

High voltage that may be present on leads could cause electrical shock.

Avoid contact with the leads and terminals.

Ensure the main power to the transmitter is off and the lines to any other external power source are disconnected or not powered while wiring the transmitter.

Probes covered with plastic and/or with plastic discs may generate an ignition-capable level of electrostatic charge under certain extreme conditions. Therefore, when the probe is used in a potentially explosive atmosphere, appropriate measures must be taken to prevent electrostatic discharge.

Eliminate the risk of Electrostatic Discharge (ESD) discharge prior to dismounting the transmitter head. Probes may generate an ignition-capable level of electrostatic charge under extreme conditions. During any type of installation or maintenance in a potentially explosive atmosphere, the responsible person should ensure that any ESD risks are eliminated before attempting to separate the probe from the transmitter head.

⚠ WARNING

Electrical shock could cause death or serious injury.

Use extreme caution when making contact with the leads and terminals.

⚠ WARNING

Any substitution of non-recognized parts may jeopardize safety. Repair (e.g. substitution of components) may also jeopardize safety and is not allowed under any circumstances.

Unauthorized changes to the product are strictly prohibited as they may unintentionally and unpredictably alter performance and jeopardize safety. Unauthorized changes that interfere with the integrity of the welds or flanges, such as making additional perforations, compromise product integrity and safety. Equipment ratings and certifications are no longer valid on any products that have been damaged or modified without the prior written permission of Emerson. Any continued use of product that has been damaged or modified without the written authorization is at the customer's sole risk and expense.

⚠ WARNING

Physical access

Unauthorized personnel may potentially cause significant damage to and/or misconfiguration of end users' equipment. This could be intentional or unintentional and needs to be protected against.

Physical security is an important part of any security program and fundamental in protecting your system. Restrict physical access by unauthorized personnel to protect end users' assets. This is true for all systems used within the facility.

NOTICE

The products described in this document are NOT designed for nuclear-qualified applications. Using non-nuclear qualified products in applications that require nuclear-qualified hardware or products may cause inaccurate readings. For information on Rosemount nuclear-qualified products, contact your local Emerson Sales Representative.

⚠ CAUTION

This product is designed to meet FCC and R&TTE requirements for a non-intentional radiator. It does not require any licensing whatsoever and has no tank restrictions associated with telecommunications issues.

⚠ CAUTION

This device complies with Part 15 of the Federal Communication Commission (FCC) Rules. Operation is subject to the following conditions:

- This device may not cause harmful interference.
- This device must accept any interference received, including interference that may cause undesired operation.

F.3 Common Modbus® host configuration....382
F.4 Specific Modbus® host configuration....387

1 Introduction

1.1 Using this manual

This manual provides installation, configuration, and maintenance information for the Rosemount™ 5300 Level Transmitter.

Transmitter overview contains an introduction to theory of operation and description of the transmitter. Information on applications, process and vessel characteristics, and a probe selection guide are also included.

Mechanical installation contains mounting considerations and mechanical installation instructions.

Electrical installation contains electrical installation instructions.

Configuration provides instructions on configuration of the transmitter using AMS Device Configurator/AMS Device Manager, a handheld communicator, DeltaV™, and Rosemount Radar Master software.

Operation contains operation techniques such as viewing measurement data and display functionality.

Service and troubleshooting provides troubleshooting techniques for the most common operating problems, as well as diagnostic and error messages, and service instructions.

Specifications and reference data supplies reference and specification data, as well as ordering information for spare parts and accessories.

Configuration parameters provides extended information about the configuration parameters.

Advanced configuration provides instructions on how to use the functions Dynamic Vapor Compensation, Signal Quality Metrics, and Probe End Projection.

Remote mounting contains mechanical installation instructions and configuration for remote housing.

FOUNDATION™ Fieldbus Block Information provides information regarding the function blocks.

HART® to Modbus® Converter (HMC) module describes the operation of the HART® to Modbus® Converter (HMC).

1.2 Product certifications

See the Rosemount 5300 Product Certifications document for detailed information on the existing approvals and certifications.

1.3 Product recycling/disposal

Consider recycling equipment and packaging.

Dispose of the product and packaging in accordance with local and national legislation.

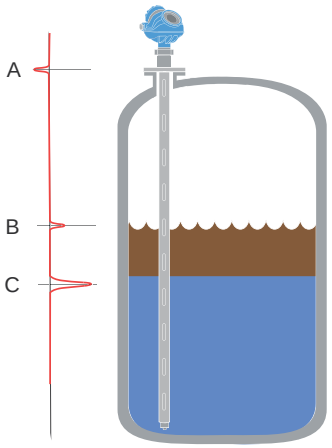
Service support

2 Transmitter overview



2.1 Measurement principle

Low power, nano-second microwave pulses are guided down a probe submerged in the process media. When a microwave pulse reaches a medium with a different dielectric constant, part of the energy is reflected back to the transmitter.

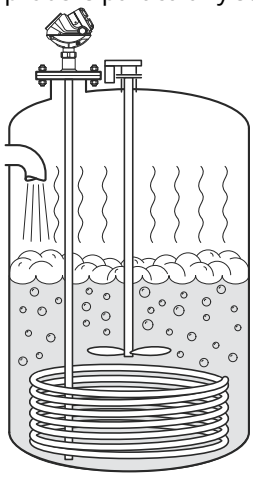
The transmitter uses the residual wave of the first reflection for measuring the interface level. Part of the wave, which was not reflected at the upper product surface, continues until it is reflected at the lower product surface. The speed of this wave depends fully on the dielectric constant of the upper product.

The time difference between the transmitted and the reflected pulse is converted into a distance, and the total level or interface level is then calculated. The reflection intensity depends on the dielectric constant of the product: the higher dielectric constant value, the stronger reflection.

Figure 2-1: Measurement Principle

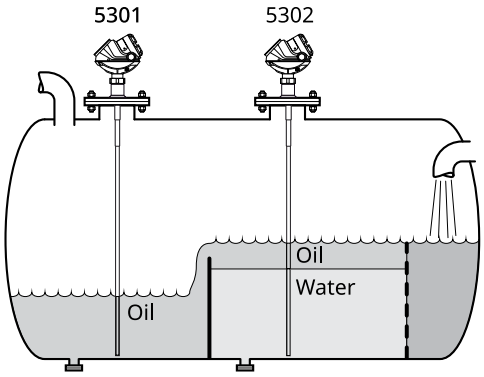
A. Reference pulse
B. Level
C. Interface level

2.2 Application examples



The Rosemount 5300 Level Transmitter is suited for aggregate (total) level measurements on most liquids, semi-liquids, solids, and liquid/liquid interfaces.

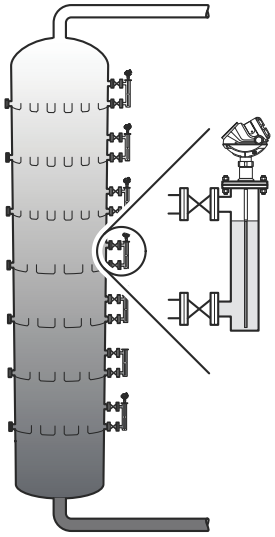
Guided microwave technology offers the highest reliability and precision to ensure measurements are virtually unaffected by temperature, pressure, vapor gas mixtures, density, turbulence, bubbling/boiling, low level, varying dielectric media, pH, and viscosity.



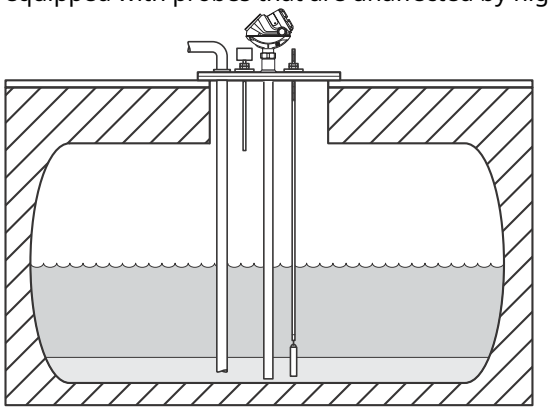
Guided wave radar technology in combination with advanced signal processing makes the Rosemount 5300 Level Transmitters suitable for a wide range of applications:

Boiling conditions with vapor and turbulence

The Rosemount 5300 Level Transmitter works well in boiling conditions with vapor and turbulence. If there are disturbing objects in the vicinity of the transmitter, the coaxial probe is particularly suitable.

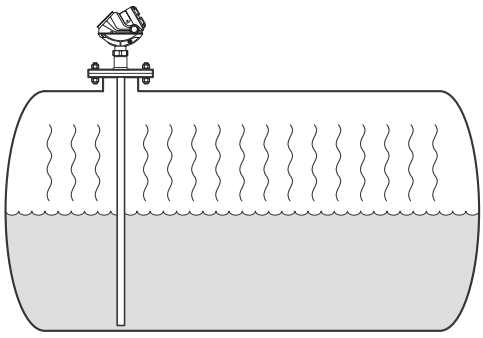


Separators, accumulators, and production tanks



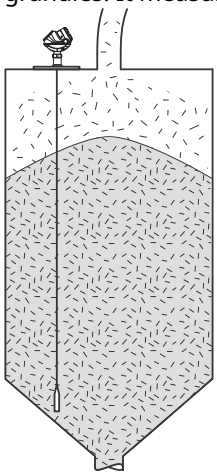
Chamber applications

The Rosemount 5300 Level Transmitter is well suited for chamber applications, such as distillation columns.



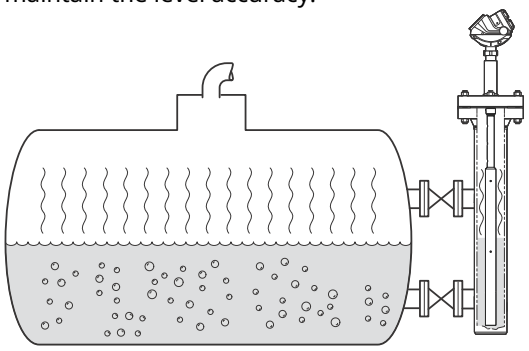
Waste tanks and sump pits

The Rosemount 5300 Level Transmitter is a good choice for underground tanks. It is installed on the top of the tank with the radar pulse concentrated near the probe. It can be equipped with probes that are unaffected by high and narrow openings or nearby objects.



Ammonia, LNG and LPG tanks

Guided wave radar technology provides reliable measurements in ammonia, LNG, and LPG tanks.

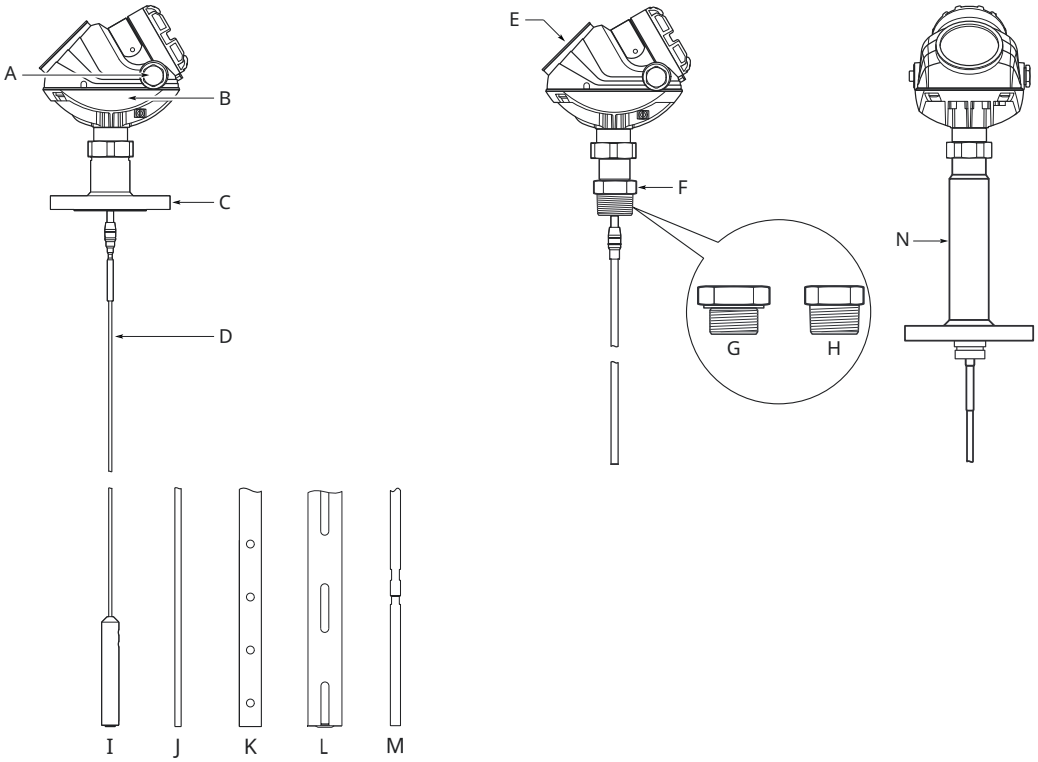


Solids measurement

Rosemount 5303, with a flexible single lead probe, is the solution for solids, powders, and granules. It measures independently of dust, angled surfaces, etc.

High-pressure saturated steam applications

The Rosemount 5300 Level Transmitter with Dynamic Vapor Compensation will automatically compensate for dielectric changes in high pressure steam applications and maintain the level accuracy.



2.3 Components of the transmitter

The Rosemount 5300 Level Transmitter has an aluminum or stainless steel (SST) transmitter housing containing advanced electronics and software for signal processing. SST housing is preferred for harsh environment applications, such as off-shore platforms or other locations where the housing can be exposed to corrodents, such as salt solutions and caustics.

The radar electronics produces an electromagnetic pulse, which is guided by the probe. It comes with flange, threaded or Tri Clamp® process connection.

There are different probe types available for various applications: rigid single lead, segmented rigid single lead, flexible single lead, coaxial, and large coaxial.

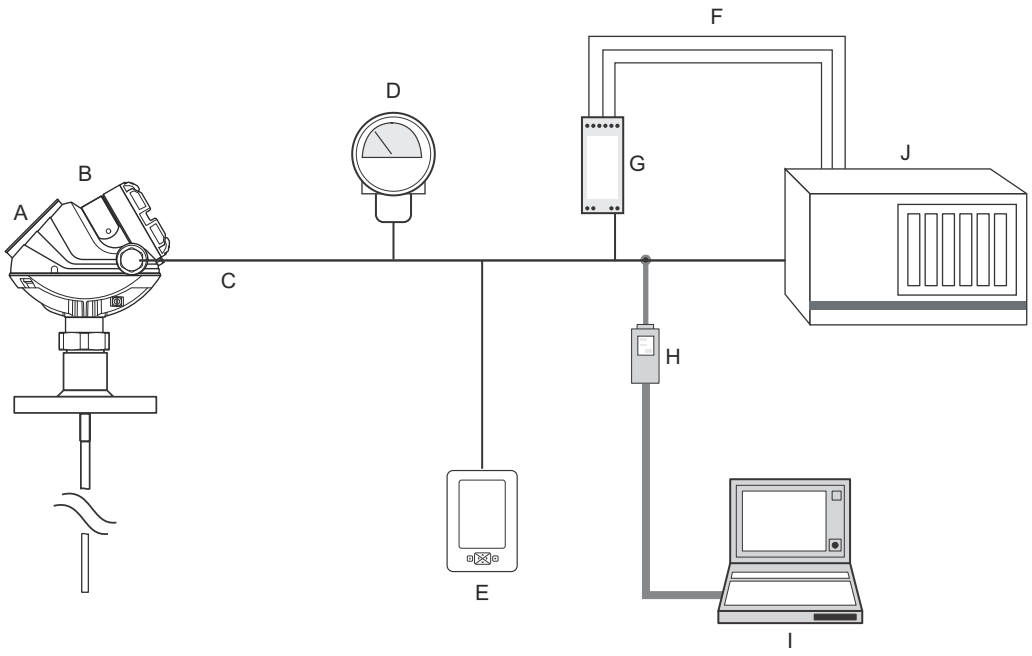
F. M50 nut

2.4 System integration



The Rosemount 5300 Level Transmitter is loop-powered, and it uses the same two wires for both power supply and output signal. The output is a 4-20 mA analog signal superimposed with a digital HART®, FOUNDATION™ Fieldbus, or Modbus® signal.

By using the optional Rosemount 333 HART Tri-Loop™, the digital HART signal can be converted into three additional 4-20 mA analog signals. With the HART protocol, multidrop configuration is possible. In this case, communication is restricted to digital, since current is fixed to the 4 mA minimum value.

The transmitter can be combined with the Emerson Wireless 775 THUM™ Adapter to wirelessly communicate HART data with IEC 62591 (*Wireless*HART®) technology.

In addition, the transmitter can be connected to a Rosemount 751 Field Signal Indicator for 4-20 mA / HART, a Rosemount 752 Remote Indicator for FOUNDATION Fieldbus, or it can be equipped with an integral display.

2.5 Probe selection guide

The following guidelines should be used to choose the appropriate probe for the Rosemount 5300 Level Transmitter:

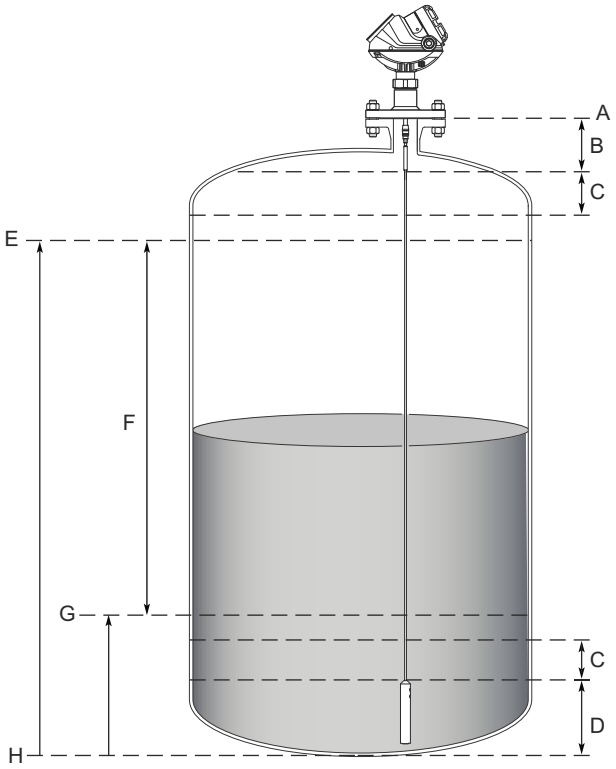
Table 2-1: Probe Selection Guide

G=Good, NR=Not Recommended, AD=Application Dependent (consult factory)

	Rigid single lead, segmented rigid single lead	Flexible single lead	Coaxial	Large coaxial
Measurements				
Level	G	G	G	G
Interface (liquid/liquid)	G	G	G	G
Process medium characteristics				
Changing density	G	G	G	G
Changing dielectric[1]	G	G	G	G
Wide pH variations	G	G	G	G
Pressure changes	G	G	G	G
Temperature changes	G	G	G	G
Condensing vapors	G	G	G	G
Bubbling/boiling surfaces	G	AD	G	G

Table 2-1: Probe Selection Guide *(continued)*

	Rigid single lead, segmented rigid single lead	Flexible single lead	Coaxial	Large coaxial
Foam (mechanical avoidance)	NR	NR	AD	AD
Foam (top of foam measurement)	AD	AD	NR	AD
Foam (foam and liquid measurement)	AD	AD	NR	AD
Clean liquids	G	G	G	G
Liquid with very low dielectric constants	G	G(2)	G	G
Coating/sticky liquids	AD(3)	AD	NR	AD
Viscous liquids	AD(3)	G	NR	AD
Crystallizing liquids	AD	AD	NR	AD
Solids, granules, powders	AD	G	NR	NR
Fibrous liquids	G	G	NR	AD
Tank environment considerations				
Probe is close (<12 in./30 cm) to tank wall / disturbing objects	AD	AD	G	G
Probe might touch tank wall, nozzle or disturbing objects	NR	NR	G	G
Turbulence	G	AD	G	G
Turbulent conditions causing breaking forces	NR	AD	NR	AD
Tall, narrow nozzles	AD	AD	G	G
Angled or slanted surface (viscous or solids materials)	G	G	NR	AD
Liquid or vapor spray might touch probe above surface	NR	NR	G	G
Disturbing Electromagnetic interference in tank	AD	AD	G	G
Cleanability of probe	G	G	NR	AD



(1) For overall level applications, a changing dielectric has no effect on the measurement. For interface measurements, a changing dielectric for the top fluid will degrade the accuracy of the interface measurement.
(2) Limited measuring range.
(3) For viscous or sticky applications, it is not recommended to use centering discs mounted along the probe.

2.6 Measuring range

The measuring range depends on probe type, dielectric constant of the product, and installation environment, and is limited by the Blind Zones at the very top and bottom of the probe. In the Blind Zones, the accuracy exceeds ±1.18 in. (30 mm), and measurements may not be possible. Measurements close to the Blind Zones will have reduced accuracy.

Figure 2-7 illustrates how the measuring range is related to the Blind Zones and the areas with reduced accuracy.

Figure 2-7: Blind Zones and Areas with Reduced Accuracy

A. Upper Reference Point
B. Upper Blind Zone
C. Reduced accuracy
D. Lower Blind Zone
E. 20mA
F. Range 0 -100 %
G. 4mA
H. Zero Reference Point

Note
Measurements may not be possible in the Blind Zones, and measurements close to the Blind Zones will have reduced accuracy. Therefore, the 4-20 mA points should be configured outside these zones.

Related information

Accuracy over measuring range

2.7 Process characteristics

The Rosemount 5300 Level Transmitter has high sensitivity because of its advanced signal processing and high signal-to-noise ratio. This makes it able to handle various disturbances, however, the following circumstances should be considered before mounting the transmitter.

2.7.1 Contamination/product build-up

Heavy contamination or product build-up on the probe should be avoided since it may decrease the sensitivity of the transmitter and lead to measurement errors.

For viscous or sticky applications, it is important to choose a suitable probe. Periodic cleaning may also be required.

Maximum measurement error due to contamination is 1-10 percent depending on probe type, dielectric constant, contamination thickness and contamination height above product surface.

Signal Quality Metrics (SQM) diagnostic option can give an indication of how good the surface signal is compared to the noise, and when to clean the probe.

Related information

Contamination/product build-up

2.7.2 Bridging

Heavy product build-up results in bridging between the pipe and inner rod for coaxial probes, and may cause erroneous level readings, so it must be prevented. A single lead probe is recommended in these situations.

2.7.3 Foam

The Rosemount 5300 Level Transmitter measurement in foamy applications depends on the foam properties; light and airy or dense and heavy, high or low dielectrics, etc. If the foam is conductive and creamy, the transmitter may measure the surface of the foam. If the foam is less conductive, the microwaves may penetrate the foam and measure the liquid surface.

2.7.4 Vapor

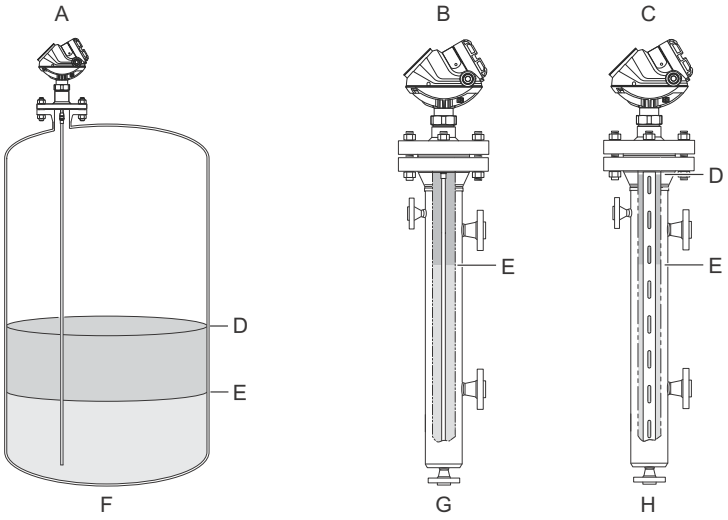
In some applications, such as high pressure boiling water, there is a heavy vapor above the product surface that could influence the level measurement. The Rosemount 5300 Level Transmitter can be configured to compensate for the influence of vapor.

2.7.5 Boiling hydrocarbons

For products with very low dielectric constants, such as boiling hydrocarbons and solids, the threshold may need to be lowered, and/or the Probe End Projection (PEP) function activated.

Related information

Probe end projection



2.7.6 Interface measurements

The Rosemount 5302 is a good choice for measuring the interface of oil and water, or other liquids with significant dielectric differences.

It is also possible to measure interface with a Rosemount 5301 in applications where the probe is fully submerged in the liquid, using the submerged probe mode.

Rosemount 5302 with the large coaxial probe provides the ability to continuously keep track of both level and interface level in fully submerged applications. The product level and interface level mode must be selected.

H. Product level and interface level with submerged probe

2.8 Vessel characteristics

2.8.1 Heating coils, agitators

Because the radar signal is transmitted along a probe, the transmitter is generally not affected by objects in the tank. Avoid physical contact with metallic objects when single lead probes are used.

Avoid physical contact between probes and agitators, as well as applications with strong fluid movement, unless the probe is anchored. If the probe is able to move 1 ft. (30 cm) from any object, such as an agitator, during operation, the probe tie-down is recommended.

To stabilize the probe for side forces, a weight may be hung at the probe end (flexible probes only) or fix/guide the probe to the tank bottom.

2.8.2 Tank shape

The guided wave radar transmitter is insensitive to the tank shape. Since the radar signal travels along a probe, the shape of the tank bottom has no effect on the measurement performance. The transmitter handles flat or dish-bottom tanks equally well.

3 Mechanical installation

3.1 Safety messages

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that potentially raises ⚠). Refer to the following safety messages before performing an operation preceded by this symbol.

⚠ WARNING

Failure to follow safe installation and servicing guidelines could result in death or serious injury.

Ensure the transmitter is installed by qualified personnel and in accordance with applicable code of practice.

Use the equipment only as specified in this manual. Failure to do so may impair the protection provided by the equipment.

Do not perform any services other than those contained in this manual unless you are qualified.

⚠ WARNING

Process leaks could result in death or serious injury.

Ensure that the transmitter is handled carefully. If the process seal is damaged, gas might escape from the tank if the transmitter head is removed from the probe.

⚠ WARNING

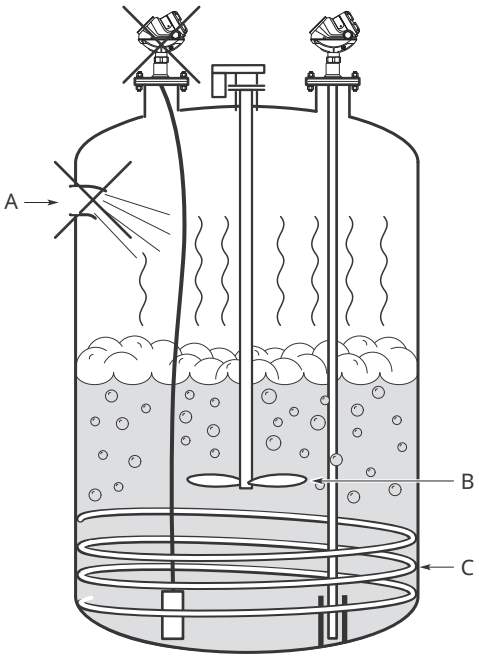
High voltage that may be present on leads could cause electrical shock.

Probes covered with plastic and/or with plastic discs may generate an ignition-capable level of electrostatic charge under certain extreme conditions. Therefore, when the probe is used in a potentially explosive atmosphere, appropriate measures must be taken to prevent electrostatic discharge.

Eliminate the risk of Electrostatic Discharge (ESD) discharge prior to dismounting the transmitter head. Probes may generate an ignition-capable level of electrostatic charge under extreme conditions. During any type of installation or maintenance in a potentially explosive atmosphere, the responsible person should ensure that any ESD risks are eliminated before attempting to separate the probe from the transmitter head.

⚠ WARNING

Any substitution of non-authorized parts or repair, other than exchanging the complete transmitter head or probe assembly, may jeopardize safety and is prohibited.



Unauthorized changes to the product are strictly prohibited as they may unintentionally and unpredictably alter performance and jeopardize safety. Unauthorized changes that interfere with the integrity of the welds or flanges, such as making additional perforations, compromise product integrity and safety. Equipment ratings and certifications are no longer valid on any products that have been damaged or modified without the prior written permission of Emerson. Any continued use of product that has been damaged or modified without the written authorization is at the customer's sole risk and expense.

3.2 Installation and mounting considerations

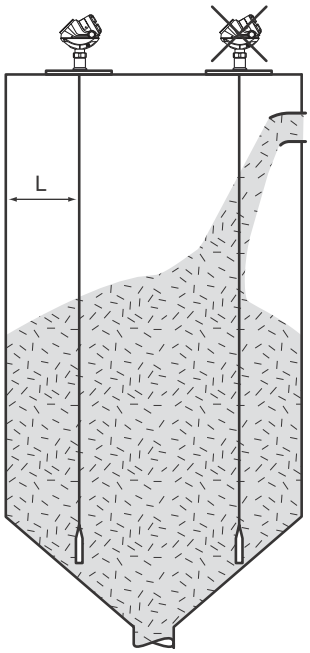
3.2.1 Recommended mounting position for liquids

When finding an appropriate mounting position for the transmitter, the conditions of the tank must be carefully considered. The transmitter should be mounted so that the influence of disturbing objects is reduced to a minimum. For easy access to the transmitter, ensure that it is mounted with sufficient service space.

Figure 3-1: Mounting Position

A. Inlet pipe
B. Agitator
C. Heating coils

The following guidelines should be considered when mounting the transmitter:



- Do not mount close to inlet pipes.

- Do not mount close to agitators. If the probe can move to within 12 in. (30 cm) away from an agitator, the probe should be anchored.
- If the probe tends to sway due to turbulent conditions in the tank, the probe should be anchored.
- Avoid mounting close to heating coils.
- Position the probe such that it is subject to a minimum of lateral force.
- The probe should not come into contact with the nozzle or other objects in the tank.

Note
Violent fluid movements causing high sideway forces may break rigid probes.

3.2.2 Recommended mounting for solids

Figure 3-2: Recommended Mounting for Solids

Consider the following guidelines when mounting the transmitter:

- Do not mount near inlet pipes in order to avoid product filling on the probe.
- Regularly check the probe for defects.
- It is recommended that the vessel be empty during installation.
- For concrete vessels, the distance (L) between the probe and the wall should be at least 20 in. (500 mm).
- Stabilize the probe for side forces, by attaching the probe to the tank bottom. For solids, use the 0.24 in. (6 mm) probe, because of the higher tensile strength. The probe should have a sag of ≥ 1 in./100 in. (10 mm/m) to prevent probe damage. See Anchor the probe for more information.
- Avoid anchoring in solids tanks over 98 ft. (30 m) in height since tensile loads are much stronger for anchored probes, see Considerations for solid applications.

- Product build-up on the silo walls near the probe may interfere with measurements. Choose a mounting position where the probe is not in contact with, or close to, the product build-up.

3.2.3 Considerations for solid applications

The flexible single lead probe is recommended for solids and is available in two versions to handle different loads and lengths:

Table 3-1: Tensile Strength and Collapse Load

Probe type	Tensile strength	Collapse load
0.16-in. (4 mm) diameter	Minimum 2698 lb (12 kN)	Maximum 3597 lb (16 kN)
0.24-in. (6 mm) diameter	Minimum 6519 lb (29 kN)	Maximum 7868 lb (35 kN)

Keep the following in mind when planning installation of the Rosemount 5300 in solid applications:

- There might be considerable down-pull forces on silo roofs caused by the media, so the silo roof must withstand the maximum probe tensile load.
- The tensile load depends on silo size, material density, and the friction coefficient. Forces increase with the buried length, the silo, and probe diameter.
- In critical cases, such as for products with a risk for build-up, use a 0.24 in. (6 mm) probe.
- Depending on position, forces on probes are two to ten times greater on probes with tie-down, than on probes with ballast weights(1).
- PTFE coated probes are not recommended for solid applications.

Guidelines for the tensile load from free-flowing solids acting on a suspended probe without any tie-down or weight in a smooth metallic wall silo as shown in Table 3-2 and Table 3-3. A safety factor of 2 is included for the figures. Consult your local Emerson representative for more information.

Table 3-2: Tensile Load for Unanchored 0.16 in. (4 mm) Flexible Single Lead Probe, lb (kN)

Material	Probe length 49 ft. (15 m)		Probe length 115 ft. (35 m)	
	Tank Ø= 10 ft. (3 m)	Tank Ø= 39 ft. (12 m)	Tank Ø= 10 ft. (3 m)	Tank Ø= 39 ft. (12 m)
Wheat	670 (3)	1120 (5)	1800 (8)	4500 (20) (1)
Polypropylene pellets	340 (1.5)	670 (3)	810 (3.6)	2360 (10.5)
Cement	900 (4)	2020 (9)	2470 (11)	7310 (32.5)(1)

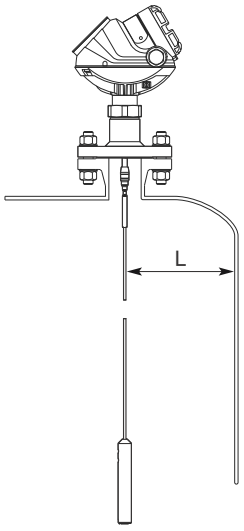
(1) Exceeds tensile strength limit.

(1) The weight should not be fixed for probe 100 ft. (30 m) or longer.

Table 3-3: Tensile Load for Unanchored 0.24 in. (6 mm) Flexible Single Lead Probe, lb (kN)

Material	Probe length 49 ft. (15 m)		Probe length 115 ft. (35 m)	
	Tank Ø= 10 ft. (3 m)	Tank Ø= 39 ft. (12 m)	Tank Ø= 10 ft. (3 m)	Tank Ø= 39 ft. (12 m)
Wheat	900 (4)	1690 (7.5)	2810 (12.5)	6740 (30)(1)
Polypropylene pellets	450 (2)	920(4.1)	1190 (5.3)	3510 (15.6)
Cement	1350 (6)	2920 (13)	3600 (16)	10790 (48)(1)

(1) Exceeds tensile strength limit.



Note
For environments where electrostatic discharges are likely to occur, such as plastic pellets, it is recommended that the probe end is grounded.

3.2.4 Free space requirement

For easy access to the transmitter, ensure it is mounted with sufficient service space. For maximum measurement performance, the transmitter should not be mounted close to the tank wall or near other objects in the tank.

If the probe is mounted close to a wall, nozzle or other tank obstruction, noise might appear in the level signal. Therefore the following minimum clearance, according to Table 3-4, must be maintained.

Figure 3-3: Free Space Requirement

L. Clearance to tank wall

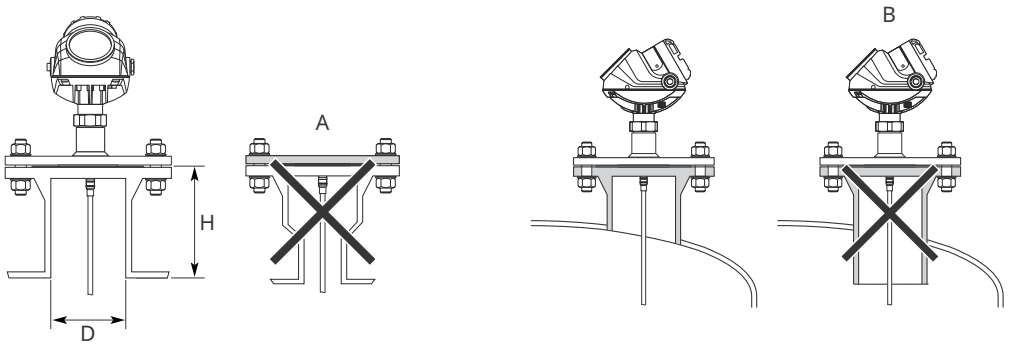


Table 3-4: Recommended Minimum Free Space for Optimal Performance

Probe type	Condition	Minimum clearance (L)
Rigid single lead/Segmented rigid single lead(1)	Smooth metal tank wall	4 in. (100 mm)
	Disturbing objects such as pipes and beams Plastic, concrete or rugged metal tank wall	16 in. (400 mm) 20 in. (500 mm)(2)
Flexible single	Smooth metal tank wall	4 in. (100 mm)
	Disturbing objects such as pipes and beams Plastic, concrete or rugged metal tank wall	20 in. (500 mm)
Coaxial/Large coaxial(1)	N/A	0 in. (0 mm)

(1) Minimum clearance from tank bottom for the coaxial, large coaxial and rigid single probes is 0.2 in. (5 mm).
(2) Applies to measurements with DC 1.4 or lower.

3.2.5 Flange connection on nozzles

Figure 3-4: Mounting in Nozzles

A. Avoid nozzles with reducer (unless using coaxial probe).
B. Confirm the nozzle does not extend into the tank.

The transmitter can be mounted in nozzles by using an appropriate flange. It is recommended that the nozzle size is within the dimensions given in Table 3-5.

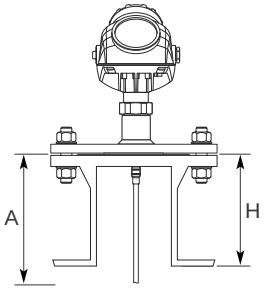
Table 3-5: Nozzle Considerations for Optimal Performance

	Single (rigid/segmented/flexible)	Coaxial/Large coaxial
Recommended nozzle diameter (D)	6 in. (150 mm)	> probe diameter
Minimum nozzle diameter (D)(1)	2 in. (50 mm)	> probe diameter
Recommended nozzle height (H)(2)	4 in. (100 mm) + nozzle diameter(3)	N/A

(1) The Trim Near Zone (TNZ) function may be necessary or an Hold Off Distance/Upper Null Zone (UNZ) setup may be required to mask the nozzle.
(2) Longer nozzles may be used in certain applications. Consult your local Emerson representative for details.
(3) For nozzles taller than 4 in. (100 mm), the long stud version is recommended (option code LS) to prevent the flexible portion from touching the edge of the nozzle.

Note
The probe must not be in contact with the nozzle (except for the coaxial probe). If the nozzle diameter is less than recommended, the measuring range may be reduced.

Note
For single lead probes, avoid 10-in. (250 mm)/DN250 or larger diameter nozzles, especially in applications with low dielectric constant. An alternative is to install a smaller nozzle inside the nozzle.



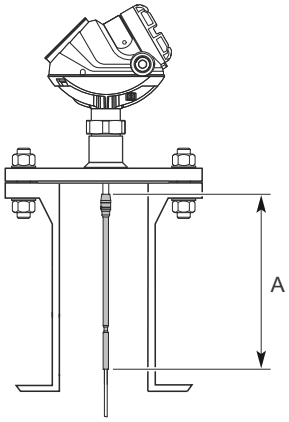
Related information

Change the hold off distance/upper null zone
Trim near zone function

Narrow nozzles

For narrow nozzles, it may be necessary to increase the Hold Off Distance/UNZ to reduce the measuring range in the upper part of the tank. Amplitude Threshold adjustments may also be needed in this case. A Trim Near Zone is recommended in most nozzle installations, for example, when there are disturbing obstacles in the near zone.

Figure 3-5: Hold Off Distance/UNZ for Narrow Nozzles



A. Hold Off Distance/UNZ

Long stud

A long stud is recommended for single flexible probes in a tall nozzle.

Figure 3-6: A Single Flexible Probe with a Long Stud

A. Long Stud (9.8 in./250 mm)

3.2.6 Installation in still pipe/chamber

General chamber considerations

Dimensioning the chamber/pipe correctly and selecting the appropriate probe is key to the success in these applications. When selecting a smaller chamber/pipe diameter, such as 2-in., a flexible probe is not suitable due to the chance of it coming into contact with the walls. Also, relatively large side inlets may interfere with the signal.

When gas lift and/or turbulence may occur (e.g. boiling hydrocarbons), a 3- or 4-in. chamber/pipe diameter is recommended for maximum measurement reliability. This is especially true in high pressure and high temperature installations.

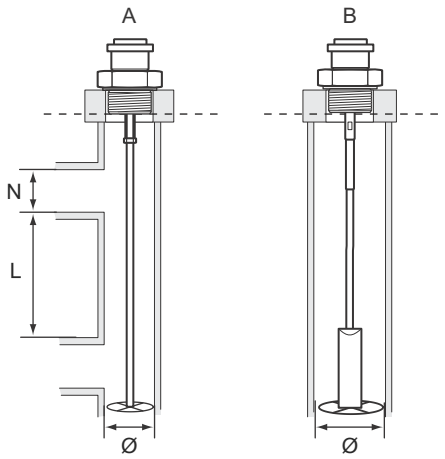


Table 3-6: Recommended and Minimum Chamber/Still Pipe Diameters for Different Probes

Probe type	Recommended diameter	Minimum diameter
Rigid single/segmented rigid single	3 or 4 in. (75 or 100 mm)	2 in. (50 mm)
Flexible single	4 in. (100 mm)	Consult your local Emerson representative
Coaxial	3 or 4 in. (75 or 100 mm)	1.5 in. (37.5 mm)
Large coaxial	3 or 4 in. (75 or 100 mm)	2 in. (50 mm)(1)

(1) Applicable to pipe schedule up to 40s,40. For higher pipe schedule consult your local Emerson representative.

Note
Metal pipes are preferred, especially in applications with low dielectric constant, to avoid disturbances from objects near the pipe.

Figure 3-7: Mounting Single Probe in Chamber/Still Pipe

A. Rigid single/segmented rigid single
B. Flexible single

Inlet pipe diameter N < Ø

Effective measuring range L ≥12 in. (300 mm).

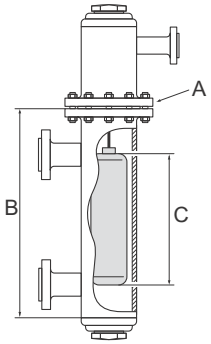
Best Practices for Using Radar in Still Pipes and Chambers Technical Note
Dimensional drawings

Rosemount chamber



A Rosemount chamber allows external mounting of process level instrumentation. It supports a variety of process connections, and optional drain and vent connections. The standard Rosemount chambers are designed according to ASME B31.3. Rosemount chambers compliant with the Pressure Equipment Directive (PED) are available. Customer specific engineered solutions for Rosemount chambers are available upon request. Use option code XC to order together with the Rosemount 5300 Series Transmitters.

Use a centering disc the same diameter as the chamber if the probe length >3.3 ft. (1 m). See Table 3-9 for which disc to use.

Existing chamber

A Rosemount 5300 Level Transmitter is the perfect replacement in an existing displacer chamber. Proprietary flanges are offered, enabling use of existing chambers to make installation easy.

Figure 3-8: Existing Displacer Chamber

A. Replace chamber flange
B. Probe length
C. Displacer length

Considerations when changing to Rosemount 5300:

- The Rosemount 5300 Level Transmitter flange choice and probe length must be correctly matched to the chamber. Both standard ASME and EN (DIN), as well as proprietary chamber flanges, are available. See Proprietary flanges to identify the proprietary flanges.
- See Table 3-9 for guidelines on which disc size to use.
- See Table 3-7 for guidelines on the required probe length.

Table 3-7: Required Probe Length in Chambers

Chamber manufacturer	Probe length[1]
Major torque-tube manufacture (249B, 249C, 249K, 249N, 259B)	Displacer + 9 in. (229 mm)
Masoneilan™ (torque tube operated), proprietary flange	Displacer + 8 in. (203 mm)
Other - torque tube[2]	Displacer + 8 in. (203 mm)
Magnetrol® (spring operated)[3]	Displacer + between 7.8 in. (195 mm) to 15 in. (383 mm)
Others - spring operated[2]	Displacer + 19.7 in. (500 mm)

(1) If flushing ring is used, add the ring height to the probe length.
(2) For other manufacturers, there are small variations. This is an approximate value; actual length should be verified.
(3) Lengths vary depending on model, SG, and rating, and should be verified.

For additional information, see the Replacing Displacers with Guided Wave Radar Technical Note.

Probe type in chamber considerations

When installing a Rosemount 5300 in a chamber, a large coaxial or a single lead probe is recommended. The large coaxial probe should always be considered first whenever the application and dimensions of the chamber allow for it.

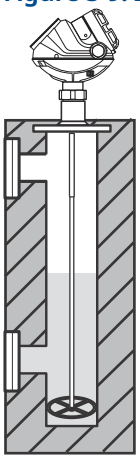
Large coaxial probes are the preferred choice for installation in chambers with limited space above and below the process connections. This type of probe has the best interface resolution and outstanding performance with low dielectric fluids. It is also unaffected by external disturbances such as protruding welds and side taps.

Single rigid probes are suitable for chamber installations. When used in a metal, small diameter pipe, single rigid probes offer a stronger return signal than when used in open applications. This makes them suitable for low dielectric and interface applications. In addition, for applications with highly viscous media where build up is likely to occur, single rigid probes is the best choice.

Single flexible probes may be used in longer bypass chambers, but care must be taken to ensure that the probe is suspended in a true vertical position and does not touch the pipe wall. If flexible probes are to be used, the bypass chambers should be 4 in. (100 mm) or larger in diameter to allow room for some flexing.

The probe must not touch the chamber wall, should extend the full height of the chamber, but not touch the bottom of the chamber. The probe length determines if a single rigid or single flexible probe should be used:

- Less than 19.7 ft. (6.0 m): Rigid single probe is recommended. Use a centering disc for probe > 3.3 ft. (1 m). When mounting space is limited, use a flexible single probe with a weight and centering disc.
- More than 19.7 ft. (6.0 m): Use flexible single probe with a weight and centering disc.[2]



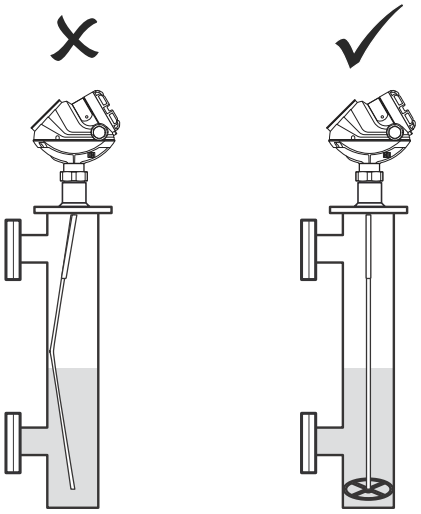
(2) The Blind Zones and the height of the weight limit the use of single flexible probes shorter than 3 ft. (1 m). If using the flexible probe, the short weight is recommended.

Insulation of the chamber

For hot applications, the chamber should always be insulated to prevent personal injuries and to reduce the amount of energy needed for heating. See Figure 3-9. It is often an advantage, and sometimes even required, for the radar measurement:

- In hot applications, insulation reduces the amount of condensation, since it prevents the upper part of the chamber from becoming a cold spot.
- Insulation prevents product solidification inside the chamber, and clogging of the inlet-pipes.

Figure 3-9: Insulated Chamber



See Insulated tanks for more information.

Centering disc for pipe installations

To prevent the probe from contacting the chamber or pipe wall, centering discs are available for flexible single and rigid single probes. The disc is attached to the end of the probe. Discs are made of stainless steel, Alloy C-276, Alloy 400, Alloy 825, Duplex 2205, or PTFE. The centering disc in PTFE is not available for HTHP probes.

Figure 3-10: Prevent the Probe from Contacting the Wall

For the segmented rigid single lead probe, up to five PTFE centering discs can be mounted along the probe, but keep a minimum distance of two segments between the discs. Additionally, a disc in SST or PTFE (part number 03300-1655-xxxx) can be attached to the end of the probe.

When mounting a centering disc, it is important that it fits correctly in the chamber/pipe. See Figure 3-11 for Dimension D. Table 3-9 shows which centering disc diameter to choose for a particular pipe. Table 3-10 shows which centering disc diameter to choose for a Rosemount chamber.

Figure 3-11: Dimension D for Centering Discs

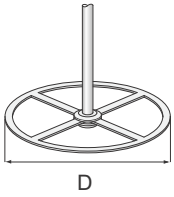


Table 3-8: Centering Disc Dimensions

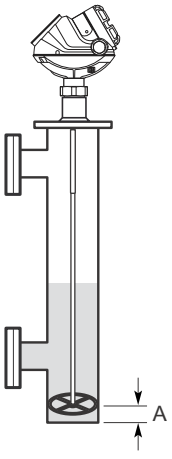
Disc size	Actual disc diameter (D)
2-in.	1.8 in. (45 mm)
3-in.	2.7 in. (68 mm)
4-in.	3.6 in. (92 mm)
6-in.	5.55 in. (141 mm)
8-in.	7.40 in. (188 mm)

Table 3-9: Centering Disc Size Recommendation for Different Pipe Schedules

Pipe size	Pipe schedule			
	5s, 5 and 10s,10	40s, 40 and 80s, 80	120	160
2-in.	2-in.	2-in.	N/A(1)	N/A(2)
3-in.	3-in.	3-in.	N/A(1)	2-in.
4-in.	4-in.	4-in.	3-in.	3-in.
5-in.	4-in.	4-in.	4-in.	4-in.
6-in.	6-in.	6-in.	4-in.	4-in.
7-in.	N/A(1)	6-in.	N/A(1)	N/A(1)
8-in.	8-in.	8-in.	6-in.	6-in.



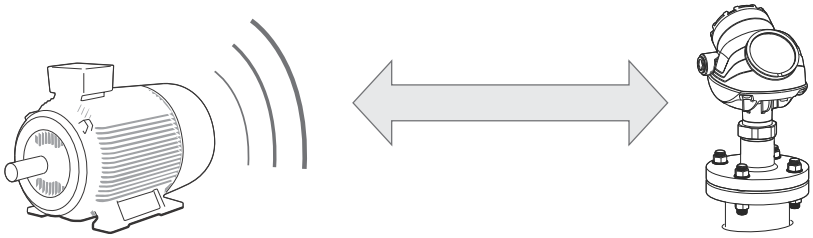
(1) Schedule is not available for pipe size.
(2) No centering disc is available.

Table 3-10: Centering Disc Size Recommendations for Rosemount Chambers

Chamber size	Chamber rating	Centering disc
3-in.	Up to Class 600/PN 100	3-in.
	Class 900, 1500/PN160, 250	2-in.
3-in. T-piece	Up to Class 600/PN 100	2-in.
4-in.	Up to Class 600/PN 100	4-in.
	Class 900, 1500/PN160, 250	3-in.

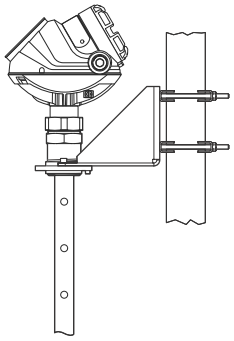
To avoid bending the probe (rigid probes), or twisting and coming into contact with the chamber wall (flexible probes), a small clearance distance between centering disc and chamber bottom is recommended. The clearance distance of 1 in. (25 mm) is selected with a dome shaped chamber bottom in mind, which may prevent the centering disc from reaching the bottom.

Figure 3-12: Clearance Distance between the Probe End and the Chamber Bottom



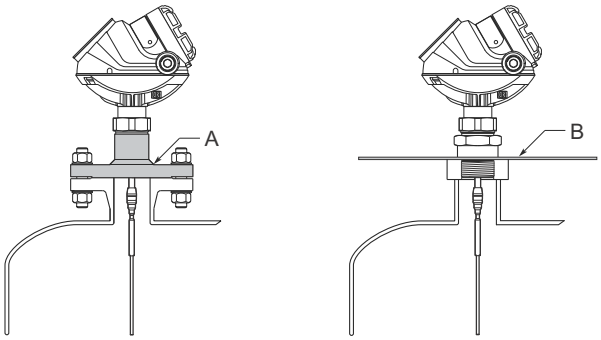
A. A clearance distance of 1 in. (25 mm) between the probe end and the chamber bottom is recommended.

3.2.7 Installation in non-metallic tanks and open-air applications



Avoid major sources of electrical disturbance in proximity of the installation (e.g. electrical motors, stirrers, servo mechanisms).

Figure 3-13: Avoid Electromagnetic Disturbances



For clean liquids, use a coaxial probe to reduce effect of potential electrical disturbances.

Figure 3-14: Coaxial Probe in an Open-Air Application

For optimal single lead probe performance in non-metallic tanks, the probe must be mounted with a metal flange, or screwed in to a metal sheet (d > 14 in./350 mm) if a threaded version is used.

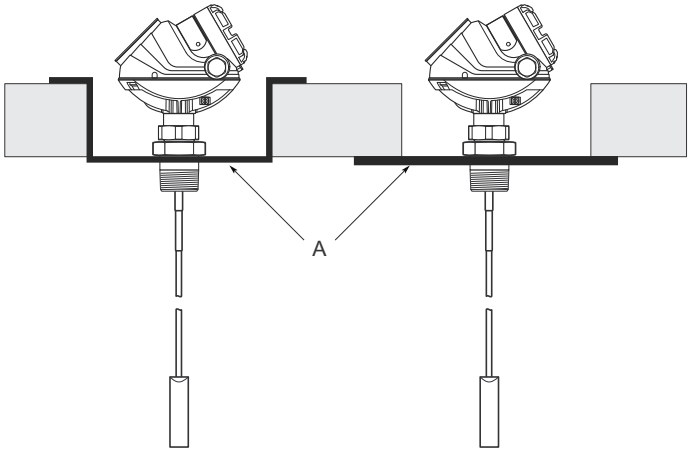


Figure 3-15: Mounting in Non-Metallic Tanks

A. Metal flange
B. Metal sheet (d > 14 in./350 mm)

3.2.8 Installation in concrete silos

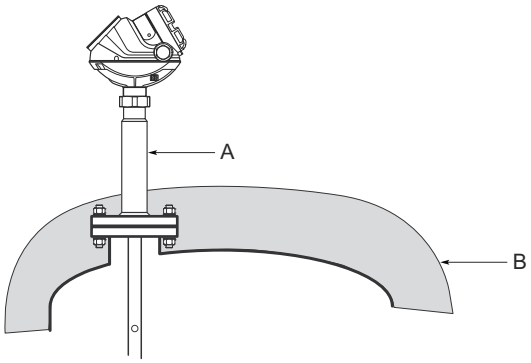
Figure 3-16: Installation in Concrete Silos

A. Metal

3.2.9 Minimum distance between two single probes

When installing multiple Rosemount 5300 Level Transmitters with single probes in the same tank, ensure to place the devices at proper distance from each other to avoid the risk of interference caused by cross-talk. Table 3-11 provides recommended minimum distance between two probes. A coaxial probe or a probe installed in a still pipe will not cause any cross-talk.

Table 3-11: Minimum Distance between Single Probes



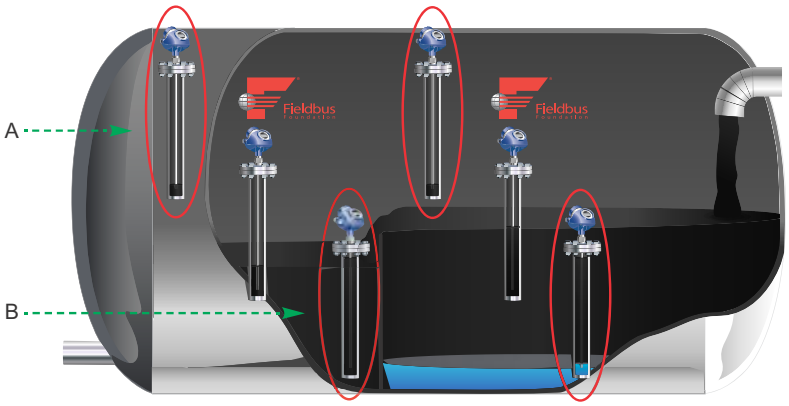
Product	Minimum distance between probes
Oil (DC = 2.1)	5.2 ft. (1.6 m)
Water (DC = 80)	3.3 ft. (1.0 m)

3.2.10 Insulated tanks

When the Rosemount 5300 is installed in high temperature applications, consider the maximum ambient temperature. See Temperature limits for details.

Tank insulation should not exceed 4 in. (100 mm) above the top of the process connection.

Figure 3-17: Tank Insulation



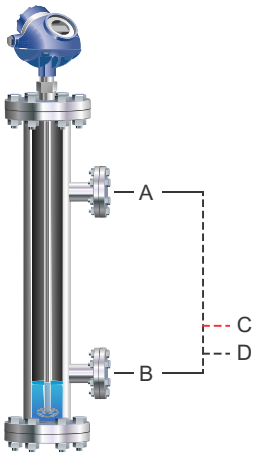
A. HTHP version
B. Tank insulation

3.2.11 Installation and configuration considerations for ESD systems

Figure 3-18 shows a common example of an Emergency Shutdown (ESD) system in a separator. High-high and low-low transmitters act as redundant safeguards. They will trigger emergency shutdowns or redirect flow of the application. In addition, there are one or several process control units that continuously measure and report the actual level in the tank to the host system and operators.

The high-high unit will always be empty during normal operation, and will indicate empty in the host system. The low-low unit will always be full during normal operation, and will indicate full in the host system as well.

Figure 3-18: ESD System in a Separator

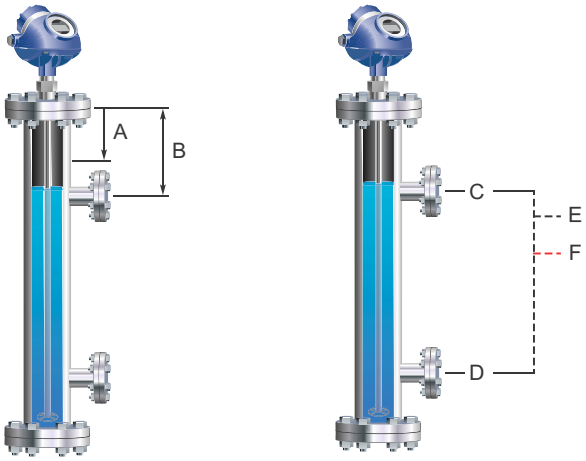


A. High-high unit
B. Low-low unit

High-high unit

The alarm levels must be located near the bottom inlet with considerable margin to the Blind Zones to ensure robust and accurate readings. See Set alarm limits for further information.

Figure 3-19: High-High Unit



A. 20 mA
B. 4 mA
C. Shutdown
D. Warning

Low-low unit

The distance from flange to upper inlet must be at least 20 in. (500 mm). If this requirement is not met, a spool piece can be added. When the requirement of 20 in. (500 mm) is met, an Upper Null Zone (UNZ) of 14 in. (350 mm) must be configured, so that any disturbance in the near zone above the upper inlet is ignored.

Figure 3-20: Low-Low Unit

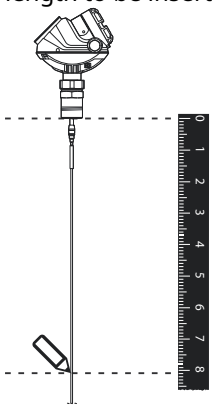
A. UNZ = 14 in. (350 mm)
B. Minimum 20 in. (500 mm)
C. 20 mA
D. 4 mA
E. Warning
F. Shutdown

3.2.12 Shipboard installations

Transmitters with aluminum housing are not approved for open deck installations.

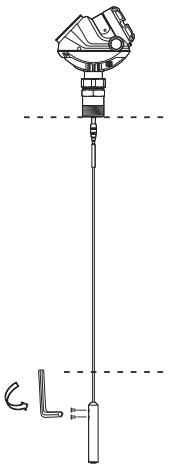
For application conditions and limitations refer to the applicable shipboard approval.

3.3 Shorten the probe



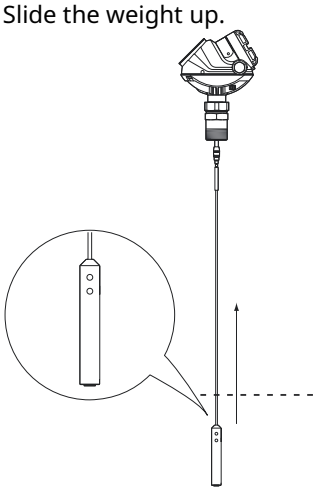
3.3.1 Shorten the flexible single lead probe

Prerequisites

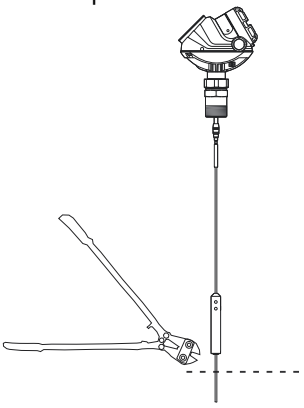


Note
The PTFE covered probes must not be cut in field.

Procedure



1. Mark where to cut the probe. Add at least 1.6 in. (40 mm) to the required probe length to be inserted into the weight.



2. Loosen the weight.

3. Slide the weight up.

4. Cut the probe at the mark.

5. Fasten the weight.

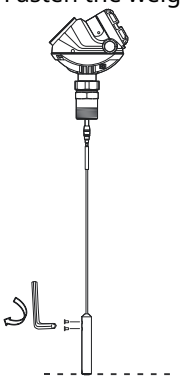


Table 3-12: Required Torque and Hex Key Dimensions

Flexible single lead probe	Required torque	Hex key dimension
4 mm wire, stainless steel	3.7 ft-lb (5 Nm)	4 mm
4 mm wire, Alloy C-276	1.8 ft-lb (2.5 Nm)	3 mm
4 mm wire, Alloy 400	1.8 ft-lb (2.5 Nm)	3 mm
4 mm wire, Duplex 2205	1.8 ft-lb (2.5 Nm)	3 mm
6 mm wire	7.4 ft-lb (10 Nm)	5 mm

Note
If the screws are not tightened according to the required torque, the weight may fall off. This is especially important for solid applications with high tensile loads on the probe.

Postrequisites

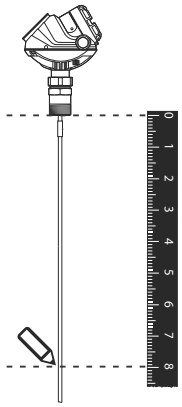
After shortening the probe be sure to update the transmitter configuration to the new probe length.

Related information

Probe length

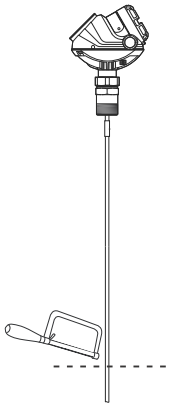
3.3.2 Shorten the rigid single lead probe

Prerequisites



The minimum probe length is 15.7 in. (400 mm).

Note
The PTFE covered probes must not be cut in field.



Note
Ensure the lead is fixed while cutting.

Procedure

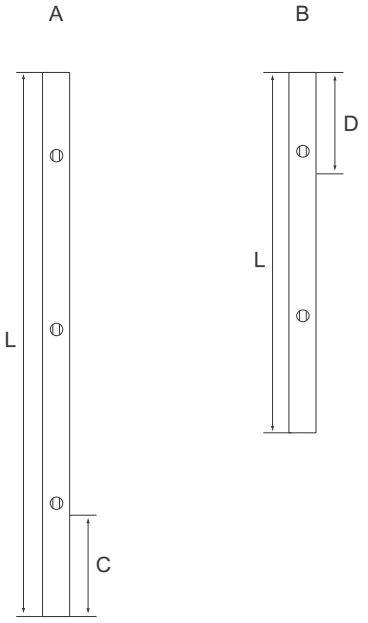
1. Mark where to cut the probe.

2. Cut the probe at the mark.

Postrequisites

After shortening the probe be sure to update the transmitter configuration to the new probe length.

Related information



Probe length

3.3.3 Shorten the coaxial probe

Prerequisites

Note
The HTHP coaxial probe must not be cut in field.

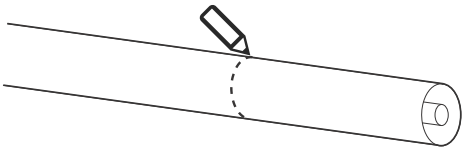


Figure 3-21: Maximum Shortening of Coaxial Probe

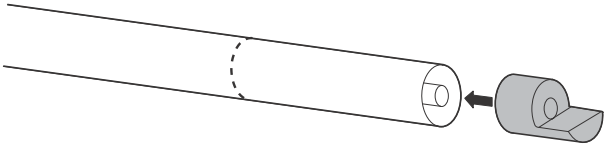
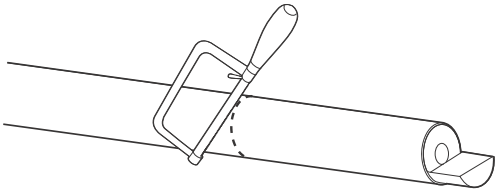
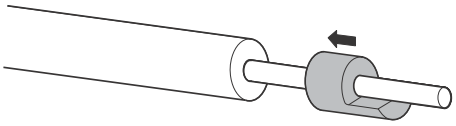


A. Ordered probe length (L) > 49 in. (1250 mm)
B. Ordered probe length (L) ≤ 49 in. (1250 mm)
C. Maximum shortening length: 23.6 in. (600 mm)
D. Minimum probe length: 15.7 in. (400 mm)

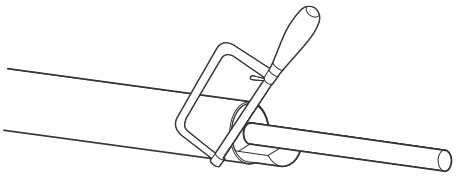
Procedure



1. Mark where to cut the probe.
   - Pipes longer than 49 in. (1250 mm) can be shortened by as much as 23.6 in. (600 mm).
   - Pipes shorter than 49 in. (1250 mm) can be cut as long as the remaining length is not less than 15.7 in. (400 mm).



2. Insert the centering piece.
   The centering piece is delivered from factory and should be used to prevent the spacers centering the rod from coming loose.



3. Cut the tube to the desired length.

4. Move the centering piece.

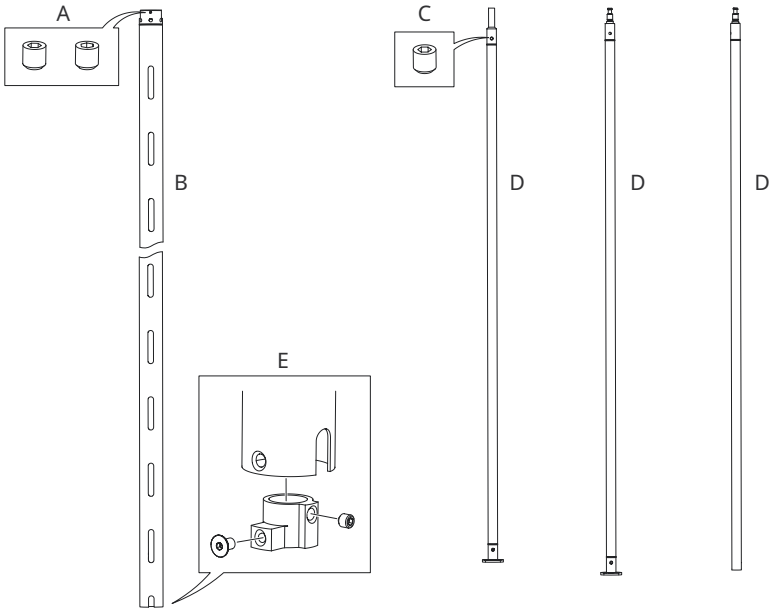
5. Cut the rod inside the tube. Ensure the rod is fixed with the centering piece while cutting.

Postrequisites

After shortening the probe be sure to update the transmitter configuration to the new probe length.

Related information

Probe length



3.3.4 Shorten the large coaxial probe

Related information

Probe length

Large coaxial probe parts

Figure 3-22: Components

A. Set screw M4, 2 pcs
B. Outer pipe
C. Set screw M5
D. Inner probe (one to three pieces depending on probe length)
E. Probe end fixture

Verify possibility to shorten the large coaxial probe

The inner probe consists of one to three segements depending on probe length. The connection part between two inner probe segements must not be cut. Before shortening the large coaxial probe, verify that your desired probe length is permitted for cutting. Check your ordered probe length and desired probe length in table Table 3-13 or Table 3-14, and follow the action instruction.

Figure 3-23: Ordered Probe Length (L) vs Desired Probe Length (X)

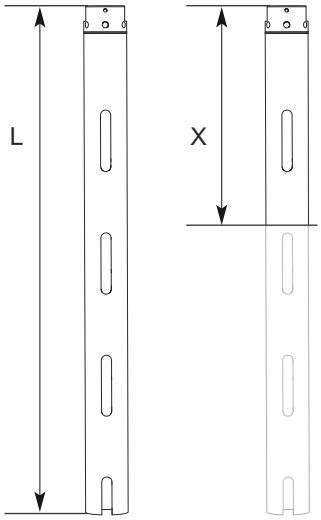


Table 3-13: Check Desired Cutting Probe Length (mm)

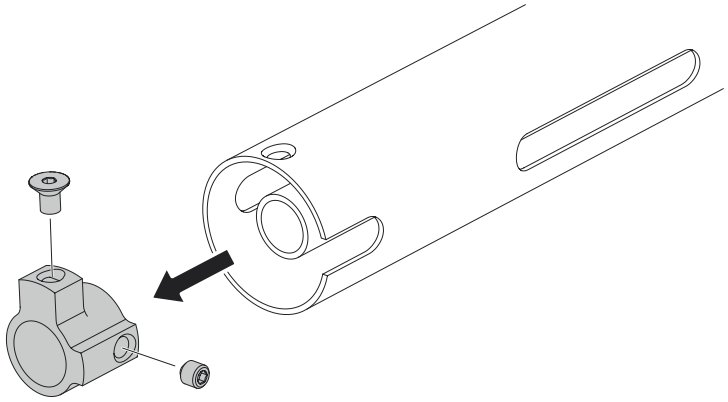
Ordered probe length (L)	Desired probe length (X)	Action
300 ≤ L ≤2100	300 ≤ X < 2100	Cutting can be performed. Follow instruction, Shorten the large coaxial probe.
2100 < L ≤ 4100	300 ≤ X < 1960	Cutting can be performed. Follow instruction, Shorten the large coaxial probe.
	1960 ≤ X ≤ 2055	A new inner probe segement must be ordered, contact your local Emerson representative.
	2055 < X < 4100	Cutting can be performed. Follow instruction, Shorten the large coaxial probe.
4100 < L ≤ 6000	300 ≤ X < 1960	Cutting can be performed. Follow instruction, Shorten the large coaxial probe.
	1960 ≤ X ≤ 2055	A new inner probe segement must be ordered, contact your local Emerson representative
	2055 < X < 3860	Cutting can be performed. Follow instruction, Shorten the large coaxial probe.
	3860 ≤ X ≤ 3955	A new inner probe segement must be ordered, contact your local Emerson representative
	3955 < X < 6000	Cutting can be performed. Follow instruction, Shorten the large coaxial probe.

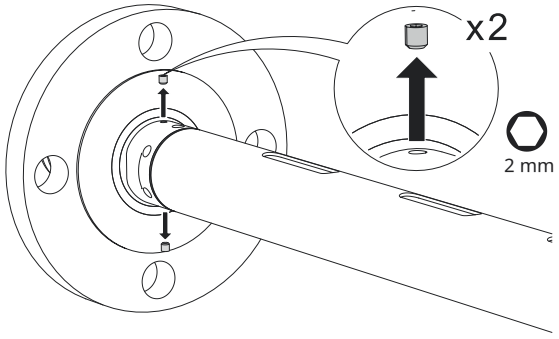
Table 3-14: Check Desired Cutting Probe Length (in.)

Ordered probe length (L)	Desired probe length (X)	Action
11.8 ≤ L ≤ 82.7	11.8 ≤ X < 82.7	Cutting can be performed. Follow instruction, Shorten the large coaxial probe.
82.7 < L ≤ 161.4	11.8 ≤ X < 77.2	Cutting can be performed. Follow instruction, Shorten the large coaxial probe.
	77.2 ≤ X ≤ 80.9	A new inner probe segement must be ordered, contact your local Emerson representative
	80.9 < X < 161.4	Cutting can be performed. Follow instruction, Shorten the large coaxial probe.
161.4 < L ≤ 236.2	11.8 ≤ X < 77.2	Cutting can be performed. Follow instruction, Shorten the large coaxial probe.
	77.2 ≤ X ≤ 80.9	A new inner probe segement must be ordered, contact your local Emerson representative
	80.9 < X < 152.0	Cutting can be performed. Follow instruction, Shorten the large coaxial probe.
	152.0 ≤ X ≤ 155.7	A new inner probe segement must be ordered, contact your local Emerson representative
	155.7 < L < 236.2	Cutting can be performed. Follow instruction, Shorten the large coaxial probe.



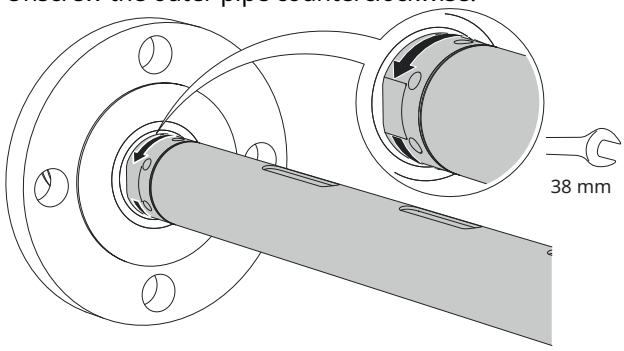
Shorten the large coaxial probe

Prerequisites

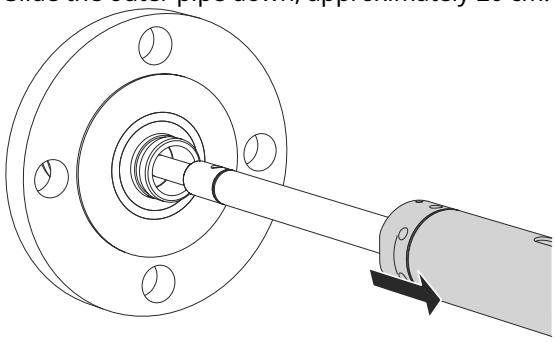


Verify your desired probe length is permitted for cutting, see Verify possibility to shorten the large coaxial probe.

Procedure



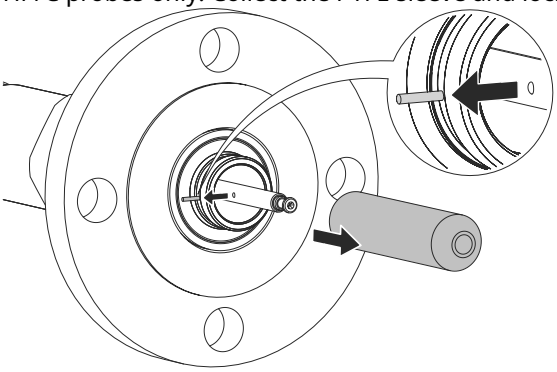
1. Remove the fixture at the end of the probe. Keep all parts safe for later use.



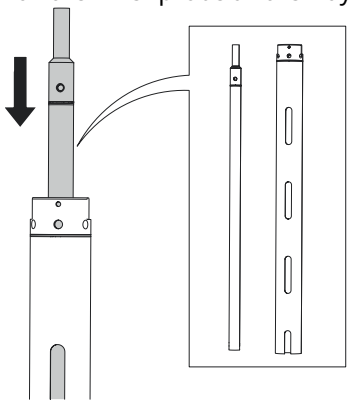
2. Loosen the outer pipe.
   a) Unscrew the two set screws.

   b) Unscrew the outer pipe counterclockwise.

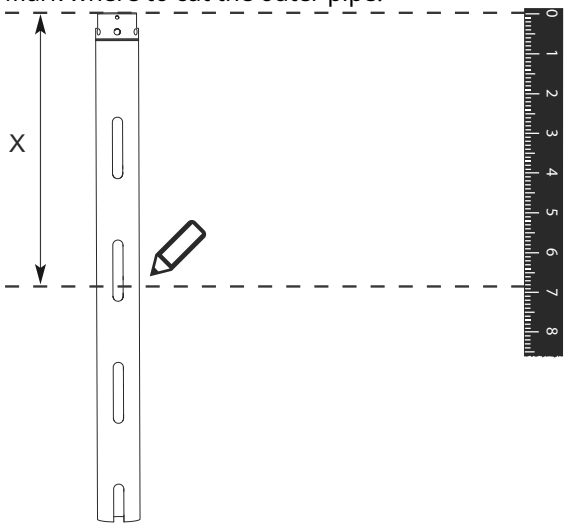
   c) Slide the outer pipe down, approximately 20 cm.



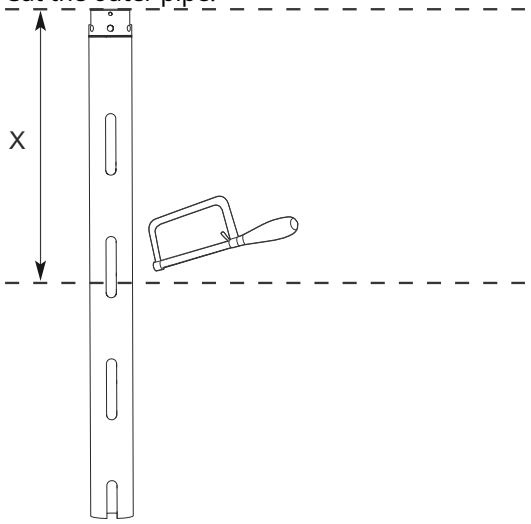
3. Loosen the inner probe.
   a) Unscrew the set screw.



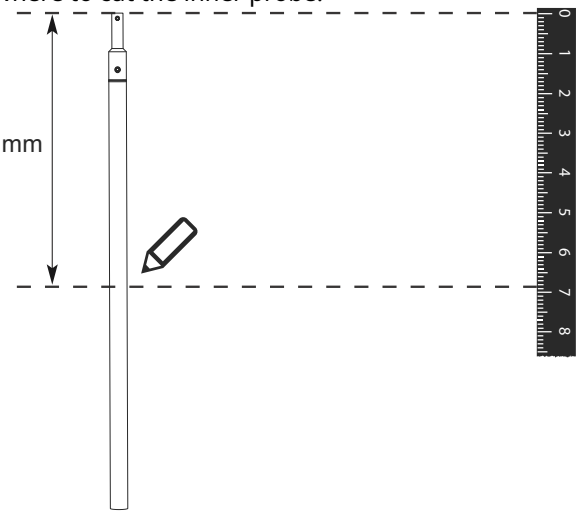
b) Unscrew the inner probe counterclockwise.



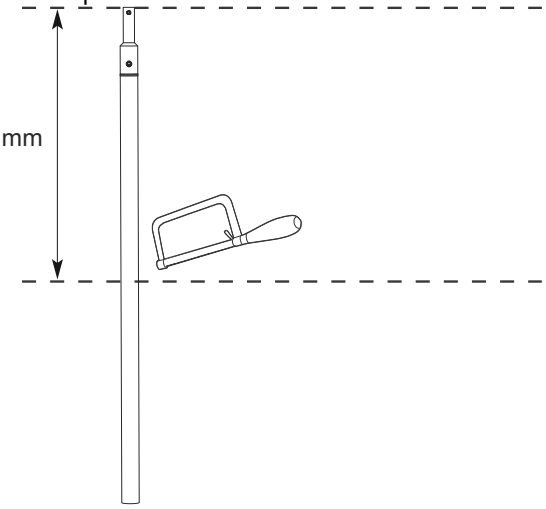
4. HP/C probes only: Collect the PTFE sleeve and locking pin for later use.



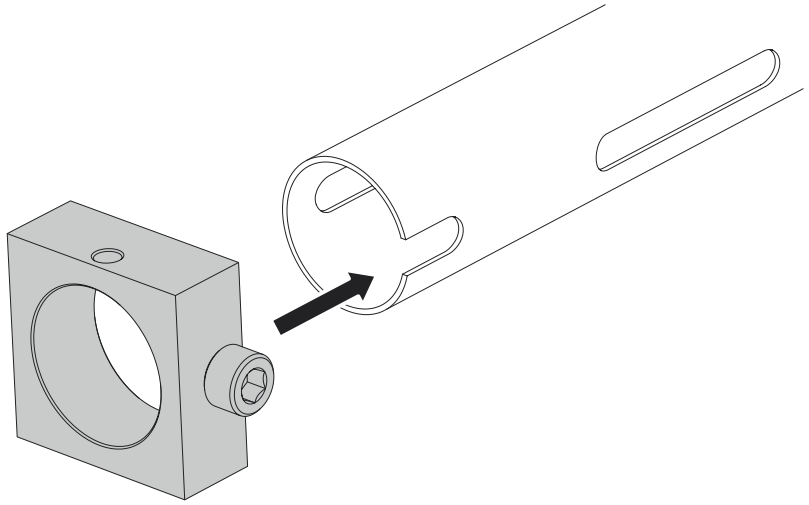
5. Pull the inner probe all the way through the outer pipe.



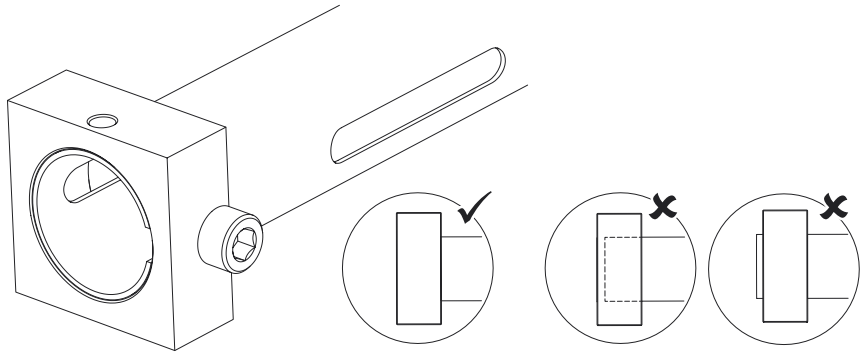
6. Mark where to cut the outer pipe.



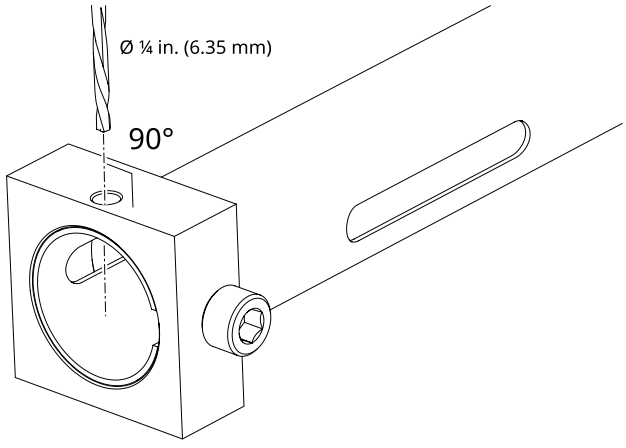
7. Cut the outer pipe.



8. Mark where to cut the inner probe.



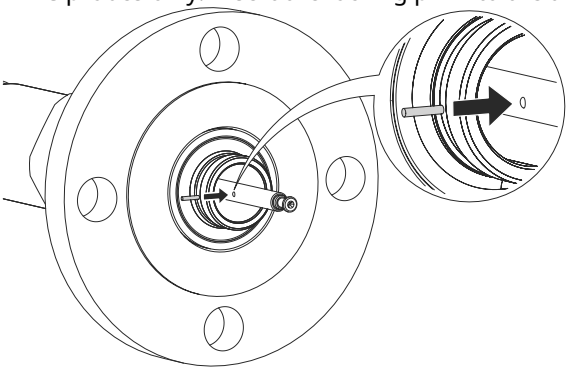
9. Cut the inner probe.



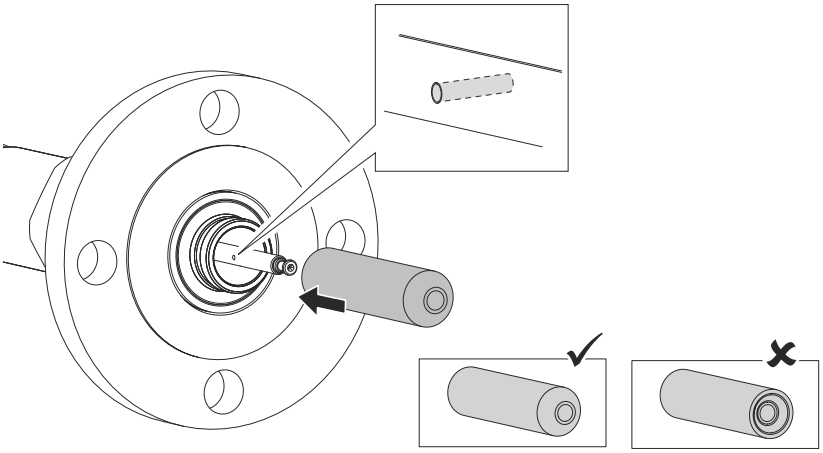
10. Drill a hole in the outer probe using the drilling fixture (included in your shipment).
    a) Place the drilling fixture at the end of the outer probe.

    b) Make sure the drilling fixture is aligned at the end of the outer probe.

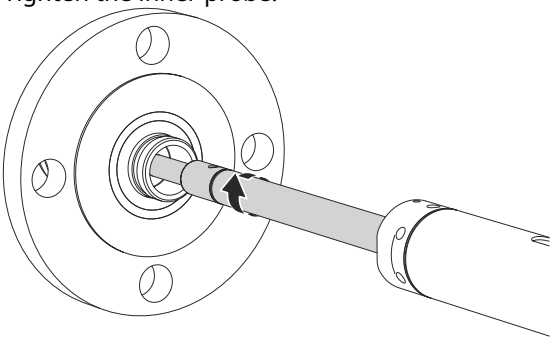
    c)



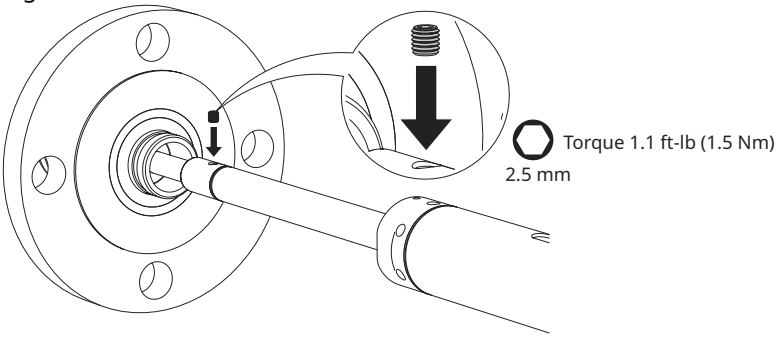
11. Threaded connections only: Countersink the drilled hole.
12. Remove sharp edges and burrs.



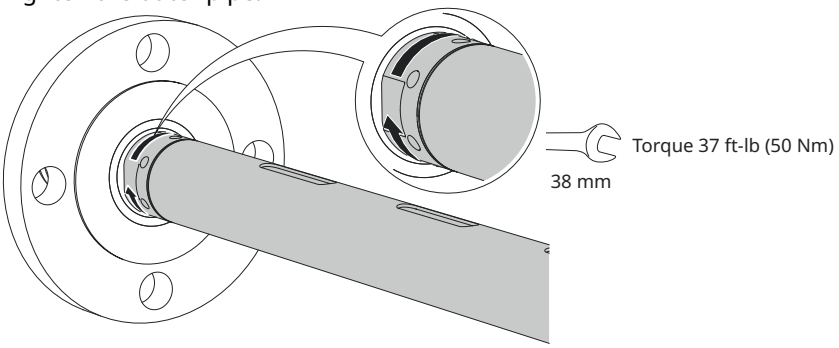
13. Inspect the inner probe. Verify that all centering discs are in good shape and the probe segments are tightened.
14. Slide the inner probe through the outer pipe.



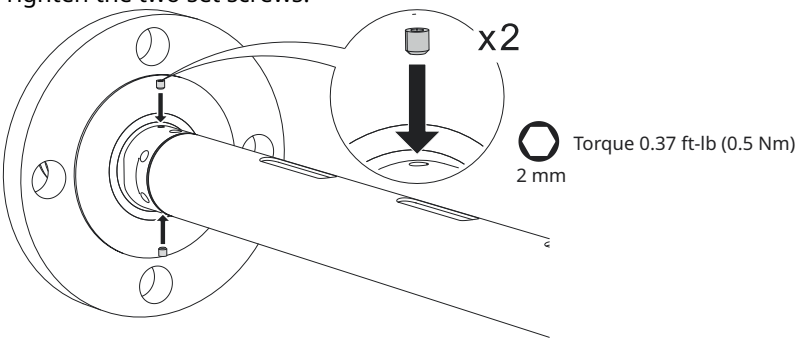
15. HP/C probes only: Insert the locking pin into the aligned holes.



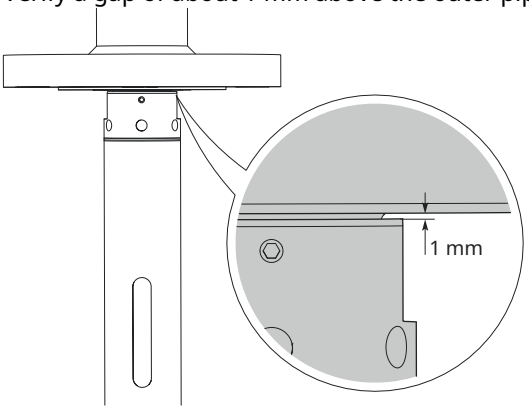
16. HP/C probes only: Mount the PTFE sleeve while keeping the locking pin in a horizontal position.



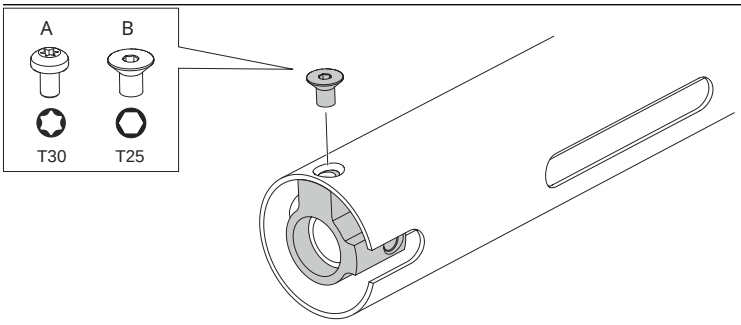
17. Tighten the inner probe.



18. Tighten the set screw.

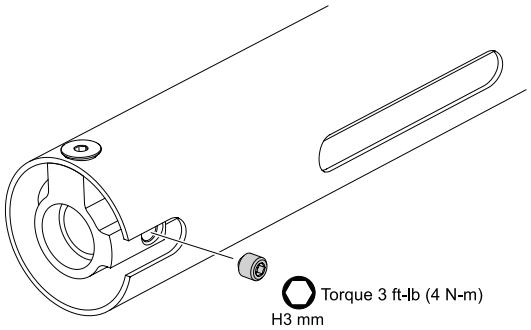


19. Tighten the outer pipe.



20. Tighten the two set screws.

21. Verify a gap of about 1 mm above the outer pipe.



22. Mount the fixture at the end of the probe.

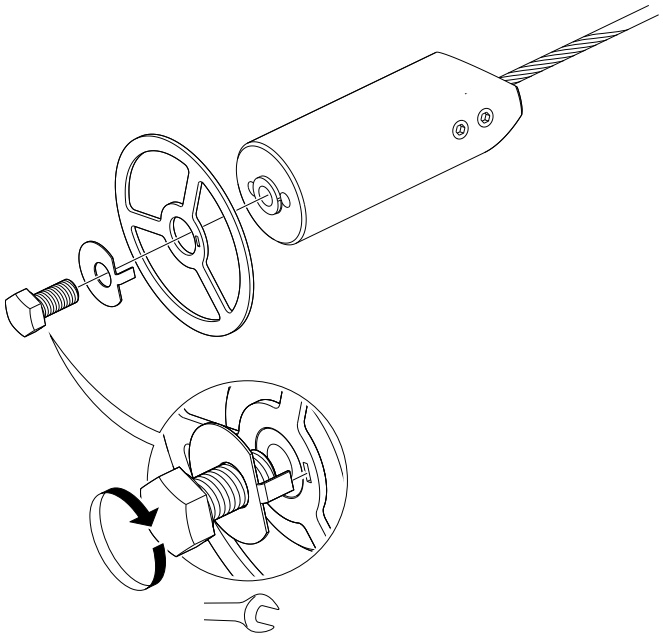
A. Flange connections: Torque 5 ft-lb (7 N-m)
B. Threaded connections: Torque 3 ft-lb (4 N-m)

23.

Postrequisites

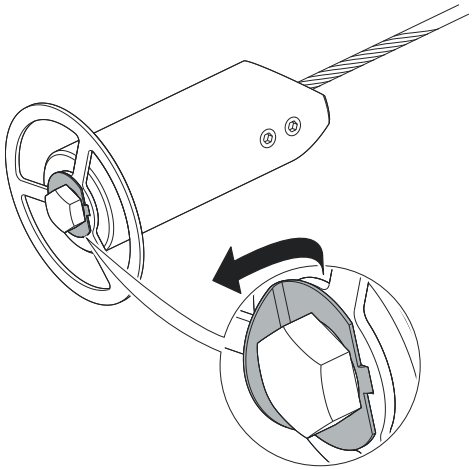
After shortening the probe be sure to update the transmitter configuration to the new probe length.

3.4 Mount a centering disc



3.4.1 Mount a centering disc on flexible single lead probe

Prerequisites

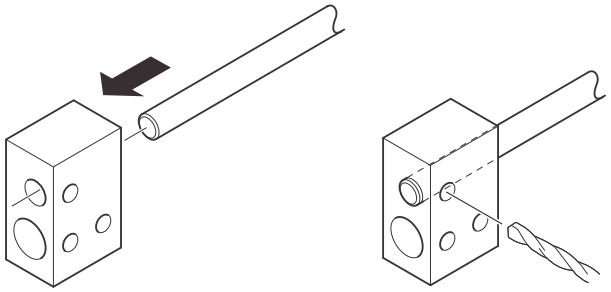


Note
When using centering discs made of PTFE, note that the maximum temperature is 482 °F (250 °C).

Procedure

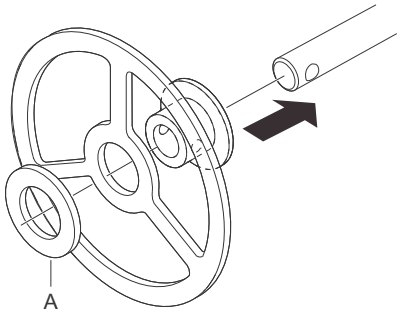
1.

2. Secure the bolt by folding the tab washer.



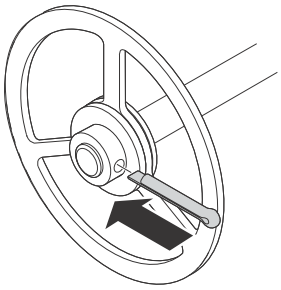
3.4.2 Mount a centering disc on rigid single lead probe (8 mm)

Note
Centering discs shall not be used with PTFE covered probes.

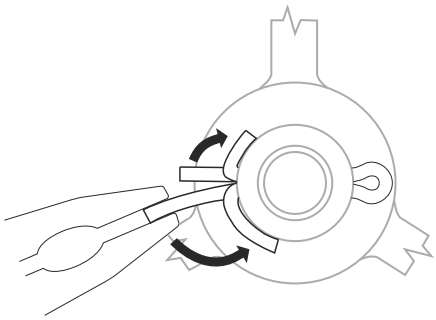


Procedure

1. Drill one hole using the drilling fixture (included in your shipment).

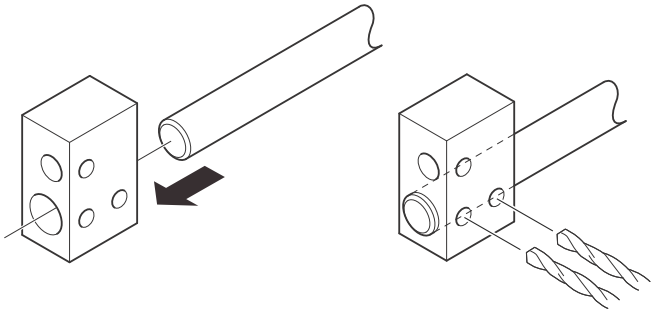


2. Mount the bushing, centering disc, and washer at the probe end.

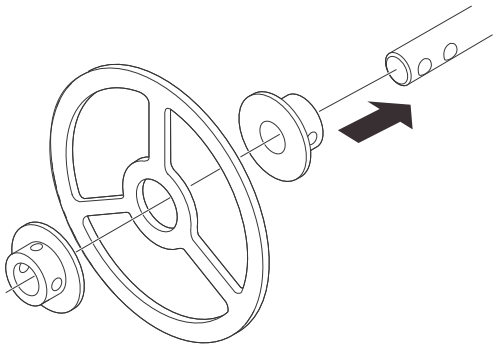


Note
Do not mount the washer (A) if the centering disc material is PTFE, Alloy C-276, Duplex 2205, or Alloy 400.

3. Insert the split pin through the bushing and the probe.

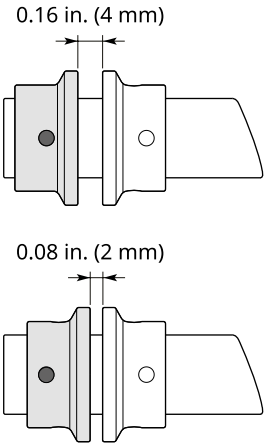


4. Secure the split pin.

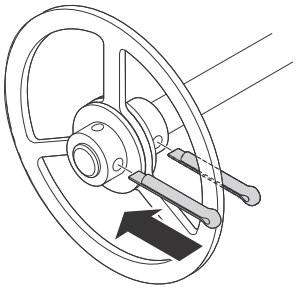


3.4.3 Mount a centering disc on rigid single lead probe (13 mm)

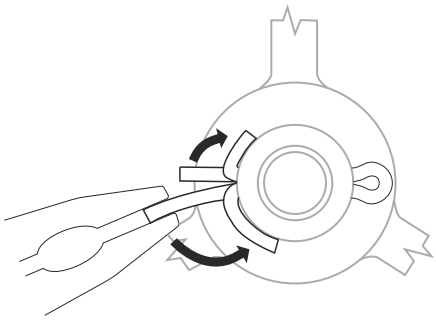
Procedure



1. Drill two holes using the drilling fixture (included in your shipment).



2. Mount the bushings and centering disc at the probe end.



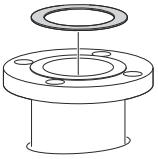
3.

4. Insert the split pins through the bushings and the probe.

5. Secure the split pins.

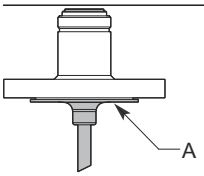
3.5 Mount device on tank

Mount the transmitter with flange on a nozzle on top of the tank. The transmitter can also be mounted on a threaded or Tri Clamp connection.



3.5.1 Tank connection with flange

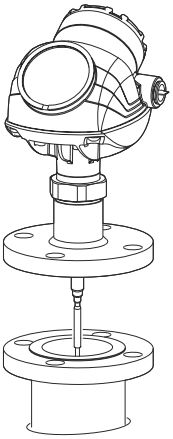
Prerequisites



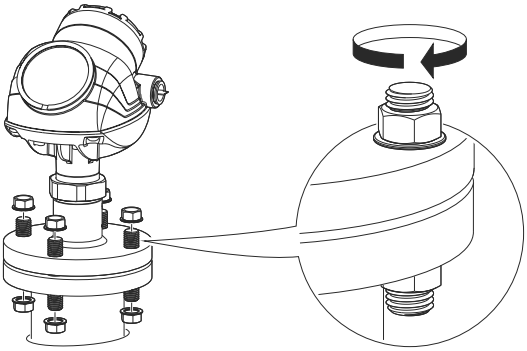
Note
PTFE covered probes must be handled carefully to prevent damage to the coating.

Procedure

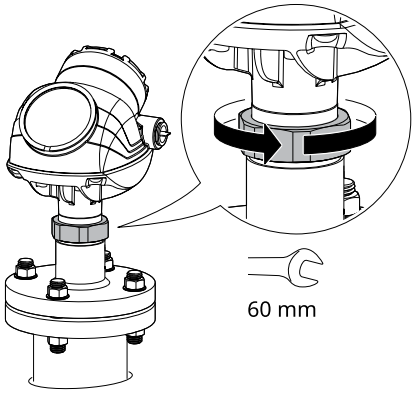
1. Place a suitable gasket on top of the tank flange.



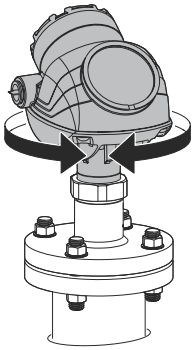
Note
Gasket should not be used for PTFE covered probe with protective plate.



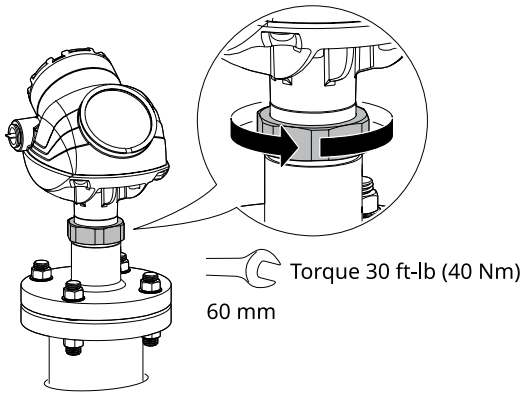
A. PTFE covered probe with protective plate



2. Lower the transmitter and probe with flange into the tank.



3. Tighten bolts and nuts with sufficient torque for the flange and gasket choice.

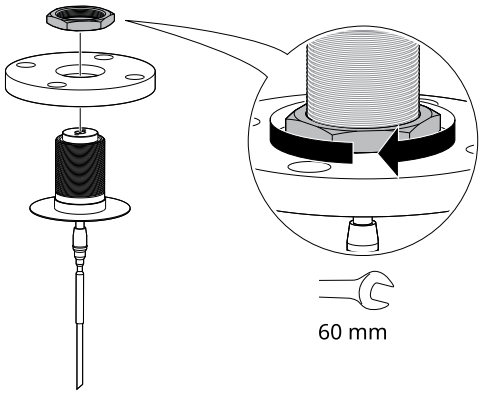


4.

5. Rotate the transmitter housing so the cable entries/display face the desired direction.

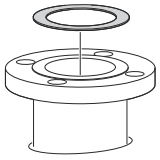
6.

3.5.2 Tank connection with loose flange (plate design)



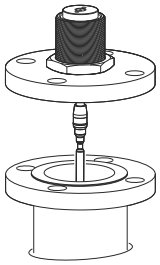
The transmitter is delivered with head, flange and probe assembled into one unit. If, for some reason, these parts have been disassembled, mount the transmitter as described below.

Prerequisites

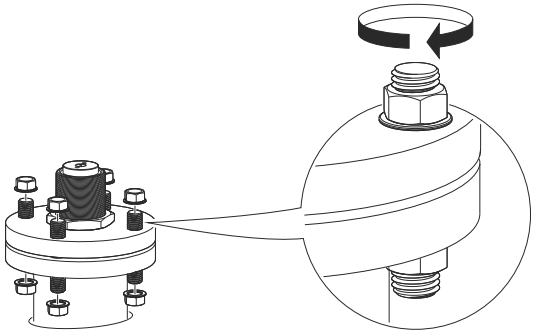


Note
PTFE covered probes must be handled carefully to prevent damage to the coating.

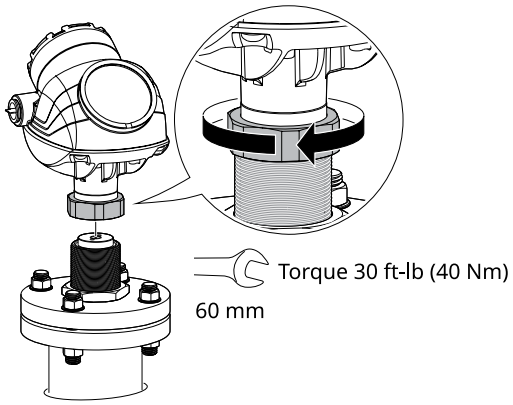
Procedure



1.



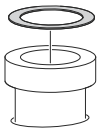
2. Place a suitable gasket on top of the tank flange.



3. Lower the probe with flange into the tank.

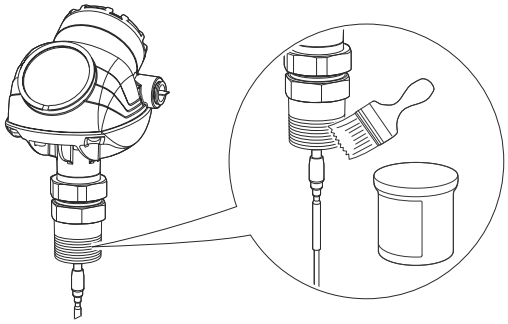
4. Tighten bolts and nuts with sufficient torque for the flange and gasket choice.

5.



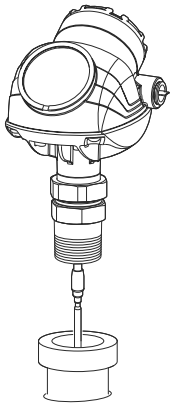
3.5.3 Threaded tank connection

Prerequisites

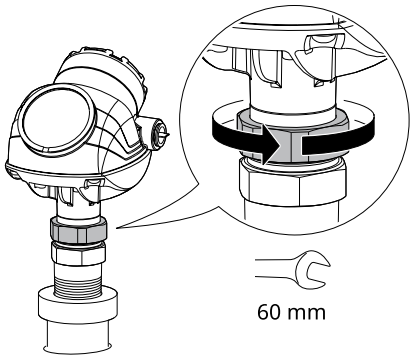


Note
PTFE covered probes must be handled carefully to prevent damage to the coating.

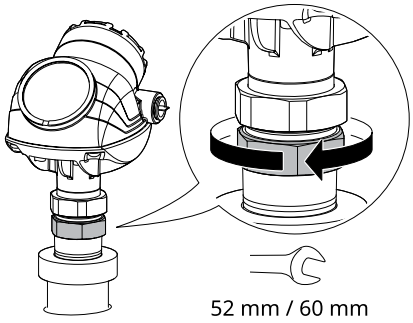
Procedure



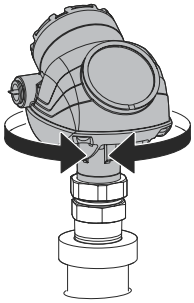
1. For adapters with BSPP (G) threads, place a suitable gasket on top of the tank flange.



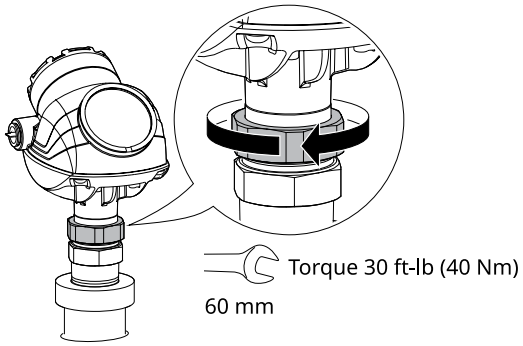
2. For adapters with NPT threads, use anti-seize paste or PTFE tape according to your site procedures.



3. Lower the transmitter and probe into the tank.

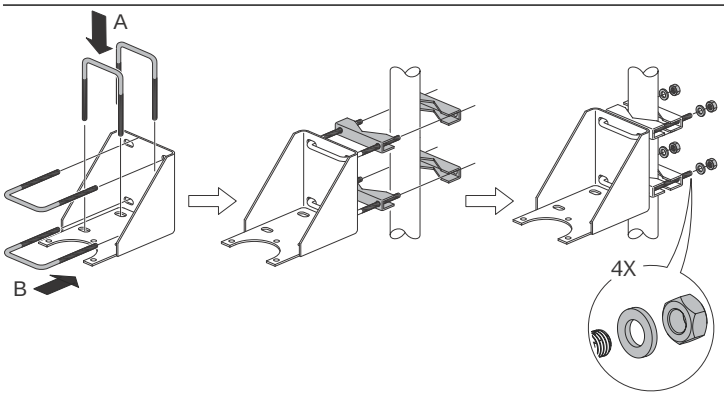


4.



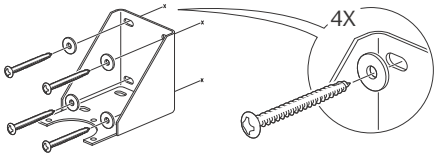
5.

6. Rotate the transmitter housing so the cable entries/display face the desired direction.



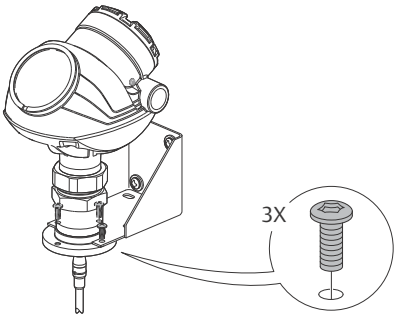
7.

3.5.4 Bracket mounting



Procedure

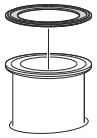
1. Mount the bracket to the pipe/wall.
   On pipe:



A. Horizontal pipe
B. Vertical pipe

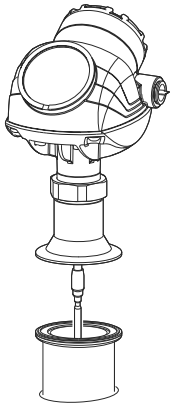
   On wall:

2. Mount the transmitter with probe to the bracket.



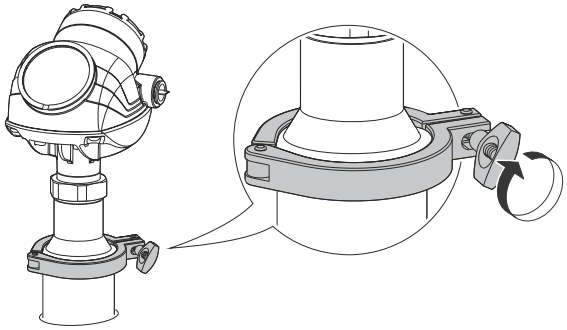
3.5.5 Tank connection with Tri Clamp

Prerequisites

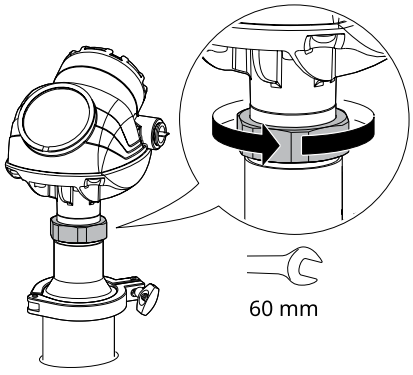


Note
PTFE covered probes must be handled carefully to prevent damage to the coating.

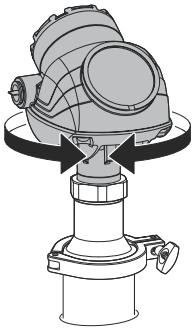
Procedure



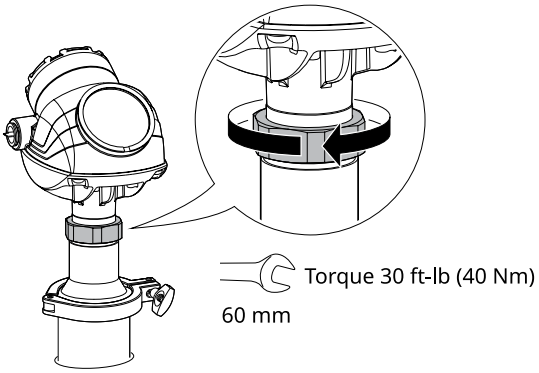
1. Place a suitable gasket on top of the tank flange.



2. Lower the transmitter and probe into the tank.

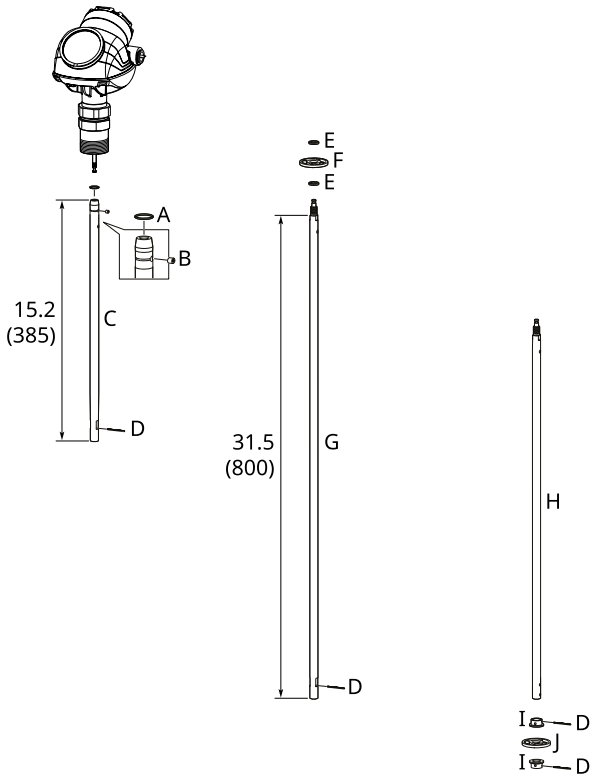


3. Tighten the clamp to the recommended torque (see the manufacturer's instruction manual).



4.

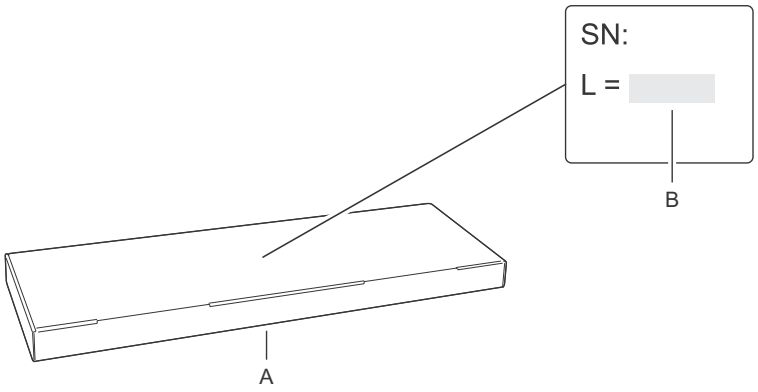
5. Rotate the transmitter housing so the cable entries/display face the desired direction.



6.

3.5.6 Segmented probe

Segmented probe parts



A. Safety ring
B. Screw
C. Top segment
D. Split pin
E. PTFE washer (optional)
F. Centering disc in PTFE (optional)
G. Middle segment
H. Bottom segment (length varies depending on total probe length)
I. Bushing (for the centering disc at the probe end)
J. Bottom centering disc in PTFE or stainless steel (optional)

Verifying probe length

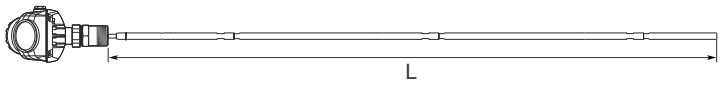
Segmented probe ordered with model code 4S

Before installation, verify the probe length (L) on the label.

Figure 3-25: Label

A. Probe segments box
B. Probe length

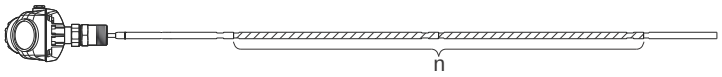
Segmented probe ordered as spare part kit



Before installation, the number of segments that add up to the desired probe length must be determined. Also, the bottom segment may need to be shortened.

Adjust the probe length

Procedure



1. Determine L, the desired probe length.

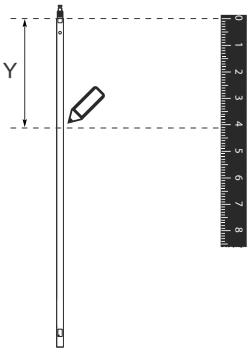
L, desired probe length:

2. Determine n, the number of middle segments needed for the desired probe length. See Determination of probe segments.

n, number of middle segments:

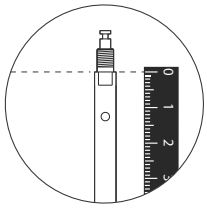
   

3. Calculate Y, the length of the bottom segment. See Determination of probe segments.



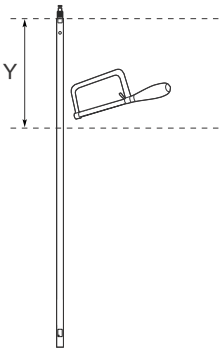
Y, length of bottom segment:

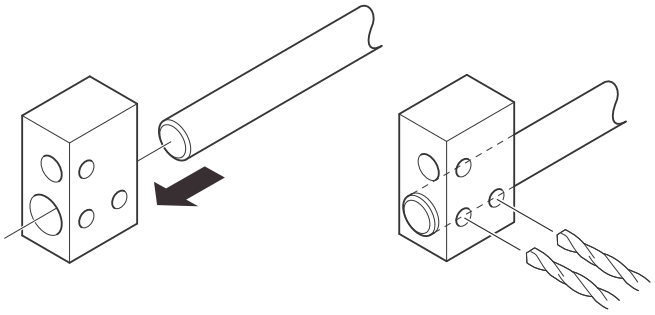


4. Continue as follows:

Length of bottom segment (Y)	Action
Y < 0.4 in. (10 mm) 	• Continue with Step 7. Do not use the bottom segment.
Y ≥ 0.4 in. (10 mm) 	• Continue with Step 5 and cut the bottom segment.
Y = 31.5 in. (800 mm) 	a. Add one extra middle segment to the calculated n. b. Continue with Step 7.



5. Mark where to cut the bottom segment.



6. Cut the bottom segment at the mark.

Note
Ensure the bottom segment is fixed while cutting.

7. Optional: If a bottom centering disc is ordered, then drill two holes on the bottom segment using the drilling fixture.

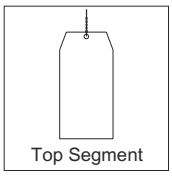
Determination of probe segments

Table 3-15: Determination of Probe Segments for Standard Seal

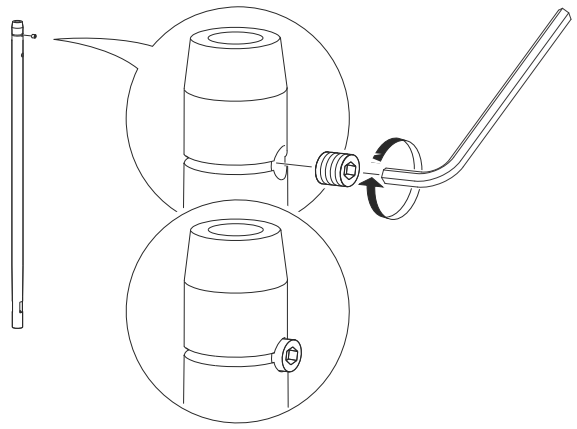
Desired probe length (L)		Number of middle segments (n)	Length of bottom segment (Y)	
in.	mm		in.	mm
15.8 ≤ L ≤ 47.2	400 ≤ L ≤ 1200	0 pc	Y = L -15.8	Y = L - 400
47.2 < L ≤ 78.7	1200 < L ≤ 2000	1 pc	Y = L - 47.2	Y = L - 1200
78.7 < L ≤ 110.2	2000 < L ≤ 2800	2 pcs	Y = L - 78.7	Y = L - 2000
110.2 < L ≤ 141.7	2800 < L ≤ 3600	3 pcs	Y = L - 110.2	Y = L - 2800
141.7 < L ≤ 173.2	3600 < L ≤ 4400	4 pcs	Y = L - 141.7	Y = L - 3600
173.2 < L ≤ 204.7	4400 < L ≤ 5200	5 pcs	Y = L - 173.2	Y = L - 4400
204.7 < L ≤ 236.2	5200 < L ≤ 6000	6 pcs	Y = L - 204.7	Y = L - 5200
236.2 < L ≤ 267.7	6000 < L ≤ 6800	7 pcs	Y = L - 236.2	Y = L - 6000
267.7 < L ≤ 299.2	6800 < L ≤ 7600	8 pcs	Y = L - 267.7	Y = L - 6800
299.2 < L ≤ 330.7	7600 < L ≤ 8400	9 pcs	Y = L - 299.2	Y = L - 7600
330.7 < L ≤ 362.2	8400 < L ≤ 9200	10 pcs	Y = L - 330.7	Y = L - 8400
362.2 < L ≤ 393.7	9200 < L ≤ 10000	11 pcs	Y = L - 362.2	Y = L - 9200

Table 3-16: Determination of Probe Segments for HTHP/HP/C Seal

Desired probe length (L)		Number of middle segments (n)	Length of bottom segment (Y)	
in.	mm		in.	mm
17.3 ≤ L ≤ 48.8	440 ≤ L ≤ 1240	0 pc	Y = L -17.3	Y = L - 440
48.8 < L ≤ 80.3	1240 < L ≤ 2040	1 pc	Y = L - 48.8	Y = L - 1240
80.3 < L ≤ 111.8	2040 < L ≤ 2840	2 pcs	Y = L - 80.3	Y = L - 2040
111.8 < L ≤ 143.3	2840 < L ≤ 3640	3 pcs	Y = L - 111.8	Y = L - 2840
143.3 < L ≤ 174.8	3640 < L ≤ 4440	4 pcs	Y = L - 143.3	Y = L - 3640
174.8 < L ≤ 206.3	4440 < L ≤ 5240	5 pcs	Y = L - 174.8	Y = L - 4440
206.3 < L ≤ 237.8	5240 < L ≤ 6040	6 pcs	Y = L - 206.3	Y = L - 5240
237.8 < L ≤ 269.3	6040 < L ≤ 6840	7 pcs	Y = L - 237.8	Y = L - 6040
269.3 < L ≤ 300.8	6840 < L ≤ 7640	8 pcs	Y = L - 269.3	Y = L - 6840
300.8 < L ≤ 332.3	7640 < L ≤ 8440	9 pcs	Y = L - 300.8	Y = L - 7640
332.3 < L ≤ 363.8	8440 < L ≤ 9240	10 pcs	Y = L - 332.3	Y = L - 8440
363.8 < L ≤ 393.7	9240 < L ≤ 10000	11 pcs	Y = L - 363.8	Y = L - 9240

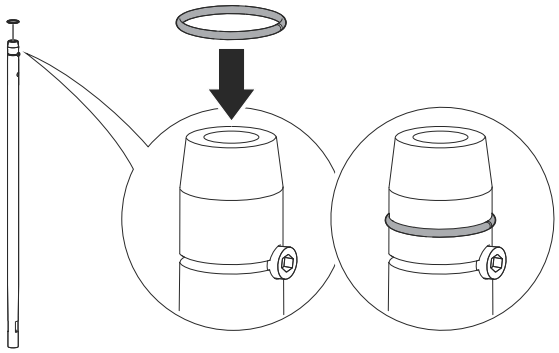


Assemble the segmented probe



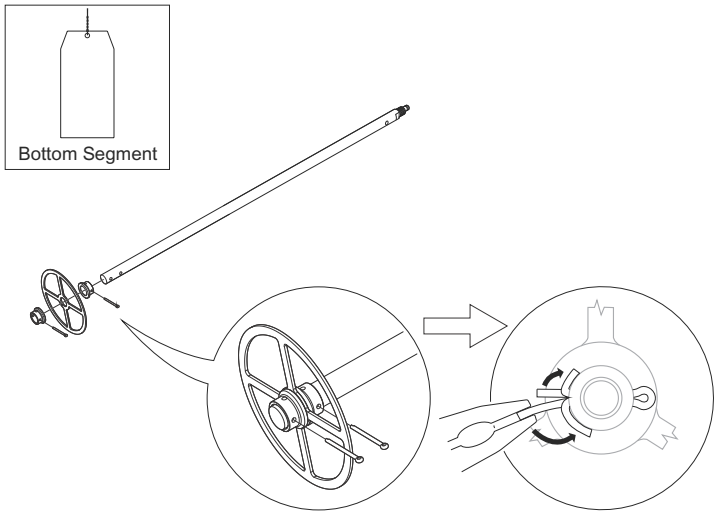
Prerequisites

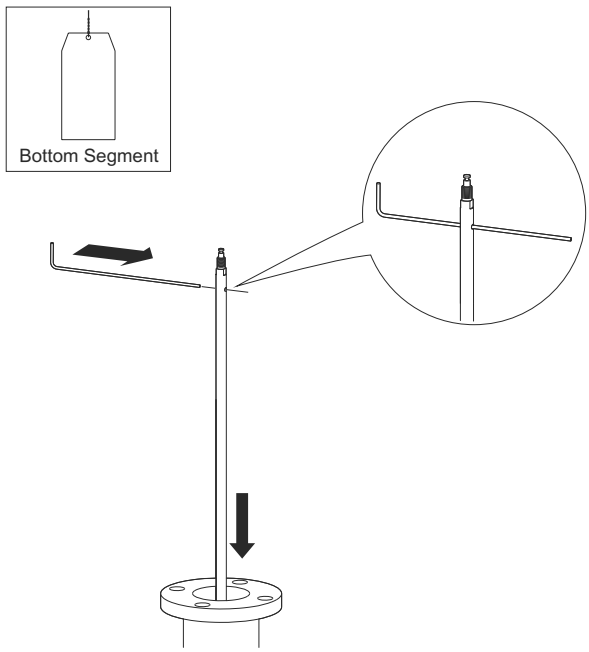
Note
If there is enough space beside the tank, the probe can be assembled before inserting it into the tank.



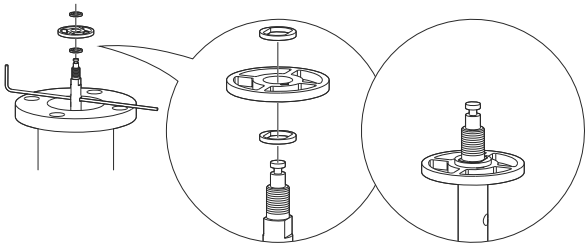
Procedure

1. Insert the stop screw to the top segment. Tighten approximately two turns.

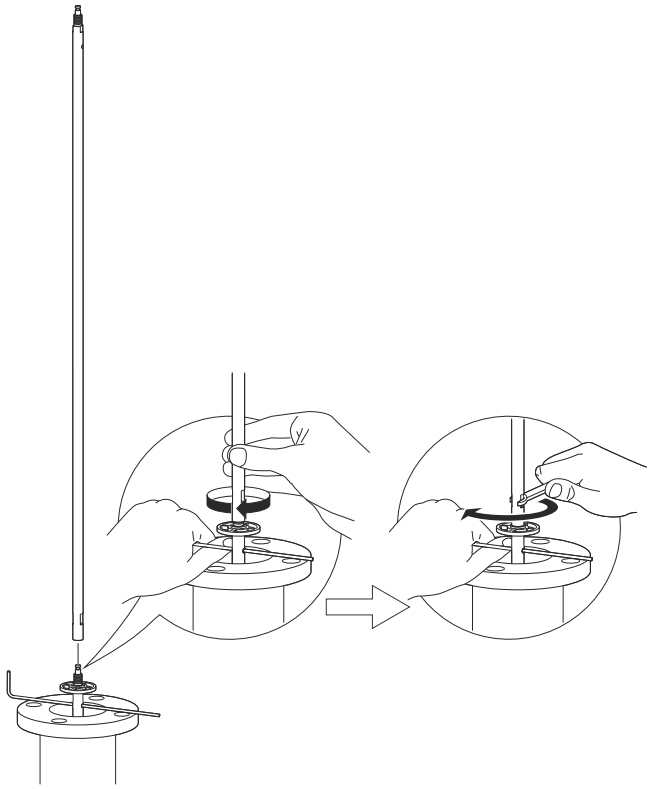




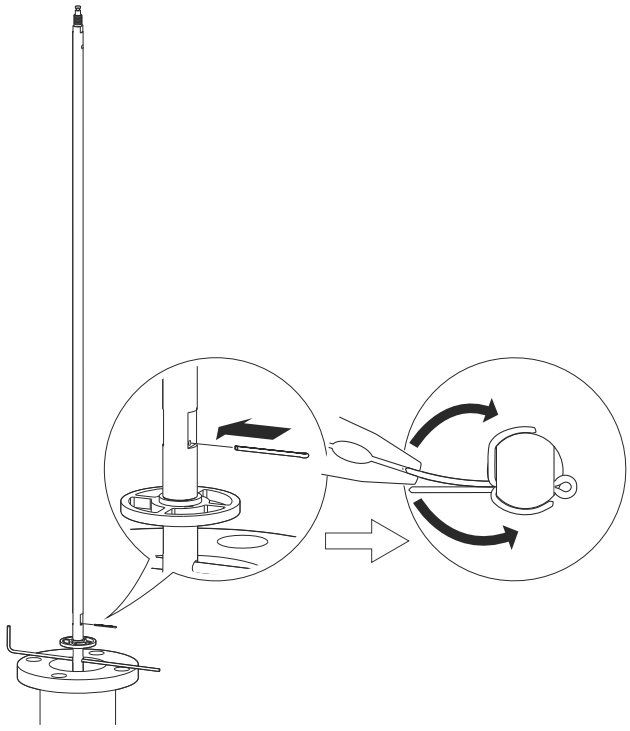
2. Pre-assemble the safety ring.



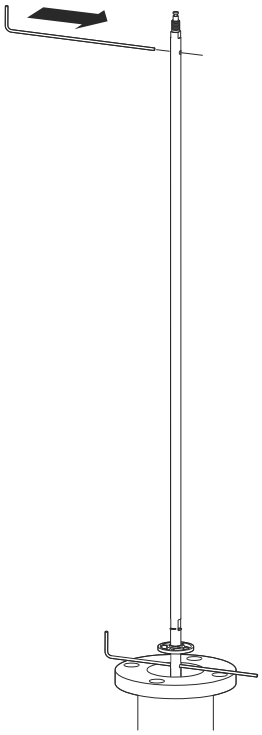
3. Optional: If ordered, mount the centering disc on the bottom segment of the probe.



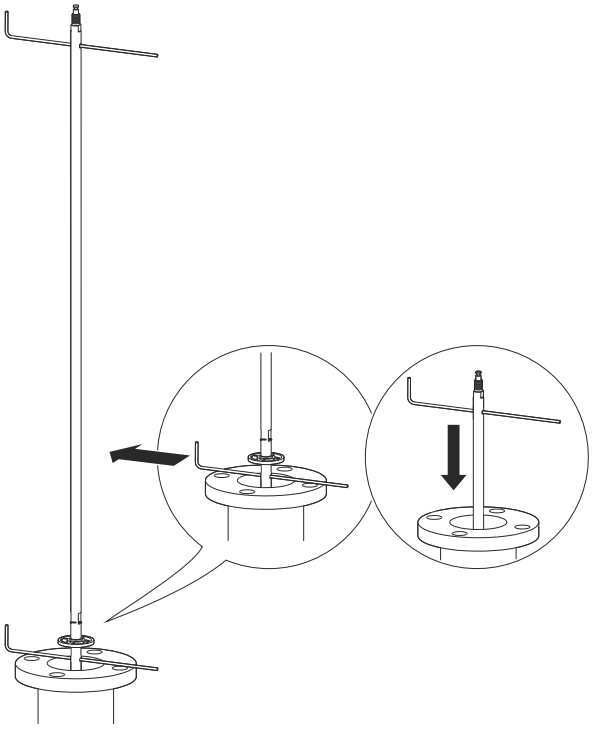
4. Insert the support tool.



5. Optional: If ordered, mount the centering disc.
   - Maximum five pcs/probe
   - Minimum two segments between each centering disc

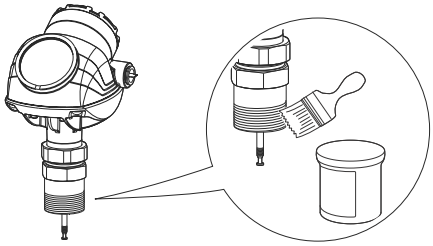


6. Mount a middle segment (hand tight).



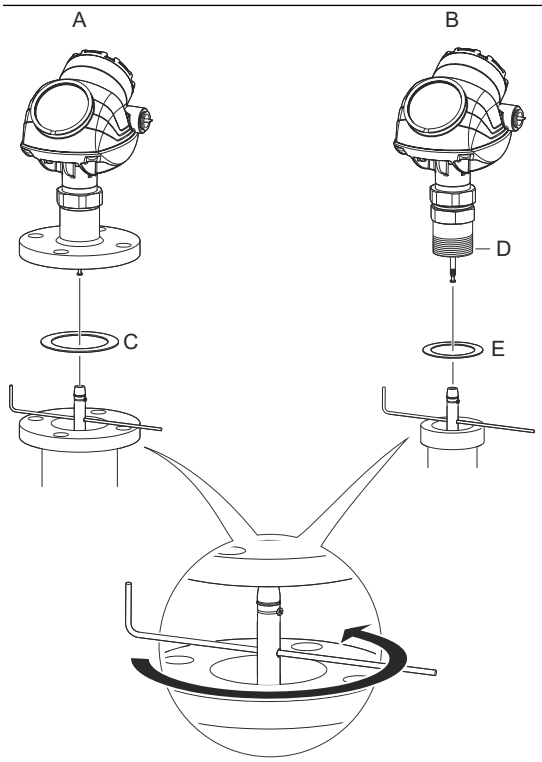
7. Secure the split pin.

8. Insert the second support tool.



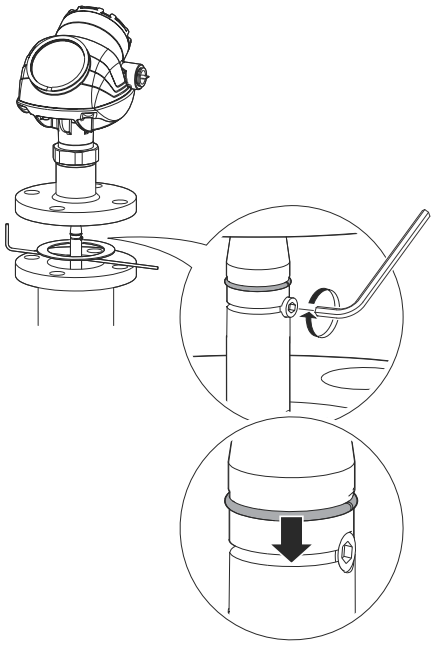
9. Remove the first support tool and lower the probe into the tank.

10. Repeat Step 5-Step 9 until all segments are mounted. Be sure to finish with the top segment of the probe.



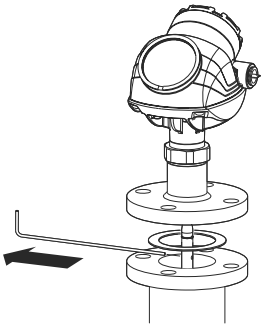
11. Seal and protect threads. Use anti-seize paste or PTFE tape according to your site

    ⚠ Only for NPT threaded tank connection.

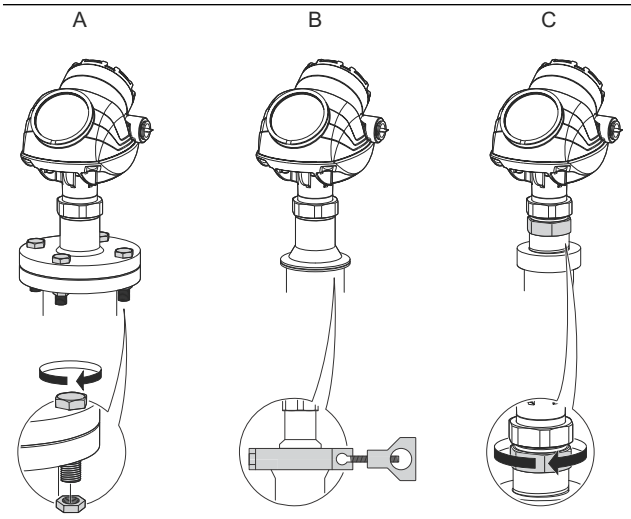


12. Attach the probe to the device.

Note
For safety reasons, at least two people are needed when mounting the device. Hold the device above the tank. High loads can break the support tool.

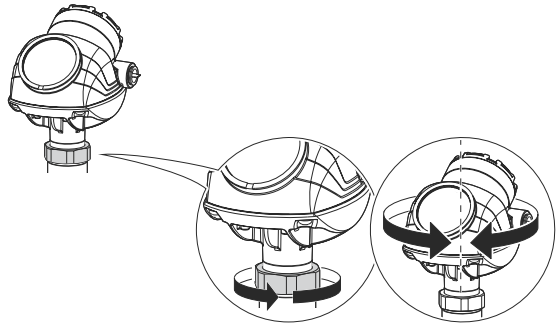


A. Flange/Tri Clamp
B. Threaded
C. Gasket
D. Sealant on threads (NPT)
E. Gasket (BSPP (G))

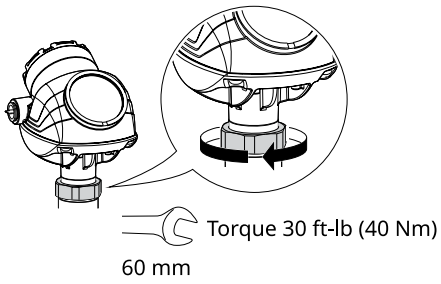


13. Tighten the stop screw and slide the safety ring into the groove.

14. Remove the support tool.



15. Mount the device on the tank.



A. Flange
B. Tri Clamp
C. Threaded

16. Rotate the housing to the desired direction.

17.

3.6 Anchor the probe

In turbulent tanks it may be necessary to fix the probe. Depending on the probe type, different methods can be used to guide the probe to the tank bottom. This may be needed in order to prevent the probe from hitting the tank wall or other objects in the tank, as well as preventing a probe from breaking.

Flexible single lead probe

The flexible single lead probe itself can be used for anchoring. Pull the probe rope through a suitable anchoring point (e.g. a welded eye), and fasten it with a chuck.

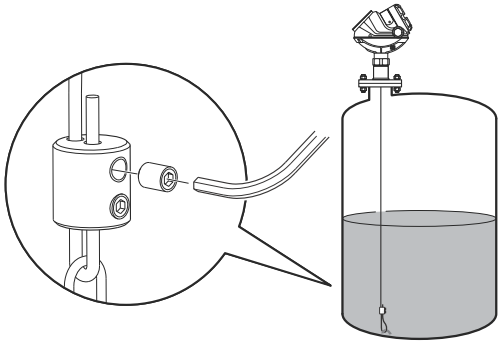


Table 3-17: Required Torque and Hex Key Dimensions

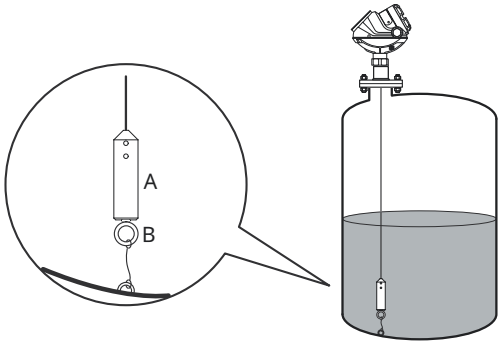
Flexible single lead probe	Required torque	Hex key dimension
4 mm wire, stainless steel	3.7 ft-lb (5 Nm)	4 mm
4 mm wire, Alloy C-276	1.8 ft-lb (2.5 Nm)	3 mm
4 mm wire, Alloy 400	1.8 ft-lb (2.5 Nm)	3 mm
4 mm wire, Duplex 2205	1.8 ft-lb (2.5 Nm)	3 mm
6 mm wire	7.4 ft-lb (10 Nm)	5 mm

The length of the loop will add to the Blind Zone. The location of the chuck will determine the beginning of the Blind Zone.



The Probe Length should be configured as the distance from the Upper Reference Point to the top of the chuck.

Figure 3-26: Flexible Single Lead Probe with Chuck

A ring (customer supplied) can be attached to the weight in a threaded (M8x14) hole at the end of the weight. Attach the ring to a suitable anchoring point.

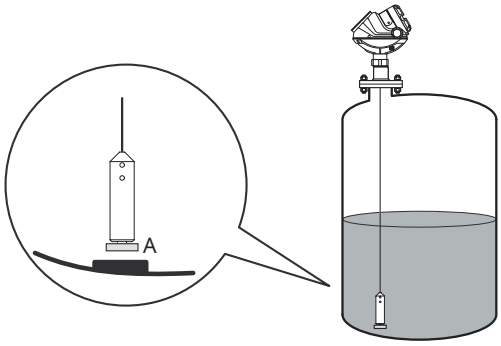


Figure 3-27: Flexible Single Lead Probe with Weight and Ring

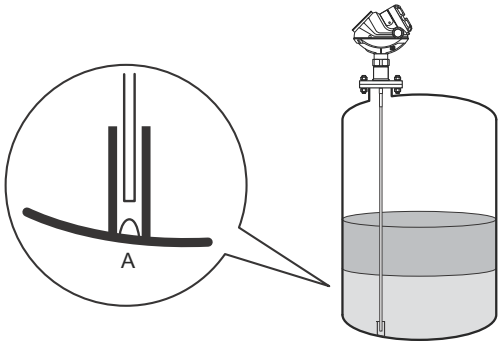
A. Weight with internal threads M8x14
B. Ring

A magnet (customer supplied) can be fastened in a threaded (M8x14) hole at the end of the weight. The probe can then be guided by placing a suitable metal plate beneath the magnet.

Figure 3-28: Flexible Single Lead Probe with Weight and Magnet

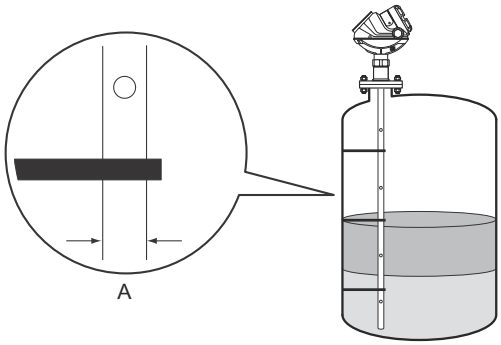


A. Magnet

Rigid single lead probe

The rigid single lead probe can be guided by a tube welded on the tank bottom. Tubes are customer supplied. Ensure that the probe can move freely in order to handle thermal expansion. The measurement accuracy will be reduced close to the tube opening.

Figure 3-29: Rigid Single Lead Probe with Tube



A. Drain

Coaxial probe

The coaxial probe can be secured to the tank wall by fixtures fastened to the tank wall. Fixtures are customer supplied. Ensure the probe can move freely due to thermal expansion without getting stuck in the fixture.

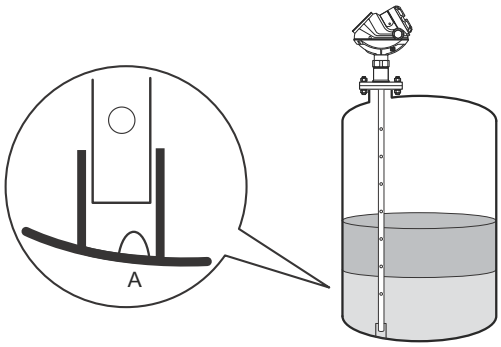


Figure 3-30: Coaxial Probe Secured to the Tank Wall

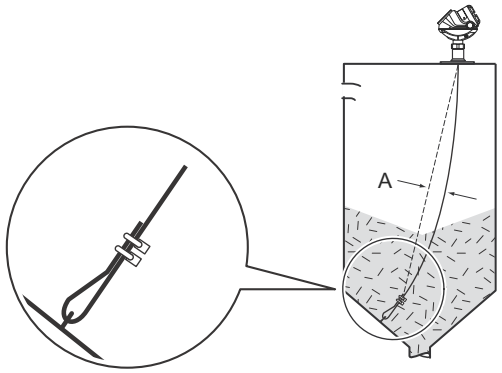
A. Coaxial: Ø 1.1 in. (28 mm), Large coaxial: Ø 1.7 in. (42 mm)

The coaxial probe can be guided by a tube welded on the tank bottom. Tubes are customer supplied. Ensure that the probe can move freely in order to handle thermal expansion. The measurement accuracy will be reduced close to the tube opening.

Figure 3-31: Coaxial Probe with Tube



A. Drain

Solids applications

Pull the probe rope through a suitable anchoring point, e.g. a welded eye and fasten it with two clamps. It is recommended the probe is slack in order to prevent high tensile loads.

The sag should be at least 1.5 in./10 ft. (10 mm/m) of the probe length.

Figure 3-32: Flexible Single Lead Probe with Two Clamps

A. ≥ 10 mm/m

4 Electrical installation

4.1 Safety messages

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that potentially raises ⚠). Refer to the following safety messages before performing an operation preceded by this symbol.

⚠ WARNING

Failure to follow safe installation and servicing guidelines could result in death or serious injury.

Ensure the transmitter is installed by qualified personnel and in accordance with applicable code of practice.

Use the equipment only as specified in this manual. Failure to do so may impair the protection provided by the equipment.

Do not perform any services other than those contained in this manual unless you are qualified.

⚠ WARNING

Process leaks could result in death or serious injury.

Ensure that the transmitter is handled carefully. If the process seal is damaged, gas might escape from the tank if the transmitter head is removed from the probe.

⚠ WARNING

Explosions could result in death or serious injury.

Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

Before connecting a handheld communicator in an explosive atmosphere, ensure that the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.

Do not remove the gauge cover in explosive atmospheres when the circuit is alive.

⚠ WARNING

High voltage that may be present on leads could cause electrical shock.

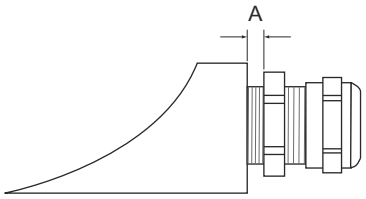
Avoid contact with the leads and terminals.

Ensure the mains power to the transmitter is off and the lines to any other external power source are disconnected or not powered while wiring the transmitter.

Probes covered with plastic and/or with plastic discs may generate an ignition-capable level of electrostatic charge under certain extreme conditions. Therefore, when the probe is used in a potentially explosive atmosphere, appropriate measures must be taken to prevent electrostatic discharge.

4.2 Cable/conduit entries

The electronics housing has two entries for ½ - 14 NPT. Optional M20×1.5, minifast® and eurofast® adapters are also available. The connections are made in accordance with local or plant electrical codes.



Make sure that unused ports are properly sealed to prevent moisture or other contamination from entering the terminal block compartment of the electronics housing.

Note
Use the enclosed metal plugs to seal unused ports. The plastic plugs mounted at delivery are not sufficient as seal!

Note
Thread sealing (PTFE) tape or paste on male threads of conduit is required to provide a water/dust tight conduit seal and to meet the required degree of ingress protection as well as to enable future removal of the plug/gland.

NPT is a standard for tapered threads. Engage the gland with 5 to 6 threads. Note that there will be a number of threads left outside the housing as illustrated in Figure 4-1.

Figure 4-1: Cable Entry with NPT Threaded Gland

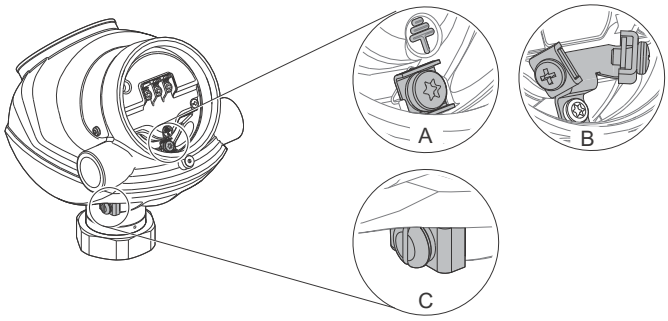
A. The NPT threaded gland leaves a number of threads outside the housing

Ensure that glands for the cable entries meet requirements for IP class 66 and 67.

4.3 Grounding

Ensure grounding is done (including IS ground inside Terminal compartment) according to Hazardous Locations Certifications, national and local electrical codes.

Grounding is essential for Hazardous Location safety (even for Flameproof/Explosion Proof versions). A ground cable with a cross-sectional area of ≥ 4 mm^2 must be used.



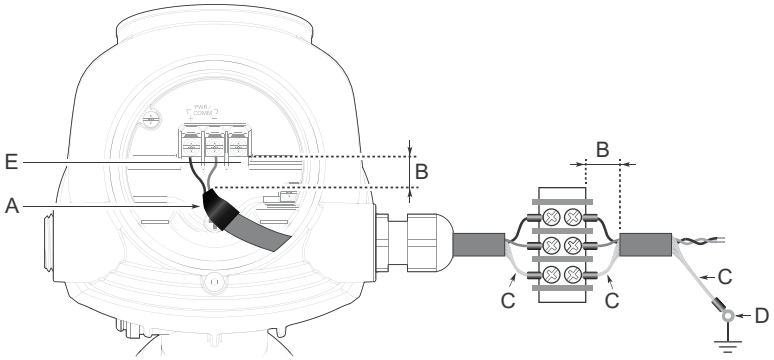
Note
Grounding the transmitter via threaded conduit connection may not provide sufficient ground.

Note
In the explosion-proof/flameproof version, the electronics is grounded via the transmitter housing. After installation and commissioning ensure that no ground currents exist due to high ground potential differences in the installation.

Transmitter housing grounding

The most effective transmitter housing grounding method is a direct connection to earth ground with minimal (< 1 Ω) impedance. There are two grounding screw connections provided (see Figure 4-2).

Figure 4-2: Ground Screws



A. Internal ground screw, torque 28 in-lb (3.2 Nm)
B. Internal ground twin-screws for Hazardous locations certifications CSA/Canada, torque 10 in-lb (1.2 Nm)
C. External ground screw, torque 36 in-lb (4.1 Nm)

Signal cable shield grounding

Ensure the instrument cable shield is:

- Trimmed close and insulated from touching the transmitter housing.
- Continuously connected throughout the segment.
- Connected to a good earth ground at the power supply end.

Figure 4-3: Cable Shield and Signal Wire Insulation

A. Insulate shield
B. Minimize distance
C. Trim shield and insulate
D. Connect shield back to the power supply ground
E. Signal cable insulation must extend into the interior of each separate terminal

4.3.1 Grounding - FOUNDATION™ Fieldbus

⚠ Signal wiring of the fieldbus segment cannot be grounded. Grounding out one of the signal wires will shut down the entire fieldbus segment.

Shield wire ground

To protect the fieldbus segment from noise, grounding techniques for shield wire usually require a single grounding point for shield wire to avoid creating a ground loop. The ground point is typically at the power supply.

4.4 Cable selection

Use shielded twisted pair wiring for the Rosemount™ 5300 Level Transmitter to comply with EMC regulations. The cables must be suitable for the supply voltage and approved for use in hazardous areas, where applicable. For instance, in the U.S., explosion-proof conduits must be used in the vicinity of the vessel. For the ATEX and the IECEx flameproof versions of the Rosemount 5300 Level Transmitter, suitable conduits with sealing device or flameproof Ex d) cable glands must be used depending on local requirements.

Use 18 AWG to 12 AWG to minimize the voltage drop to the transmitter.

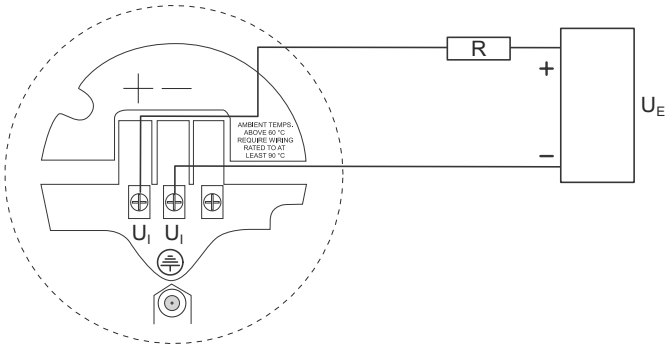
Note
Avoid running instrument cable next to power cables in cable trays or near heavy electrical equipment.

4.5 Hazardous areas

When the Rosemount 5300 Level Transmitter is installed in a hazardous area, local regulations and specifications in applicable certificates must be observed.

4.6 4-20 mA/HART® communication

4.6.1 Power requirements



Terminals in the transmitter housing provide connections for signal cables. The Rosemount 5300 Level Transmitter is loop-powered and operates with the following power supplies:

Table 4-1: External Power Supply for HART

Approval type	Input voltage (U_i)(1)
None	16 - 42.4 Vdc
Non-sparking/Energy Limited	16 - 42.4 Vdc
Intrinsically Safe	16 - 30 Vdc
Explosion-proof/Flameproof	20 - 42.4 Vdc

(1) Reverse polarity protection.

Figure 4-4: External Power Supply for HART

R = Load Resistance (Ω)

U_E = External Power Supply Voltage (Vdc)

U_i = Input Voltage (Vdc)

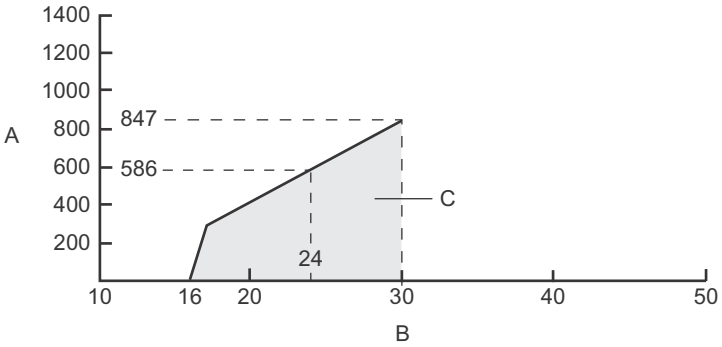


Table 4-2: Minimum Input Voltage (U_i) at Different Currents

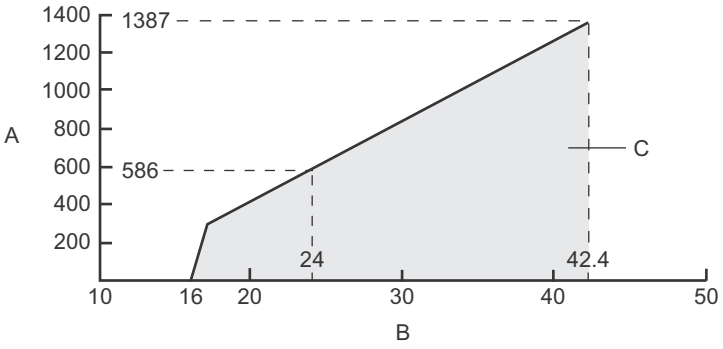
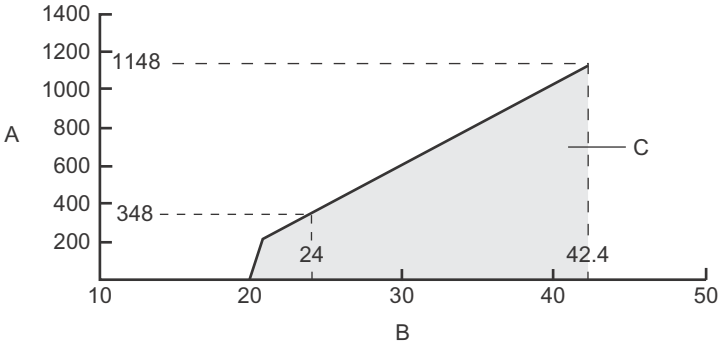
Hazardous approval	Current	
	3.75 mA	21.75 mA
	Minimum input voltage (U_i)	
Non-hazardous installations, intrinsically safe installations and Non-sparking installations	16 Vdc	11 Vdc
Explosion-proof/flameproof installations	20 Vdc	15.5 Vdc

4.6.2 Load limitations



For HART® communication, a minimum loop resistance of 250 Ω is required. Maximum loop resistance is determined by the voltage level of the external power supply, as given by the following diagrams:

Figure 4-5: Intrinsically Safe Installations

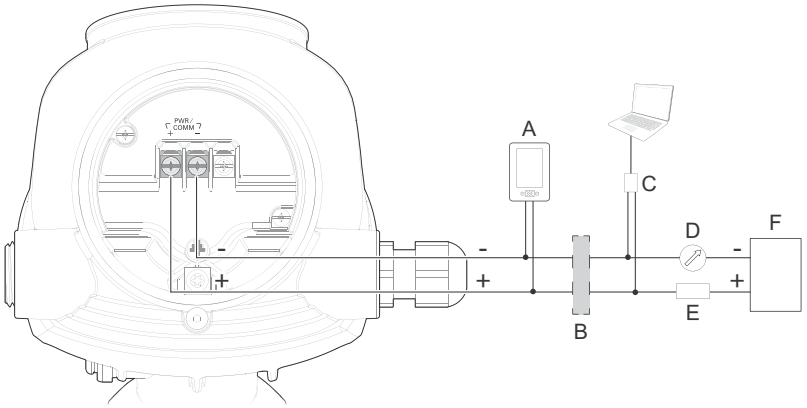


A. Loop Resistance (Ohms)
B. External Power Supply Voltage (Vdc)
C. Operating region

Figure 4-6: Non-Hazardous and Non-Sparking/Energy Limited Installations

A. Loop Resistance (Ohms)
B. External Power Supply Voltage (Vdc)
C. Operating region

Figure 4-7: Explosion-Proof/Flameproof (Ex d) Installations



A. Loop Resistance (Ohms)
B. External Power Supply Voltage (Vdc)
C. Operating region

Note
For the Ex d case, the diagram is only valid if the load resistance is at the + side and if the - side is grounded, otherwise the maximum load resistance is limited to 435 Ω.

4.6.3 Wiring diagram

Figure 4-8: Wiring Diagram for 4-20 mA/HART®

A. Handheld communicator
B. Approved IS barrier (for Intrinsically Safe installations only)
C. HART modem
D. Current meter
E. Load resistance (≥250 Ω)
F. Power supply

Note
Rosemount 5300 Level Transmitters with flameproof/explosion-proof output have a built-in barrier; no external barrier needed.

For flameproof/explosion-proof applications the resistance between the negative terminal on the transmitter and the power supply must not exceed 435 Ω.

Note
For flameproof/explosion-proof installations, ensure the transmitter is grounded to the internal ground terminal inside the terminal compartment in accordance with national and local electrical codes.

Note
For intrinsically safe installations, ensure the instruments in the loop are installed in accordance with intrinsically safe field wiring practices and system control drawings when applicable.

4.7 HART® to Modbus® converter (HMC)

4.7.1 External power supply

The input voltage U_i for Modbus is 8-30 Vdc (max. rating).

4.7.2 Signal wiring

For the RS-485 bus, use shielded twisted pair wiring, preferably with an impedance of 120 Ω (typically 24 AWG) in order to comply with the EIA-485 standard and EMC regulations. The maximum cable length is 4000 ft./1200 m.

4.7.3 Power supply cabling

The power supply cables must be suitable for the supply voltage and ambient temperature, and approved for use in hazardous areas, where applicable.

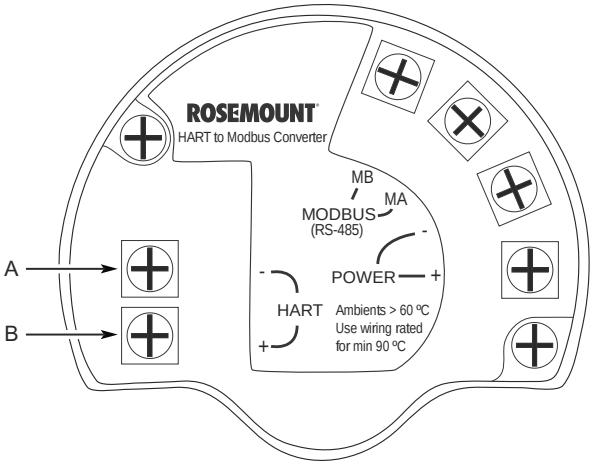
4.7.4 Ground (common mode) voltage limit

± 7 V

4.7.5 Bus termination

Standard RS-485 bus termination per EIA-485

4.7.6 Connection terminals



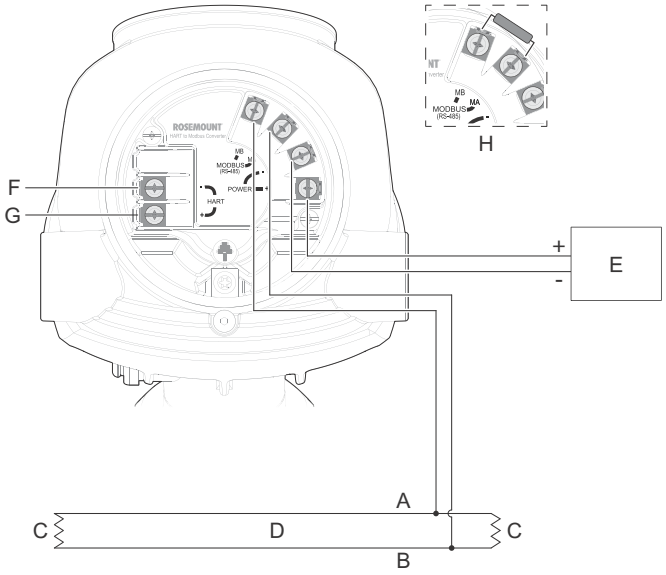
The connection terminals are described in Table 4-3.

Table 4-3: Connection Terminals

Connector label	Description	Comment
HART +	Positive HART connector	Connect to PC with Rosemount Radar Master software, handheld communicator, or other HART configurators.
HART -	Negative HART connector	
MA	Modbus RS-485 B connection (RX/TX+)(1)	Connect to RTU
MB	Modbus RS-485 A connection (RX/TX-)(1)	
POWER +	Positive power input terminal	Apply +8 Vdc to +30 Vdc (max. rating)
POWER -	Negative power input terminal	

(1) The designation of the connectors do not follow the EIA-485 standard, which states that RX/TX- should be referred to as 'A' and RX/TX+ as 'B'.

Figure 4-9: Connection Terminals for Rosemount 5300 with HART to Modbus Converter



A. HART -
B. HART +

4.7.7 RS-485 bus

- The Rosemount 5300 Level Transmitter does not provide electrical isolation between the RS-485 bus and the transmitter power supply.
- Maintain a bus topology and minimize stub length.
- The RS-485 bus needs to be terminated once at each end, but should not be terminated elsewhere on the bus.

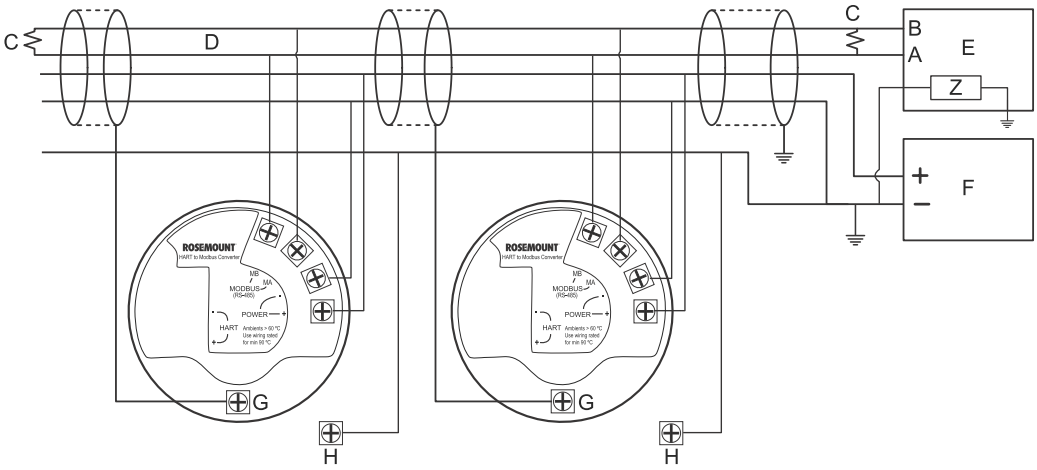
4.7.8 Wiring diagram

Figure 4-10: Wiring Diagram for RS-485 with Modbus®

A. "A" line
B. "B" line
C. 120 Ω
D. RS-485 Bus
E. Power supply
F. HART -
G. HART +
H. If it is the last transmitter on the bus, connect the 120 Ω termination resistor.

Note
Rosemount 5300 Level Transmitters with Flameproof/Explosion-proof output have a built-in barrier; no external barrier needed.(3)

4.7.9 Installation cases



- Use common ground for Modbus Master and power supply.
- The power cables and RS-485 bus are in the same cable installation.
- A ground cable is installed and shall be used (cable size > 4 mm according to IEC60079-14, or size according to applicable national regulations and standards). A properly installed threaded conduit connection may provide sufficient ground.
- The cable shielding is grounded at master site (optional).

Note
⚠ The HART to Modbus Converter (HMC) equipped transmitter contains intrinsically safe circuits that require the housing to be grounded in accordance with national and local electrical codes. Failure to do so may impair the protection provided by the equipment.

(3) An external galvanic isolator is always recommended to be used for Flameproof/Explosion-proof installations.

Install the Rosemount 5300 Level Transmitter as shown in Figure 4-11. Up to 32 devices may be wired on one RS-485 bus using a multidrop wiring topology.

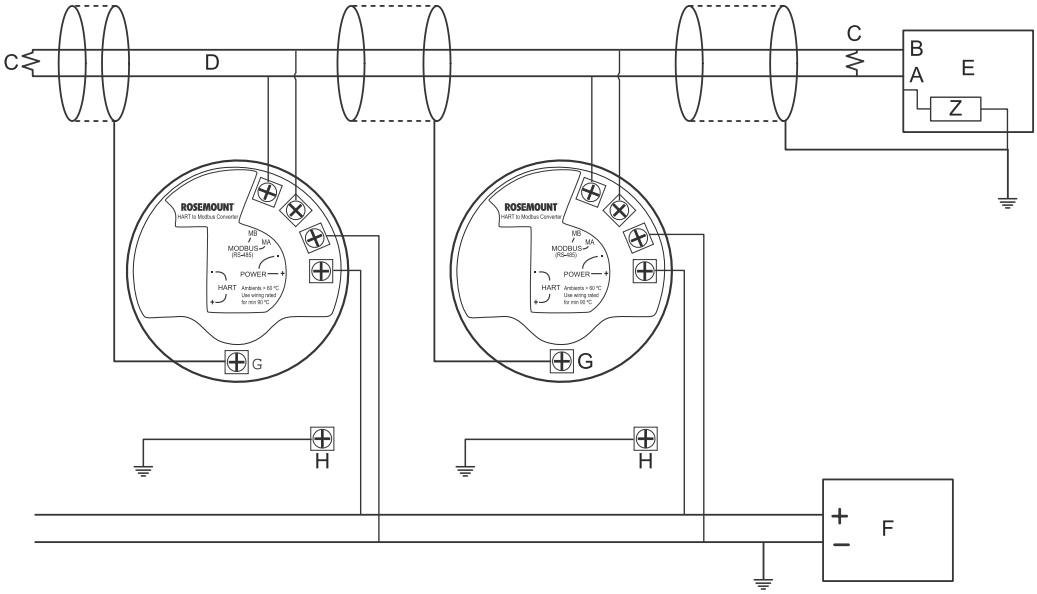


Figure 4-11: Multidrop Connection of Rosemount 5300 Level Transmitters

A. "A" line
B. "B" line
C. 120Ω
D. RS-485 bus
E. Modbus Master
F. Power supply
G. Internal ground screw
H. External ground screw

Alternatively, the Rosemount 5300 Level Transmitter can be installed as shown in Figure 4-12. If this wiring layout is used, there is an increased risk for communication disturbances due to differences in potential between grounding points. By using the same grounding point for Modbus Master and power supply, this risk is reduced.

Figure 4-12: Alternative Multidrop Connection of Rosemount 5300 Level Transmitters

B. "B" line
C. 120Ω
D. RS-485 bus
E. Modbus Master
F. Power supply
G. Internal ground screw
H. External ground screw

Star topology

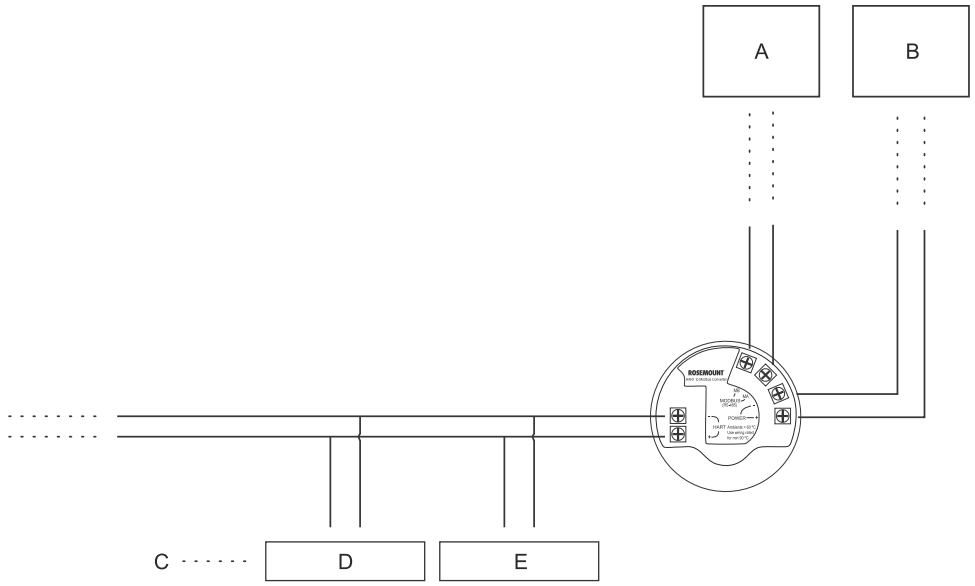
For a star topology connection of the Rosemount 5300 Level Transmitter, the transmitter with the longest cable run needs to be fitted with a 120 Ω termination resistor.

Figure 4-13: Star Topology Connection of Rosemount 5300

A. 120 Ω termination resistor

4.7.10 External HART® devices (slaves)

The HART to Modbus® Converter (HMC) supports up to four external HART devices. The external devices are separated by using the HART address. The address must be different between the external devices and only addresses 1 to 5 are allowed for multiple slaves. Connect the devices one at a time and change the short address prior to connecting the next device by using a HART Configuration Tool such as Rosemount Radar Master, or a handheld communicator.



Note
The power supply from the HMC to external HART devices is not intrinsically safe. In a hazardous environment, any external HART device connected to the HMC must have Flameproof/Explosion-proof certification.

The HMC cyclically polls the HART devices for measurement values. The update rate depends on the number of connected devices and is shown in Table 4-4.

Table 4-4: Approximate Update Rates for Measurement Values

Number of devices (slaves)	Approximate update rate
1	2 seconds
2	3 seconds
3	4 seconds
4	5 seconds
5	5 seconds

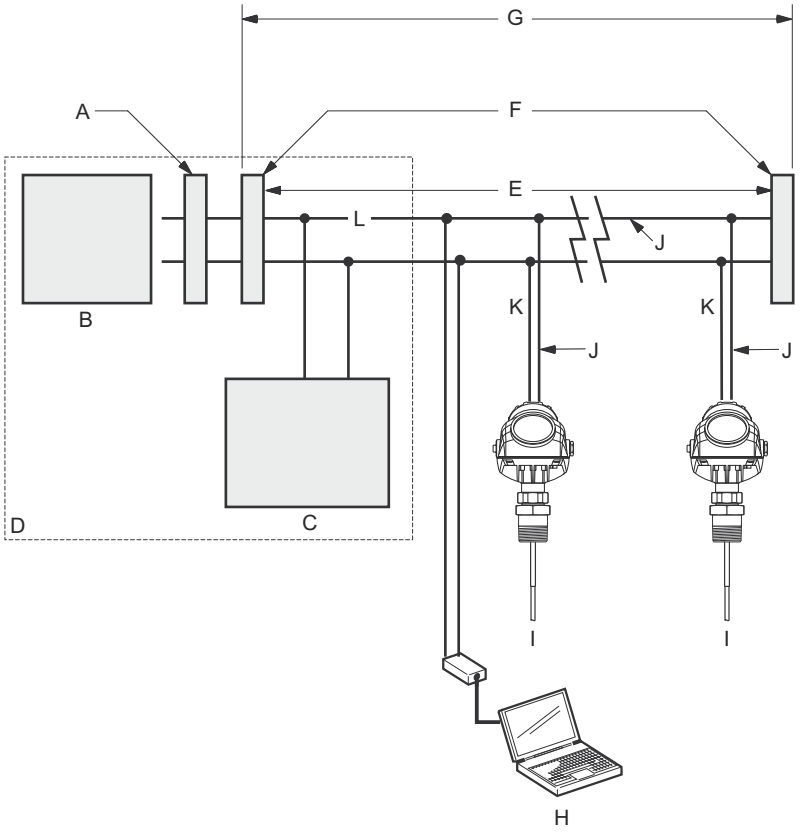
A. RS-485 bus
B. Power supply
C. Up to four external devices
D. External HART device 2
E. External HART device 1

4.8 FOUNDATION™ Fieldbus

4.8.1 Power requirements



Terminals in the transmitter housing provide connections for signal cables. The Rosemount 5300 Level Transmitter is powered over FOUNDATION™ Fieldbus with standard fieldbus power supplies. The transmitter operates with the following power supplies:

Table 4-5: External Power Supply for FOUNDATION Fieldbus

Approval type	Power supply (Vdc)
None	9 - 32
Non-sparking/Energy limited	9 - 32
Intrinsically Safe	9 - 30
FISCO	9 - 17.5
Explosion-proof/flameproof	16 - 32

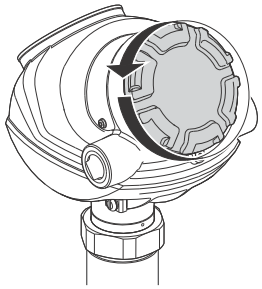
4.8.3 Wiring diagram

Figure 4-16: Wiring Diagram for FOUNDATION Fieldbus

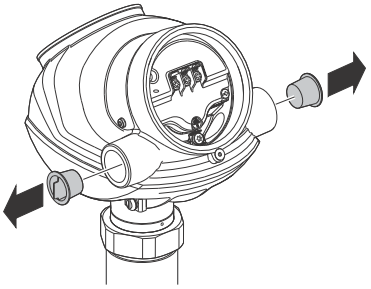
A. Handheld communicator
B. Approved IS barrier (for Intrinsically Safe installations only)
C. FOUNDATION Fieldbus modem
D. Power supply

Note
Rosemount 5300 Level Transmitters with flameproof/explosion-proof output have a built-in barrier; no external barrier needed.



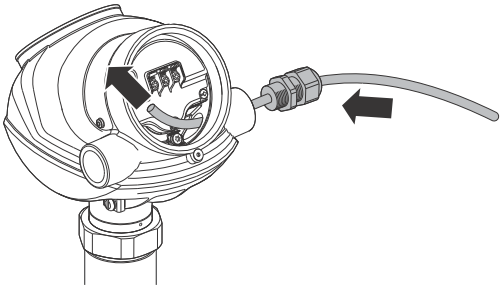
Note
For intrinsically safe installations, ensure the instruments in the loop are installed in accordance with intrinsically safe field wiring practices.

Note
For explosion-proof/flameproof installations, ensure the transmitter is grounded to the internal ground terminal inside the terminal compartment in accordance with national and local electrical codes.

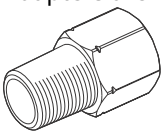


4.9 Connect wiring and power up

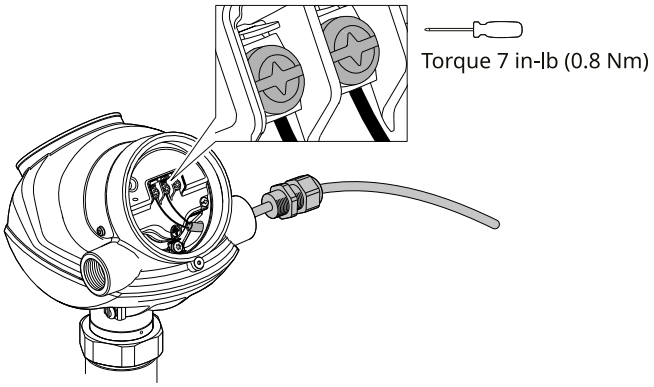
Procedure



1. ⚠ Confirm the power supply is switched off.
2. Remove the terminal block cover.

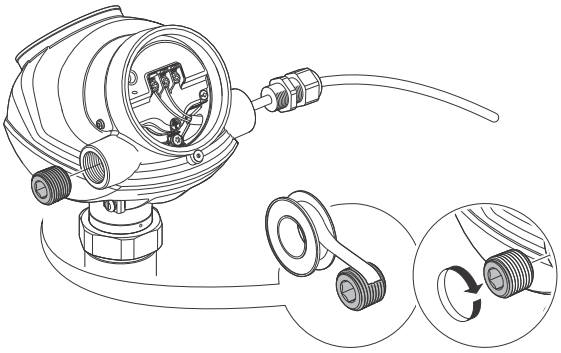


3. Remove the plastic plugs.



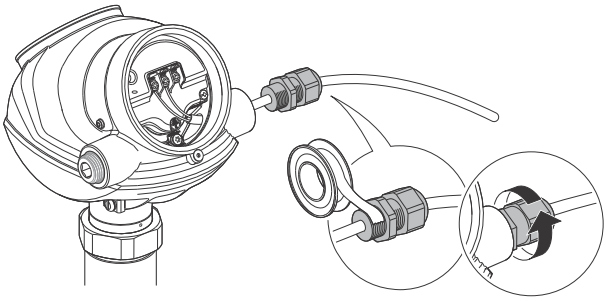
4. Pull the cable through the cable gland/conduit.

Adapters are required if M20 glands are used.



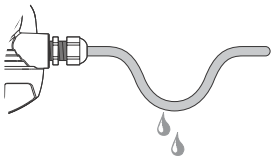
5. Connect the cable wires (see Figure 4-8, Figure 4-16, and Figure 4-10

6. Ensure proper grounding.

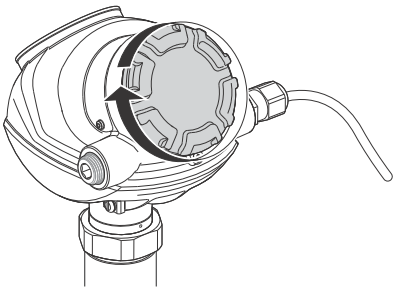


7. Use the enclosed metal plug to seal any unused port.

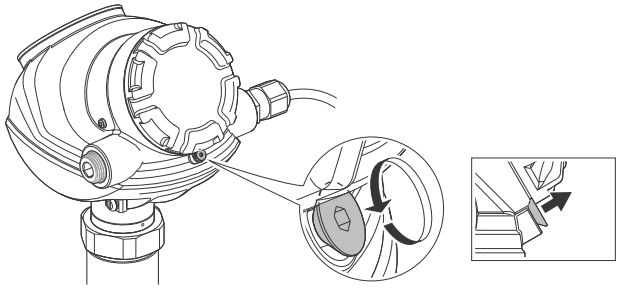
Note
Apply PTFE tape or other sealant to the threads.



8. Tighten the cable gland.



Note
Apply PTFE tape or other sealant to the threads.



Note
Be sure to arrange the wiring with a drip loop.

9. ⚠ Mount the cover making sure the cover is secure to meet explosion-proof requirements.

10. Turn the jam screw counterclockwise until it contacts the cover.
    ⚠ Required for flameproof installations only.

11. Connect the power supply.

Related information

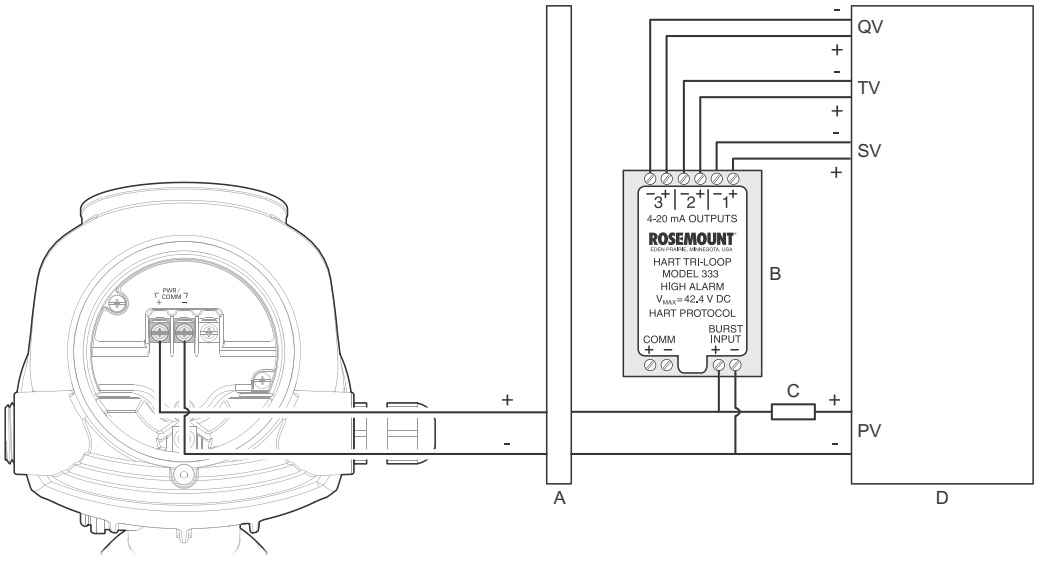
Grounding

4.10 Optional devices



4.10.1 Rosemount 333 HART® Tri-Loop™

The Rosemount 5300 outputs a HART signal with four process variables. By using the Rosemount 333 HART Tri-Loop, up to three additional analog 4-20 mA outputs are provided.

Each Tri-Loop channel receives power from control room. Channel 1 must be powered for the Tri-Loop to operate.

The transmitter receives power from control room.

5 Configuration

5.1 Safety messages

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that potentially raises ⚠). Refer to the following safety messages before performing an operation preceded by this symbol.

⚠ WARNING

Failure to follow safe installation and servicing guidelines could result in death or serious injury.

Ensure the transmitter is installed by qualified personnel and in accordance with applicable code of practice.

Use the equipment only as specified in this manual. Failure to do so may impair the protection provided by the equipment.

Do not perform any services other than those contained in this manual unless you are qualified.

⚠ WARNING

Explosions could result in death or serious injury.

Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

Before connecting a handheld communicator in an explosive atmosphere, ensure that the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.

Do not remove the gauge cover in explosive atmospheres when the circuit is alive.

5.2 Overview

The configuration of a Rosemount™ 5300 Level Transmitter is normally a simple and straightforward task. The complete configuration of a Rosemount 5300 Level Transmitter includes basic configuration, echo tuning, and advanced configuration. This section describes basic configuration.

If the transmitter is pre-configured at the factory according to the ordering specifications in the Configuration Data Sheet, no further basic configuration is required unless tank conditions have changed. The Rosemount 5300 Level Transmitter supports a set of advanced configuration options as well, which can be used to handle special tank conditions and applications.

It is highly recommended that prior to changing any parameters, save your current configuration as a backup file. If for any reason configuration data is lost or accidentally modified making the device inoperable, this backup file can be reloaded into the device.

5.2.1 Basic configuration

The basic configuration includes parameters for a standard configuration which is sufficient in most cases. The basic configuration comprises the following items:

- Measurement units
- Tank configuration - Tank geometry - Environment - Volume
- Analog output

5.2.2 Echo tuning

Amplitude thresholds can be adjusted in order to handle special situations when, for example, objects in the tank cause disturbing echoes that are stronger than the surface echo. A useful function is the Amplitude Threshold Curve (ATC) which lets you filter out single disturbing echoes. See Amplitude threshold curve for more information.

5.2.3 LCD configuration

It is possible to specify the variables to be presented on the display panel. See also Specify display panel variables.

5.2.4 Advanced configuration

For some applications, further device specific configuration is needed in addition to the basic configuration. This may be due to product properties or tank shape. See Advanced configuration for more information.

5.3 Configuration tools

- Field Device Integration (FDI) compliant systems
- Device Descriptor (DD) compliant systems
- Device Type Manager (DTM™) compliant systems
- Rosemount Radar Master

5.4 Host system integration

5.4.1 Confirm system readiness (HART® only)

Confirm HART® revision capability

If using HART based control or asset management systems, confirm the HART capability of those systems prior to transmitter installation. Not all systems are capable of communicating with HART Revision 7 protocol.

Transmitters with a firmware version 2F0 or later can be configured for either HART Revision 5 or 7.

Confirm correct device driver

Procedure

- Verify that the latest Device Driver (FDI/DD/DTM™) is loaded on your systems to ensure proper communication. See Table 5-1.
- Download the latest Device Driver from Emerson.com/MySoftware.

Table 5-1: Rosemount 5300 Device Revisions and Files

Firmware version(1)	Find Device Driver	
	HART® Universal Revision	Device Revision(2)
2F0 or later	7	4
	5	3
2A2 - 2E0	5	3

(1) Firmware version is printed on the transmitter head label (e.g. SW 2E0), or can be found here:

- *FDI/DD/DTM (select **Device Information** → **Revisions** → **Firmware Versions**).*
- *Rosemount Radar Master (select **Device** → **Properties**).*

(2) Device revision is printed on the transmitter head label (e.g. HART Dev Rev 4).

Download AMS Device Configurator

AMS Device Configurator is a software for configuration of Emerson field devices using FDI technology.

Procedure

Download the software at Emerson.com/AMSDeviceConfigurator.

Add the FDI Package to AMS Device Configurator

Procedure

1. Start **AMS Device Configurator**.
2. At the top left, click the menu icon and select **Add Device Package**.

3. Browse to the downloaded FDI Package and select **Open**.
4. Select **Add**.
5. Select **Back**.

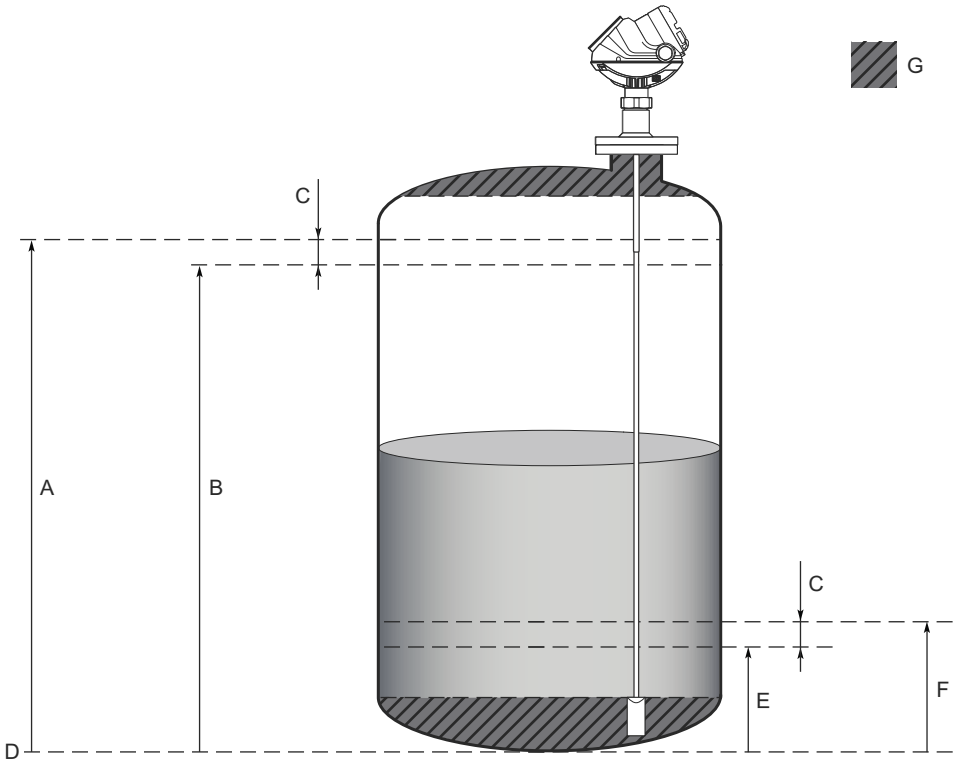
Switch HART® revision mode

If the HART configuration tool is not capable of communicating with HART Revision 7, the device will load a generic menu with limited capability. To switch the HART revision mode from the generic menu:

Procedure

1. Locate the “Message” field.
2. In the Message field, enter **HART5** or **HART7**.

5.4.2 Set alarm limits



The alarm limits that are set in the host system need to be adjusted for the expected maximum product level rate and configured Damping Value.

When setting the high alarm limit, a safety margin (see Figure 5-1) should be subtracted from the desired high alarm limit. For the low alarm limit, the same safety margin should be added to the desired low alarm limit.

The safety margin ensures that the response time of the device is taken into account when specifying the alarm limits. See Table 5-2 or Table 5-3 (if Signal Quality Metrics is turned on) to determine the safety margin for your application.

Note
Alert limit values must be outside the Blind Zones and preferable outside areas with reduced accuracy.

Figure 5-1: Safety Margin for Alarm Limits

A. Desired high alarm limit
B. High alarm limit
C. Safety margin
D. Zero reference point
E. Desired low alarm limit
F. Low alarm limit
G. Blind Zones

Table 5-2: Safety Margin in Inches and Millimeters

Level rate in/min (mm/min)	Damping value			
	2 s (default)	10 s	20 s	50 s
Level Rate > 6.40 (160)	0.25 × Level Rate	0.60 × Level Rate	0.90 × Level Rate	1.90 × Level Rate
2.35 (60) < Level Rate < 6.40 (160)	0.50 × Level Rate	0.85 × Level Rate	1.15 × Level Rate	2.15 × Level Rate
1.05 (25) < Level Rate < 2.35 (60)	0.90 × Level Rate	1.25 × Level Rate	1.60 × Level Rate	2.60 × Level Rate
Level Rate < 1.05 (25)	1.75 × Level Rate	2.10 × Level Rate	2.40 × Level Rate	3.40 × Level Rate

Table 5-3: Safety Margin in Inches and Millimeters with Signal Quality Metrics Turned On

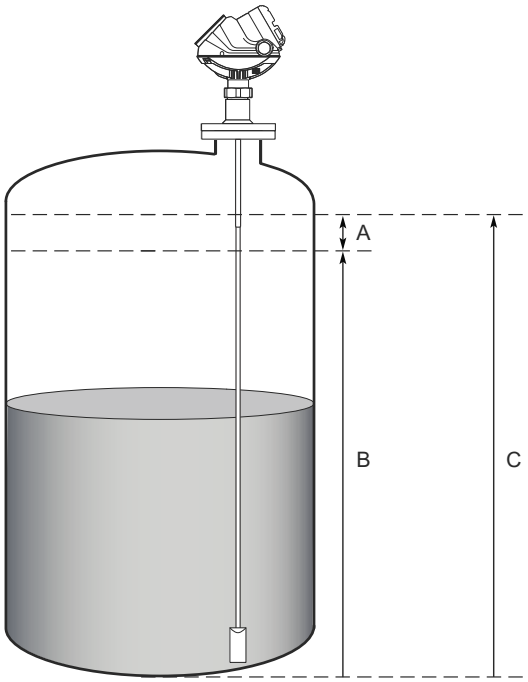
Level rate in/min (mm/min)	Damping value			
	2 s (default)	10 s	20 s	50 s
Level Rate > 6.40 (160)	0.40 × Level Rate	0.65 × Level Rate	1.00 × Level Rate	2.00 × Level Rate
2.35 (60) < Level Rate < 6.40 (160)	0.85 × Level Rate	1.10 × Level Rate	1.45 × Level Rate	2.45 × Level Rate
1.05 (25) < Level Rate < 2.35 (60)	1.55 × Level Rate	1.85 × Level Rate	2.15 × Level Rate	3.15 × Level Rate
Level Rate < 1.05 (25)	3.05 × Level Rate	3.30 × Level Rate	3.65 × Level Rate	4.65 × Level Rate

Procedure

1. Identify maximum product level rate for the application.
2. Note configured Damping Value.
   a) Rosemount Radar Master: Select **Setup** → **Advanced**.
   FDI/DD/DTM: Select **Service Tools** → **Echo Tuning**.
   b) Rosemount Radar Master: Select the **Echo Tracking** tab.
   FDI/DD/DTM: Select **Tracking Tab**.
3. Calculate where to position the high alarm limit in your host system.
   a) Determine desired high alarm limit.
   b) Subtract safety margin from the desired high alarm limit according to Table 5-2 (or Table 5-3 if Signal Quality Metrics is turned on).
4. Calculate where to position the low alarm limit in your host system.
   a) Determine desired low alarm limit.
   b) Add safety margin to the desired low alarm limit according to Table 5-2 (or Table 5-3 if Signal Quality Metrics is turned on).

Determine high alarm limit

Maximum product level rate = 100 mm/min Damping Value = 10 s



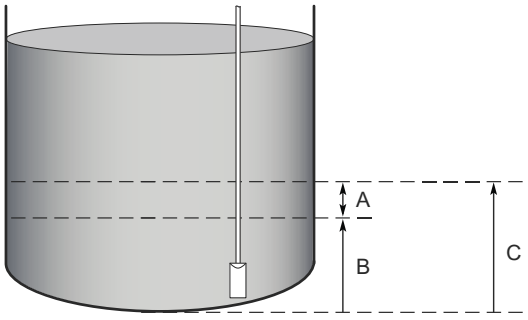
The Signal Quality Metrics is turned off in this example, so the safety margin is calculated using Table 5-2.

Safety margin = 0.85 × Level Rate = 0.85 × 100 = 85 mm

Desired high level alarm limit = 8500 mm

High alarm limit = Desired high alarm limit - Safety margin = 8500 - 85 = 8415 mm

Figure 5-2: Example - Determine High Alarm Limit



A. Safety margin = 85 mm
B. High alarm limit = 8500 - 85 = 8415 mm
C. Desired high alarm limit = 8500 mm

Determine low alarm limit

Desired low level alarm limit = 300 mm

Low alarm limit = Desired low alarm limit + Safety margin = 300 + 85 = 385 mm

Figure 5-3: Example - Determine Low Alarm Limit

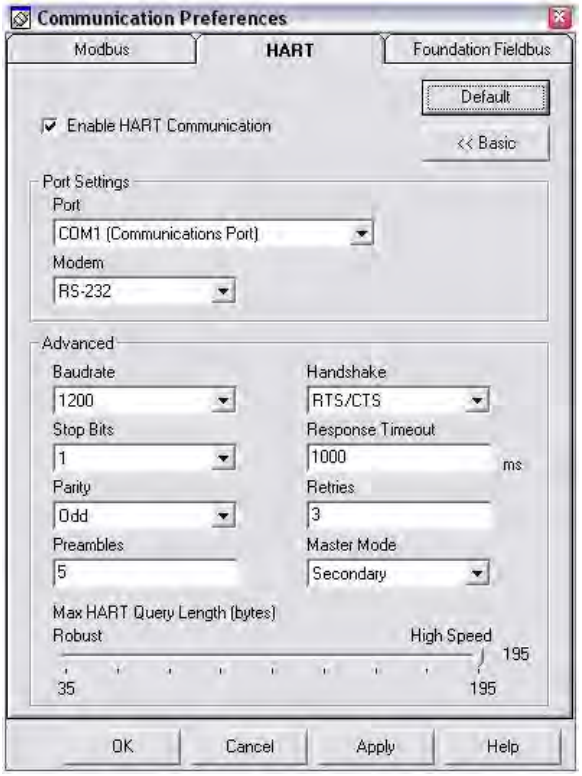
A. Safety margin = 85 mm
B. Desired low alarm limit = 300 mm
C. Low alarm limit = 300 + 85 = 385 mm

5.5 Establish HART® communication for transmitter with HART to Modbus® Converter

Configuration is done by sending HART commands through the HART to Modbus Converter (HMC) to the 5300 Level Transmitter electronics. To establish HART communication, connect to the MA/MB terminals, or to the HART terminals.

5.5.1 Connect to the MA/MB terminals using RRM

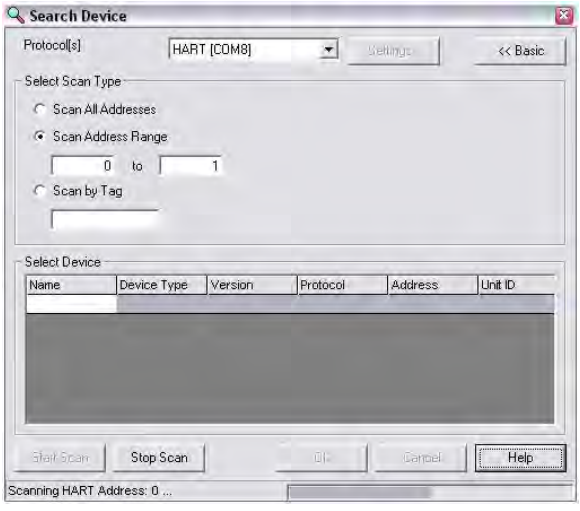
The Rosemount 5300 Level Transmitter can be configured with Rosemount Radar Master using the MA, MB terminals.



Prerequisites

An RS-485 Converter is required to connect to the transmitter.

Procedure



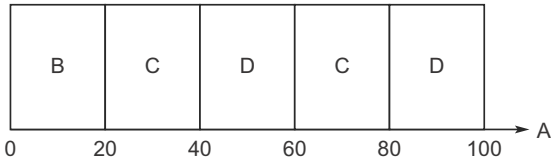
1. Connect the RS-485 Converter to the MA, MB connectors.
2. Start Rosemount Radar Master.
3. Enable HART communication and set communication preferences.
    a) Select **View** → **Communication Preferences**.
    b) Select the **HART** tab.
    c) Select the **Enable HART Communication** checkbox.
    d) In the ***Port*** list, select the COM port number that the RS-485 Converter is connected to.

e) Select **Advanced** and use the following settings:

f) Select **OK**.

4. Connect the power wires (or cycle power) to the transmitter.
5. Wait 20 seconds, and then search for and connect to device.
   a) Select **Device** → **Search**.
   b) Ensure HART address 1 is being scanned.

   c) Select **Start Scan**.
   After a while the ***Search Device*** window presents a list of found transmitters.



d) Select the device from the list and select **OK** to connect.

6. After completing the configuration, disconnect the RS-485 Converter, connect the Modbus communication wires and cycle power to the transmitter.
7. Verify communication between the transmitter and the RTU is established (can take up to 60 seconds from startup).

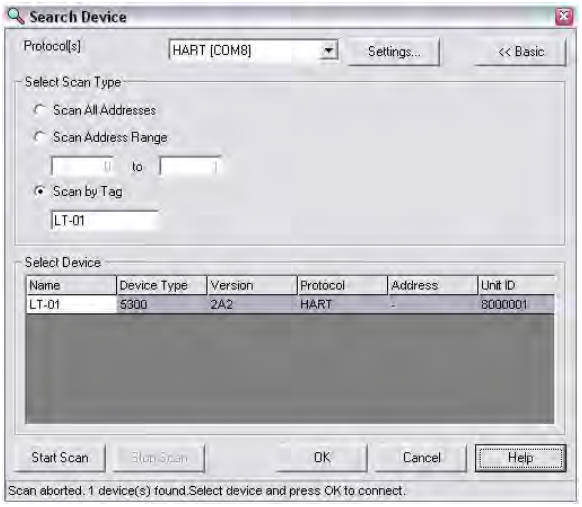
RS-485 communication after startup

The transmitter will try to establish communication using different protocols during 20 second time-slots from time of startup.

Figure 5-4: RS-485 Communication after Startup

A. Time (s)
B. Modbus RTU
C. HART
D. Configured protocol (Modbus RTU, Levelmaster, or Modbus ASCII)

The transmitter will continue to use a communication protocol once communication has been established.



Establish communication when multiple 5300/5400 Modbus units are on the bus using RRM

By default, the transmitters have HART address 1. It will not be possible to establish communication on HART address 1 if several transmitters have the same address. In this case, there are alternative solutions to establish communication:

Procedure

1. Select **Device** → **Search**.
2. In the *Search Device* window, select **Scan by Tag**.

3. Enter the HART Device Tag of the transmitter. Communication can now be established with an individual transmitter even if several devices have the same HART address.

4. Ensure the Rosemount 5300 is alone on bus. Disconnect or turn off power from any other devices.

5.5.2 Connect to the HART terminals

To configure the Rosemount 5300 Level Transmitter, connect the communicator or PC to the HART terminals using a HART modem. Both the configuration tool and the RS-485 bus can be connected simultaneously. Configuration data is sent with HART commands through the HART to Modbus Converter (HMC) to the Rosemount 5300 Level Transmitter electronics. Note that the power supply must be connected during configuration.

Note
Measurement data is not updated to the Modbus Master when a configuration tool is connected.

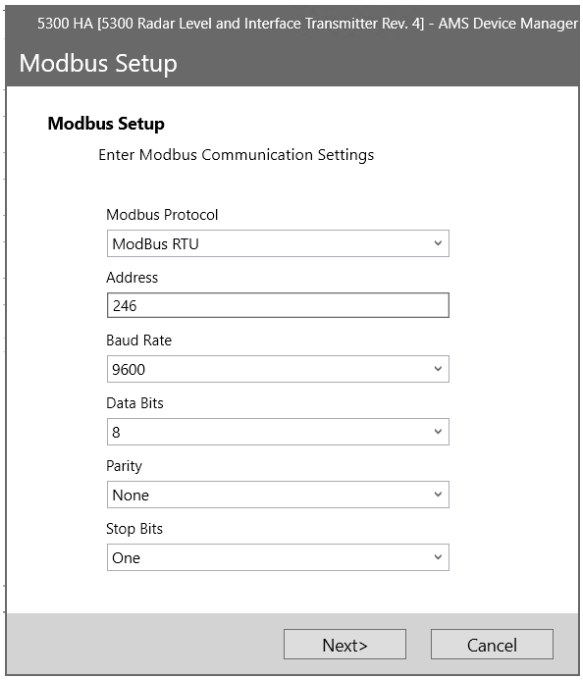
Connection terminals

5.6 Change Modbus communication parameters

5.6.1 Change Modbus communication parameters using FDI/DTM

To change the Modbus address and communication parameters:



Prerequisites

To change Modbus communication parameters, the Rosemount 5300 Level Transmitter must use HART address 1, the default address.

Procedure

1. Select **Configure** → **Manual Setup** → **Device Setup**.

2. Select the **HART** tab.
3. Select **Modbus Setup**.
4. In the ***Modbus Setup*** window, select Modbus protocol and type the desired Modbus address.

5. Enter the baud rate, parity, and stop bits, then select **Next**.

Postrequisites

After changing communication parameters, disconnect the HART modem and wait at least 60 seconds for the change to take effect. In case the MA/MB terminals are used for connection to the HART to Modbus Converter (HMC), disconnect the RS-485 Converter, cycle power to the transmitter and wait up to 60 seconds for the change to take effect.

5.6.2 Change Modbus communication parameters using a handheld communicator

The Modbus communication parameters can be changed by entering a text string in the HART Message parameter.

Prerequisites

To change Modbus communication parameters, the Rosemount 5300 must use HART address 1, the default address.

Procedure

1. Select: **Overview** → **Device Information** → **Identification**.
2. Enter desired string into the **Message** area.

Postrequisites

After changing communication parameters, disconnect the handheld communicator and wait up to 60 seconds for the change to take effect.

5.6.3 Change Modbus communication parameters using RRM

To change the Modbus address and communication parameters in Rosemount Radar Master:

Prerequisites

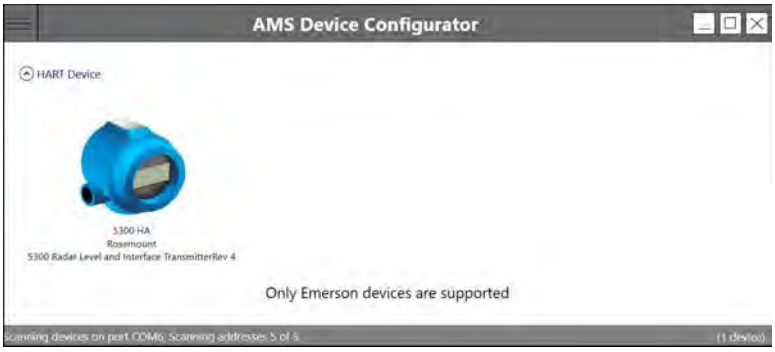
To change Modbus communication parameters, the Rosemount 5300 Level Transmitter must use HART address 1, the default address.

Procedure

1. Start Rosemount Radar Master and connect to the transmitter.
2. Select **Setup** → **General**.
3. Select the **Communication** tab.
4. Select **Modbus Setup**.
5. In the ***Modbus Setup*** window, select **Enter Modbus communication settings**.
   It is also possible to enter a user-defined Modbus message in the ***Modbus String*** area.
6. Select Modbus protocol and type the desired Modbus address.
7. Enter the baud rate, parity, and stop bits, then select **OK**.

Postrequisites

After changing communication parameters, disconnect the HART modem and wait at least 60 seconds for the change to take effect. In case the MA/MB terminals are used for connection to the HART to Modbus Converter (HMC), disconnect the RS-485 Converter, cycle power to the transmitter and wait up to 60 seconds for the change to take effect.

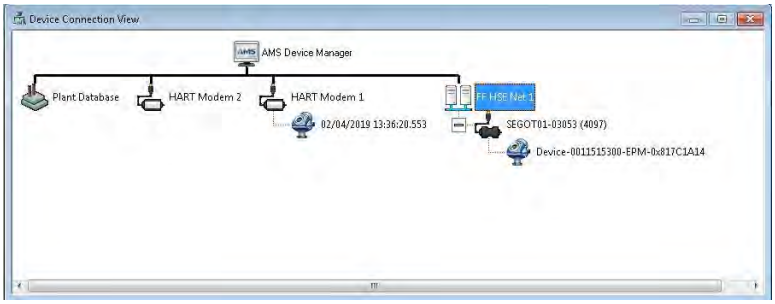


5.7 Basic configuration using FDI/DD/DTM

See Basic configuration parameters for information on the various configuration parameters.

5.7.1 Connect to device using AMS Device Configurator

Procedure



1. Start AMS Device Configurator.
2. Double-click the device icon.

5.7.2 Connect to device using AMS Device Manager

Procedure

1. Start AMS Device Manager.
2. Select **View** → **Device Connection View**.
3. In the *Device Connection View*, double-click the modem icon.
4. Double-click the device icon.

5.7.3 Connect to device using a handheld communicator

Procedure

Turn on the handheld communicator and connect to the device.

5.7.4 Configure device

Configure HART® devices

Procedure

1. Select **Configure** → **Guided Setup**.
2. Select **Level Measurement Setup** and follow the instructions.
3. Select **Device Specific Setup**.
4. Run **Verify Level** to check your level measurement.
5. (Optional) Select **Volume Setup**.
6. (Optional) Select **Display Setup**.

Configure FOUNDATION™ Fieldbus devices

Procedure

1. Select **Configure** → **Guided Setup**.
2. Select **Level Measurement Setup** and follow the instructions.
3. (Optional) Select **Volume Calculation Setup**.
4. (Optional) Select **Device Specific Setup**.
5. (Recommended) Select **Restart Measurement**.

5.8 Basic configuration using DeltaV

The Rosemount 5300 Level Transmitter supports DD Methods for DeltaV™ to facilitate transmitter configuration. The following description shows how to use DeltaV with AMS Device Manager to configure the Rosemount 5300 Level Transmitter. The corresponding FOUNDATION™ Fieldbus commands are also shown.

Procedure

1. From the **Start** menu, select **DeltaV** → **Engineering** → **DeltaV Explorer**.
2. Navigate through the file structure to find the Rosemount 5300 Level Transmitter.
3. Right-click the Rosemount 5300 Level Transmitter icon and select **Properties**.

The *Fieldbus Device Properties* window lets you enter device tag and description. This information is not required for the operation of the transmitter and can be left out if desired.

4. Check that the general information complies with the ordering information. General information such as device type (Rosemount 5300), manufacturer, device ID are presented.

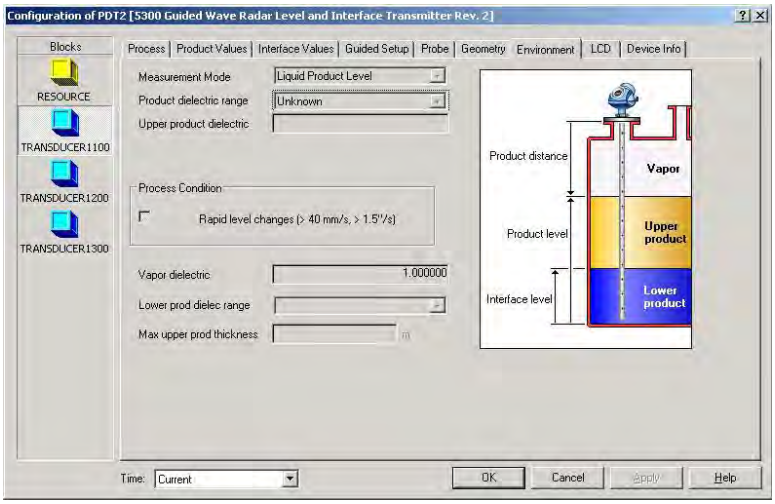
   The Rosemount 5300 Level Transmitter device ID consists of the following components: Manufacturer ID-Model-Serial Number.

   ### Example

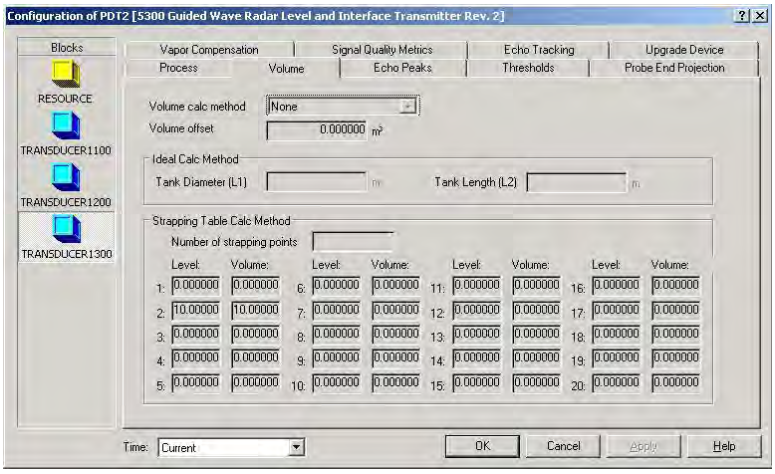
   0011515300 Radar T2-0x81413425

5. In the *DeltaV Explorer*, select the desired transmitter and choose the **Configure** option.

6. Select the **TRANSDUCER1100** block, and then select the **Probe** tab.



7. Check configuration of Probe Type.
   The transmitter automatically makes some initial calibrations based on the selected Probe Type. Normally, the Probe Type is pre-configured at the factory.
8. Check the entered Probe Length.
9. Select the **TRANSDUCER1100** block, and then select the **Geometry** tab.



10. Enter the **Tank Height**.
11. Select the **Mounting Type**.
12. If using pipe, chamber or nozzle, then select the **Inner Diameter**.
13. If using nozzle, then enter the **Nozzle Height**.

14. Select the **Environment** tab.

15. Select the **Measurement Mode**.
16. Enter the **Product Dielectric Range**/**Upper Product Dielectric**.
17. Select the **Rapid level changes** check-box only if the surface is moving quickly up or down at rates over 1.5 in./s (40 mm/s).
18. To configure volume calculation, select the **TRANSDUCER1300** block, and then select the **Volume** tab.

19. In the *Volume Calc method* list, select the **Volume Calculation Method**.
20. If an ideal tank shape is selected, then enter the **Tank Diameter** and **Tank Length** (not for spherical tanks).
21. If **Strapping Table** is selected, starting at the bottom of the tank, for each new point, enter the total volume up to the specified level value.
22. (Optional) Enter the **Volume Offset** value.

5.9 Basic configuration using RRM

To configure the Rosemount 5300 Level Transmitter using Rosemount Radar Master (RRM), choose either of the following methods:

- Guided Setup if you are unfamiliar with the Rosemount 5300 Level Transmitter (see Guided setup).
- Setup functions if you are already familiar with the configuration process or for changes to the current settings (Using the setup functions).

5.9.1 System requirements

Hardware

	Minimum	Recommended
Processor	Pentium 200 MHz	Pentium 1 GHz
Memory	64 MB RAM	128 MB RAM
Graphical card	Screen resolution of 800 x 600	Screen resolution of 1024 x 768
COM Port	1 serial COM port or 1 USB port	
Hard drive space	100 MB	

Software

Operating systems supported:

- Microsoft® Windows 11
- Microsoft Windows 10
- Microsoft Windows 2000 - Service pack 3
- Microsoft Windows XP - Service pack 2 and Service pack 3
- Microsoft Windows 7 - 32-bit and 64-bit versions

5.9.2 Help in RRM

To open the Help window:

Procedure

Select **Help** → **Contents**.

Help is also available from a Help button in most windows.

5.9.3 Download Rosemount Radar Master

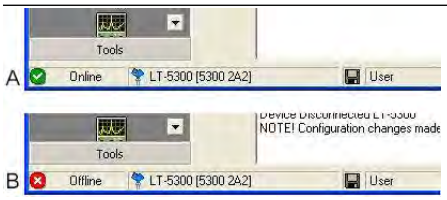
Rosemount Radar Master is a software for configuration of radar devices.

Procedure

Download the software at Emerson.com/RosemountRadarMaster.

5.9.4 Installing the RRM software for HART® communication

To install the Rosemount Radar Master:



Procedure

1. Insert the installation CD into your CD-ROM drive.
2. If the installation program is not automatically started, choose **Run** from the Windows Start bar.
3. Type `D:\RRM\Setup.exe`, where D is the CD-ROM drive.
4. Follow the instructions on the screen.
5. Confirm that HART is chosen as default protocol.
6. For Windows 2000/XP/7, set COM port buffers to 1, see Set the COM port buffers.

Getting started

Procedure

1. Click the **Start** button, and then select **All Programs** → **Rosemount** → **Rosemount Radar Master** or click the RRM icon in the Windows workspace.
2. If the *Search Device* window did not appear automatically, then select **Device** → **Search**.
3. In the *Search Device* window, choose communication protocol HART.
4. If you want to specify start and stop address, then select **Advanced**.
5. Click the **Start Scan** button. Now RRM searches for the transmitter.
   After a while the *Search Device* window presents a list of found transmitters.
6. Select the desired transmitter and select **OK** to connect.
7. If communication does not work, check that the correct COM port is connected to the computer and that the COM port is properly configured, see Specify the COM port. You may also check in the *Communication Preferences* window that HART communication is enabled.
8. In the RRM Status Bar, verify that RRM communicates with the transmitter.

A. RRM communicates with the transmitter
B. No communication with the transmitter

5.9.5 Specify the COM port

If communication is not established, open the *Communication Preferences* window and check that the correct COM Port is selected:

Procedure

1. In RRM, select **View** → **Communication Preferences**.
2. Select the **HART** tab.

3. Select the **Enable HART Communication** checkbox.
4. Check which COM port the modem is connected to.
5. Choose the COM port option that matches the actual COM port on the PC that the transmitter is connected to.

5.9.6 Set the COM port buffers

For Windows 2000/XP/7 the COM port Receive Buffer and Transmit Buffer need to be set to 1. To set the COM port buffers:

Procedure

1. In the MS Windows Control Panel, open the **System** option.
2. Select the **Hardware** tab, and then select **Device Manager**.
3. Expand the **Ports** node in the tree view.
4. Righ-click the selected COM port and select **Properties**.
5. Select the **Port Settings** tab, and then select **Advanced**.
6. Drag the **Receive Buffer** slider to 1.
7. Drag the **Transmit Buffer** slider to 1.
8. Select **OK**.
9. Restart the computer.

5.9.7 Installing the RRM software for FOUNDATION™ Fieldbus

To install the Rosemount Radar Master for FOUNDATION Fieldbus communication:

Procedure

1. Start by installing the *National Instruments Communication Manager* software.

   See National Instruments manual (Getting started with your PCMCIA-FBUS and the NI-FBUS® software) for more information.
2. Insert the RRM installation CD into your CD-ROM drive.
3. If the installation program is not automatically started, choose **Run** from the Windows Start bar.
4. Type `D:\RRM\Setup.exe` where D is the CD-ROM drive.
5. Follow the instructions on the screen.
6. Confirm that FOUNDATION Fieldbus is chosen as default protocol.

Getting started

Procedure

1. Before starting RRM ensure that appropriate settings are made with the *National Instruments Interface Configuration Utility*:

   If only Rosemount Radar Master is connected to the bus:

   - Device address = Fixed
   - Device Type = Link Master Device
   - Usage = NI-FBUS

   If other host systems are connected to the bus:

   - Device address = Visitor
   - Device Type = Basic Device
   - Usage = NI-FBUS

2. Click the **Start** button, and then select **All Programs** → **Rosemount** → **Rosemount Radar Master** or click the RRM icon in the Windows workspace.
3. If the National Instruments Communication Manager server is not running, select **Yes** when RRM displays a request for starting the server.
4. If the *Search Device* window did not appear automatically, then select **Device** → **Search**.
5. In the *Search Device* window, choose communication protocol FOUNDATION Fieldbus (if not already selected).
6. If you want to specify start and stop address, then select **Advanced**.

7. Select **Start Scan**. Now RRM searches for the transmitter.
   After a while RRM shows the transmitters found on the bus.

8. Select the desired transmitter and select **OK** to connect.
9. In the RRM Status Bar, verify that RRM communicates with the transmitter.

A. RRM communicates with the transmitter
B. No communication with the transmitter

5.9.8 Specifying measurement units

Measurement units for data presentation in RRM can be specified when the RRM program is installed. Units can also be changed as follows:

Procedure

1. Select **View** → **Application Preferences**.
2. Select the **Measurement Units** tab.
3. Choose the desired units for length, level rate, volume, and temperature.

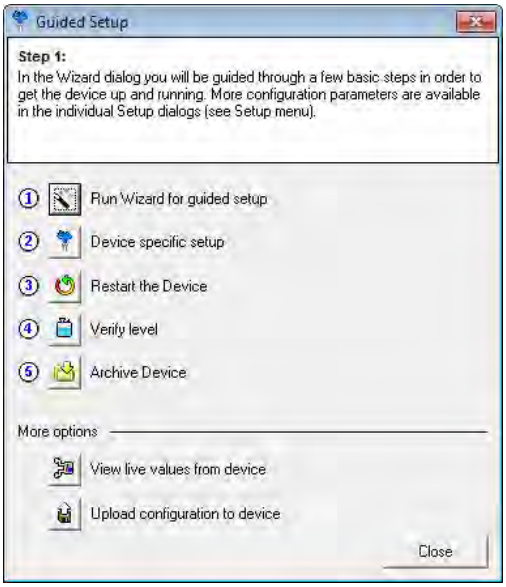
5.9.9 Using the setup functions

Use the setup function if you are already familiar with the configuration process for the Rosemount 5300 Series Transmitter or for changes to the current settings:

Procedure

1. Start the RRM software.

2. In the RRM workspace choose the appropriate icon for the configuration of transmitter parameters.



Icon	Description
Wizard	The Wizard is a tool that guides you through the basic configuration procedure of a Rosemount 5300 Level Transmitter.
General	Configuration of general settings such as communication parameters, device tag, and measurement units. This window also lets you configure which LCD variables to be displayed.
Tank	Configuration of probe, tank geometry, tank environment, and volume
Output	Configuration of analog and digital output
Echo Curve	Disturbance echo handling
Advanced	Advanced configuration

5.9.10 Guided setup

The following description shows how to use the Guided Setup in Rosemount Radar Master. The Guided Setup is useful if you are unfamiliar with the Rosemount 5300 Level Transmitter.

Procedure

1. Start the Guided Setup.
   a) Start Rosemount Radar Master. It automatically presents a list of available transmitters.
   b) Select the desired transmitter. Now the transmitter is connected and the *Guided Setup* window appears automatically:

2. In the *Guided Setup* window, select **Run Wizard for guided setup** and follow the instructions. Now you will be guided through a short transmitter installation procedure.

   Note
   The *Guided Setup* is an extended installation guide that includes more than just the configuration Wizard. It can be disabled by unchecking the **Open Guided Setup dialog after Connect** check box in the *Application Preferences* window (select **View** → **Application Preferences**, and then select the **View Options** tab).

3. In the *Device Properties* window, check that the information complies with the ordering information.

   The *Device Properties* window presents general information stored in the transmitter database such as device model, serial number, communication protocol and device address.

4. (Optional) In the *Device Tag* window, enter tag, message, descriptor, and date. The information is not required for the operation of the transmitter and can be left out if desired.
5. In the *Digital Units* window, select the digital units of measurement for the device.
6. In the *Probe* window, check configuration of Probe Type.

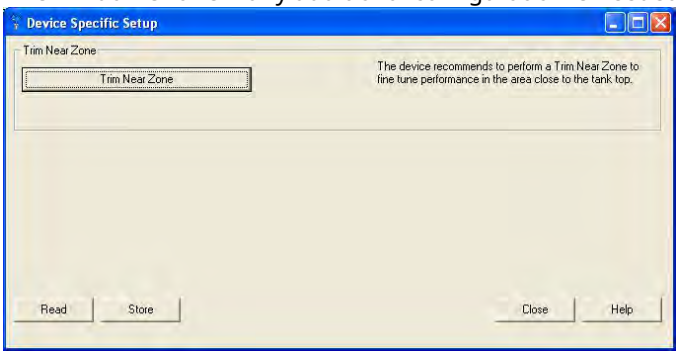
   The transmitter automatically makes some initial calibrations based on the selected Probe Type. Normally, the Probe Type is pre-configured at the factory.

7. Check the entered Probe Length.
8. In the *Geometry* window, set the tank geometry parameters.
   a) Enter the **Tank Height**.
   b) Select the **Mounting Type**.
   c) If using pipe, chamber or nozzle, then select the **Pipe/Chamber/Nozzle Inner Diameter**.
   d) If using nozzle, then enter the **Nozzle Height**.
9. In the *Environment* window, specify tank environment.
   a) Select the **Measurement Mode**.
   b) Enter the **Product Dielectric Range**/**Upper Product Dielectric Constant**.
10. In the *Volume* window, select the **Volume Calculation Method**.
11. If an ideal tank shape is selected, then enter the **Diameter** and **Length** (not for spherical tanks).
12. If **Strapping Table** is selected, starting at the bottom of the tank, for each new point, enter the total volume up to the specified level value.
13. (Optional) Enter the **Volume Offset** value.
14. (HART only) In the *Analog Out 1* window, configure the analog output.
    a) In the *Output Source (PV)* list, select the desired transmitter variable to use for the analog output.
    b) Specify the analog output range by setting the **Lower Range Value (4 mA)** and the **Upper Range Value (20 mA)** to the desired values.
    c) In the *Alarm Mode AOut 1* list, select the **Alarm Mode** you want to use for your analog out channel.

15. In the *Finish Configuration Wizard* window, select **Finish** and continue with the next step in the guided setup.

    This is the last window in the Configuration Wizard concluding the basic configuration. The current configuration can be changed at any time using the setup windows (General, Tank, Output etc., see Using the setup functions). The setup windows contain further options not available in the Configuration Wizard.

Device specific setup



The Device Specific Setup provides additional configuration functions, as recommended by the device.

Procedure

1. In the *Guided Setup* window, select **Device specific setup** and follow the on-screen instructions.

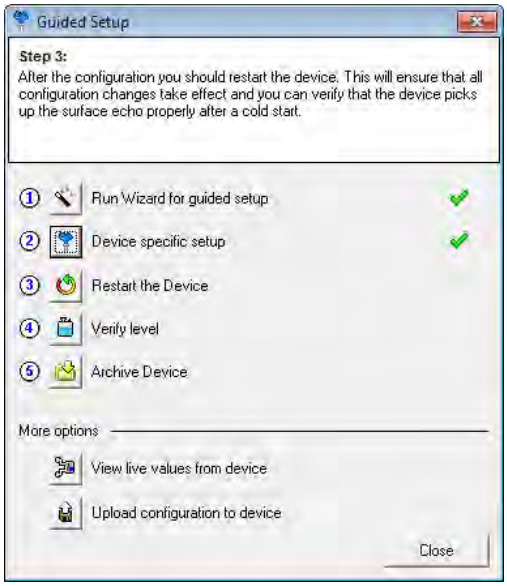
This window shows if any additional configuration is needed.

2. Choose the tank material if recommended.
3. Proceed to Restart the device if no configuration is needed.

Related information

Trim near zone function
Probe end projection

Dielectric constant settings



Restart the device

When the transmitter is configured, it should be restarted to ensure that all configuration changes are properly activated and the transmitter performs as expected.

Procedure

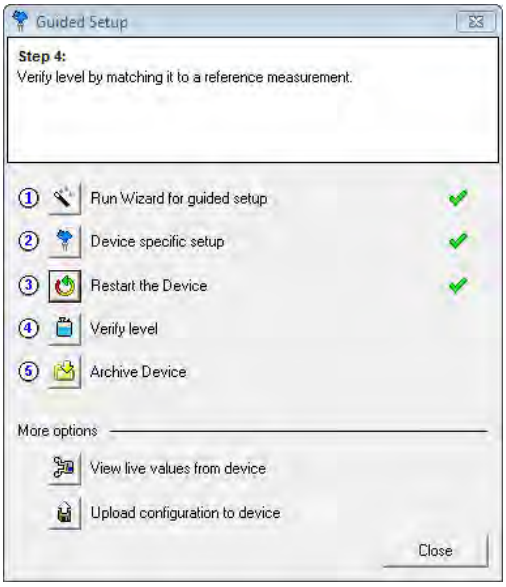
In the *Guided Setup* window, select **Restart the Device**.

It may take up to 60 seconds until measurement values are updated.

Run verify level

The Verify Level tool matches the product level reported by the device to a reference measurement (for example hand-dipping with a measurement tape).

If any difference, the Calibration Distance parameter will be adjusted. A minor adjustment using Calibration Distance is normal. There may, for example be a deviation between the actual tank height and the configured value.



Prerequisites

Ensure that:

- The product surface is calm.
- The tank is not being filled or emptied
- The actual level is well above the probe end.

Procedure

1. In the *Guided Setup* window, select **Verify level** to check your level measurement.

2. Follow the on-screen instructions.

Note
The offset (Calibration Distance parameter) is automatically set after completing the Verify Level method. An offset greater than 4 in. (100 mm) indicates a problem with the level measurement. Re-check configuration parameters. If these are correct, then view an echo plot and evaluate thresholds.

Related information

Calibration distance

Archive device

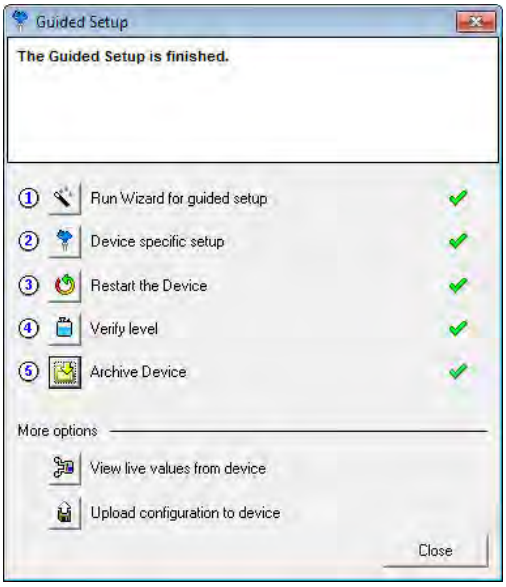
When configuration is finished, it is recommended that the configuration is saved to a backup file.

The backup file may be useful to:

- Install another Rosemount 5300 Level Transmitter in a similar tank since the file can be directly uploaded to a new device.
- Restore the configuration, if for any reason, configuration data is lost or accidentally modified making the device inoperable.

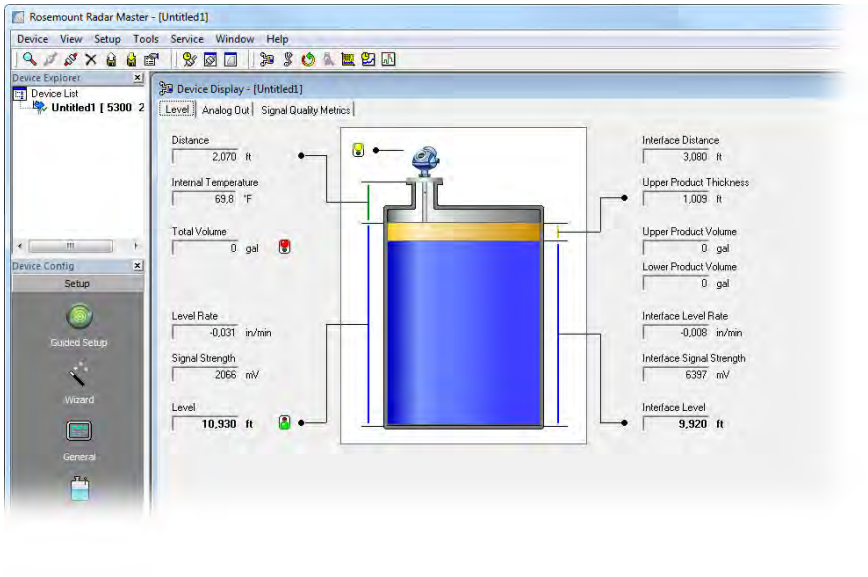
Procedure

In the *Guided Setup* window, select **Archive Device**.



The Archive Device function will create an information package for support purposes. The package includes a complete backup of the device, several logs, and echo curves.

View live values from device

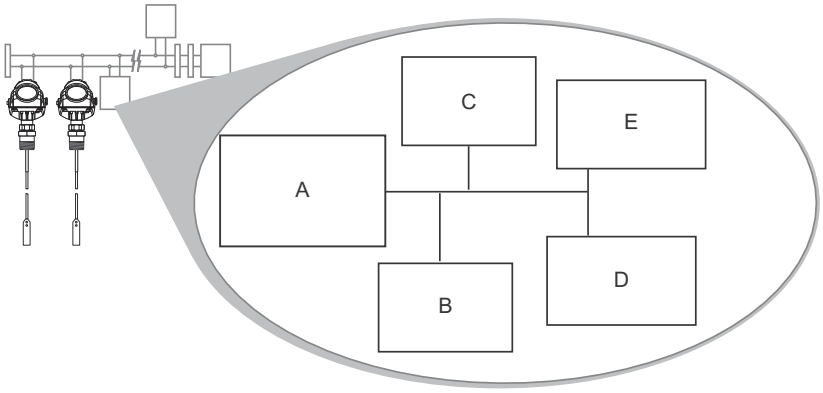


View live values from device to verify that the transmitter works correctly.

Procedure

1. In the *Guided Setup* window, select **View live values from device**.

2. Verify the transmitter works correctly. If the measured values seem incorrect, configuration settings may need to be adjusted.



5.10 FOUNDATION™ Fieldbus overview

This section provides a brief overview of FOUNDATION Fieldbus block operation with the Rosemount 5300 Level Transmitter.

For detailed information about FOUNDATION Fieldbus technology and function blocks, refer to the Rosemount 5300 FOUNDATION Fieldbus Block Reference Manual.

Figure 5-5 illustrates how the signals are channeled through the transmitter.

Figure 5-5: Function Block Diagram for the Rosemount 5300 with FOUNDATION Fieldbus

A. FOUNDATION Fieldbus compliant communications stack
B. Register transducer block
C. Level transducer block
D. Resource block physical device information
E. Advanced configuration block

Note
It is highly recommended that you limit the number of periodic writes to all static or non-volatile parameters such as HI_HI_LIM, LOW_CUT, SP, TRACK_IN_D, OUT, IO_OPTS, BIAS, STATUS_OPTS, SP_HI_LIM, and so on. Static parameter writes increment the static revision counter, ST_REV, and are written to the device's non-volatile memory. Fieldbus devices have a non-volatile memory write limit. If a static or non-volatile parameter is configured to be written periodically, the device can stop its normal operation after it reaches its limit or fail to accept new values.

5.10.1 Assigning device tag and node address

A Rosemount 5300 Level Transmitter is shipped with a blank tag and a temporary address (unless specifically ordered with both) to allow a host to automatically assign an address and a tag. If the tag or address need to be changed, use the features of the configuration tool. The tool basically does the following:

Procedure

1. Changes the address to a temporary address (248-251).
2. Changes the tag to a new value.
3. Changes the address to a new address.

   When the transmitter is at a temporary address, only the tag and address can be changed or written to. The resource, transducer, and function blocks are all disabled.

5.10.2 FOUNDATION™ Fieldbus block operation

Function blocks within the fieldbus device perform the various functions required for process control. Function blocks perform process control functions, such as Analog Input (AI) functions, as well as Proportional-Integral Derivative (PID) functions.

The standard function blocks provide a common structure for defining function block inputs, outputs, control parameters, events, alarms, and modes, and combining them into a process that can be implemented within a single device or over the fieldbus network. This simplifies the identification of characteristics that are common to function blocks.

In addition to function blocks, fieldbus devices contain two other block types to support the function blocks. These are the resource block and the transducer block.

Resource blocks contain the hardware specific characteristics associated with a device; they have no input or output parameters. The algorithm within a resource block monitors and controls the general operation of the physical device hardware. There is only one resource block defined for a device.

Transducer blocks connect function blocks to local input/output functions. They read sensor hardware and write to effector (actuator) hardware.

Resource block

The resource block contains diagnostic, hardware, electronics, and mode handling information. There are no linkable inputs or outputs to the resource block.

Related information

Resource Transducer Block

Register transducer block

The register transducer block allows a service engineer to access all database registers in the device.

Related information

Register Transducer Block

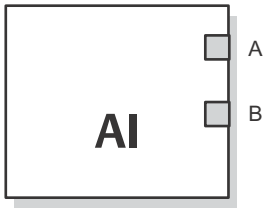
Advanced configuration transducer block

The advanced configuration transducer block contains functions such as amplitude threshold settings for filtering of disturbing echoes and noise, simulation of measurement values, and strapping table for volume measurements.

Related information

Advanced Configuration Transducer Block

Level transducer block



The level transducer block contains transmitter information including diagnostics and the ability to configure, set to factory defaults and restarting the transmitter.

Related information

Level Transducer Block

Analog Input block

Figure 5-6: Analog Input Block

A. OUT_D = Discrete output that signals a selected alarm condition
B. OUT = The block output value and status

The Analog Input (AI) function block processes field device measurements and makes them available to other function blocks. The output value from the AI block is in engineering units and contains a status indicating the quality of the measurement. The measuring device may have several measurements or derived values available in different channels. Use the channel number to define the variable that the AI block processes and passes on to linked blocks.

Related information

Analog-Input Block

Function block summary

The following function blocks are available for the Rosemount 5300 Level Transmitter:

- Analog Input (AI)
- Proportional/Integral/Derivative (PID)
- Signal Characterizer (SGCR)

- Arithmetic (ARTH)
- Input Selector (ISEL)
- Output Splitter (OS)

For detailed information about FOUNDATION Fieldbus technology and function blocks used in the Rosemount 5300 Level Transmitter, refer to the FOUNDATION Fieldbus Blocks Reference Manual .

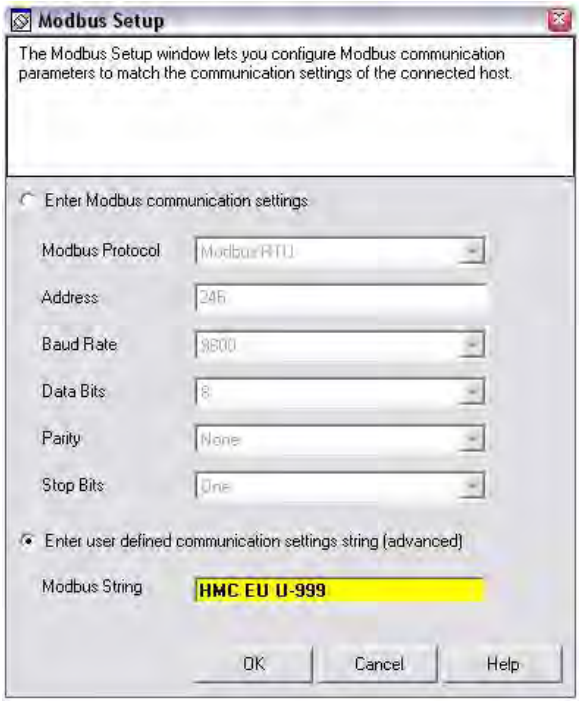
5.11 Configure the alarm output for the Modbus® transmitter

The output from the Modbus transmitter in case of an error (such as a field device malfunction) can be configured.

Use the Modbus string to configure the alarm output. The values for Modbus registers corresponding to PV, SV, TV, and QV will be changed accordingly (applicable registers in area 1300, 2000, 2100, and 2200).

Prerequisites

If the Modbus communication setup has been changed, but the transmitter has not yet started to use the new configuration, then you need to disconnect the HART modem and wait up to 60 seconds for the change to take effect.



In case the MA/MB terminals are used for connection to the HART to Modbus Converter (HMC), disconnect the RS-485 Converter, cycle power to the transmitter and wait up to 60 seconds for the change to take effect.

The Modbus communication settings will otherwise be lost if you write a new message to the transmitter.

Procedure

1. Start Rosemount Radar Master and connect to the transmitter.
2. Select **Setup** → **General**.
3. Select the **Communication** tab.
4. Select **Modbus Setup**.
5. Select **Enter user defined communication settings string (advanced)**.

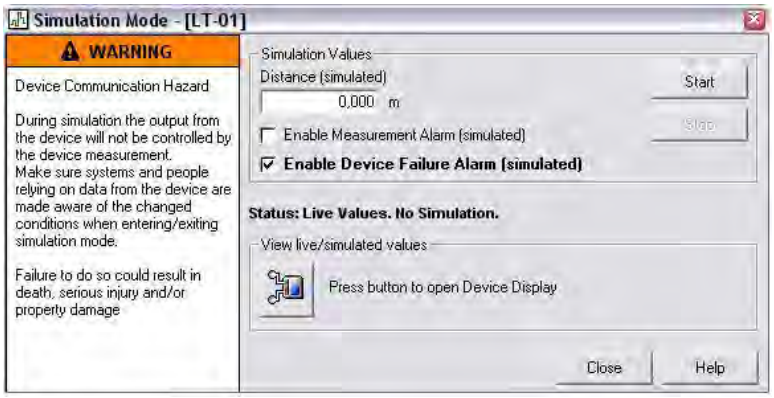
6. Enter the Modbus string, and select **OK**.

Postrequisites

After changing the Alarm Output configuration, disconnect the HART modem and wait up to 60 seconds for the change to take effect. In case the MA/MB terminals are used for connection to the HMC, disconnect the RS-485 Converter, cycle power to the transmitter, and wait up to 60 seconds for the change to take effect.

5.11.1 Modbus alarm output strings

Table 5-4: Available Alarm Output Text Strings



Protocol	String	Alarm output
Modbus RTU	HMC EN	Not a number (NaN), default
	HMC EF	Freeze, hold last value
	HMC EU U-0.1	User defined value, -0.1 in this example
Levelmaster	HMC M2 EH	High value, 999.99, default
	HMC M2 EL	Low value, -99.99
	HMC M2 EF	Freeze, hold last value
	HMC M2 EU U0	User defined value (range -99.99 to 999.99), 0 in this example
Modbus ASCII	HMC M1 EN	Not a number (NaN), default
	HMC M1 EF	Freeze, hold last value
	HMC M1 EU U-0.1	User defined value (range -99.99 to 999.99), -0.1 in this example

5.11.2 Verify alarm output

To verify the alarm output, use Rosemount Radar Master to simulate a device failure:

Procedure

1. Establish HART communication with the transmitter through Rosemount Radar Master.
2. Select **Tools** → **Simulation Mode**.

3. Select **Enable Device Failure Alarm (simulated)**.
4. Select **Start**.
5. Disconnect HART modem.
6. Verify that the configured alarm output is available in the Modbus host.
7. Use Rosemount Radar Master to turn off simulation mode.

5.11.3 Use status information to evaluate measurement validity

The transmitter updates status information about the current measurement, and this status information is available as a bitfield register through Modbus communication.

By monitoring the status information it is possible to determine if the current measurement output value is valid.

Related information

Common Modbus host configuration

5.11.4 Use Heartbeat to detect errors

By reading and evaluating the Heartbeat value from the device, it is possible to verify that the communication link between the transmitter, HMC, RTU and even the control system communicating with the RTU is working.

Assign Heartbeat to one of the transmitter variables (SV, TV, or QV). Heartbeat is increased by one for each measurement cycle in the device (until it eventually starts over at zero again).

In case this value is not updated, it means that the communication link is broken.

5.12 Tri-Loop™ HART®-to-Analog converter

The Rosemount 333 HART® Tri-Loop™ HART-to-Analog signal converter is capable of converting a digital HART Burst signal into three additional 4-20 mA analog signals.

Related information

Rosemount 333 Reference Manual

5.12.1 Set the level transmitter up for HART Tri-Loop using FDI/DD/DTM

To set the Rosemount 5300 Level Transmitter up for the HART Tri-Loop:

Procedure

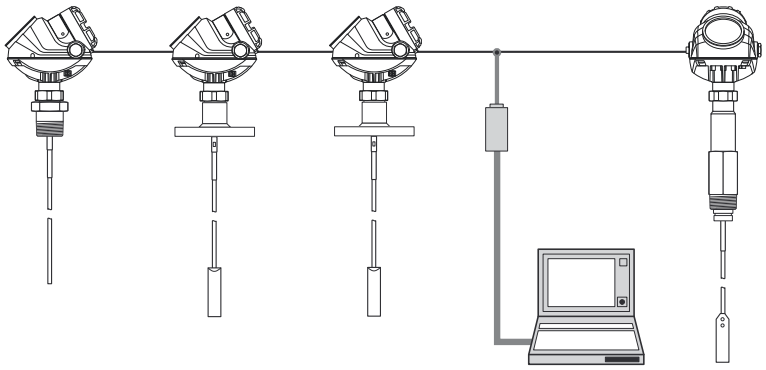
1. Make sure the transmitter is properly configured.
2. If desired, change the measurement units.
   a) Select **Configure** → **Manual Setup** → **Device Setup** → **Units**.
3. Set the desired device variable to use for Primary Variable (PV), Secondary Variable (SV), Third Variable (TV), and Fourth Variable (QV). Select **Configure** → **Manual Setup** → **Device Setup** → **HART**.
   a) Select **Configure** → **Manual Setup** → **Device Setup** → **HART**.
   b) Under ***Variable Mapping***, select variables for PV, SV, TV, and QV.
4. Set the Rosemount Rosemount 5300 to Burst Mode.
   a) Select **View/Configure Message 1**.
   b) Under ***Burst Message 1 Mode***, select **On**.
   c) Under ***Burst Message 1 Command***, select **Cmd 3: Read Dynamic Variables/ Current**, and then select **Next**.
   d) Under ***Burst Message 1 Trigger Mode***, select **Continuous**.
   e) Set the Burst Message 1 Update Rate, and then select **Finish**.
5. Prior to exiting the configuration, note the selected variables for SV, TV, and QV, and the units set for each of the variables. The same configuration must be used for the Rosemount 333.

5.12.2 Set the level transmitter up for HART Tri-Loop using RRM

To set the Rosemount 5300 Level Transmitter up for the HART Tri-Loop:

Procedure

1. Make sure the Rosemount 5300 Level Transmitter is properly configured.
2. Assign transmitter variables Primary Variable, Secondary Variable etc. Select**Setup** → **Output/General**.
3. Configure variable units: length, level rate, volume and temperature. Select: **Setup** → **General/Units**.
4. Set the Rosemount 5300 to Burst Mode. Select **Setup** → **General/Communication**.



Note
Using a HART revision 7 device, the Rosemount 5300 Level Transmitter supports up to 3 Burst messages. It can burst Cmd 1, 2, 3, 9, 33, 48. For command aggregation, Cmd78 is used. Supported burst trigger modes in HART 7: Continuous, Windowed, Falling, and Rising.

5. Select burst option 3 = process variables and current (process vars/crnt).
6. Prior to exiting the configuration, note the selected variables for SV, TV, and QV, and the units set for each of the variables. The same configuration must be used for the Rosemount 333.

5.13 HART® multi-drop configuration

The Rosemount 5300 Level Transmitter can be run in multidrop mode. In the multidrop mode each transmitter has a unique HART address.

Figure 5-7: Multidrop Connection

5.13.1 Change the poll address using FDI/DD/DTM

To set the desired address for multidrop operation:

Procedure

1. Select **Manual Setup** → **Device Setup**.
2. Select **HART** → **Change Address**.
3. Set the desired address for multidrop operation.
   - HART 5: addresses between 1 and 15
   - HART 7: addresses between 1 and 63
4. Select **Next** to save the new address.

5.13.2 Change the poll address using a handheld communicator

To set the desired address for multidrop operation:

Procedure

1. Select **Configure** → **Manual Setup** → **Device Setup** → **HART** → **Comm Settings**.
2. Set **Poll addr** to the desired address for multidrop operation.
   - HART 5: addresses between 1 and 15

- HART 7: addresses between 1 and 63

3. Select **Send** to save the new address.

5.13.3 Change the poll address using RRM

To set the desired address for multidrop operation:

Procedure

1. Select **Setup** → **General**.
2. Select the **Communication** tab.
3. Set the desired address for multidrop operation.
   - HART 5: addresses between 1 and 15
   - HART 7: addresses between 1 and 63
4. Click the **Store** button to save the new address.

6 Operation

6.1 Safety messages

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that potentially raises ⚠). Refer to the following safety messages before performing an operation preceded by this symbol.

⚠ WARNING

Failure to follow safe installation and servicing guidelines could result in death or serious injury.

Ensure the transmitter is installed by qualified personnel and in accordance with applicable code of practice.

Use the equipment only as specified in this manual. Failure to do so may impair the protection provided by the equipment.

⚠ WARNING

Explosions could result in death or serious injury.

Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

Before connecting a handheld communicator in an explosive atmosphere, ensure that the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.

⚠ WARNING

Electrical shock could cause death or serious injury.

Use extreme caution when making contact with the leads and terminals.

⚠ WARNING

High voltage that may be present on leads could cause electrical shock.

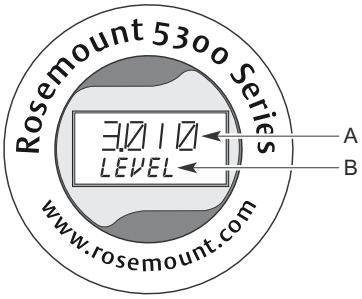
Probes covered with plastic and/or with plastic discs may generate an ignition-capable level of electrostatic charge under certain extreme conditions. Therefore, when the probe is used in a potentially explosive atmosphere, appropriate measures must be taken to prevent electrostatic discharge.

⚠ WARNING

Any substitution of non-authorized parts or repair, other than exchanging the complete transmitter head or probe assembly, may jeopardize safety and is prohibited.

Unauthorized changes to the product are strictly prohibited as they may unintentionally and unpredictably alter performance and jeopardize safety. Unauthorized changes that interfere with the integrity of the welds or flanges, such as making additional perforations, compromise product integrity and safety. Equipment ratings and certifications are no longer valid on any products that have been damaged or modified without the prior written permission of Emerson. Any continued use of product that has been damaged or modified without the written authorization is at the customer's sole risk and expense.

6.2 Using the display panel



The Rosemount™ 5300 Level Transmitter uses an optional display panel for presentation of measurement data. When the transmitter is switched on, the display panel presents information such as transmitter model, measurement frequency, software version, communication type (HART®, FF), serial number, HART identification tag, setting of write protection switch, and Analog Output settings.

When the transmitter is up and running, the display panel presents level, signal amplitude, volume, and other measurement data depending on the display panel configuration (see Specify display panel variables). The available LCD parameters are listed in Table 6-1.

The display has two rows, the upper row shows the measurement value and the lower row shows the parameter name and measurement unit. It toggles between the different measurement values every two seconds. The lower row toggles between parameter name and measurement unit each second.

Variables to be presented are configurable by using a handheld communicator, AMS Device Configurator, AMS Device Manager, DeltaV™, the Rosemount Radar Master software or any FDI/DD/DTM compliant host.

Figure 6-1: The Rosemount 5300 Level Transmitter Display Panel

A. Measurement value
B. Toggling between measurement parameter and measurement unit

Error messages are listed in LCD error messages.

Table 6-1: LCD Parameters and Presentation on Display

Parameter	Presentation on display	Description
Level	LEVEL	Product level
Distance	DIST	Distance from the upper reference point to the product surface
Level rate	LRATE	The speed of level movement up or down
Signal strength	AMPL	The signal amplitude of the surface echo
Volume	VOUME	Total product volume
Internal temperature	INTEMP	Temperature inside the transmitter housing
Analog output current	ANOUT	4 -20 mA current
Percent range	%RANGE	Level value in percent of total measurement range
Interface level	IFLVL	Level of the lower product
Interface distance	IFDIST	Distance between the upper reference point and the interface between the upper and lower product
Interface level rate	IFRATE	The speed of interface level movement up or down
Interface signal strength	IFAMPL	The signal amplitude of the interface echo
Volume lower	VOL LO	Product volume of lower product
Volume upper	VOL UP	Product volume of upper product
Upper product thickness	UPTKNS	Thickness of the upper product
Signal quality	SIG Q	The signal quality
Surface/noise margin	SNM	The relationship between the surface peak amplitude and the strongest noise peak amplitude
Vapor DC	VAP DC	The vapor dielectric constant

6.3 Specify display panel variables

6.3.1 Specify display panel variables using FDI/DD/DTM

Specify variables and corresponding measurement units to be presented on the display panel (LCD) screen:

Procedure

1. HART®: Select **Configure** → **Manual Setup** → **Device Setup**.
   FOUNDATION™ Fieldbus: Select **Configure** → **Manual Setup**
2. Select the **Display** tab.

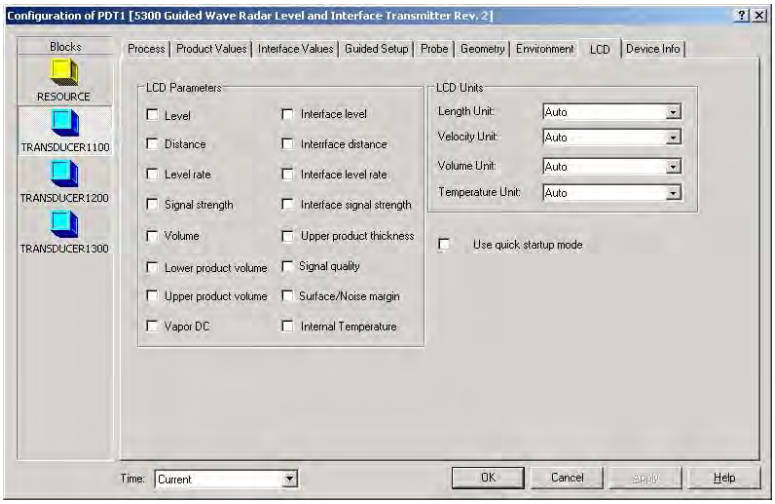
3. Select the desired variables and measurement units to be displayed on the LCD display.

4. Select **Save** to save the configuration and close the window.

6.3.2 Specify display panel variables using a handheld communicator

Specify variables and corresponding measurement units to be presented on the display panel (LCD) screen:

Procedure



1. Specify LCD parameters:
   a) HART®: Select **Configure** → **Manual Setup** → **Device Setup**.
   FOUNDATION™ Fieldbus: Select **Configure** → **Manual Setup**
   b) Select **Display**.
   c) Select **LCD Parameters**.
   d) Select the desired variables to be displayed on the LCD display.
   e) Select **Send**, and follow the instructions.
2. Specify measurment units:
   a) HART: Select **Configure** → **Manual Setup** → **Device Setup**.
   FOUNDATION Fieldbus: Select **Configure** → **Manual Setup**.
   b) HART: Select **Units**.
   FOUNDATION Fieldbus: Select **LCD Units**.
   c) Specify desired measurement units.
   d) Select **Send**, and follow the instructions.

6.3.3 Specify display panel variables using DeltaV

To specify which variables to view on the display panel (LCD) screen and the corresponding measurement units:

Procedure

1. Right-click the transmitter icon and choose the **Properties** option.
2. Select the **Transducer1100** block.
3. Select the **LCD** tab.

4. Select the variables to be shown on the display panel.
5. Select the desired LCD measurement units.

   You can specify the same measurement units as selected in the **Product Values** tab and in the **Interface Values** tab by choosing the **Auto** option for the LCD Unit.
6. Select **OK** to save the LCD settings in the transmitter database.

6.3.4 Specify display panel variables using RRM

Specify variables and corresponding measurement units to be presented on the display panel (LCD) screen:

Procedure

1. Select **Setup** → **General**, or select the **General** icon in the *Device Config* window.
2. Select the **LCD** tab.
3. Select the variables to be shown on the display panel.
   a) Select the **Store** button to save the LCD settings in the transmitter database.
4. Select the **Units** tab.
5. Select the desired measurement units.
   a) Select the **Store** button to save the LCD settings in the transmitter database.

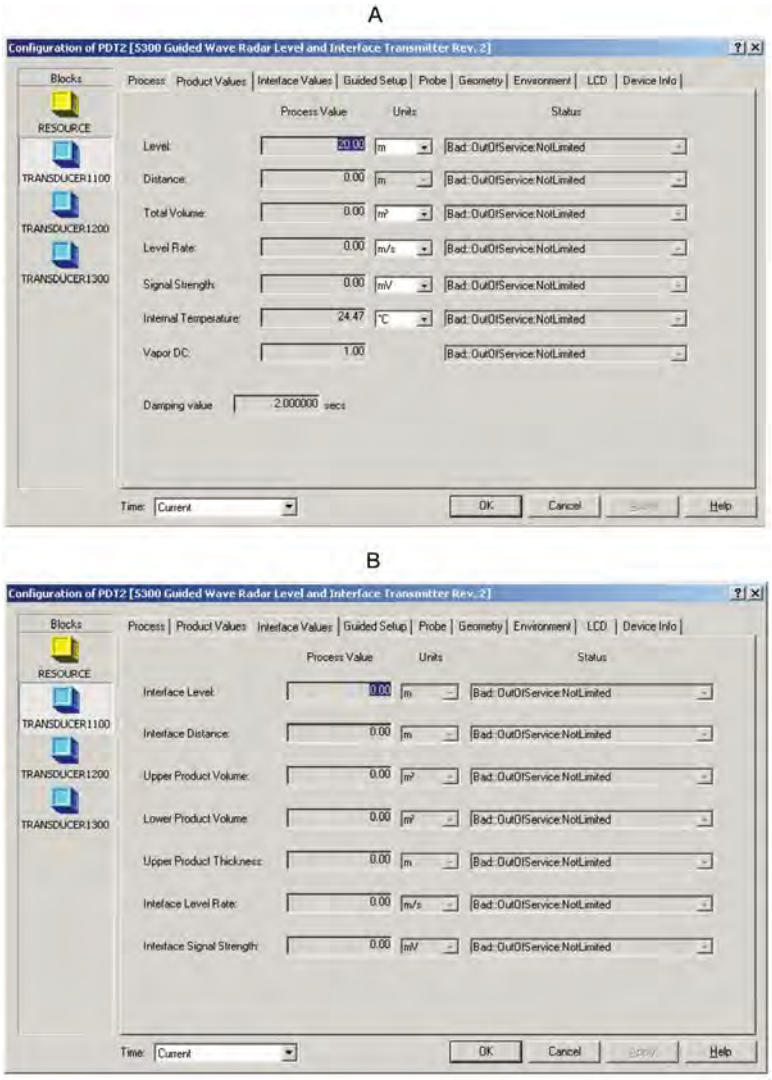
6.4 View measurement data

6.4.1 View measurement data in FDI/DD/DTM

Current measurement data of the primary variables are presented on the **Overview** screen. To view all current measurement values, do the following:

Procedure

1. Select **Service Tools** → **Variables**.
2. HART®: Select **Mapped Variable**, **Process**, **Device**, or **Signal Quality**.
   FOUNDATION™ Fieldbus: Select **Product Variables**, **Interface Variables** or **Signal Quality Metrics**.



6.4.2 View measurement data in DeltaV

Procedure

1. Right-click the transmitter icon and choose the **Properties** option.
2. Select the **Transducer1100** block.

3. Select the desired group of measurement values to view.
   - To view level values such as Level and Distance, select the **Product Values** tab.
   - To view interface measurement values, select the **Interface Values** tab.

Figure 6-2: Presentation of Measurement Data in DeltaV for Rosemount 5300

A. Level values
B. Interface level values

6.4.3 View measurement data in RRM

To view measurement data in Rosemount Radar Master:

Procedure

1. Select **Tools** → **Device Display**.

2. Select the desired group of measurement values to view.
   - To view measurement data such as level, signal strength, etc., select the **Level** tab.
   - To view the analog output signal, select the **Analog Out** tab.
   - To view signal quality and surface/noise margin, select the **Signal Quality Metrics** tab.

7 Service and troubleshooting

7.1 Safety messages

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that potentially raises ⚠). Refer to the following safety messages before performing an operation preceded by this symbol.

⚠ WARNING

Failure to follow safe installation and servicing guidelines could result in death or serious injury.

Ensure the transmitter is installed by qualified personnel and in accordance with applicable code of practice.

Use the equipment only as specified in this manual. Failure to do so may impair the protection provided by the equipment.

Do not perform any services other than those contained in this manual unless you are qualified.

⚠ WARNING

Process leaks could result in death or serious injury.

Ensure that the transmitter is handled carefully. If the process seal is damaged, gas might escape from the tank if the transmitter head is removed from the probe.

⚠ WARNING

Explosions could result in death or serious injury.

Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

Before connecting a handheld communicator in an explosive atmosphere, ensure that the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.

Do not remove the gauge cover in explosive atmospheres when the circuit is alive.

⚠ WARNING

High voltage that may be present on leads could cause electrical shock.

Avoid contact with the leads and terminals.

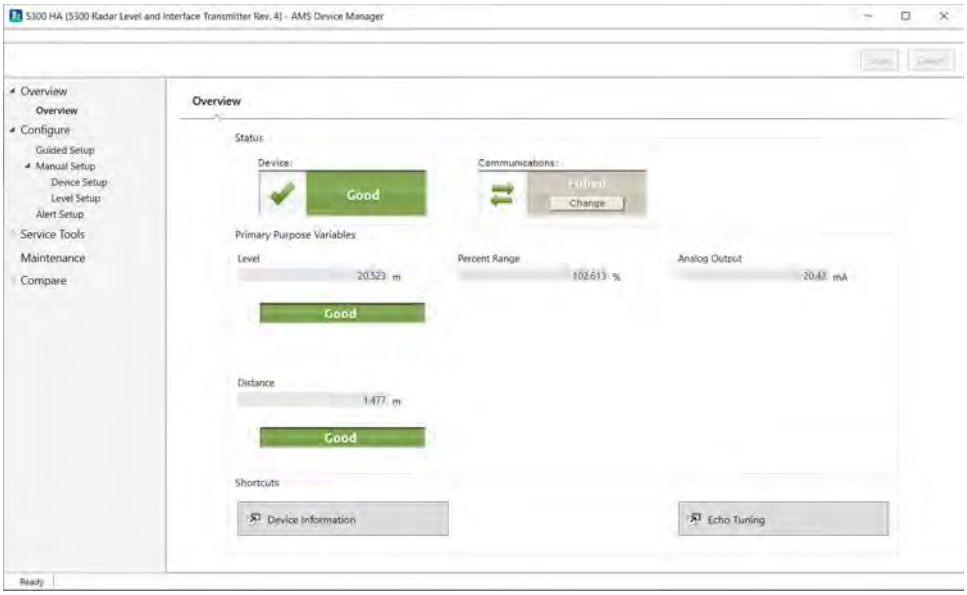
Ensure the mains power to the transmitter is off and the lines to any other external power source are disconnected or not powered while wiring the transmitter.

Probes covered with plastic and/or with plastic discs may generate an ignition-capable level of electrostatic charge under certain extreme conditions. Therefore, when the probe is used in a potentially explosive atmosphere, appropriate measures must be taken to prevent electrostatic discharge.

⚠ WARNING

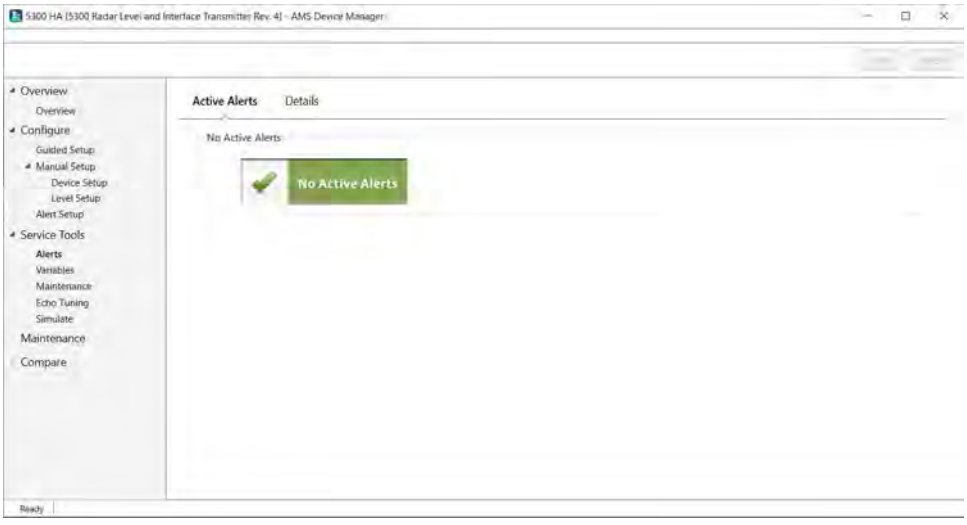
Any substitution of non-authorized parts or repair, other than exchanging the complete transmitter head or probe assembly, may jeopardize safety and is prohibited.

Unauthorized changes to the product are strictly prohibited as they may unintentionally and unpredictably alter performance and jeopardize safety. Unauthorized changes that interfere with the integrity of the welds or flanges, such as making additional perforations, compromise product integrity and safety. Equipment ratings and certifications are no longer valid on any products that have been damaged or modified without the prior written permission of Emerson. Any continued use of product that has been damaged or modified without the written authorization is at the customer's sole risk and expense.



7.2 View diagnostics

7.2.1 View device status in AMS Configurator/AMS Device Manager



To view the device status and active alerts in AMS Device Configurator/AMS Device Manager:

Procedure

1. To view device status select **Overview**.

2. To view active alerts select **Service Tools** → **Alerts**.

Related information

Diagnostic messages per NAMUR NE 107 (HART)
Diagnostic messages per NAMUR NE 107 (FOUNDATION Fieldbus)

7.2.2 View device status using a handheld communicator

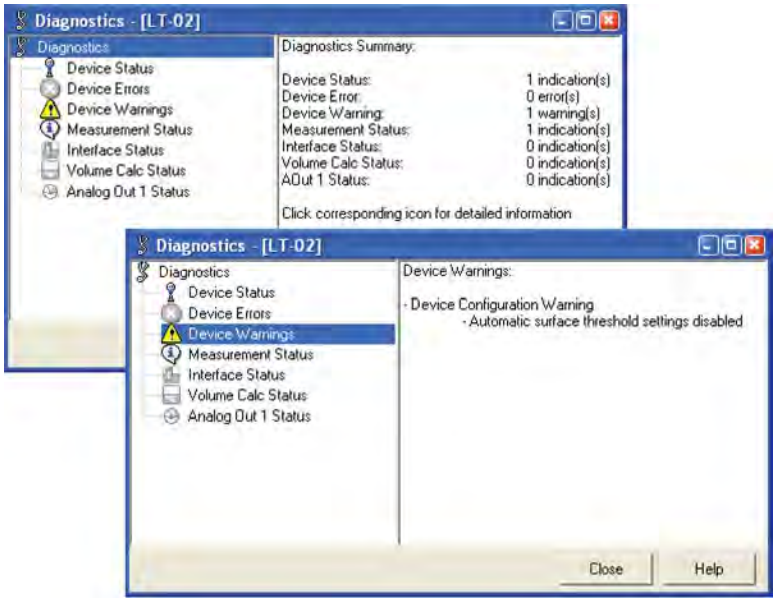
To view the device status and active alerts usinga a handheld commnicator:

Procedure

1. To view device status select **Overview**.
2. To view active alerts select **Service Tools** → **Alerts**.

Related information

Diagnostic messages per NAMUR NE 107 (HART)
Diagnostic messages per NAMUR NE 107 (FOUNDATION Fieldbus)



7.2.3 View diagnostics in RRM

To view the *Diagnostics* window in Rosemount Radar Master:

Procedure

Select **Tools** → **Diagnostics**.

Figure 7-1: The Diagnostics Window in Rosemount Radar Master

7.3 Diagnostic messages

7.3.1 Diagnostic messages per NAMUR NE 107 (HART®)

Diagnostic messages per NAMUR NE 107 are listed in Table 7-1 and Table 7-2.

Table 7-1: Status - Failure

Message	Description	Recommended actions
Volume measurment failure - Invalid Volume	Reasons may be multiple: • Incorrect volume configuration • Level measurement invalid	1. If **Level Measurement Failure** is active, clear that alert first. 2. Check volume configuration. 3. Load default database to the device and reconfigure it. 4. If error persists it might indicate a hardware error, replace the transmitter head.
Level/Interface Measurement Failure	No valid level reading. Reasons may be multiple: • No valid surface echo peak in the measuring range. • Incorrect transmitter configuration.	1. Analyze echo curve for reason and check device configuration. 2. Check device physical installation (for instance probe contamination). 3. Load default database to the device and reconfigure it. 4. If error persists it might indicate a hardware error, replace the transmitter head.
Probe Missing	The transmitter cannot detect the probe.	1. Check that the probe is properly connected.
Sensor Database (HREG) error	The device has found an error in the configuration database.	1. Load default database to the device to clear the error. 2. Reconfigure the device. 3. If the alert persists, replace the transmitter head.
Electronics Failure (RAM Error)	The device has detected a fault with an electrical component on the main board electronics module assembly.	1. Replace transmitter head.
Electronics Failure (FPROM Error)		
Electronics Failure (Microwave Module Error)		
Electronics Failure (Analog Output Error)		
Electronics Failure (Modem Error)		
Electronics Failure (Hardware Error)		
Electronics Failure (Other Memory Error)		

Table 7-1: Status - Failure *(continued)*

Message	Description	Recommended actions
Software Error	The device software has encountered an error. Reasons may be multiple, including too low supplied voltage, or an error being simulated.	1. Make sure that enough voltage is supplied to the device. 2. Restart the device. 3. Turn off simulation of device failure. 4. If the alert persists, replace the transmitter head.
Internal Temperature Critical	The internal temperature of the device has reached critical levels and the integrity of the device electronics has been compromised. Ambient temperature should not exceed device specifications (-40 °C to +80 °C).	1. Replace the transmitter head.
Proof Test Reflector Alarm	The product in the tank is at a critically high level.	1. Remove product from the tank.

Table 7-2: Status - Maintenance Request

Message	Description	Recommended actions
Loop Current Fixed	The analog output channel has been set to a fixed output.	1. Put the analog output channel back to variable output.
Device Simulation Active	The measurement output from the device is currently being simulated.	1. Use the **Simulation Mode** method to enable or disable simulation.
Internal temperature out of limits	Internal temperature is outside its limits (-40 °C to +80 °C).	1. Check ambient temperature at installation site.
Configuration Warning - Unsupported Combination of Functions	Please consult the reference manual for details.	1. Check device configuration.
Configuration Warning - Function not Supported	Support for the configured functions has not been purchased.	1. Upgrade the device. 2. Set measurement mode to **Level**. 3. Turn off Signal Quality Metrics. 4. Turn off Vapor Compensation.
Configuration Error - Vapor Compensation not Calibrated	The vapor compensation function need to be calibrated to work properly.	1. Run the **Calibrate Vapor Compensation** function.
Measurement Error - Vapor Compensation Reflector Not Found	The device cannot find the reference reflector echo.	1. Check that the correct reference reflector is configured. 2. Check that the correct probe is attached. 3. Check if the probe needs to be cleaned. 4. Recalibrate vapor compensation.

Table 7-2: Status - Maintenance Request *(continued)*

Message	Description	Recommended actions
Configuration Error - Invalid Volume Strapping Table	The volume calculation strapping table is incorrectly configured.	1. Check that the values in the strapping table are entered in increasing order. 2. Check that the number of strapping points to use is correct.
Configuration Error	Configuration Error	1. Load the default database to the device. 2. Restart measurement. 3. Reconfigure the device. 4. Contact Rosemount customer support.
Loop Current Saturated	The analog output channel is saturated because the level measurement is outside the configured analog output limits.	1. Check the analog output configuration.
Volume measurement warning - Level is out of Range	The level measurement is outside the configured volume range.	1. Check volume configuration.
Measurement Warning - Probe End Projection DC Estimation Limited	Probe End Projection DC estimation is outside the configured limit.	1. Check **Probe End Projection** configuration.
Measurement Warning - Vapor DC Estimation Limited	Vapor DC estimation is outside the configured limit.	1. Check **Vapor DC** configuration.
Measurement Warning - Interface Close To Maximum Range	The interface is close to the maximum the device can handle. If the interface thickness increases, the device may lose the interface echo.	1. Decrease the interface thickness in the tank.
Low Signal Quality Margin	Signal Quality is below the configured alarm level.	1. Clean any product buildup from the probe. 2. If the probe is corroded, consider replacing it.
Low Surface/Noise Margin	Surface/Noise Margin is below the configured alarm level.	1. Clean any product buildup from the probe. 2. If the probe is corroded, consider replacing it.
Level Supervision Test Mode Active - Test Mode Active	The device is in test mode and is not reporting actual information. Measurement output currently corresponds to position of verification reflector.	1. Use the **Start/Stop Test Mode** method for Level Supervision to start or stop test mode.

7.3.2 Diagnostic messages per NAMUR NE 107 (FOUNDATION™ Fieldbus)

Diagnostic messages per NAMUR NE 107 are listed in Table 7-3 to Table 7-5.

Table 7-3: Status - Failed

Message	Description	Recommended actions
Electronics Failure – Main Board	The device has detected a fault with an electrical component on the main board electronics module assembly.	1. Replace the transmitter head.
Electronics Failure – Output board	The device has detected a fault with an electrical component on the output board electronics module assembly.	1. Replace the transmitter head.
Internal Communication Failure	The communication between the main board and the output board has been lost.	1. Replace the transmitter head.
Memory Failure – Output Board	Configuration data has been corrupted or pending configuration changes have been lost due to loss of power before storage could complete.	1. Restart the device. 2. Reconfigure the device. 3. If error persists, it may indicate a faulty memory chip. Replace the transmitter head.
Internal Temperature Critical	The internal temperature of the device has reached critical levels and the integrity of the device electronics may be compromised. Environmental temperature should not exceed device specifications.	1. Verify that ambient temperature is within the specified range. 2. Remote mount the transmitter head away from the process and environmental conditions. 3. Restart the device. 4. If the condition persists, replace the device.
Software Failure	The device software has encountered an error. Reasons may be multiple, including too low supplied voltage, or an error being simulated.	1. Make sure that enough voltage is supplied to the device. 2. Restart the device. 3. Turn off simulation of device failure. 4. If the alert persists, replace the transmitter head.
Software Incompatibility Error	Fieldbus software and main firmware versions are incompatible.	1. Replace the transmitter head.
Probe Missing	The transmitter cannot detect the probe.	1. Check that the probe is properly connected.
Sensor Database Error	The device has found an error in the configuration database.	1. Load default database to the device to clear the error and restart device. 2. Reconfigure the device. 3. If the alert persists, replace the transmitter head.

Table 7-4: Status - Function Check

Message	Description	Recommended actions
Check function	One or more Transducer Blocks are in Out of Service mode.	1. Return Transducer Block to **Auto** mode.

Table 7-5: Status - Maintenance Required

Message	Description	Recommended actions
Level/Interface Measurement Failure	There is no valid level reading. Reasons may be multiple: • No valid surface echo peak in the measuring range • Incorrect transmitter configuration	1. Analyze echo curve for reason and check device configuration. 2. Check device installation (for instance probe contamination). 3. Load default database to the device and reconfigure it. 4. If error persists it might indicate a hardware error. Replace the transmitter head.
Volume Measurement Failure	Reasons may be multiple: • Incorrect volume configuration • Level measurement invalid	1. If **Level Measurement Failure** is active, clear that alert first. 2. Check volume configuration 3. Load default database to the device and reconfigure it. 4. If error persists it might indicate a hardware error, replace the transmitter head.
Volume Measurement Warning	The level measurement is outside the configured volume range.	1. Check volume configuration.
Internal Temperature Out of Limit	The temperature of the electronics board has exceeded the transmitter's operating range.	1. Verify that ambient temperature is within the operating range. 2. Restart the device. 3. Remote mount the transmitter head away from the process and environmental conditions. 4. If the condition persists, replace the device.
Measurement Error	The device cannot find the reference reflector echo.	1. Check that the correct reference reflector is configured. 2. Check that the correct probe is attached. 3. Check if probe needs to be cleaned. 4. Recalibrate **Vapor Compensation**.
Measurement Warning	The interface is close to the maximum the device can handle. If the interface thickness increases, the device may lose the interface echo.	1. If **Interface Thickness Close to Max** is checked, decrease the thickness interface in the tank
	Probe End Projection Dielectric Constant estimation is outside the configured limit.	1. If **Probe End Projection DC Estimation Limited** is checked, check **Probe End Projection** configuration.
	Vapor Dielectric Constant estimation is outside the configured limit	1. If **Vapor DC Estimation Limited** is checked, check **Vapor Dielectric Constant** configuration.

Table 7-5: Status - Maintenance Required *(continued)*

Message	Description	Recommended actions
Configuration Error	Start Code and Measurement Mode Mismatch.	If **Start code and Measurement Mode Mismatched** is checked: 1. Upgrade the device. 2. Set measurement mode to **Level**.
	The volume calculation strapping table is incorrectly configured.	If **Invalid Strapping Table** is checked: 1. Check that the values in the strapping table are entered in increasing order. 2. Check that the number of strapping points to use is correct.
	The vapor compensation function needs to be calibrated to work properly.	If **Vapor Compensation Not Calibrated** is checked: 1. Run the **Calibrate Vapor Compensation** function.
	Other Configuration Error.	If **Configuration Error** is checked: 1. Load the default database to the device. 2. Restart measurement. 3. Reconfigure the device. 4. Contact Rosemount customer support.
Configuration Warning	Unsupported combination of functions.	1. if **Unsupported Combination of Functions** is checked, check device configuration.
	Support for the configured functions has not been purchased.	If **Signal Quality Not Supported** or **Vapor Compensation not supported** is checked: 1. Upgrade the device. 2. Turn off Signal Quality Metrics. 3. Turn off Vapor Compensation.
	Process Seal and Probe Type Mismatch.	1. If **Process Seal and Probe Type Mismatch** is checked, check configuration of Probe Type and Process Seal using Rosemount Radar Master.
	Unsupported Probe Type.	1. If **Unsupported Probe Type** is checked, check Probe Type configuration.
Device Simulation Active	The measurement output from the device is currently being simulated.	1. Use **Start/Stop Device Simulation** to enable or disable simulation.

Table 7-5: Status - Maintenance Required *(continued)*

Message	Description	Recommended actions
Signal Quality Low	The Signal Quality is below the defined alert limit.	1. Take action based on your intended use of this alert. 2. Clean the probe. 3. If no actions are necessary, consider to change the limit.
Surface/Noise Margin Low	The Surface/Noise Margin is below the defined alert limit.	1. Take action based on your intended use of this alert. 2. Clean the probe. 3. If no actions are necessary, consider changing the limit.

7.3.3 Status messages in Rosemount Radar Master

Device status

Device status messages that may appear on the display or in Rosemount Radar Master are shown in Table 7-6:

Table 7-6: Device status

Message	Description	Action
Running Boot Software	The application software could not be started.	Contact Emerson Service Department.
Device Warning	A device warning is active.	See Warning Messages for details.
Device Error	A device error is active.	See Error Messages for details.
Sim Mode 0 Active	The simulation mode is active.	Turn off the simulation mode in Rosemount Radar Master, select Tools, Simulation Mode, and click the Stop button.
Advanced Simulation Mode Active	The advanced simulation mode is active.	To turn off the Advanced Simulation mode, set Holding Register 3600=0 (see View/edit holding registers using RRM).
Interface Invalid	The interface measurement is invalid.	Check the Error Messages, Warning Messages, and the Interface Status for details.
Invalid Measurement	The level measurement is invalid.	Check Error Messages, Warning Messages, and Measurement Status for details.
User Register Area Write Protected	The configuration registers are write protected.	Use the Lock/Unlock function to turn off the write protection (see Write protection).
Write Protected Jumper Set	Write protection jumper on the display is enabled.	Remove the write protection jumper.
Factory Settings Used	The factory default configuration is used.	The transmitter has lost its calibration. Contact Emerson Service Department.
Probe missing	Probe is not detected.	Check that the probe is correctly mounted. Check the connection between probe and transmitter head.

Errors

Error messages that may be displayed on the display or in Rosemount Radar Master are shown in Table 7-7. Errors normally result in Analog Output alarm.

Errors are indicated in Rosemount Radar Master in the *Diagnostics* window.

Table 7-7: Error Messages

Message	Description	Action
RAM error	An error in the gauge data memory (RAM) has been detected during the startup tests. **Note** This automatically resets the gauge.	Contact Emerson service department.
FPROM error	An error in the gauge program memory (FPROM) has been detected during the startup tests. **Note** This automatically resets the gauge.	Contact Emerson service department.
Database (Hreg) error	An error in the transmitter configuration memory (EEPROM) has been detected. The error is either a checksum error that can be solved by loading the default database or a hardware error. **Note** The default values are used until the problem is solved.	Load default database and restart the transmitter. Contact Emerson service department if the problem persists.
Microwave Module error	An error in the microwave module.	Contact Emerson service department.
LCD error	An error in the LCD is detected.	Contact Emerson service department.
Modem error	An error in the modem used for digital communication has been detected.	Contact Emerson service department.
Analog out error	An error in the Analog Out Module.	Contact Emerson service department.
Internal temperature error	An error in the internal temperature measurement. -40 °C<Internal Temperature<85 °C.	Contact Emerson service department.
Other hardware error	An unspecified hardware error has been detected.	Contact Emerson service department.
Measurement error	A serious measurement error has been detected.	Contact Emerson service department.
Configuration error	At least one configuration parameter is outside allowed range. **Note** The default values are used until the problem is solved.	• Load the default database and restart the transmitter (see Reset to factory settings) • Configure the transmitter or upload a backup configuration file (see Download configuration from file to device using RRM) • Contact Emerson service department if the problem persists
Software error	An error has been detected in the transmitter software.	Contact Emerson service department.

Warnings

Table 7-8 shows a list of diagnostic messages that may be displayed on the display or in Rosemount Radar Master. Warnings are less serious than errors and in most cases do not result in Analog Output alarms.

In Rosemount Radar Master, warnings are indicated in the *Diagnostics* window.

Table 7-8: Warning Messages

Message	Description	Action
RAM warning	See Diagnostics (Rosemount Radar Master: **Tools** → **Diagnostics**) for further information on a warning message. Also see View diagnostics in RRM.	
FPROM warning		
Hreg warning		
MWM warning		
LCD warning		
Modem warning		
Analog out warning		
Internal temperature warning		
Other hardware warning		
Measurement warning		
Config warning		
SW warning		

Measurement status

Measurement Status messages that may appear on the display or in Rosemount Radar Master are shown in Table 7-9:

Table 7-9: Measurement Status

Message	Description	Action
Full tank	The level measurement is in Full Tank state. The transmitter waits for the surface echo to be detected at the top of the tank.	No action needed.
Empty tank	The level measurement is in Empty Tank state. The transmitter waits for the surface echo to be detected at the bottom of the tank.	No action needed.
Probe missing	Probe is not detected.	Check that the probe is correctly mounted. Check the connection between probe and transmitter head.
Seal contaminated	Suspected contamination of the seal has been detected.	Check if the seal connection with the probe is contaminated.
Reference pulse calculated	The position of the reference pulse is calculated from the internal reference pulse.	No action needed.
Reference pulse invalid	An error in the reference pulse in the last sampled tank signal.	Check Warning messages. If MicroWave Module (MWM) Warning is active, this might indicate a transmitter error. Contact Emerson Service Department.

Table 7-9: Measurement Status *(continued)*

Message	Description	Action
DeltaF not at setpoint	The DeltaF is not correctly regulated.	Check Warning Messages. If MicroWave Module (MWM) Warning is active, this might indicate a transmitter error. Contact Emerson Service Department.
Tank signal clip warning	The last Tank Signal was clipped.	Check Warning Messages. If MWM Warning is active, this might indicate a transmitter error. Contact Emerson Service Department.
No surface echo found	The Surface Echo Pulse cannot be detected. Possible cause: • Wrong surface threshold • Liquid level in Blind Zone or below probe end	Check if the configuration can be changed so that the surface echo can be tracked in this current region. View the Echo Curve plot and check surface threshold.
Predicted level	The presented level is predicted. The surface echo could not be detected.	Check if the configuration can be changed so that the surface echo can be tracked in this current region. View the Echo Curve plot and check surface threshold.
No reference echo	The Reference Echo Pulse cannot be detected. Possible cause: • The tank is full. • The transmitter is configured with wrong probe type. • Reference Amplitude Threshold is incorrect.	• Check the product level. • Check that correct probe type is configured. • Check Reference Amplitude Threshold.
Reduced reference echo	The reference echo has been found with reduced amplitude.	No action needed.
In full tank state	The level measurement is in the full tank state, waiting for a surface echo detection at the top of the tank.	No action needed.
Sampling failed	The sampling of the last tank signal failed.	Check Warning Messages.
Invalid volume value	The given volume value is invalid. The given measurements are simulated.	Check Volume Status for details.
Sim mode 0 active	The simulation mode is active. The given measurements are simulated.	Turn off the simulation mode.
Advanced Simulation Mode active	The advanced simulation mode is active.	To turn off the Advanced Simulation mode, set Holding Register 3600=0 (see View/edit holding registers using RRM).
Invalid Lower Volume Value	The given lower volume value is invalid.	Check Lower Volume Status for details.
Invalid Upper Volume Value	The given upper volume value is invalid.	Check Upper Volume Status for details.
Using probe end projection measurement	The probe end projection is active in the transmitter software.	No action needed.
Reference echo present	An echo has been detected in the reference zone.	No action needed.

Table 7-9: Measurement Status *(continued)*

Message	Description	Action
Sudden level jump detected	This may result from various measurement problems, such as: • Rapid level changes • Surface level within Blind Zone • Disturbing echo	Check the tank to find out what causes problem to track the surface. • Set the Rapid Level Changes parameter, see Rapid level changes. • In the Blind Zones, the level may jump to Full Tank/End of Probe • See Disturbance echo handling.
Nearzone echo present	An echo has been detected in the nearzone.	No action needed.
Nonlinear gain used	The nonlinear gain is enabled.	No action needed.
Nearzone measurement	The current sweep can be used as a measurement of the nearzone.	No action needed.

Interface status

Interface status messages that may appear on the display or in Rosemount Radar Master are shown in Table 7-10:

Table 7-10: Interface Status

Message	Description	Action
Interface not OK	The interface measurement is not OK.	Check other interface status messages for reason.
Interface not found	No interface available	No action needed.
	Interface threshold to high	Adjust Interface threshold, see Example 2: Interface peak not found.
Can't measure interface on horizontal probe	Interface cannot be measured when the probe is horizontally mounted.	Change the probe mounting or turn off interface measurement by changing the measurement mode.
Can't handle max possible interface thickness	With the current configuration, the maximum measurement range is too short to guarantee that the interface echo can always be found.	Accept the limitation or change the tank environment and device configuration.
Interface thickness close to max range	The interface is close to the limit where it will be lost due to the limited maximum measurement range.	No action needed but the interface echo may be lost if the upper product thickness increases.
Interface set to max thickness	No interface echo found. The upper product thickness is set the maximum value of the current level measurement.	No action needed.
Interface thickness greater than probe length	The interface was found below the probe end.	The Upper Product Dielectric Constant is probably incorrect.

Volume calculation status

Volume calculation status messages that may appear on the display or in Rosemount Radar Master are shown in Table 7-11:

Table 7-11: Volume Status

Message	Description	Action
Level is below lowest strapping point.	The measured level is below the lowest point in the given strapping table.	For a correct volume calculation in this region, change the strapping table.
Level is above highest strapping point.	The measured level is above the highest point in the given strapping table.	For a correct volume calculation in this region, change the strapping table.
Level out of range.	The measured level is outside the given tank shape.	Check if the correct tank type is chosen and check the configured Tank Height.
Strap table length not valid.	The configured strap table length is too small or too large.	Change the strapping table size to a valid number of strapping points. A maximum number of 20 strapping points can be entered.
Strap table not valid.	The strapping table is not correctly configured.	Check that both level and volume values in the strapping table are increasing with strapping table index.
Level not valid.	The measured level is not valid. No volume value can be calculated.	Check Measurement Status, Warning and Error Messages.
Volume configuration missing.	No volume calculation method is chosen.	Do a volume configuration.
Volume not valid.	The calculated volume is not valid.	Check the other volume status messages for the reason.

Analog output status

Analog output status messages that may appear on the display or in Rosemount Radar Master are shown in Table 7-12.

Note
Analog output status messages may not appear on the integral display while the Rosemount 5300 Level Transmitter runs in HART 7 multidrop mode.

Table 7-12: Analog Output Status

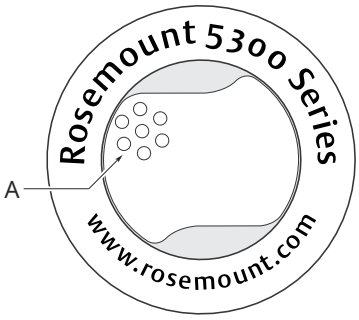
Message	Description	Action
Not connected	Analog output hardware is not connected.	
Alarm Mode	The analog output is in Alarm Mode.	Check Error and Warning Messages to find the reason for the Alarm.
Saturated	The analog output signal value is saturated, i.e. equal to the saturation value.	No action needed.
Multidrop	The transmitter is in Multidrop Mode. The analog output is fixed at 4 mA.	This is the normal setting when a device is used in Multidrop configuration.
Fixed Current mode	The analog output is in fixed current mode.	This mode is used when calibrating the Analog Output channel.
PV out of Limits	The Primary variable is out of range.	Check the Upper and Lower Range Value
Span Too Small	The configured span is too small.	Check the Upper and Lower Range Value.
Invalid Limits	The given Upper and Lower Sensor Limits are invalid.	Check that the difference between the Upper and Lower Sensor Limits is greater than the Minimum Span.

7.4 LCD error messages

Figure 7-2: The Rosemount 5300 Display Panel Displaying an Error Message

Table 7-13: Error Messages Displayed on the Rosemount 5300 Display Panel

Error message	Description
RAM FAIL	An error in the gauge data memory (RAM) has been detected during the startup tests. **Note** This resets the gauge automatically.
FPROM FAIL	An error in the gauge program memory (FPROM) has been detected during the startup tests. **Note** This resets the gauge automatically.
HREG FAIL	An error in the transmitter configuration memory (EEPROM) has been detected. The error is either a checksum error that can be solved by loading the default database, or a hardware error. **Note** The default values are used until the problem is solved.
OMEM FAIL	Other memory failure.
MWM FAIL	An error in the microwave module.
DPLY FAIL	An error in the LCD.
MODEM FAIL	Modem hardware failure.
AOUT FAIL	An error in the Analog Out Module.
OHW FAIL	An unspecified hardware error has been detected.
ITEMP FAIL	An error in the internal temperature measurement.
MEAS FAIL	A serious measurement error has been detected.
CONFIG FAIL	At least one configuration parameter is outside the allowed range. **Note** The default values are used until the problem is solved.
SW FAIL	An error has been detected in the transmitter software.



Related information

Errors

7.5 LED error messages

For Rosemount 5300 Level Transmitters without display, a flashing Light Emitting Diode (LED) is used for presentation of error messages.

Figure 7-3: Rosemount 5300 Level Transmitter with LED

A. Flashing LED

In normal operation, the LED flashes once every other second. When an error occurs, the LED flashes a sequence that corresponds to the Code number followed by a five second pause. This sequence is continuously repeated. The following errors can be displayed:

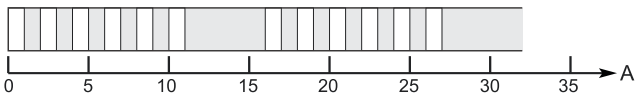


Table 7-14: LED Error Codes

Code	Error
0	Ram Failure
1	FPROM
2	HREG
4	Microwave Module
5	Display
6	Modem
7	Analog Out
8	Internal Temperature
11	Hardware
12	Measurement
14	Configuration
15	Software

Example

Modem error (code 6) is displayed as the following flash sequence:

Figure 7-4: Flash Sequence Example

7.6.1 Resource block

This section describes error conditions found in the Resource block. Read Table 7-15 through Table 7-17 to determine the appropriate corrective action.

Block errors

Table 7-15 lists conditions reported in the BLOCK_ERR parameter.

Table 7-15: Resource Block Block_Err Messages

Condition name and description
Other
Simulate Active: This indicates that the simulation switch is in place. This is not an indication that the I/O blocks are using simulated data
Device Fault State Set
Device Needs Maintenance Soon
Memory Failure: A memory failure has occurred in FLASH, RAM, or EEPROM memory
Lost Static Data: Static data that is stored in non-volatile memory has been lost
Lost NV Data: Non-volatile data that is stored in non-volatile memory has been lost
Device Needs Maintenance Now
Out of Service: The actual mode is out of service

Table 7-16: Resource Block Summary_Status Messages

Condition name
Uninitialized
No repair needed
Repairable
Call Service Center

Table 7-17: Resource Block DETAILED_STATUS with Recommended Action Messages

Condition name	RECOMMENDED action
LOI Transducer block error	• Restart processor • Check display connection • Call service center
Sensor Transducer block error	• Restart processor • Check Rosemount 5300 cable • Call service center
Mfg. Block integrity error	• Restart processor • Call service center

Table 7-17: Resource Block DETAILED_STATUS with Recommended Action Messages *(continued)*

Condition name	RECOMMENDED action
Non-Volatile memory integrity error	• Restart processor • Call service center
ROM integrity error	• Restart processor • Call service center

7.6.2 Transducer Block

This section describes error conditions found in the Sensor Transducer Block.

Table 7-18: Transducer Block Block_Err Messages

Condition name and description
Other
Out of Service: The actual mode is out of service

Table 7-19: Transducer Block XD_ERR Messages

Condition name and description
Electronics Failure: An electrical component failed
I/O Failure: An I/O failure occurred
Data Integrity Error: Data stored in the device is no longer valid due to a non-volatile memory checksum failure, a data verify after write failure, etc.
Algorithm Error: The algorithm used in the transducer block produced an error due to overflow, data reasonableness failure, etc.

7.6.3 Analog Input (AI) function block errors

Table 7-20 describes error conditions that are supported by the AI Block. Read Table 7-21 to determine the appropriate corrective action.

Table 7-20: AI BLOCK_ERR Conditions

Condition number	Condition name	Description
1	Block Configuration Error	The selected channel carries a measurement that is incompatible with the engineering units selected in XD_SCALE, the L_TYPE parameter is not configured, or CHANNEL = zero.
3	Simulate Active	Simulation is enabled and the block is using a simulated value in its execution.
7	Input Failure/Process Variable has Bad Status	The hardware is bad, or a bad status is being simulated.
15	Out of Service	The actual mode is out of service.

Table 7-21: Troubleshooting the AI Block

Symptom	Possible causes	Recommended actions
Bad or no level readings (Read the AI "BLOCK_ERR" parameter)	BLOCK_ERR reads OUT OF SERVICE (OOS)	• AI Block target mode set to OOS. • Resource Block OUT OF SERVICE.
	BLOCK_ERR reads CONFIGURATION ERROR	• Check CHANNEL parameter (see CHANNEL). • Check L_TYPE parameter (see L_TYPE). • Check XD_SCALE engineering units. (see XD_SCALE and OUT_SCALE).
	BLOCK_ERR reads POWERUP	Download Schedule into block. Refer to host for downloading procedure.
	BLOCK_ERR reads BAD INPUT	• Sensor Transducer Block Out Of Service (OOS). • Resource Block Out of Service (OOS).
	No BLOCK_ERR but readings are not correct. If using Indirect mode, scaling could be wrong	• Check XD_SCALE parameter. • Check OUT_SCALE parameter. (see XD_SCALE and OUT_SCALE).
OUT parameter status reads UNCERTAIN and substatus reads EngUnitRangViolation	Out_ScaleEU_0 and EU_100 settings are incorrect.	See XD_SCALE and OUT_SCALE.
Mode will not leave OOS	Target mode not set	Set target mode to something other than OOS.
	Configuration error	BLOCK_ERR will show the configuration error bit set. The following are parameters that must be set before the block is allowed out of OOS: CHANNEL must be set to a valid value and cannot be left at the initial value of 0. XD_SCALE.UNITS_INDX must match the units in the transducer block channel value. L_TYPE must be set to Direct, Indirect, or Indirect Square Root and cannot be left at the initial value of 0.
	Resource block	The actual mode of the Resource block is OOS. See Resource Block Diagnostics for corrective action.
	Schedule	Block is not scheduled and therefore cannot execute to go to Target Mode. Schedule the block to execute.
Process and/or block alarms will not work	Features	FEATURES_SEL does not have Alerts enabled. Enable the Alerts bit.
	Notification	LIM_NOTIFY is not high enough. Set equal to MAX_NOTIFY.
	Status Options	STATUS_OPTS has Propagate Fault Forward bit set. This should be cleared to cause an alarm to occur.

Table 7-21: Troubleshooting the AI Block *(continued)*

Symptom	Possible causes	Recommended actions
Value of output does not make sense	Linearization Type	L_TYPE must be set to Direct, Indirect, or Indirect Square Root and cannot be left at the initial value of 0.
	Scaling	Scaling parameters are set incorrectly: XD_SCALE.EU0 and EU100 should match that of the transducer block channel value. OUT_SCALE.EU0 and EU100 are not set properly.
Cannot set HI_LIMIT, HI_HI_LIMIT, LO_LIMIT, or LO_LO_LIMIT Values	Scaling	Limit values are outside the OUT_SCALE.EU0 and OUT_SCALE.EU100 values. Change OUT_SCALE or set values within range.

7.7 Troubleshooting guide

If there is a malfunction despite the absence of diagnostic messages, see Table 7-22 for information on possible causes.

Table 7-22: Troubleshooting Chart

Symptom	Possible cause	Action
No level reading	• Power disconnected • Data communication cables disconnected • Probe is not connected	• Check the power supply • Check the cables for serial data communication • View the Diagnostic window, see View diagnostics in order to check active status messages • Check if “Probe Missing” is active. If it is, check the probe connection
No HART communication.	• COM Port configuration does not match the connected COM Port • Cables may be disconnected • Wrong HART address is used • Hardware failure • HART resistor	• Check that correct COM Port is selected in the HART server (see Specify the COM port) • Check wiring diagram • Verify that the 250 Ω resistor is in the loop. • Check cables • Ensure that correct HART short address is used. Try address=0 • Check Analog Output current value to verify that transmitter hardware works • Check that the correct settings are used in Rosemount Radar Master. Select Device, Search from the menu. Click Settings and HART tab. Ensure the values are properly chosen. The standard values are shown in Specify the COM port.

Table 7-22: Troubleshooting Chart *(continued)*

Symptom	Possible cause	Action
Analog Out is set in Alarm.	Measurement or transmitter failure.	View the Diagnostic window, see View diagnostics to check active error and status messages.
Both Surface pulse and Interface Pulse are detected, but Interface Level is reported as unknown in the Echo Curve plot.	Measurement Mode is set to “Level Only”.	Set Measurement Mode to “Level and Interface” (see Measurement mode).
Both Surface pulse and Interface pulse are detected, but Interface Level is reported as unknown in the Echo Curve plot.	Interface pulse is identified as a double bounce	No action required.
	Surface pulse and Interface pulse are very close	Use the Echo Curve plot to verify that the surface and interface are close, see Analyzing the measurement signal.
Surface pulse is detected, but Level is incorrectly reported as Full or Empty.	• Wrong Probe Type set • Bad Reference Threshold value	View the Diagnostics window, see View diagnostics, to check active messages and check if the warning “Full Tank/Empty Tank” is active. If this is the case, check that: • the transmitter is configured with correct probe type • the reference pulse is below the reference amplitude threshold. If not, adjust reference threshold to an appropriate value
The reference pulse is not detected.	• The tank is full • The transmitter is configured with wrong probe type • Reference Amplitude Threshold is incorrect	• Check the product level • Check that correct probe type is configured • Check Reference Amplitude Threshold
	Large coaxial probe is used	No action
Incorrect Interface Level reading.	• Interface threshold incorrect • Upper Product Dielectric constant incorrect	• Adjust Interface threshold, see Example 2: Interface peak not found • Check the Upper Product Dielectric constant, see Upper product dielectric constant
Incorrect level reading.	• Configuration error • Disturbing objects in the tank	• Check the Tank Height parameter • Check status information and diagnostic information • Check that the transmitter has not locked on an interfering object, see Disturbance echo handling • Adjust the Surface amplitude threshold, see Example 1: Product surface peak not found

Table 7-22: Troubleshooting Chart *(continued)*

Symptom	Possible cause	Action
Both Surface pulse and Interface pulse are detected, but no interface is present in the tank.	Double bounce handling does not work properly.	Verify that the following parameters are correctly configured: • Nozzle Height • Upper Product Dielectric Constant • Lower Product Dielectric Constant
Integral display does not work.		• Check the display configuration • Check loop power • Check Display connection • Contact Emerson Service Department (1)
FOUNDATION Fieldbus Card to Transmitter Communication Fault		• Verify Device Mode setting, should be FOUNDATION Fieldbus (Parameter: ENV_DEVICE_MODE) • Restart method from Resource Block • Reboot gauge (Cycle Power)
Level Measurement Failure		• Check Power Supply • Check the gauge configuration (Transducer Block) • Check that the mechanical installation is correct
Temperature Measurement Failure		• Check ambient temperature (2) • Restart gauge • Contact Emerson Service Department
Volume Measurement Failure		• Restart gauge • Check gauge configuration using PC Based configuration tool
No surface echo		• Check signal strength • Restart transmitter • See Example 1: Product surface peak not found
DB Error/ Microwave Unit Error/ Configuration Error/ Other Error		• Restart transmitter • Set database to default; load default Database • Download Application Software • Call Service Center
SW Error/ Display Error/ Analog Out Error		• Restart transmitter • Call Service Center

(1) A malfunctioning display panel may only be replaced by service personnel at the Emerson service department. A display must not be replaced when the transmitter is in operation.

(2) If the Rosemount 5300 Level Transmitter has been exposed to temperatures outside the specified limits, the device may stop its normal operation.

7.7.1 Troubleshooting the HART® to Modbus® Converter

No communication on RS-485 bus (MA, MB)

Recommended actions

1. Check that the cables are connected.
2. Check that PWR+ is connected to + and PWR- is connected to - on the power supply.
3. Ensure the Rosemount 5300 Level Transmitter is supplied with 8-30 Vdc (max. rating).
4. Try alternating MA/MB if you are unsure of the polarity.
5. If an RS-485 converter is used, make sure it is properly installed and configured.
6. The last Rosemount 5300 Level Transmitter may need a terminating 120Ω resistor connected between MA and MB.

No communication in RRM using HART+, HART-

Recommended actions

1. Verify the HART modem is properly connected.
2. Check if device is at an alternate HART address (default 1).

No communication in RRM using MA, MB

Recommended actions

1. Check if device is at an alternate HART address (default 1).
2. Cycle the power and wait 20 seconds before polling.

Related information

No communication on RS-485 bus (MA, MB)

No communication with Modbus RTU protocol

Recommended actions

1. Make sure the Modbus communication protocol configuration is done properly.
2. Make sure the Modbus RTU address is unique on the bus.
3. Cycle the power and try to connect.
4. Check the RTU communication settings.

Related information

No communication on RS-485 bus (MA, MB)
Modbus communication protocol configuration

No communication with Modbus ASCII protocol

Recommended actions

1. Make sure the Modbus communication protocol configuration is done properly.

2. Make sure the Modbus ASCII address is unique on the bus.
3. Cycle the power, waiting 40 seconds before communication begins.
4. Check the RTU communication settings.

Related information

No communication on RS-485 bus (MA, MB)
Modbus communication protocol configuration

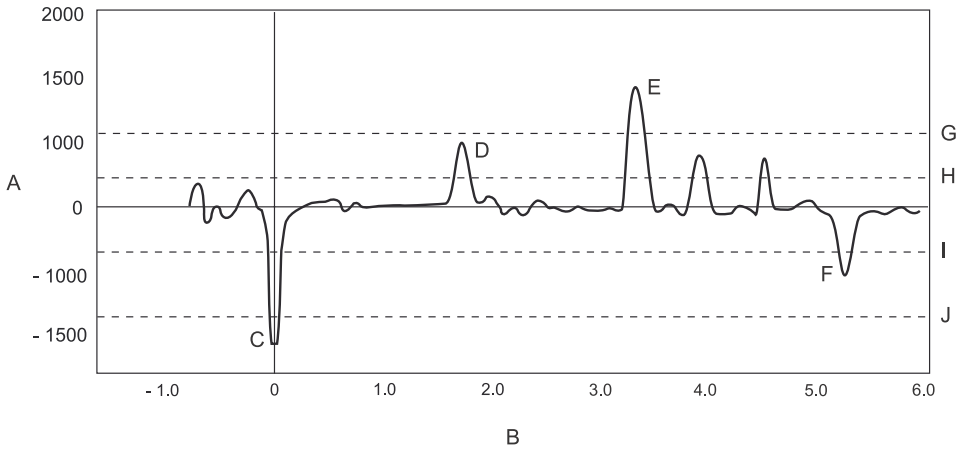
No communication with Levelmaster protocol

Recommended actions

1. Make sure the Modbus communication protocol configuration is done properly.
2. Make sure the Levelmaster address is unique on the bus.
3. Cycle the power, waiting 40 seconds before communication begins.
4. Check the RTU communication settings.

Related information

No communication on RS-485 bus (MA, MB)
Modbus communication protocol configuration



7.8 Service and troubleshooting tools

7.8.1 Analyzing the measurement signal

Using the Echo Curve plot function, an instant view of the tank signal is shown. Measurement problems can be solved by studying the position and amplitude of the different pulses.

Note
Figure 7-5 illustrates the key elements of a theoretical echo curve. In an actual echo curve, the probe end pulse and the probe end echo threshold line are not visible in an interface application, they are shown for illustration purposes only.

Figure 7-5: The Echo Curve Function Presents All Visible Echoes

A. Amplitude, mV
B. Distance, m
C. Reference
D. P1 Surface
E. P2 Interface
F. Probe End
G. Interface Threshold
H. Surface Threshold (ATC)
I. Probe End Threshold
J. Reference Threshold

Echo peaks

In a typical measurement situation, the following peaks appear in the echo curve plot:

Reference peak

This peak is caused by the transition between transmitter and the tank vapor space or air. It is used by the transmitter as a starting reference point for distance to the level surface. The echo peak amplitude depends on the probe type and installation geometry.

Note
No reference peak will be included in the echo curve of a large coaxial probe. An internal reference point is used for the large coaxial probe.

Product surface peak

This peak indicates the product level and is caused by a reflection from the product surface.

The signal strength of the reflection depends on the dielectric constant of the product. Product with a high dielectric constant (for example water) gives better reflection (a strong signal amplitude) than product with a low dielectric constant (for example oil).

Interface peak

This peak indicates the interface level. The peak is caused by reflection from the interface between an upper product and a bottom product with a relatively high dielectric constant. This peak is identified when the measurement mode is set to Product Level and Interface Level or Interface Level with Submerged Probe.

Probe end peak

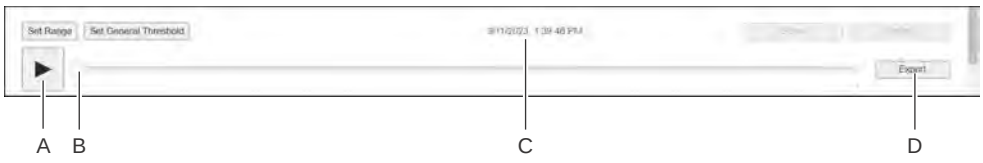
It is caused by reflection from the probe end. If the probe is grounded, the peak will be positive. If the probe end is submerged in a high dielectric media, such as water, it will not be visible.

7.8.2 Use the echo curve analyzer in AMS Device Configurator

The echo curve analyzer shows the measurement signal amplitude from the top to the bottom of the tank. It includes functions for viewing and recording the echo curve, and configuration of amplitude thresholds. To read the echo curve in AMS Device Configurator:

Procedure

1. Select **Service Tools** → **Echo Tuning**.
2. Select the **Echo Curve** tab.
   AMS Device Configurator reads one echo curve and then stops.



3. To continuously update the echo curve, select the **Play** icon.

Timeline

Use the timeline to navigate through the read echo curves.

Figure 7-6: Timeline

A. Play or pause, when the play button is selected, the tank spectrum is continuously updated.
B. Timeline slider, drag the slider to move the timeline forward or backward.
C. Date and time of echo curve readout.
D. Export echo curves.

Export echo curves

Echo curves plotted since the play button was selected are available for export, maximum 24 hours.

Procedure

1. Select **Service Tools** → **Echo Curve**.
2. Select **Export**.
3. Type your desired file name.
4. Browse to the desired directory, and then select **Save**.

Set surface threshold to a fixed value

Procedure

1. Select **Service Tools** → **Echo Curve**.
2. Select the **Set General Threshold** button. To set the surface threshold do one of the following:
3. Type the desired value, and select **Set** to set the ATC to a fixed value (a horizontal line).

Set surface threshold points to individual values

Procedure

1. Select **Service Tools** → **Echo Curve**.
2. Click and drag one point at the time in the ATC in order to raise or lower the threshold at a certain position in the tank.
3. Select the **Store** button to save your threshold settings.

Set interface threshold

Procedure

1. Select **Service Tools** → **Echo Curve**.
2. Select and drag the interface threshold line to a desired fixed value.
3. Select the **Store** button to save your threshold settings.

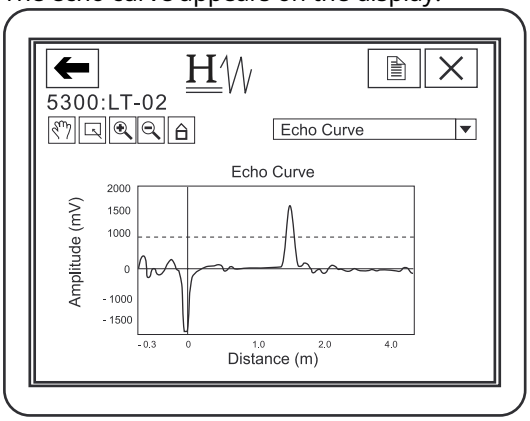
Zoom in and out the echo curve

You can zoom in to a specific area of the echo curve.

Procedure

- To zoom in or out, use either of the following options:
  - Mouse scroll wheel.
  - Touchpad to pinch zoom.
- To reset the zoom level, in the upper right corner of the echo curve, select **Reset Zoom**.

7.8.3 Use the echo curve analyzer with a handheld communicator



Using a handheld communicator that supports the Electronic Device Description Language (EDDL) with enhancements allows you to view the Echo Curve, create an Amplitude Threshold Curve (ATC) and specify amplitude thresholds such as the Surface Threshold, Interface Threshold, and Reference Threshold.

View the echo curve

To view the echo curve:

Procedure

1. Select **Service Tools** → **Echo Tuning** → **Echo Curve**.
   The echo curve appears on the display:

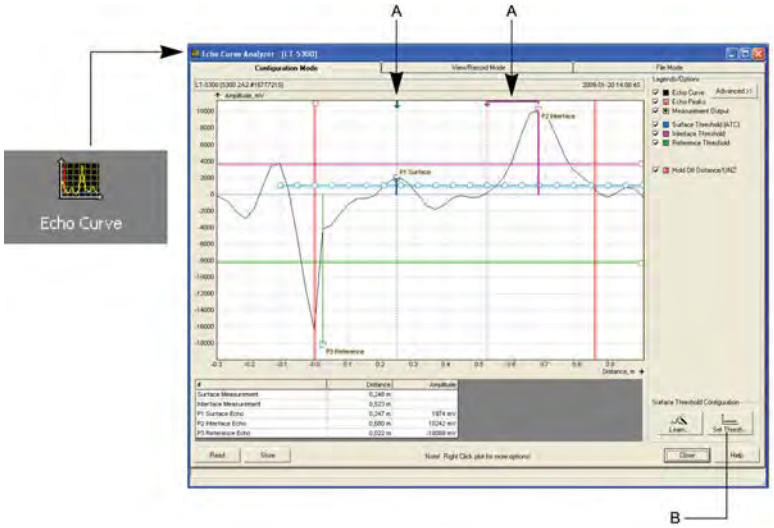
2. Use the Hand and Zoom tools to view specific parts of the Echo Curve.
   The drop down list allows you to choose items, such as the different amplitude thresholds, to be displayed in the plot.
   The echo curve plot also shows an ATC if available. See Adjust thresholds using a handheld communicator for further threshold options.

7.8.4 Use the echo curve analyzer in RRM

The Echo Curve Analyzer in Rosemount Radar Master shows the measurement signal amplitude from the top to the bottom of the tank. It includes functions for viewing and recording the Echo Curve, and advanced functions for configuration of amplitude thresholds. To plot the measurement signal:

Procedure

1. Start Rosemount Radar Master.
2. Open **Device Config/Tools** (or **Device Config/Setup**).
3. Select the **Echo Curve** icon.
   The *Echo Curve Analyzer* window appears with the **View/Record Mode** tab (or the **Configuration Mode** tab) selected.



The configuration mode tab

The Configuration Mode tab lets you adjust the different amplitude thresholds. When clicking the **Echo Curve** icon under *Device Config/Setup*, the *Echo Curve Analyzer* window appears with the **Configuration Mode** tab selected.

See the Rosemount Radar Master online-help for descriptions of the various display options in the *Echo Curve Analyzer* window.

Note
By manually changing the amplitude thresholds in the Echo Curve plot, the Automatic mode is disabled for the corresponding threshold (see Amplitude thresholds for more information on how to adjust the amplitude thresholds).

Figure 7-7: Echo Curve Analyzer Plot in Configuration Mode

A. Measurement Output
B. Set Threshold

The current level Measurement Output from the device is presented with an arrow at the top of the plot.

Normally, the measurement output points directly at the surface echo peak, but if, for instance, the tank is empty, and there is no surface echo peak detected, the Measurement Output is still presented indicating the distance to the tank bottom.

In Figure 7-7, the interface output peak is pointing to the linear distance based on corrections for the dielectric of the material. The actual interface peak is at the electrical distance.

Modify ATC

The ATC can also be manually edited if further fine tuning is needed.

Procedure

Click and drag one circle at the time in the ATC in order to raise or lower the threshold at a certain position in the tank. You may zoom in (left click and drag) for higher resolution when modifying ATC points.

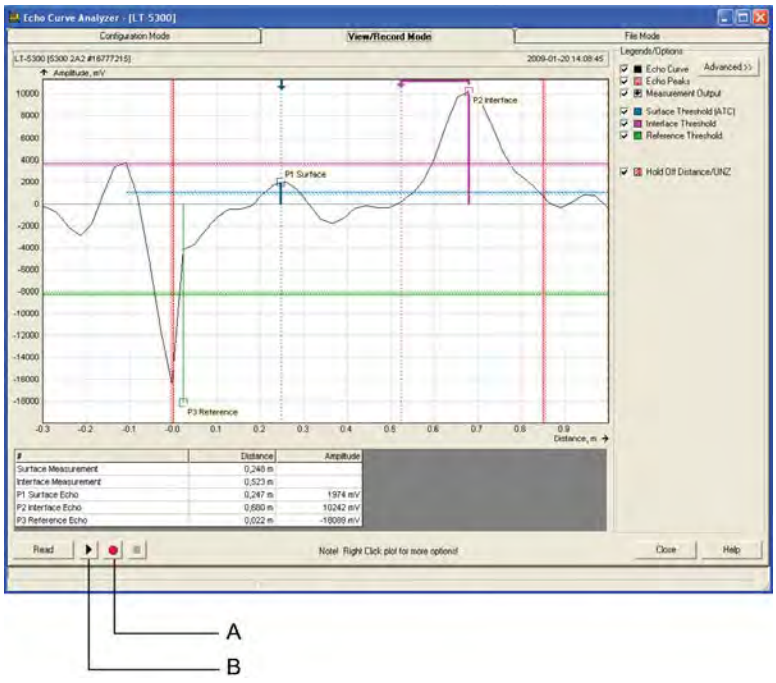
Set surface threshold to a fixed value

Procedure

Select the **Set Threshold** button to set the ATC to a fixed value (a horizontal line).

Set interface threshold

Procedure



Drag the circle on the right hand side to modify the threshold or right click the circle and select **Properties** to enter a value.

The view/record mode tab

The View/Record Mode tab presents a plot of the current tank conditions. Each radar echo is displayed as a peak in the signal plot.

When clicking the **Echo Curve** icon under **Device Config/Tools**, the *Echo Curve Analyzer window* appears with the **View/Record Mode** tab selected:

Figure 7-8: An Echo Curve Plot in View/Record Mode

A. Record tank spectra
B. Play (continuously updates the spectrum)

Advanced

The Advanced button opens a list below the Echo Curve plot with information about all echoes in the tank such as signal amplitude and position in the tank.

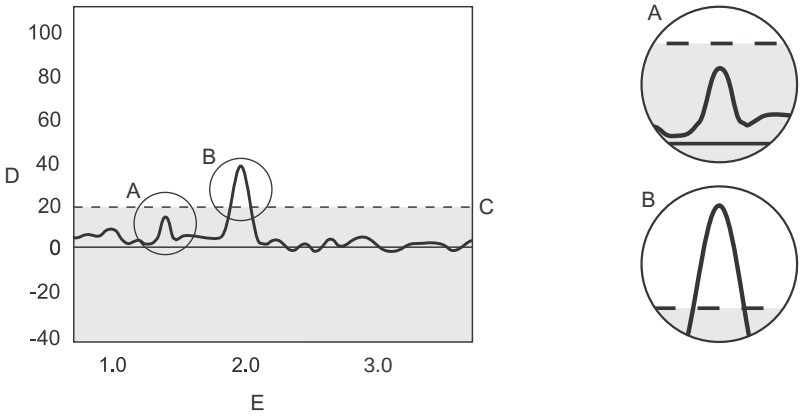
Play

When the Play button is clicked, the tank spectrum is continuously updated without being stored.

Record tank spectra

This function allows you to record tank spectra over time. This can be a useful function if, for example, you want to study the tank signal when filling or emptying the tank.

The file mode tab



The **File Mode** tab lets you open files with saved snapshots/movies to be presented in the spectrum plot. A movie file can be played to view the amplitude plot at the desired update rate.

7.8.5 Amplitude thresholds

Measurement with the Rosemount 5300 is based on the fact that the radar signal pulses are reflected by the product surface and the interface between two liquids. Signal amplitude thresholds are used to separate the measurement signal from disturbing echoes and noise.

The transmitter uses certain criteria to decide which type of pulse that is detected. For example, counting from the top of the tank, the first echo found above the Surface Threshold is considered as the product surface, as illustrated in Figure 7-9. Other pulses further away from the top, although above the Surface Threshold, are ignored. When the surface echo is found, the next pulse below the product surface and with a signal strength above the Interface Threshold, is considered as the Interface.

Figure 7-9: Threshold Principle

A. The echo peak is below the threshold (dotted line) and is suppressed by the device.
B. This echo peak is interpreted as the product surface, since it is the first peak closest to device that is above the surface threshold.
C. Threshold
D. Amplitude
E. Distance

By default, the device automatically calculates threshold values depending on the measurement mode, various dielectric constant values and process conditions that you have configured. The configured Upper Product Dielectric Constant is used for setting the automatically calculated amplitude thresholds. Normally no other threshold adjustment is needed. But if the transmitter still does not track for example the product surface, it may be necessary to manually adjust the thresholds.

Reference threshold

Threshold to filter out noise in the echo curve for detection of the Reference peak. The reference peak is a strong negative echo very close to the device.(4)

Surface threshold

Threshold to filter out noise in the echo curve for detection of the Surface. Noise below the threshold is suppressed. The first echo peak closest to the device that crosses and is above the Surface Threshold is the surface echo.

The surface threshold is designed as a number of individually adjustable amplitude threshold points, the Amplitude Threshold Curve (ATC), see Amplitude threshold curve.

Interface threshold

Threshold to filter out noise in the echo curve for detection of the Interface. The first echo peak after the surface echo that crosses and is above the Interface Threshold is the interface echo.

Full tank threshold

Note
By default, the Full Tank Threshold Offset value is 0 (function is not used). Do not use this function unless you are qualified.

The Full Tank threshold is related to the Reference Threshold, and can be used for detecting that the tank is full.(5) The given offset value determines the gap between the Reference threshold and the Full Tank threshold. The transmitter considers the tank full when the amplitude of the Reference Peak has dropped to a value between the two threshold values.

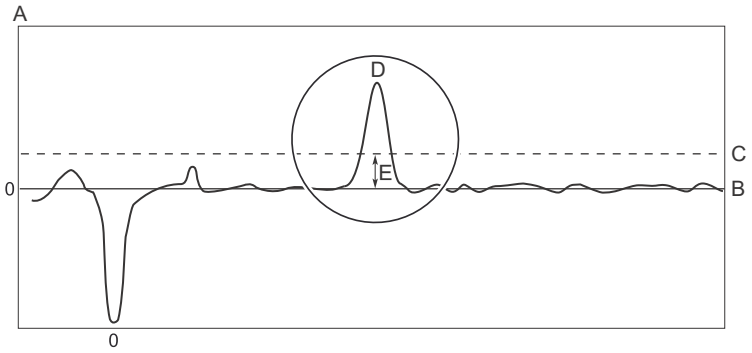
If the amplitude of the Reference peak is below the Full Tank Threshold (negative amplitude of the Reference peak), the tank is not considered full.

By default, this value is 0 (function is not used). This is because highly contaminated or condensed tank-seals, and turbulent or boiling surfaces, which can cause splashing, may cause function to be triggered.

Probe end threshold

Threshold to filter out noise in the echo curve for detection of the Probe End peak. The probe end peak is a fairly strong positive or negative echo (depending on probe type) that is present at the probe end when tank is empty.

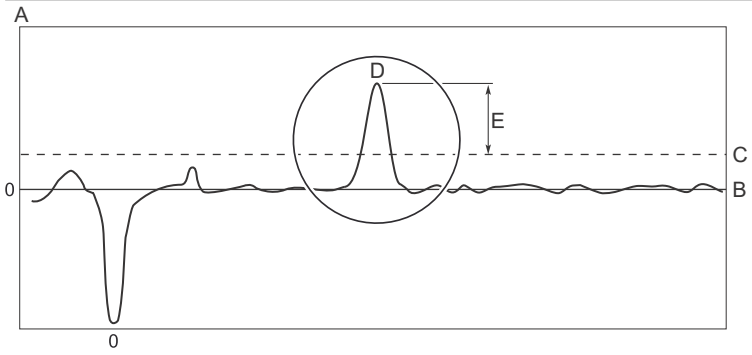
Guidelines for setting the amplitude thresholds



Normally, the amplitude thresholds are automatically set by the transmitter, and no manual settings are needed. However, due to the properties of the product, it may in rare cases be necessary to adjust the amplitude thresholds for optimum measurement performance.

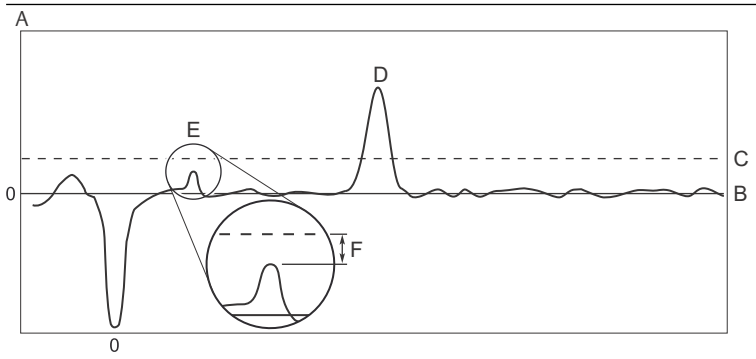
Guidelines for setting the surface threshold

Before changing the Surface Threshold, ensure the product level is at least 20 in. (0.5 m) from the lower side of the device flange.



(4) The reference threshold has no impact on the large coaxial probes since an internal reference point is used for those probes.
(5) The full tank threshold has no impact on the large coaxial probes since an internal reference point is used for those probes.

- Surface Thresholds should never be set to values less than:
  - 700 mV at distance 0-20 ft. (0-6 m) from the upper reference point.
  - 500 mV at distance more than 20 ft. (6 m) from the upper reference point.
- Set the Surface Threshold to about ⅓ of the weakest surface echo amplitude in the measuring range.



A. Amplitude (mV)
B. Distance
C. Surface Threshold
D. Surface echo
E. About ⅓ of surface echo amplitude

- Ensure to include a 500 mV margin between the Surface Threshold and the surface echo amplitude over the entire measuring range. For best performance, verify margin by lowering the product surface, or if not possible by using Figure 7-10 to #unique_291/unique_291_Connect_42_RFIXfe92916.

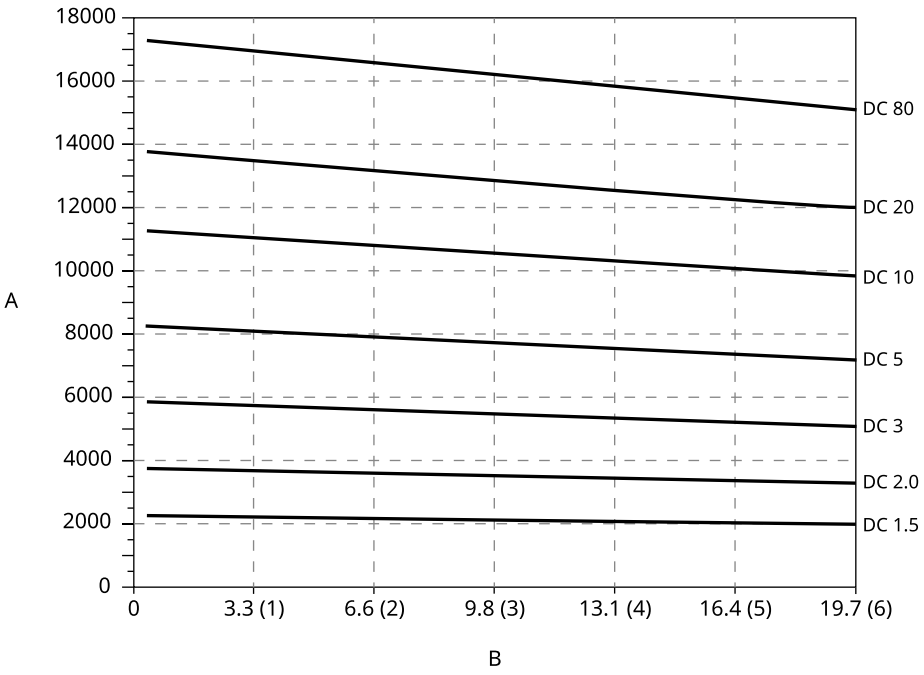
A. Amplitude (mV)
B. Distance
C. Surface Threshold
D. Surface echo
E. At least 500 mV margin

- Surface Threshold should be at least 500 mV greater than the amplitude of disturbances.

A. Amplitude (mV)
B. Distance
C. Surface Threshold
D. Surface echo
E. Disturbance
F. At least 500 mV margin

Contact your local Emerson representative if the transmitter is still having difficulties to track the product surface after applying the guidelines.

Guidelines for setting the interface threshold



- The Interface Threshold should be approximately 50 percent of the interface signal amplitude.
- If possible, Interface Threshold should be higher than Surface Threshold.

Typical surface echo amplitudes and thresholds

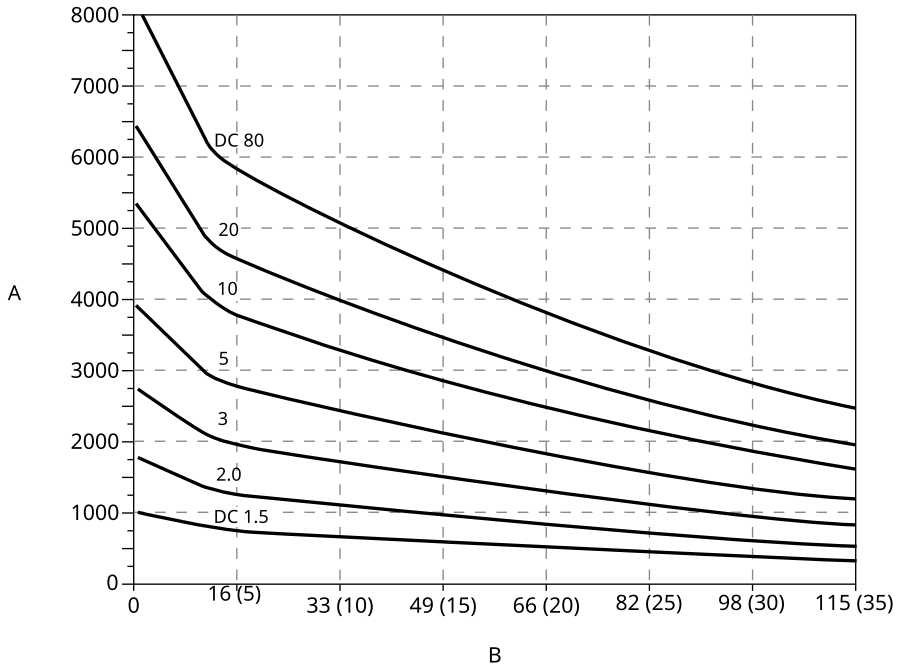


Figure 7-10 and Figure 7-11 shows typical signal amplitude of the surface echo (signal strength) at different distances to the surface. The signal amplitude of the surface echo depends on the dielectric constant of the product. Product with a high dielectric constant (for example water) gives better reflection (a strong signal amplitude) than product with a low dielectric constant (for example oil).

Note
The amplitude of the surface echo is also depended on the distance to the product surface. Since the signal is attenuated along the probe, the surface echo will be strongest close to the tank top, and then weaker further away from the tank top. In addition, the signal amplitude of the surface echo can vary because of product, foam, turbulence, ambient temperature and so on.

The values in Figure 7-10 and Figure 7-11 are estimations. Significantly different Surface Threshold values may have to be used to handle special tank conditions and applications.

B. Distance, ft. (m)

A. Amplitude (mV)
B. Distance, ft. (m)

Figure 7-12 shows typical surface thresholds for different values of the upper product dielectric constant.

A. Amplitude (mV)
B. Dielectric constant of upper product

Adjust thresholds using FDI/DD/DTM

Normally, the amplitude thresholds are automatically set by the Rosemount 5300 Transmitter, and no manual settings are needed. However, due to the properties of the product, it may in rare cases be necessary to adjust the amplitude thresholds for optimum measurement performance.

Prerequisites

Note
Before changing the amplitude thresholds, check that the Upper Product Dielectric Constant parameter is set as accurately as possible. The Upper Product Dielectric Constant is used for setting the automatically calculated amplitude thresholds.

Procedure

1. Select **Service Tools** → **Echo Tuning**.
2. In the **Thresholds** tab, specify desired threshold settings: Interface, Reference, Probe End and Full Tank thresholds.
3. Select **Save**.

Adjust thresholds using a handheld communicator

To adjust the amplitude thresholds:

Prerequisites

Note
Before changing the amplitude thresholds, check that the Upper Product Dielectric Constant parameter is set as accurately as possible. The Upper Product Dielectric Constant is used for setting the automatically calculated amplitude thresholds.

Procedure

1. HART: Select HART **Service Tools** → **Echo Tuning** → **Thresholds**.
   FOUNDATION Fieldbus: Select HART **Service Tools** → **Echo Tuning** → **Echo Tuning**.
   The different threshold options appear on the display.
2. Open the desired option. For example, to specify a constant Surface Threshold:
   HART: Select **Surface** → **Set Threshold**.
   FOUNDATION Fieldbus: Select option **Surface Threshold** → **Set Threshold**.
   See also Analyzing the measurement signal and Amplitude thresholds for more information on how to use the amplitude thresholds.
3. Select **Save** and follow the instructions.

Adjust thresholds using RRM

Normally, the amplitude thresholds are automatically set by the Rosemount 5300 Transmitter, and no manual settings are needed. However, due to the properties of the product, it may in rare cases be necessary to adjust the amplitude thresholds for optimum measurement performance.

Prerequisites

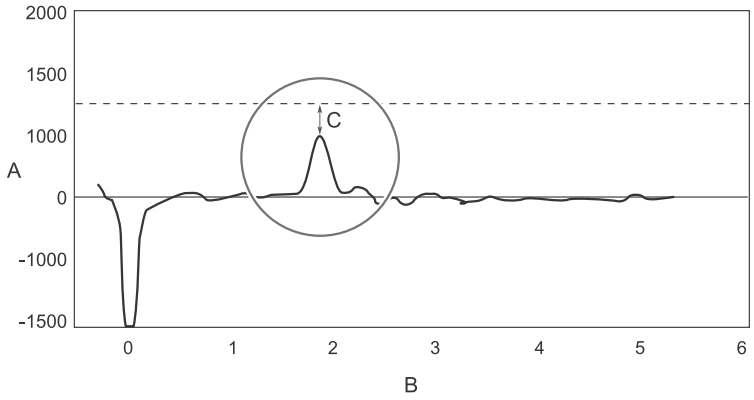
Note
Before changing the amplitude thresholds, check that the Upper Product Dielectric Constant parameter is set as accurately as possible. The Upper Product Dielectric Constant is used for setting the automatically calculated amplitude thresholds.

Procedure

1. Select **Setup** → **Advanced**.
2. In the **Thresholds** tab, specify desired threshold settings: Interface, Reference, Probe End and Full Tank thresholds.
3. Select **Store**.

Automatic surface threshold

When this option is selected, the transmitter automatically sets the Surface threshold to a constant value based on the configured Dielectric Constant of the product.



Note that by enabling the Automatic Surface threshold setting, the Amplitude Threshold Curve (ATC) is replaced by a constant threshold value.

The Surface threshold can also be manually set by using the Set Threshold function (see The configuration mode tab).

Example 1: Product surface peak not found

If the transmitter does not track the product surface correctly, it may be necessary to adjust the threshold values. In Figure 7-13, the Surface Threshold is too high and as a result the product level will not be detected. In a situation like this, the Surface Threshold has to be lowered so that the surface peak is not filtered out.

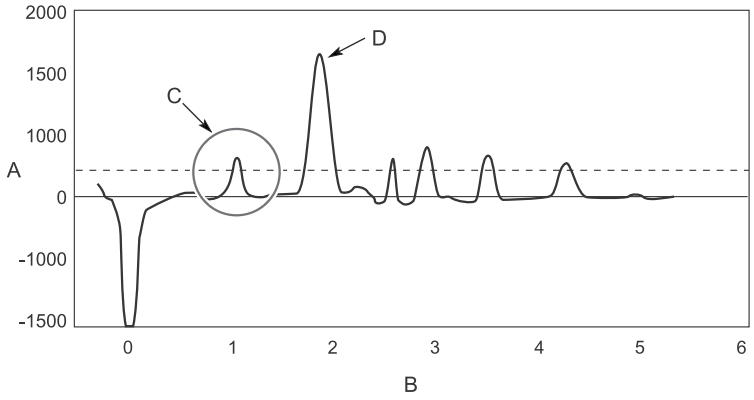


Figure 7-13: Surface Threshold Is Too High

A. Amplitude
B. Distance
C. Surface Threshold is above the Product Surface peak. Surface Threshold= Amplitude Threshold Curve (ATC)

If there are disturbing objects in the tank, the Surface Threshold must be carefully set to avoid locking on the wrong amplitude peak. In Figure 7-14, the Surface Threshold is too low, and as a result the transmitter has locked on a peak above the actual product surface. A disturbance was interpreted as the product surface, since this was the first amplitude peak closest to device that went above Surface Threshold. The actual product surface was interpreted as the interface or the probe end.

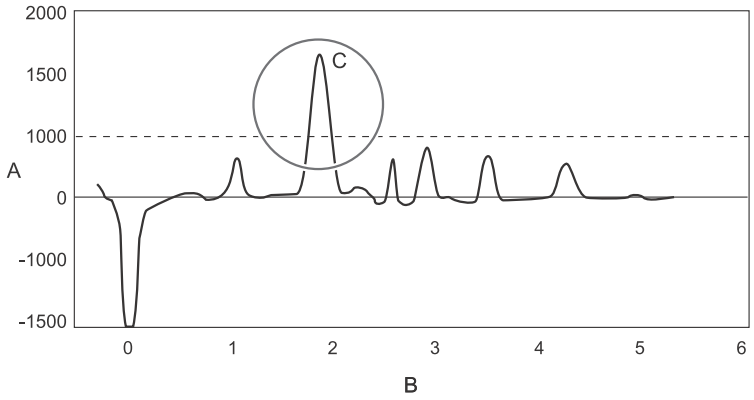

Figure 7-14: Surface Threshold Is Too Low

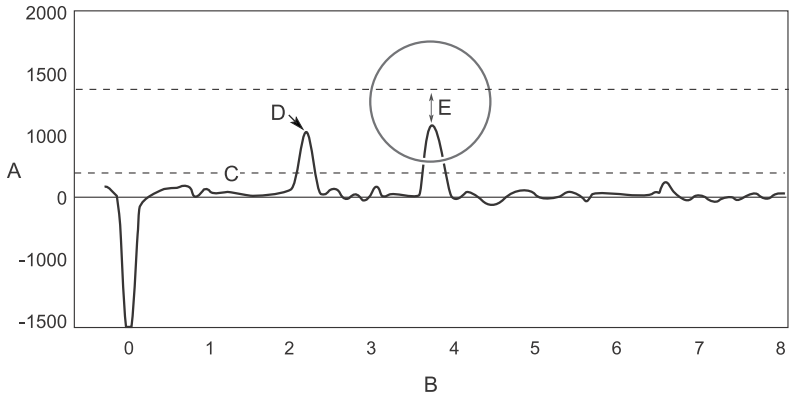
A. Amplitude
B. Distance
C. Disturbing echo misinterpreted as product surface
D. Actual product surface

By adjusting the Surface Threshold the product surface is properly detected as illustrated in Figure 7-15.

Figure 7-15: Echo Curve Plot after Surface Threshold Was Adjusted



A. Amplitude
B. Distance
C. After Surface Threshold is adjusted the product surface is correctly detected.

Example 2: Interface peak not found

In interface applications where the bottom product has a relatively low dielectric constant (<40), or if the signal is attenuated in the upper product, the amplitude of the reflected signal from the interface is relatively low and difficult for the transmitter to detect. In such a case it may be possible to detect the reflected signal from the interface if the Interface Threshold is adjusted.

Figure 7-16 illustrates a situation where the Interface Threshold is too high. The signal amplitude peak at the interface between the upper and lower products is not detected in this case.

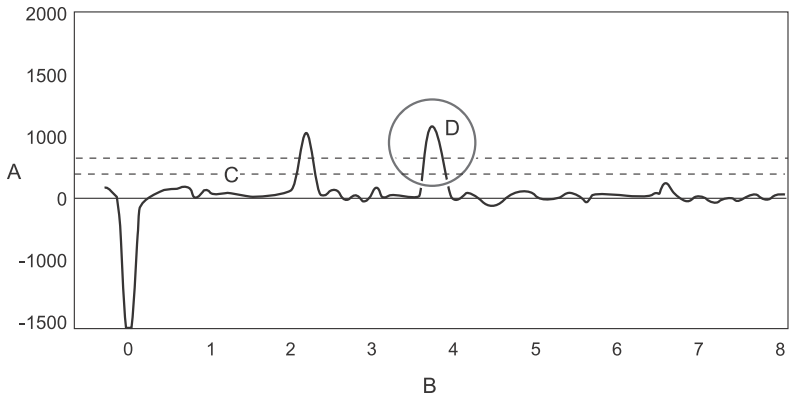


Figure 7-16: Echo Curve Plot Indicating that the Interface Threshold for the Interface Peak Is Too High

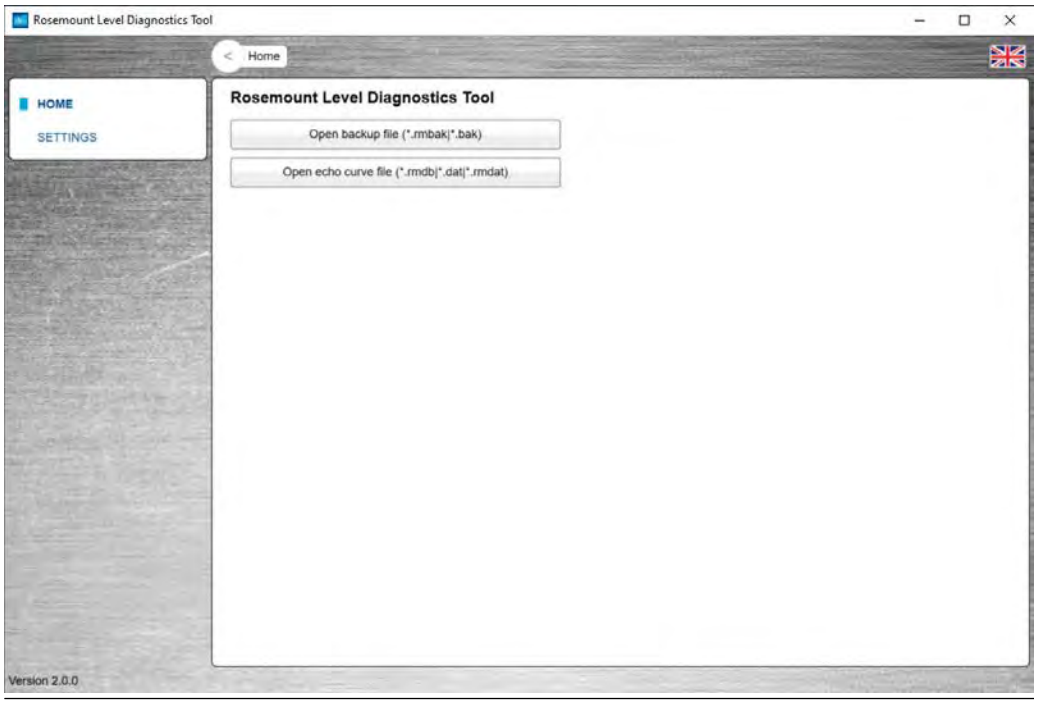
A. Amplitude
B. Distance
C. Surface Threshold
D. Product Surface Peak
E. The Interface Threshold is above the Interface Peak.

By adjusting Interface Threshold, the peak at the interface between the upper and lower products is detected as illustrated in Figure 7-17.

Figure 7-17: After Changing the Interface Threshold the Transmitter Detects the Interface



A. Amplitude
B. Distance
C. Surface Threshold
D. After Interface Threshold is adjusted the interface is correctly detected.

If the Lower Product Dielectric Constant is known, the corresponding configuration parameter can be changed as an alternative to adjusting the amplitude thresholds.

7.8.6 Using the Rosemount Level Diagnostics Tool

You can view backup and echo curve files with the Rosemount Level Diagnostics Tool.

Figure 7-18: Rosemount Level Diagnostics Tool

Download Rosemount Level Diagnostics Tool

Procedure

Download the software at Emerson.com/RosemountLevelDiagnosticsTool.

View a backup file of the device configuration

You can view backup files with the Rosemount Level Diagnostics Tool.

Procedure

1. Start **Rosemount Level Diagnostics Tool**.
2. Select **Open backup file**.
3. Browse to the saved backup file (.rmbak or .bak), and then select **Open**.

View a saved echo curve file

You can view echo curve files with the Rosemount Level Diagnostics Tool.

Procedure

1. Start **Rosemount Level Diagnostics Tool**.
2. Select **Open echo curve file**.
3. Browse to the saved echo curve file (.rmdb, .dat, or .rmdat), and then select **Open**.

Change measurement units

Procedure

1. Select **Settings**.
2. In the **Length presentation unit** list, select the desired unit.
3. In the **Volume presentation unit** list, select the desired unit.
4. In the **Temperature presentation unit** list, select the desired unit.
5. In the **Velocity presentation unit** list, select the desired unit.

7.8.7 Calibrate analog output

Calibrate analog output using FDI/DD/DTM

Use this function to calibrate the analog output by comparing the actual output current with the nominal 4 mA and 20 mA currents. Calibration is done at factory and the analog output does not normally need to be recalibrated.

Procedure

1. Select **Configure** → **Manual Setup** → **Device Setup**.
2. Select the **Analog Output** tab.
3. Select **D/A Trim**.
4. Follow the on-screen instructions to calibrate the 4 mA and the 20 mA outputs.

Calibrate analog output using RRM

Use this function to calibrate the analog output by comparing the actual output current with the nominal 4 mA and 20 mA currents. Calibration is done at factory and the analog output does not normally need to be recalibrated.

Procedure

1. Start Rosemount Radar Master and connect to device.
2. Select **Setup** → **Output**.
3. Select the **Analog Out 1** tab.
4. Select the **Calibrate DAC** button.
   If the **Calibrate DAC** button is hidden, then select **Advanced** for more options.
5. Follow the on-screen instructions to calibrate the 4 mA and the 20 mA outputs.

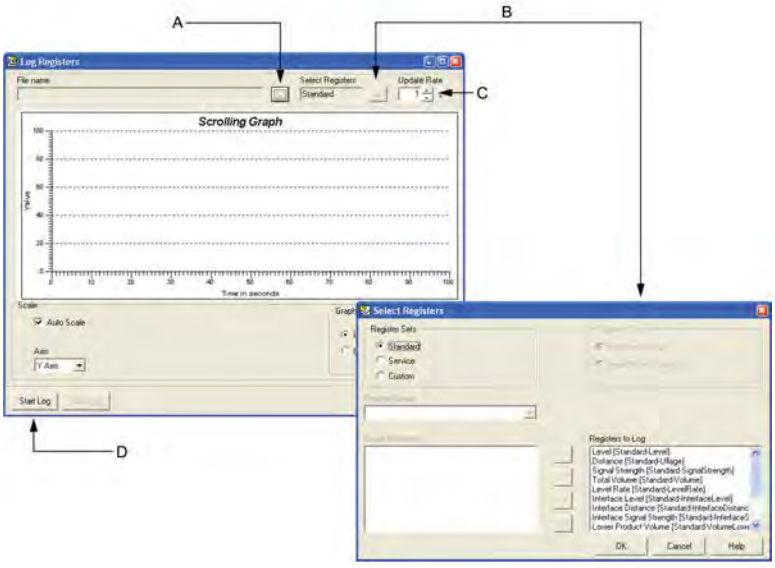
7.8.8 Logging measurement data

By using the Log Device Registers function in the Rosemount Radar Master software, you can log Input and Holding registers over time. It is possible to choose from different pre-defined sets of registers. This function is useful for verifying that the transmitter works properly.

Prerequisites

This function is only available in Rosemount Radar Master.

Procedure



1. In Rosemount Radar Master, select **Tools** → **Log Device Registers.**
2. In the *Log Registers* window, select the **Browse** button.

3. Type your desired file name.
4. Browse to the desired directory, and then select **Save**.
5. Select the **Select Register** button.
6. Select the desired registers to be logged. There are three options available:

Option	Description
Standard	Logs the most common registers and are often sufficient.
Service	If you experience problems with your device you may be asked to send a Service Log to our service department.
Custom	Define your own set of parameters to log.

7. If **Custom** is selected, then:
   a) Select **Read only (Input)** or **Read/Write (Holding)**.
   b) In the *Register Group* list, select select the desired register group.
   c) Under *Group Registers*, select one of the parameters, and then select the right arrow button (>), or select the double arrow button (>>) to add the whole group.
8. Enter the update rate. An update rate of for example 10 seconds means that the plot will be updated every 10 seconds.
9. Select the **Start Log** button. The logging will proceed until stopped by clicking the **Stop Log** button.

Figure 7-19: The Log Registers Function

A. Browse
B. Select register
C. Update rate
D. Start log

7.8.9 Save a backup file of the device configuration

Save a backup file of the device configuration using FDI/DTM

When configuration is finished, it is recommended to store the device configuration in a backup file for future reference.

The backup file may be useful to:

- Restore the configuration of the transmitter.
- Install another transmitter in a similar tank.
- Troubleshoot the transmitter.

Procedure

1. Select **Service Tools** → **Maintenance** → **Backup**.
2. Select **Save/Restore Configuration**.
3. Select **Save Configuration**.
4. Type your desired file name.
5. Browse to the desired folder within the available directory, and then select **Save**.

Save a backup file of the device configuration using RRM

Use this Rosemount Radar Master option to make a backup copy of the configuration parameters in the transmitter database. The backup file can be used to restore the transmitter configuration. It can also be used for configuration of a transmitter in a similar application. Parameters in the saved file can be uploaded directly to the new device.

Procedure

1. In Rosemount Radar Master, select **Device** → **Backup Config to File**.
2. Browse to the desired directory.
3. Type a name of the backup file, and then select **Save**.
   Now the transmitter configuration is stored.

7.8.10 Download configuration from file to device

Download configuration from file to device using FDI/DTM

Procedure

1. Select **Service Tools** → **Maintenance** → **Backup**.
2. Select **Restore Configuration**.
3. Browse to the backup file and select **Open**.

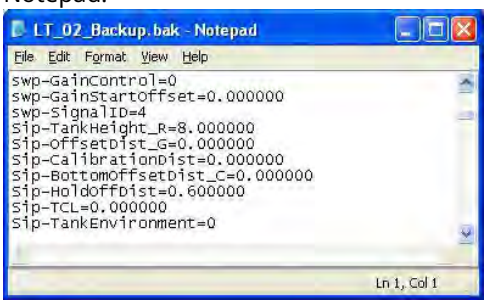
Download configuration from file to device using RRM

To upload a backup configuration using Rosemount Radar Master:

Procedure

Select **Device** → **Upload Config to Device**.

7.8.11 View backup files using RRM



The backup file can be viewed by using the Backup File Reader which is installed with the Rosemount Radar Master software.

Procedure

Click the **Start** button, and then select **All Programs** → **Rosemount** → **Radar Master Tools** → **Backup File Reader**.

The backup file can also be viewed as a text file in a word processing program such as the Notepad.

See also Open the configuration report using RRM for further information on viewing backup files.

7.8.12 Open the configuration report using RRM

The configuration report shows what configuration changes have been done to the transmitter compared to the factory configuration. The report compares a specified backup file with the default transmitter configuration.

Procedure

1. In Rosemount Radar Master, select **Tools** → **Configuration Report**.
2. Browse to desired backup file to generate the configuration report from, and then select **Open**.

   Information on probe type, software versions, software and hardware configuration, and unit code is presented.

7.8.13 Save a configuration report to file using FDI/DTM

The configuration report shows what configuration changes have been done to the transmitter compared to the factory configuration. The report compares a specified backup file with the default transmitter configuration.

Procedure

1. Select **Service Tools** → **Maintenance** → **Backup**.
2. Select **Save/Restore Configuration**.
3. Select **Create Report**.
4. Type your desired file name.
5. Browse to the desired folder within the available directory, and then select **Save**.

7.8.14 Reset to factory settings

Reset to factory settings using FDI/DD/DTM

This function resets all or a specific part of the holding registers to factory settings.

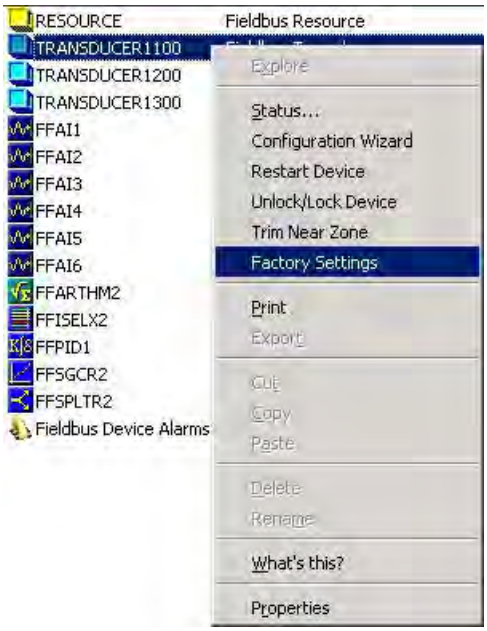
Prerequisites

Note
It is recommended that a backup of the configuration is done before the factory reset. Then the old transmitter configuration can be loaded if necessary.

Procedure

1. Select option **Service Tools** → **Maintenance** → **Reset/Restore**.
2. HART: Select the **Restore Default Settings** button and follow the instructions.
   FOUNDATION Fieldbus: Select the **Reset to Factory Default** button and follow the instructions.

Reset to factory settings using DeltaV



This function resets all or a specific part of the holding registers to factory settings.

Prerequisites

Note
It is recommended that a backup of the configuration is done before the factory reset. Then the old transmitter configuration can be loaded if necessary.

Procedure

1. In the *DeltaV™ Explorer*, select the desired transmitter icon, and then right-click the **TRANSDUCER1100** block icon.
2. Select **Factory Settings**.

Reset to factory settings using RRM

This function resets all or a specific part of the holding registers to factory settings.

Prerequisites

Note
It is recommended that a backup of the configuration is done before the factory reset. Then the old transmitter configuration can be loaded if necessary.

Procedure

Select **Tools** → **Factory Settings** and follow the instructions.

7.8.15 Use the simulation mode

Use the simulation mode with FDI/DD/DTM

This function can be used to simulate measurements and alarms.

Procedure

1. HART: Select **Service Tools** → **Simulate** → **Simulate**.
   FOUNDATION Fieldbus: **Service Tools** → **Simulate** → **Measurement**.
2. Select the **Start/Stop Device Simulation** button and follow the instructions.

Use the simulation mode with DeltaV

This function can be used to simulate measurements and alarms.

Procedure

1. In the *DeltaV™ Explorer*, select the desired transmitter icon, and then right-click the **TRANSDUCER1300** block icon.

2. Select **Simulation Mode**.

Use the simulation mode with RRM

This function can be used to simulate measurements and alarms.

Procedure

1. Select **Tools** → **Simulation Mode**.
2. In the *Distance (simulated)* box, type the desired value.
3. To simulate a measurement alarm, select the **Enable Measurement Alarm (simulated)** checkbox.
4. To simulate a failure alarm (e.g. an internal hardware failure), select the **Enable Device Failure Alarm (simulated)** checkbox.
5. Select **Start**.

7.8.16 Enter service mode in Rosemount Radar Master

Service functions for advanced users are available in Rosemount Radar Master. All options in the Service menu are enabled when entering the service mode.

Procedure

1. Select **Service** → **Enter Service Mode**.
2. Type the password and select **Submit**.

   The default password is "admin".

7.8.17 Change password for the service mode

To change the password for enabling all options in the Service menu:

Procedure

1. Select **Service** → **Change Password**.
2. Type your current password.
3. Type a new password.

7.8.18 View input registers

View input registers using FDI/DTM

Measured data is continuously stored in the input registers. By viewing the contents of the input registers, expert users can check that the transmitter works properly.

Procedure

1. Select **Configure** → **Manual Setup** → **Level Setup**.
2. Select **Advanced** → **Expert Options** → **Input Registers**.
3. Type the desired register number to start reading from.
   Registers can also be viewed by selecting a group from the **Block** list.
4. Select **Refresh**.

View input registers using RRM

Measured data is continuously stored in the input registers. By viewing the contents of the input registers, expert users can check that the transmitter works properly.

Procedure

1. In Rosemount Radar Master, enter the service mode.
   a) Select **Service** → **Enter Service Mode**.
   b) Type the password and select **Submit**.
      The default password is "admin".
2. Select **Service** → **View Input Registers**.
3. Select the **Dec** or **Hex** checkbox as desired.

Option	Description
Dec	Display values in decimal format.
Hex	Display values in hexadecimal (Hex) format.

4. In the *View Input Registers* window, do one of the following:
   - To search for registers by name, select the **Names** checkbox, and then in the list, select the desired register group.
   - To search for registers by entering the register number, select the **Numbers** checkbox, and then type the desired register number and the number of registers to read.
5. Select **Read**.

7.8.19 View holding registers

View holding registers using FDI/DTM

Procedure

1. Select **Configure** → **Manual Setup** → **Level Setup**.
2. Select **Advanced** → **Expert Options** → **Holding Registers**.
3. Type the desired register number to start reading from.
   Registers can also be viewed by selecting a group from the **Block** list.
4. Select **Refresh**.

7.8.20 Edit holding registers

Edit holding registers using FDI/DTM

The holding registers store various transmitter parameters, such as configuration data, used to control the measurement performance.

Prerequisites

Note
Do not use holding registers to configure the transmitter unless you are qualified. This dialog is mainly used for service purposes and for advanced configuration.

Procedure

1. Select **Configure** → **Manual Setup** → **Level Setup**.
2. Select **Advanced** → **Expert Options** → **Holding Registers**.
3. Type the desired register number to start reading from.
   Registers can also be viewed by selecting a group from the **Block** list.
4. Select **Refresh**.
5. To change a holding register value, type a new value in the corresponding value field, or select a new value from the corresponding list.
6. Select **Save** to store the new value.

View/edit holding registers using RRM

The holding registers store various transmitter parameters, such as configuration data, used to control the measurement performance.

Prerequisites

Note
Do not use holding registers to configure the transmitter unless you are qualified. This dialog is mainly used for service purposes and for advanced configuration.

Procedure

1. In Rosemount Radar Master, enter the service mode.
   a) Select **Service** → **Enter Service Mode**.
   b) Type the password and select **Submit**.
      The default password is "admin".

2. Select **Service** → **View Holding Registers**.
3. Select the **Dec** or **Hex** checkbox as desired.

Option	Description
Dec	Display values in decimal format.
Hex	Display values in hexadecimal (Hex) format.

4. In the *View Holding Registers* window, do one of the following:
   - To search for registers by name, select the **Names** checkbox, and then in the list, select the desired register group.
   - To search for registers by entering the register number, select the **Numbers** checkbox, and then type the desired register number and the number of registers to read.
5. Select **Read**.
6. To change a holding register value, type a new value in the corresponding value field.

   Some holding registers can be edited in a separate window. In this case, you can change individual data bits.
7. Select **Store** to store the new value.

7.8.21 Write protection

Write protect a transmitter using FDI/DD/DTM

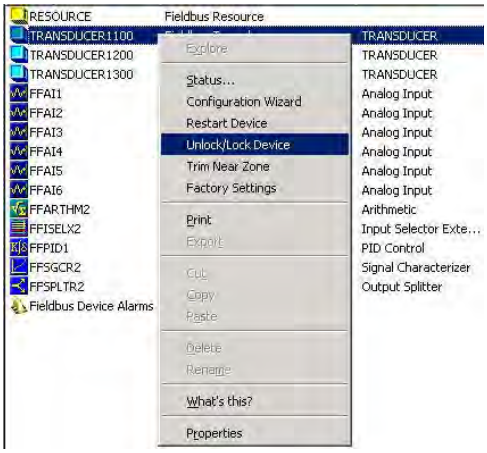
The transmitter can be protected from unintentional configuration changes by a password protected function. The default password is 12345. It is recommended that this password is not changed to facilitate service and maintenance of the transmitter.

Procedure

1. HART®: Select **Overview** → **Device Information** → **Alarm and Security** → **Security**.

   FOUNDATION Fieldbus: Select **Overview** → **Device Information** → **Security**.
2. HART: Select **Write Protect** and follow the instructions.

   FOUNDATION Fieldbus: Select **Write Protect Level** or **Write Protect All**, and follow the instructions.



Write protect a transmitter using DeltaV

The transmitter can be protected from unintentional configuration changes by a password protected function. The default password is 12345. It is recommended that this password is not changed to facilitate service and maintenance of the transmitter.

Procedure

1. In the *DeltaV™ Explorer*, select the transmitter icon, and right-click the **TRANSDUCER1100** block icon.

2. Select **Unlock/Lock Device**.

Write protect a transmitter using RRM

The transmitter can be protected from unintentional configuration changes by a password protected function. The default password is 12345. It is recommended that this password is not changed to facilitate service and maintenance of the transmitter.

Procedure

1. Select **Tools** → **Lock/Unlock Configuration Area**.
2. Type the password to lock/unlock, and then select **OK**.

7.8.22 Upgrade the HART® to Modbus® Converter firmware

The HMC's firmware is upgraded using Rosemount Radar Master.

Prerequisites

Note
All settings in the HART to Modbus converter (HMC) will be lost after upgrading the transmitter. Reconfiguration of Modbus communication setup and alarm handling is required after completing the upgrade.

Note
During firmware upgrade, the HMC Modbus RTU address must be 246, the default address. Ensure to disconnect other Modbus RTU devices that are connected and have address 246.

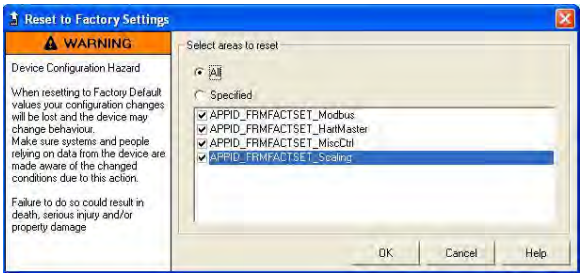
Note
Do not interrupt communication between the PC and the Rosemount 5300 Level Transmitter during the firmware upload.

Procedure

1. Start Rosemount Radar Master.
2. Enable Modbus communication and set communication preferences.
   a) Select **View** → **Communication Preferences**.
   b) Select the **Modbus** tab.
   c) Select the **Enable Modbus Communication** checkbox.

d) In the ***Port*** list, select the COM port number that the RS-485 Converter is connected to.

e) Select **Advanced** and use the following settings:

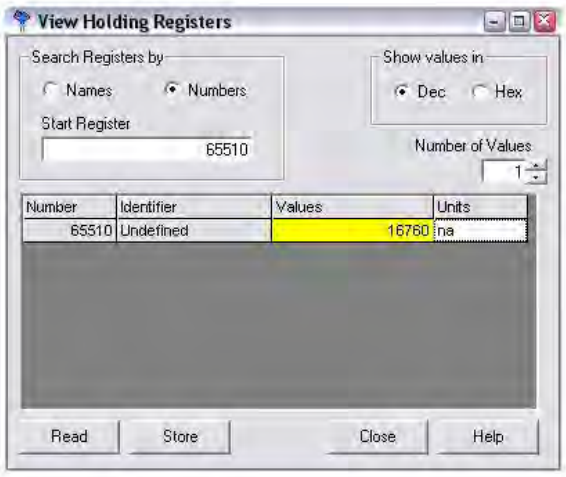


- Modem: RS-485
- Baudrate: According to configuration in HMC (default 9600)
- Stop Bits: According to configuration in HMC (default 1)
- Parity: According to configuration in HMC (default None)
- Handshake: RTS/CTS
- Response Timeout: 1000 ms
- Retries: 3

f) Select **OK**.

3. Search for and connect to device.
   a) Select **Device** → **Search** to open the ***Search Device*** window.
      If the HMC is configured for Modbus ASCII or Levelmaster communication, cycle the power to the transmitter and then open the ***Search Device*** window. The HMC will then communicate using Modbus RTU for 20 seconds and under that time it is possible to connect with Rosemount Radar Master.
   b) In the ***Protocols(s)*** list, verify that Modbus is selected.
   c) Select **Scan Address Range**, and type a start and end address.
      The default HMC Modbus address is 246.
   d) Select **Start Scan**.
   e) Select **OK** to connect when the device is found.
4. Ensure the HMC Modbus address is set to 246 (the default address).
   a) Select **Setup** → **General**.
   b) In the ***Device Address*** box, type 246 and select **Store**.
5. Enter service mode.
   a) Select **Service** → **Enter Service Mode**.
   b) Type the password and select **Submit**.
      The default password is "admin".
6. Upload HMC firmware to device.
   a) Select **Service** → **Upload Firmware**.
   b) Select **Browse** and navigate to the folder containing the HMC firmware file.
   c) Select the ".cry" file, and select **Open**.
   d) In the ***Upload Firmware*** window, select **Upload** to start the firmware upgrade.
7. When upload is finished, select **Tools** → **Diagnostics**.
8. Select **Device Errors** and check for “Checksum”.
9. If “Checksum” is on the list, then do the following:

a) Select **Tools** → **Factory Settings**.



b) Select **All** and then select **OK**.

c) Select **Yes**.

Note
An error message might be displayed when performing the Reset to Factory Settings operation. The operation has been successful if the checksum error has been cleared.

10. Select **Tools** → **Restart Device**.
11. Select **Tools** → **Diagnostics**, and then select **Device Errors** to verify that the "Checksum" error is no longer present.
12. If the "Checksum" error is still present, then do the following:
    a) Select **Service** → **View Holding Registers**.
    b) Select **Numbers**.
    c) In the ***Start Register*** box, type `65510`, and then select **Read**.
    d) Type the value `16760` for register `65510` and select **Store**.

13. Select **Tools** → **Restart Device**.

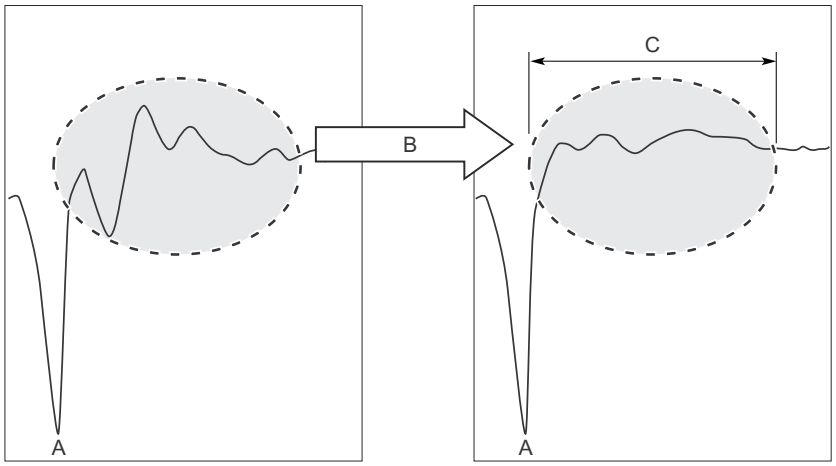
14. If the HMC is configured for Modbus ASCII or Levelmaster communication, then proceed with the following:
    a) Close Rosemount Radar Master and disconnect the RS-485 converter from the HMC.
    b) Cycle the power to the HMC to exit the Modbus RTU communication mode.

7.9 Application challenges

7.9.1 Handling disturbances at top of tank

In addition to using the ATC, the Rosemount 5300 Level Transmitter supports alternative methods to filter out disturbances at the top of the tank, such as the Trim Near Zone and the Hold Off Distance/Upper Null Zone functions, which can be used to handle disturbances from narrow nozzles or nozzles with rough edges.

Trim near zone function



The Trim Near Zone function is used to fine tune performance in the area close to the tank top (Near Zone). The Near Zone stretches about 3.3 ft (1 m) into the tank from the lower side of the device flange.

The device will learn how the echo curve in the Near Zone looks like and use this for enhancing accuracy when the surface echo is within the Near Zone. When leaving factory, the near zone measurement has been fine tuned. The factory setting is normally sufficient and does not need to be repeated after installation.

However, since the setting is optimized depending on actual installation, further trimming may be necessary in the case of unfavorable conditions (for instance if there are disturbance echoes caused by the tank nozzle, or if you have exchanged the probe). Trimming means that the measurement performance in the Near Zone is maintained even under these conditions and prevents false echo indication.

Figure 7-20 describes the Trim Near Zone function and its effect on the echo curve. This effect is only visible if measurement conditions so require.

Figure 7-20: Echo Curve Before and After Trim Near Zone

A. Reference Peak
B. Trim Near Zone
C. 0-3.3 ft (0-1 m)

Perform trim near zone using FDI/DD/DTM

The Trim Near Zone function is used to fine tune performance in the area close to the tank top (Near Zone).

Prerequisites

Before performing the Trim Near Zone, ensure that:

- There is product in the tank.
- The product level is below the Near Zone region (0-3.3 ft (0-1 m) below the Upper Reference Point).
- The ambient temperature is within 72 °F (40 °C) of the expected ambient operating temperature.

Note
The Trim Near Zone function should only be used for reducing impact from stationary disturbances. It is not suitable for occasional disturbances.

Note
For firmware version 2.A2 or later the Trim Near Zone is not possible in combination with narrow nozzles, as defined below:

- 50 mm < Nozzle height < 300 mm
- Nozzle diameter < 2 in. for all single probes (except 13 mm single rigid)
- Nozzle diameter < 3 in. for 13 mm single rigid

Note
Trim Near Zone is not available for large coaxial probes.

Note
For devices with option code BR5, refer to the Rosemount 5300 Single Probes with Cold Temperature Option Code BR5 Manual Supplement.

Procedure

1. HART®: Select **Overview** → **Echo Tuning**.
   FOUNDATION™ Fieldbus: **Configure** → **Manual Setup** → **Avanced**.
2. Select **Near Zone** → **Trim Near Zone** and follow the instructions.
3. When near zone trimming is complete, restart the device.
   a) HART: Select **Service Tools** → **Maintenance**.
      FOUNDATION Fieldbus: Select **Service Tools** → **Maintenance** → **Reset/Restart**.
   b) Select **Restart Device**.

Perform trim near zone using RRM

The Trim Near Zone function is used to fine tune performance in the area close to the tank top (Near Zone).

Prerequisites

Before performing the Trim Near Zone, ensure that:

- There is product in the tank.
- The product level is below the Near Zone region (0-3.3 ft (0-1 m) below the Upper Reference Point).
- The ambient temperature is within 72 °F (40 °C) of the expected ambient operating temperature.

Note
The Trim Near Zone function should only be used for reducing impact from stationary disturbances. It is not suitable for occasional disturbances.

Note
For firmware version 2.A2 or later the Trim Near Zone is not possible in combination with narrow nozzles, as defined below:

- 50 mm < Nozzle height < 300 mm
- Nozzle diameter < 2 in. for all single probes (except 13 mm single rigid)
- Nozzle diameter < 3 in. for 13 mm single rigid

Note
Trim Near Zone is not available for large coaxial probes.

Note
For devices with option code BR5, refer to the Rosemount 5300 Single Probes with Cold Temperature Option Code BR5 Manual Supplement.

Procedure

1. Select **Setup** → **Advanced**.
2. Select the **Near Zone** tab.
3. Select **Trim Near Zone** and follow the on-screen instructions.
4. When near zone trimming is complete, restart the device.
   a) Select **Tools** → **Restart Device**.

Reset trim near zone using FDI/DD/DTM

To reset the Trim Near Zone function to factory settings:

Procedure

1. HART®: Select **Overview** → **Echo Tuning**.
   FOUNDATION™ Fieldbus: **Configure** → **Manual Setup** → **Advanced**.
2. Select **Near Zone** → **Reset near zone trimming to factory settings** and follow the instructions.

Reset trim near zone using RRM

To reset the Trim Near Zone function to factory settings:

Procedure

1. Select **Setup** → **Advanced**.
2. Select the **Near Zone** tab.
3. Select **Trim Near Zone**.
4. Select **Reset near zone trimming to factory settings**, and then select **OK**.

Change the hold off distance/upper null zone

Change the hold off distance/upper null zone using FDI/DD/DTM

The Hold Off Distance/Upper Null Zone (UNZ) defines a zone close to the transmitter where echoes are ignored. This zone can be extended to block out disturbing echoes at the top of the tank.

Prerequisites

Note
By adjusting the Hold Off Distance/UNZ, the measuring range is reduced.

Note
Before changing the Hold Off Distance/UNZ, check entered value for the high alarm limit. The high alarm limit must be outside the Hold Off Distance/UNZ.

Procedure

1. Use the Echo Curve plot to verify if there are disturbances in the upper part of the tank.
2. Set the Hold Off Distance/UNZ to the desired value.
   a) HART®: Select **Configure** → **Manual Setup** → **Level Setup** → **Probe**.
      FOUNDATION™ Fieldbus: Select **Configure** → **Manual Setup** → **Probe**.
   b) Set **Upper Null Zone** to the desired value.
   c) Select **Send**.

Hold off distance/upper null zone (UNZ)

7.9.2 Disturbance echo handling

When the Basic Configuration is done, the transmitter may need a fine-tuning to handle disturbing objects in the tank. The Amplitude Threshold Curve (ATC) function can be used for disturbance echo handling with the Rosemount 5300 Level Transmitter.

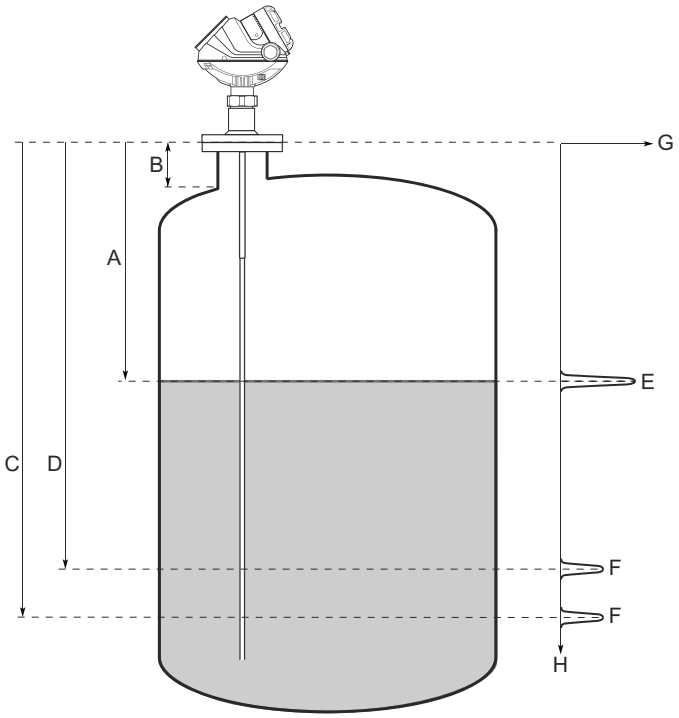
Amplitude threshold curve

As shown in Figure 7-21, the ATC can be designed to filter out single disturbing echoes by adapting the curve around the corresponding amplitude peak. It is important in this case that the disturbance is fixed at a certain tank level. Disturbing echoes which may appear different from time to time can be filtered out by raising the whole ATC.

Figure 7-21: Disturbing Echoes Can Be Filtered out by Creating an Amplitude Threshold

A. Amplitude, mV
B. Distance, m
C. Disturbing object
D. Measurement signal
E. Amplitude Threshold Curve

Signal quality metrics



Build up on the probe and different surface conditions are factors that can affect signal and noise levels. Signal Quality Metrics can give an indication of how good the surface signal is compared to the noise. For more information, see Signal Quality Metrics.

7.9.3 Double bounce handling

A double bounce echo occurs when a radar signal bounces back and forth between the product surface and the tank roof before it is detected by the transmitter. Double bounces are most likely to appear in metal water tanks. When using interface measurement to detect a potential oil layer on top of the water, an unidentified double bounce echo peak could cause problems being interpreted as an interface echo peak.

Normally, these echo peaks are identified and discarded as double bounce peaks by the Rosemount 5300. Both the echo peak amplitude and position are used to identify a double bounce.

Figure 7-22: Double Bounce Echo Peak Position

A. Surface distance
B. Nozzle height
C. Distance to potential double bounce = Surface distance × 2
D. Distance to potential double bounce = (Surface distance × 2) - Nozzle height
E. Surface echo peak
F. Double bounce echo peaks
G. Signal amplitude
H. Distance

Required settings for effective double bounce identification

- The position of a potential double bouce echo peak is related to the nozzle hight. A properly configured nozzle height is therefor essential to achieve an efficient double bounce handling.
- The configured dielectic constants are included in the evaluation of the echo peak amplitude and should therefore also be set correctly.

Upper product dielectric constant

7.9.4 Interface level with submerged probe

The measurement mode Interface Level with Submerged Probe is used to handle interface measurements when the product level is not visible, for example in a full chamber pipe as illustrated in Figure 7-23. In this case the probe is fully submerged into the upper product, and only the interface level is detected by the transmitter.

Figure 7-23: Interface Level Measurements in a Full Chamber

A. Interface distance
B. Interface level
C. Product level is ignored
D. Interface level is measured

Even if the upper product level drops, it is ignored by the transmitter which continues to measure only the interface level. If the product level drops, the air filled region in the upper part of the pipe will slightly reduce the measurement accuracy of the interface level. To achieve high accuracy in this measurement mode, the probe must be fully submerged, or a Rosemount 5302 for Level and Interface measurements should be used.

Set the measurement mode using FDI/DD/DTM

To set the measurement mode to Interface Level with Submerged Probe:

Prerequisites

Note
Do not set measurement mode to Interface Level with Submerged Probe for applications where both product level and interface level should be measured.

Procedure

1. Select **Configure** → **Level Setup**.
2. Select the **Environment** tab.
3. Under *Measurement Mode*, select the **Interface Level with submerged probe** checkbox.

4. Select **Send**.

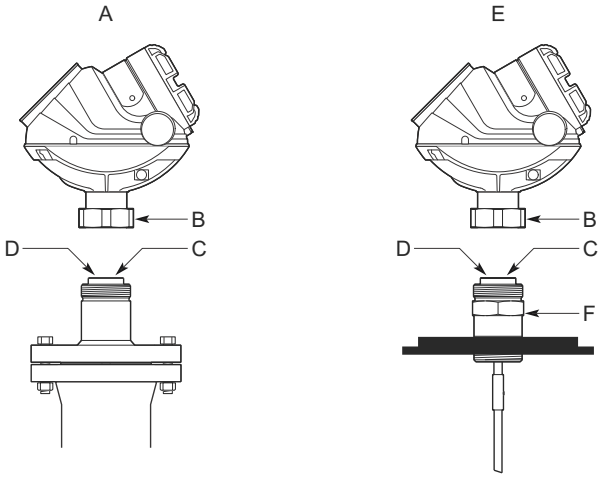
Note
Adjust Interface Threshold if the interface level pulse is not detected. Note that in submerged mode the interface is picked up by the surface threshold.

Set the measurement mode using RRM

To set the measurement mode to Interface Level with Submerged Probe:

Prerequisites

Note
Do not set measurement mode to Interface Level with Submerged Probe for applications where both product level and interface level should be measured.



Procedure

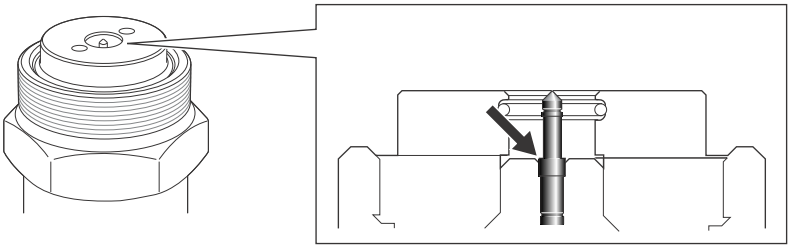
1. Select **Setup** → **Tank**.
2. Select the **Environment** tab.
3. Under *Measurement Mode*, select the **Interface Level with submerged probe** checkbox.
4. Select **Store**.

Note
Adjust Interface Threshold if the interface level pulse is not detected. Note that in submerged mode the interface is picked up by the surface threshold.

7.10 Replace the transmitter head

Figure 7-24: Transmitter Head Replacement

A. Flanged version
B. Nut
C. Process seal
D. Put the protection plug here
E. Threaded version
F. Adapter



Prerequisites

Note
If the transmitter head must be removed from the probe, ensure that the process seal is carefully protected from dust and water.

Procedure

1. Loosen the nut that connects the transmitter head to the process seal.
2. ⚠ Carefully lift the transmitter head.
3. On the probe, ensure that the upper surface of the process seal is clean and free from dust and water. Wipe it clean with a dry and lint-free cloth.
4. Verify the spring-loaded pin at the center of the process seal is properly inserted. When inserted properly, only the plunger is seen above the edge inside the seal hole.

   Note
   Do not remove the process seal from the adapter.

5. If the transmitter head is not mounted directly, attach the protection plug to the process seal to protect the exposed parts from dust and water. If a protection plug is not available, then cover the process seal with a plastic bag.
6. Rotate the new transmitter head so the device display faces the desired direction.
7. Tighten the nut. Max torque is 30 ft-lb (40 Nm).

Postrequisites

Configure the transmitter.

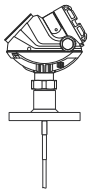
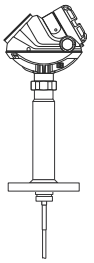
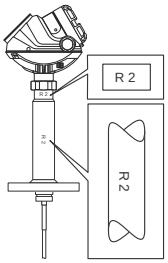
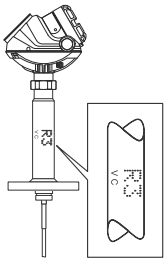
Configuration

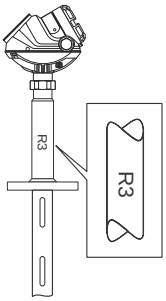
7.11 Changing a probe

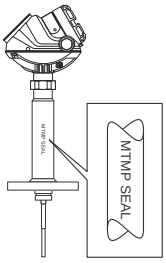












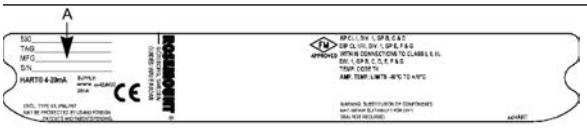
7.11.1 Probe and firmware compatibility

Transmitter heads with a firmware version earlier than 1.A4 (manufacturing date before 2008-06-18) are not compatible with HP/HTHP/C probes marked with R2.

Transmitter heads with a firmware version 1.A4 or later are compatible with HP/HTHP probes without the R2 marking when the Trim Near Zone function is performed, as illustrated below.

Only probes with both R3 and VC marking are compatible with the Dynamic Vapor Compensation function. See Check if Dynamic Vapor Compensation function is supported using RRM to determine if the Dynamic Vapor Compensation function is supported by the transmitter head.

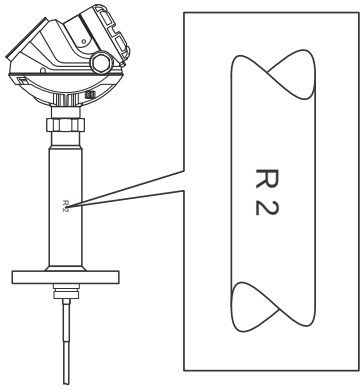
Table 7-23: Compatibility between Firmware Version and Probe Type



Firmware version	Probe type					
	Standard	HP/HTHP without R2 marking	HP/HTHP/C with R2 marking only(1)	HTHP with both R3 and VC marking	Large coaxial HP/C	MTMP
						
Earlier than 1.A4	Yes	Yes	No	No	No	No
1.A4	Yes	Yes(2)	Yes	No	No	No
2.A2 - 2.F0	Yes	Yes(2)	Yes(3)	No	No	No
2.H0 -2.J0	Yes	Yes (2)	Yes (3)	Yes(4)	No	No
2.L3 or later	Yes	Yes (2)	Yes (3)	Yes(4)	Yes	Yes

(1) The R2 marking is on the housing seal or the adapter as seen in the figure.
(2) Trim Near Zone function is required.
(3) When Dynamic Vapor Compensation is not used.
(4) The probe requires that Dynamic Vapor Compensation is activated in the device for full functionality.

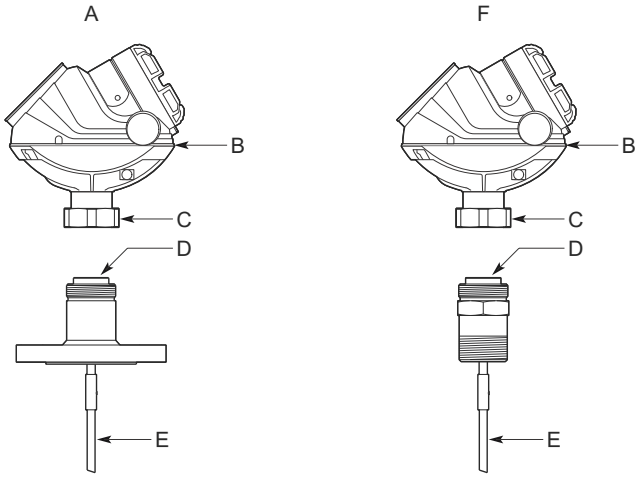
7.11.2 Check firmware and probe version



Procedure

1. Check the manufacturing date on the transmitter head label.

A. Manufacturing Date Before 080618 (YYMMDD)

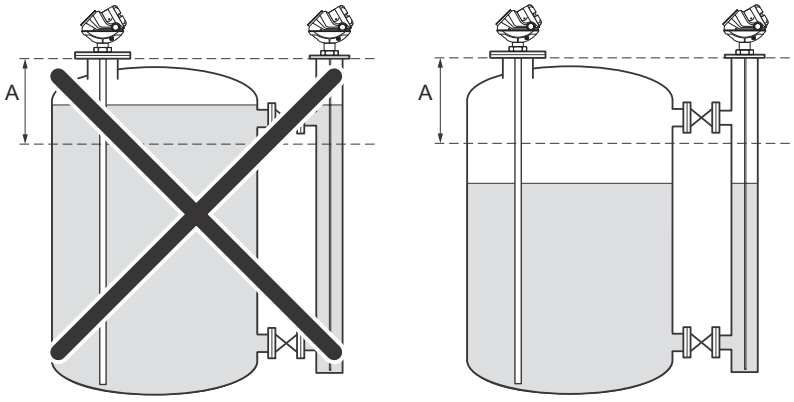


2. Check the marking on the probe.

3. Check the software revision number (firmware version).
   a) FDI/DD/DTM: Select **Device Information** → **Revisions** → **Firmware revision**.
      Rosemount Radar Master: Select **Device** → **Properties**.

7.11.3 Replace the probe

Figure 7-25: Probe Replacement



A. Flange version
B. Transmitter head
C. Nut
D. Process seal
E. Probe
F. Threaded version

Procedure

1. Loosen the nut.
2. ⚠ Remove the transmitter head from the old probe. Be sure to protect the transmitter head bottom from dust and water.

3. On the new probe, ensure that the protection plug is removed and the upper surface of the process seal is clean. Also verify that the spring-loaded pin at the center of the process seal is properly inserted.
4. Mount the transmitter head on the new probe.
5. Tighten the nut. Max torque is 30 ft-lb (40 Nm).
6. If the new probe is not of the same type as the old one, update the transmitter configuration by setting the Probe Type parameter to the appropriate value.
    a) FDI/DD/DTM: Select **Configure** → **Manual Setup** → **Level Setup**.
    Rosemount Radar Master: Select **Setup** → **Tank**.
    b) Select the **Probe** tab.
    c) In the **Probe Type** list, select desired probe type.
7. Measure the Probe Length and enter the measured value.
    a) FDI/DD/DTM: Select **Configure** → **Manual Setup** → **Level Setup**.
    Rosemount Radar Master: Select **Setup** → **Tank**.
    b) Select the **Probe** tab.
    c) In the **Probe Length** box, enter the measured Probe Length value.
8. In certain cases, a fine tune by using the Trim Near Zone function is necessary.
    When using the Trim Near Zone function, product level in the vessel must be lowered beneath the Near Zone to get precise measurement data (see Figure 7-26).

Figure 7-26: Product Level Lowered beneath the Near Zone

A. Near Zone, 40 in. (1 m)

9. Run Verify Level to check your level measurement.

Run verify level

7.12 Service support

To expedite the return process, refer to Emerson.com and contact the nearest Emerson representative.

⚠ CAUTION

Individuals who handle products exposed to a hazardous substance can avoid injury if they are informed of and understand the hazard. Returned products must include a copy of the required Safety Data Sheet (SDS) for each substance.

Emerson representatives will explain the additional information and procedures necessary to return goods exposed to hazardous substances.

A Specifications and reference data

A.1 Performance specifications

A.1.1 General

Reference conditions

Single Standard probe, 77 °F (25 °C) in water (DC=80) and ambient pressure in a 4-in. pipe using Trim Near Zone function.

Reference accuracy

± 0.12 in. (3 mm) or 0.03% of measured distance, whichever is greatest

For probes with spacers, the accuracy may deviate close to the spacers. Accuracy may be affected by remote housing.

Repeatability

± 0.04 in. (1 mm)[6]

Ambient temperature effect

± 0.008 in. (0.2 mm) /°K or ± 30 ppm/°K of measured value, whichever is greatest[7]

Electromagnetic interference effect

- Shielded cable: ± 0.2 in. (5 mm)[8]
- Unshielded cable: ± 2 in. (50 mm)[8]

For FOUNDATION™ Fieldbus units it may be required to ground the signal cable shield at the power supply and transmitter to achieve optimum performance.

Thresholds may need to be adjusted, see Guidelines for setting the amplitude thresholds for general guidelines on manual threshold settings.

Update interval

Minimum 1 update per second

A.1.2 Environment

Vibration resistance

- Aluminum housing: Level 1 IEC 60770-1/IEC 61298-3 ed 1 chapter 7, IACS E10
- Stainless Steel housing: IACS E10

(6) In accordance with IEC 60770-1. See the IEC 60770-1 standard for a definition of radar specific performance parameters and if applicable corresponding test procedures.
(7) For the BR5 option code with ambient temperatures between -67 °F (-55 °C) and -40 °F (-40 °C), the ambient temperature effect is ± 0.012 in. (0.3 mm) /°K or ± 45 ppm/°K of measured value, whichever is greatest.
(8) Deviation through electromagnetic interference according to EN 61326.

Electromagnetic compatibility

Emission and Immunity: EMC directive 2014/30/EU, EN 61326-1:2013, and EN61326-3-1:2006.

NAMUR recommendations: NE21[9]

CE-mark

Complies with applicable directives (EMC, ATEX).

Built-in lightning protection

EN 61326, IEC 61000-4-5, level 2kV (6kV with T1 terminal block)

Contamination/product build-up

- Single lead probes are preferred when there is a risk of contamination (because build-up can result in the product bridging between the inner lead and outer pipe for the coaxial versions).
- For viscous or sticky applications, PTFE probes are recommended. Periodic cleaning may also be required.
- For viscous or sticky applications, it is not recommended to use centering discs mounted along the single lead probe.
- Signal Quality Metrics (option code D01, or DA1) can be used to determine when to clean the probe. Transmitters equipped with the Diagnostics Suite option can calculate Signal Quality Metrics.

Table A-1: Maximum Recommended Viscosity and Contamination/Build-up

Probe type	Maximum viscosity	Contamination/build-up
Single lead	8000 cP[1][2]	Build-up allowed
Large coaxial	1500 cP	Thin build-up allowed, but no bridging
Coaxial	500 cP	Not recommended

(1) Consult your local Emerson representative in the case of agitation/turbulence and high viscous products.

(2) Be cautious in HTHP viscous or crystallizing media applications where temperature at instrument connection is significantly lower than process temperature with risk of coating in the upper part of probe that may reduce the measurement signal. Consider using M, HP, or STD probes in such applications.

A.1.3 Measuring range

See Table A-2 and Table A-3 for each probe's measuring range and minimum dielectric constant. Due to the measuring range depending on the application and factors described below, the values are a guideline for clean liquids. For more information, ask your local Emerson representative.

Note
For Remote Housing, see Table A-4 and Table A-5 for the maximum recommended measuring range for different remote housing lengths, installation types, dielectric constants, and probe types.

(9) Namur NE21 not available with option code QT.

Different parameters (factors) affect the echo and therefore the maximum measuring range differs depending on application according to:

- Disturbing objects close to the probe.
- Media with higher dielectric constant (ε_r) gives better reflection and allows a longer measuring range.
- Surface foam and particles in the tank atmosphere may affect measuring performance.
- Heavy product build-up or contamination on the probe should be avoided since it can reduce measuring range and might cause erroneous level readings.

Table A-2: Maximum Measuring Range

Probe type	Maximum measuring range
Rigid single lead/segmented rigid single lead	9 ft. 10 in. (3 m) for 8 mm probes (code 4A) 19 ft. 8 in. (6 m) for 13 mm probes (code 4B) 32 ft. 9 in. (10 m) for 13 mm probes (code 4S)
Flexible single lead	164 ft. (50 m)(1)(2)
Coaxial	19 ft. 8 in. (6 m)
Large coaxial	19 ft. 8 in. (6 m)

(1) Maximum measuring range for Duplex 2205 probes type 5A and 5B is 105 ft. (32 m).
(2) Maximum measuring range for PTFE covered probes type 5A is 98 ft (30 m).

Table A-3: Minimum Dielectric Constant

Probe type	Minimum dielectric constant			
	Std	**MTMP/HP**	**HTHP**	**C**
Rigid single lead/ segmented rigid single lead	1.4(1)(2) (1.25 if installed in a metallic bypass or stilling well)	1.6(1)(2) (1.4 if installed in a metallic bypass or stilling well)		
Flexible single lead	1.4, up to 49 ft. (15 m)(1) 1.8, up to 82 ft. (25 m)(1) 2.0, up to 115 ft. (35 m)(1)(3) 3, up to 138 ft. (42 m) 4, up to 151 ft. (46 m) 6, up to 164 ft. (50 m)	1.6, up to 49 ft. (15 m)(1) 1.8, up to 82 ft. (25 m)(1) 2.0, up to 115 ft. (35 m)(1)(3) 3, up to 138 ft. (42 m) 4, up to 151 ft. (46 m) 6, up to 164 ft. (50 m)		
Coaxial	1.2	1.4	2.0	1.4
Large coaxial	1.2	1.4	N/A	1.4

(1) Probe end projection software function will improve the minimum measurable dielectric constant. Consult the factory for details.
(2) May be lower depending on installation.
(3) Up to 49 ft. (15 m) for Duplex 2205 probes type 5A and 5B.

Table A-4: Remote Housing Measuring Range for Tank Installations, ft. (m)

Probe type[1]	1 m remote housing			2 m remote housing			3 m remote housing		
	DC 1.4	DC 2	DC 80	DC 1.4	DC 2	DC 80	DC 1.4	DC 2	DC 80
Rigid single 8 mm	4 (1.25)	4 (1.25)	10 (3)[2]	9 (2.75)	9 (2.75)	10 (3)[2]	10 (3)	10 (3)	10 (3)
Rigid single 13 mm	4 (1.25)	4 (1.25)	19 (6)[2]	9 (2.75)	9 (2.75)	19 (6)[2]	14 (4.25)	14 (4.25)	19 (6)[2]
Segmented rigid single	4 (1.25)	4 (1.25)	33 (10)[2]	9 (2.75)	9 (2.75)	33 (10)[2]	14 (4.25)	14 (4.25)	33 (10)[2]
Flexible single	4 (1.25)	4 (1.25)	159 (48.5)[2]	9 (2.75)	9 (2.75)	154 (47)[2]	14 (4.25)	14 (4.25)	149 (45.5)[2]
Coaxial/Large coaxial	19 (6)	19 (6)	19 (6)	19 (6)	19 (6)	19 (6)	19 (6)	19 (6)	19 (6)

(1) Validated for ambient temperature range -40 °F to 185 °F (-40 °C to 85 °C).
(2) Accuracy may be affected up to ± 1.2 in. (30 mm).

Table A-5: Remote Housing Measuring Range for Chamber/Pipe Installations < 4 in. (100 mm), ft. (m)

Probe type[1]	1 m remote housing			2 m remote housing			3 m remote housing		
	DC 1.4	DC 2	DC 80	DC 1.4	DC 2	DC 80	DC 1.4	DC 2	DC 80

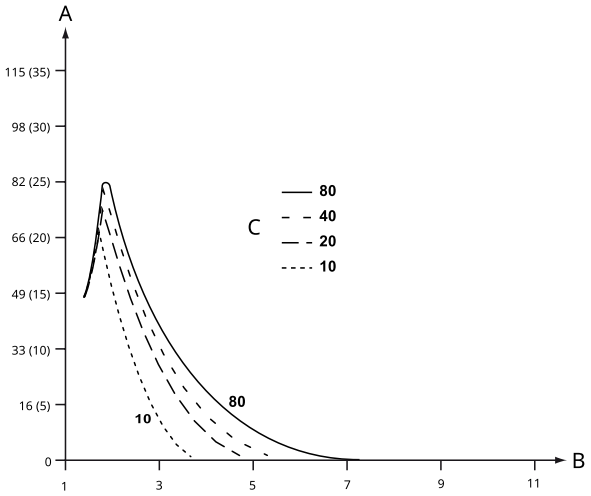
Flexible single[3]	33 (10)[2]	33 (10)[2]	33 (10)[2]	33 (10)[2]	33 (10)[2]	33 (10)[2]	33 (10)[2]	33 (10)[2]	33 (10)[2]
Coaxial/Large coaxial	19 (6)	19 (6)	19 (6)	19 (6)	19 (6)	19 (6)	19 (6)	19 (6)	19 (6)



(1) Validated for ambient temperature range -40 °F to 185 °F (-40 °C to 85 °C).
(2) Accuracy may be affected up to ± 1.2 in. (30 mm).
(3) Required chamber/pipe size is 3 or 4 in. (75 -100 mm).

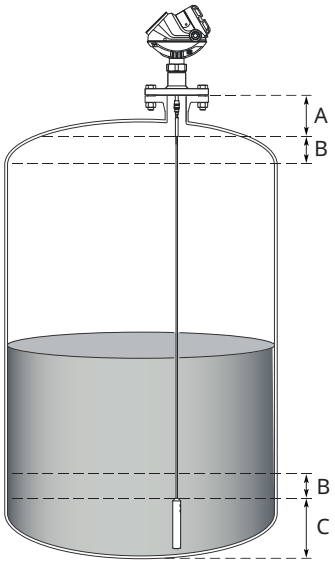
Interface measuring range

The maximum allowable upper product thickness/measuring range is primarily determined by the dielectric constants of the two liquids.

Typical applications include interfaces between oil/oil-like and water/water-like liquids, with a low (<3) dielectric constant for the upper product and a high (>20) dielectric constant for the lower product. For such applications, the maximum measuring range is limited by the length of the coaxial, large coaxial, and rigid single lead probes.

For flexible probes, the maximum measuring range is reduced by the maximum upper product thickness, according to the diagram below. However, characteristics may vary between the different applications. Maximum distance to the interface is 164 ft. (50 m) minus the maximum upper product thickness.

A. Maximum upper product thickness, ft. (m)
B. Upper product dielectric constant
C. Lower product dielectric constant



A.1.4 Accuracy over measuring range

The measuring range depends on probe type, dielectric constant of the product and installation environment, and is limited by the Blind Zones at the very top and bottom of the probe. In the Blind Zones, the accuracy exceeds ±1.18 in. (30 mm), and measurements may not be possible. Measurements close to the Blind Zones will have reduced accuracy.

The following conditions will impact the Blind Zones:

- If the single lead probes are installed in a nozzle, the nozzle height shall be added to the specified Upper Blind Zone.
- The measuring range for the PTFE covered flexible single lead probe includes the weight when measuring on a high dielectric media.
- When using a metallic centering disc, the Lower Blind Zone is 8 in. (20 cm), including weight if applicable. When using a PTFE centering disc, the Lower Blind Zone is not affected.

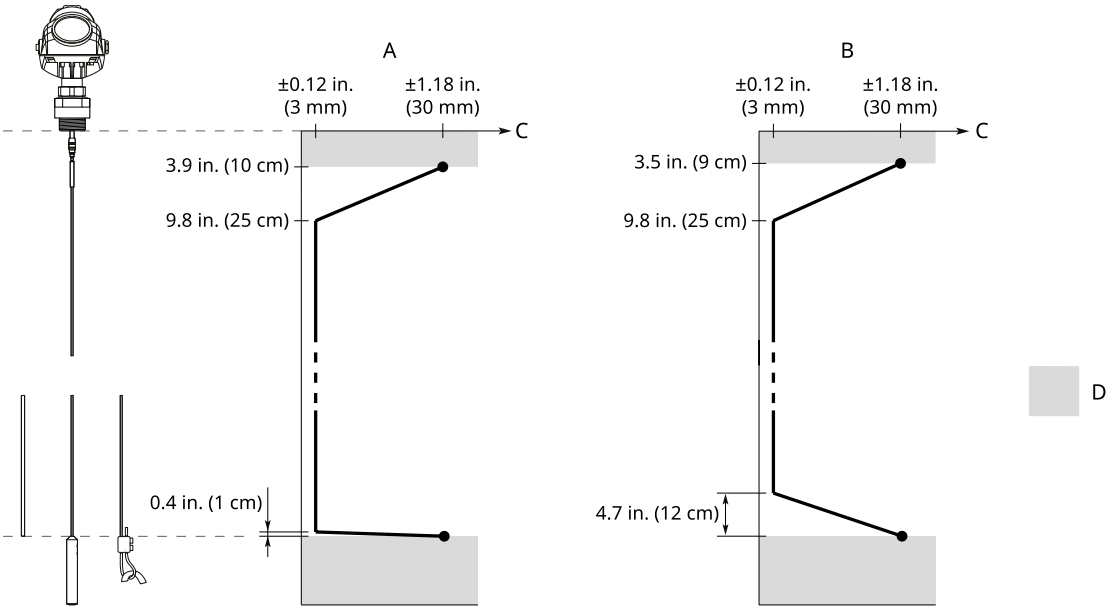


Figure A-2: Blind Zones

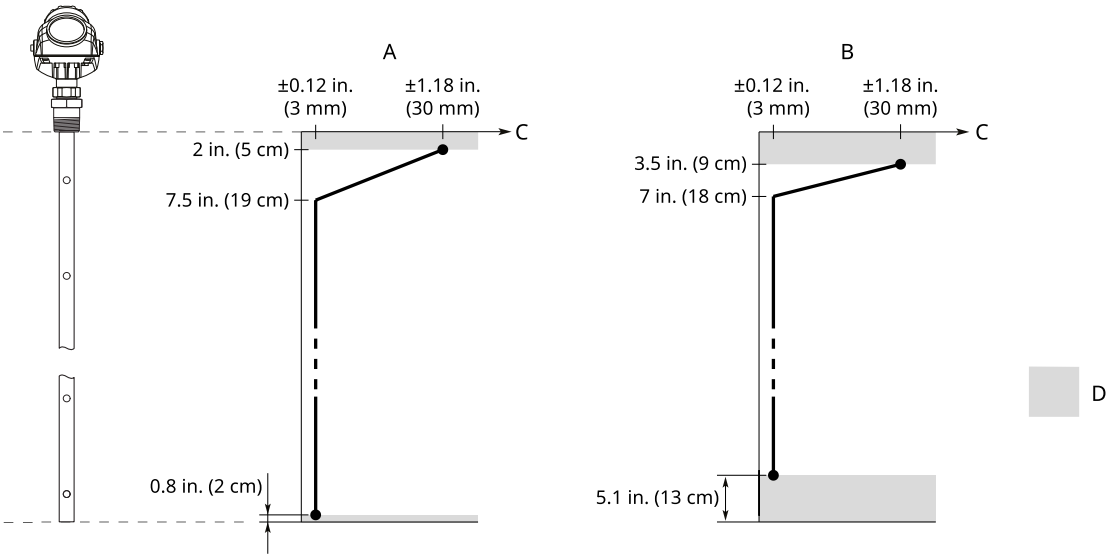

A. Upper Blind Zone
B. Reduced accuracy
C. Lower Blind Zone

Note
Measurements may not be possible in the Blind Zones, and measurements close to the Blind Zones will have reduced accuracy. Therefore, the 4-20 mA points should be configured outside these zones.

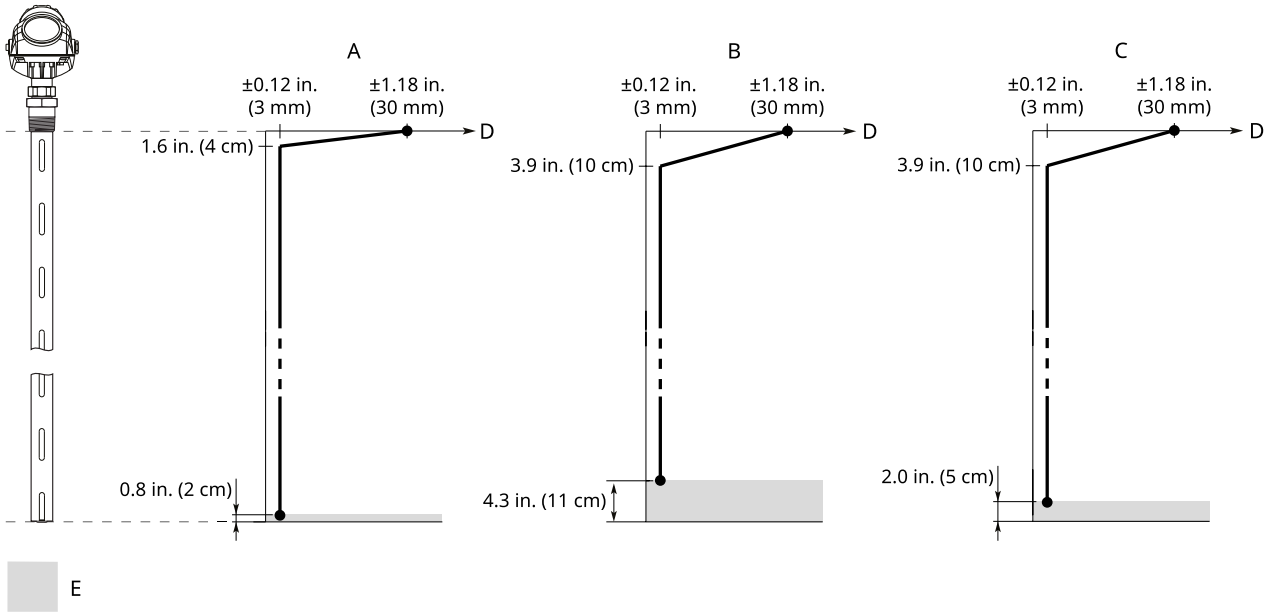

Figure A-3, Figure A-4, and Figure A-5 illustrate the accuracy over measuring range at reference condition with alternating probe types and varying dielectric constant of the product.

C. Oil (DC = 2), Liquid product level and interface level measurement mode
D. Accuracy
E. Blind Zone

A.2 Functional specifications

A.2.1 General

Field of application

Liquids and semi-liquids level and/or liquid/liquid interfaces or solids level

- Model 5301, for liquid level or submerged interface measurements
- Model 5302, for liquid level, liquid level and interface, or solid level measurements
- Model 5303, for solid level measurements

Measurement principle

Time Domain Reflectometry (TDR)

Related information

Measurement principle

Microwave output power

Nominal 300 µW, Max. 45 mW

EMC

FCC part 15 subpart B and EMC Directive (2014/30/EU). Considered to be an unintentional radiator under the Part 15 rules.

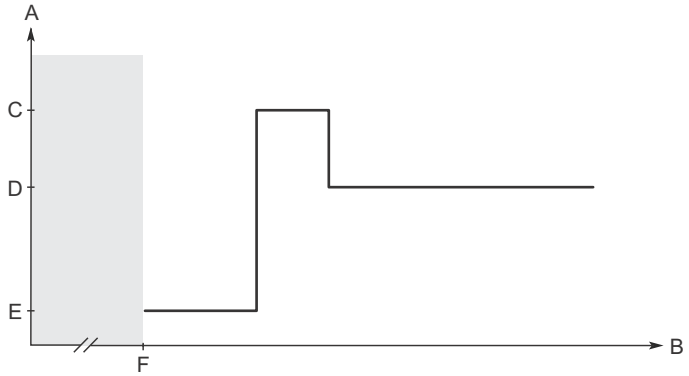
Humidity

0 to 100% relative humidity

Safety response time

< 8 s at damping value 2 s

The safety response time will be a function of the configured damping value.



Start-up time

< 40 s[10]

A.2.2 Start-up sequence

For the Rosemount™ 5300, the radar will first go to Low Alarm current for nine seconds during boot-up followed by nine seconds of High Alarm or Low Alarm current depending on alarm mode. After that measurement is re-established and the 4-20mA output settles at the actual level value.[11] Refer to Figure A-6 and Figure A-7. If a different start-up behavior is preferred, contact your local Emerson representatives.

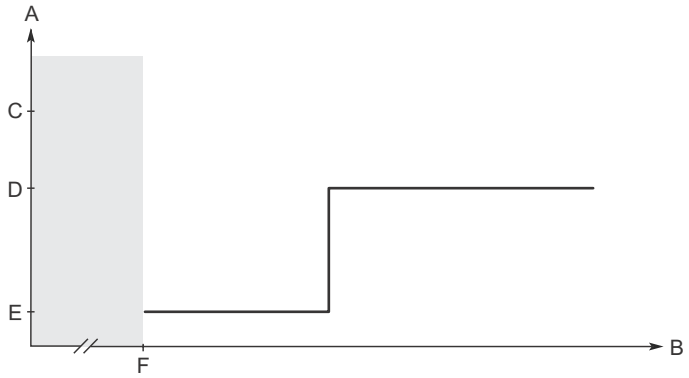


Figure A-6: Start-Up Sequence, Alarm Mode High

A. Current, mA
B. Time, s
C. High Alarm current (Rosemount or Namur value, according to configuration)
D. Actual level value
E. Low Alarm current (Rosemount or Namur value, according to configuration)
F. For option code BR5 at temperatures below -40 °F (-40 °C): Five minutes delay with an undefined current value

(10) The start-up time is extended with five additional minutes for option code BR5 at temperatures below -40 °F (-40 °C). Refer to Start-up sequence.
(11) For devices with option code BR5 at temperatures below -40 °F (-40 °C), the start-up sequence is delayed for five minutes with an undefined current value.

Figure A-7: Start-Up Sequence, Alarm Mode Low

A. Current, mA
B. Time, s
C. High Alarm current (Rosemount or Namur value, according to configuration)
D. Actual level value
E. Low Alarm current (Rosemount or Namur value, according to configuration)
F. For option code BR5 at temperatures below -40 °F (-40 °C): Five minutes delay with an undefined current value

A.2.3 4-20 mA HART®

Output

Two-wire, 4-20 mA. Digital process variable is superimposed on 4-20 mA signal, and available to any host that conforms to the HART® protocol. The digital HART signal can be used in multidrop mode.

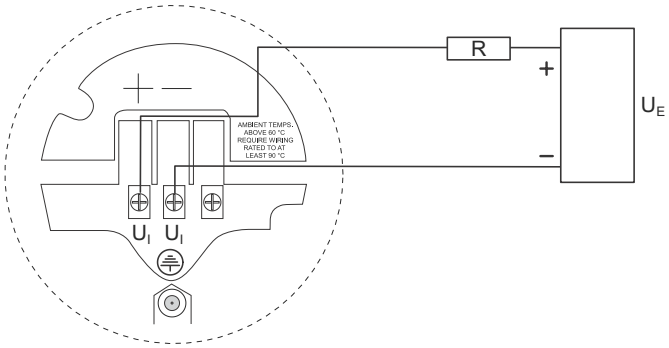
HART revision

The default output is HART Revision 7. To order HART Revision 5 factory configured, add option code HR5. The device can also be field configured to HART Revision 5 if needed.

Signal wiring

Recommended output cabling is twisted shielded pairs, 24-12 AWG.

Power requirements



Terminals in the transmitter housing provide connections for signal cables. The Rosemount 5300 Level Transmitter is loop-powered and operates with the following power supplies:

Table A-6: External Power Supply for HART

Approval type	Input voltage (U_i)(1)
None	16 - 42.4 Vdc
Non-sparking/Energy Limited	16 - 42.4 Vdc
Intrinsically Safe	16 - 30 Vdc
Explosion-proof/Flameproof	20 - 42.4 Vdc

(1) Reverse polarity protection.

Figure A-8: External Power Supply for HART

R = Load Resistance (Ω)

U_E = External Power Supply Voltage (Vdc)

U_i = Input Voltage (Vdc)

Table A-7: Minimum Input Voltage (U_i) at Different Currents

Hazardous approval	Current	
	3.75 mA	21.75 mA
	Minimum input voltage (U_i)	
Non-hazardous installations, intrinsically safe installations and Non-sparking installations	16 Vdc	11 Vdc
Explosion-proof/flameproof installations	20 Vdc	15.5 Vdc

Signal on alarm

	High	Low
Standard	21.75 mA	3.75 mA
Namur NE43	22.50 mA	3.60 mA

Saturation levels

	High	Low
Standard	20.8 mA	3.9 mA
Namur NE43	20.5 mA	3.8 mA

A.2.4 FOUNDATION™ Fieldbus

Power requirements

Terminals in the transmitter housing provide connections for signal cables. The Rosemount 5300 Level Transmitter is powered over FOUNDATION™ Fieldbus with standard fieldbus power supplies. The transmitter operates with the following power supplies:

Table A-8: External Power Supply for FOUNDATION Fieldbus

Approval type	Power supply (Vdc)
None	9 - 32
Non-sparking/Energy limited	9 - 32
Intrinsically Safe	9 - 30
FISCO	9 - 17.5
Explosion-proof/flameproof	16 - 32

Quiescent current draw

22 mA

Blocks and execution time

Block	Execution time
1 Resource	N/A
3 Transducer	N/A
6 Analog Input (AI)	10 ms
1 Proportional/Integrate/Derivate (PID)	15 ms
1 Signal Characterizer (SGCR)	10 ms
1 Integrator (INT)	10 ms
1 Arithmetic (ARTH)	10 ms
1 Input Selector (ISEL)	10 ms
1 Control Selector (CS)	10 ms
1 Output Splitter (OS)	10 ms

FOUNDATION Fieldbus class (basic or Link Master)

Link Master (LAS)

Number of available VCRs

Maximum 20, including one fixed

FOUNDATION Fieldbus instantiation

Yes

Conforming FOUNDATION™ Fieldbus

ITK 6.0.1

- Plantweb™ Insight alerts

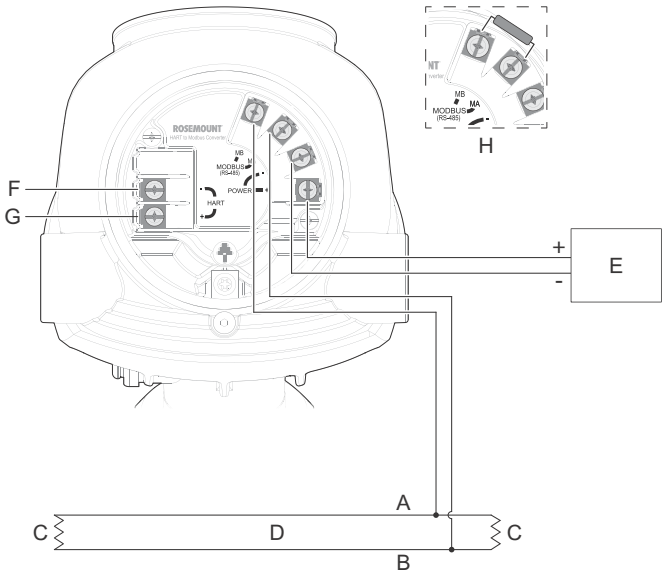
A.2.5 Modbus®

Output

The RS-485 Modbus version communicates by Modbus RTU, Modbus ASCII, and Levelmaster protocols.

8 data bits, 1 start bit, 1 stop bit, and software selectable parity.

Baud Rate	1200, 2400, 4800, 9600 (default), and 19200 bits/s
Address Range	1 to 255 (default device address is 246)



HART communication is used for configuration via the HART terminals or tunneling via the RS-485.

External power supply

The input voltage U_i for Modbus is 8-30 Vdc (max. rating).

Wiring diagram

Figure A-9: Wiring Diagram for RS-485 with Modbus®

A. "A" line
B. "B" line
C. 120 Ω
D. RS-485 Bus
E. Power supply
F. HART -
G. HART +
H. If it is the last transmitter on the bus, connect the 120 Ω termination resistor.

Note
Rosemount 5300 Level Transmitters with Flameproof/Explosion-proof output have a built-in barrier; no external barrier needed.(12)

Power consumption

- < 0.5 W (with HART address=1)
- < 1.2 W (incl. four HART slaves)

Note
The Rosemount 5300 Level Transmitter with Modbus protocol is configured to HART address 1 at factory. This reduces power consumption by locking the analog output at 4 mA.

A.2.6 Display and configuration

Integral display

The integral digital display can toggle between: level, distance, volume, internal temperature, interface distance, interface level, peak amplitudes, interface thickness, percentage of range, analog current out.

Note
The display cannot be used for configuration purposes.

Configuration tools

- Field Device Integration (FDI) compliant systems
- Device Descriptor (DD) compliant systems
- Device Type Manager (DTM™) compliant systems
- Rosemount Radar Master

Output units

- Level, Interface and Distance: ft., in., m, cm, or mm
- Level Rate: ft./s, m/s, in./min, m/h
- Volume: $ft.^3$, $in.^3$, US gals, Imp gals, barrels, yd^3, m^3, or liters
- Temperature: °F and °C

(12) An external galvanic isolator is always recommended to be used for Flameproof/Explosion-proof installations.

Output variables

Table A-9: Output Variables

Variable	5301	5302	5303	PV, SV, TV, QV
Level	✓	✓	✓	✓
Distance to Level (Ullage)	✓	✓	✓	✓
Level Rate	✓	✓	✓	✓

(1) Interface measurement only for fully submerged probe.
(2) Not available as primary variable.
(3) Not available for FOUNDATION™ Fieldbus, Modbus® Signal Output, or for HART® units in fixed current mode.
(4) LCD display variable only.

Damping

0-60 s (2 s, default value)

A.2.7 Diagnostics

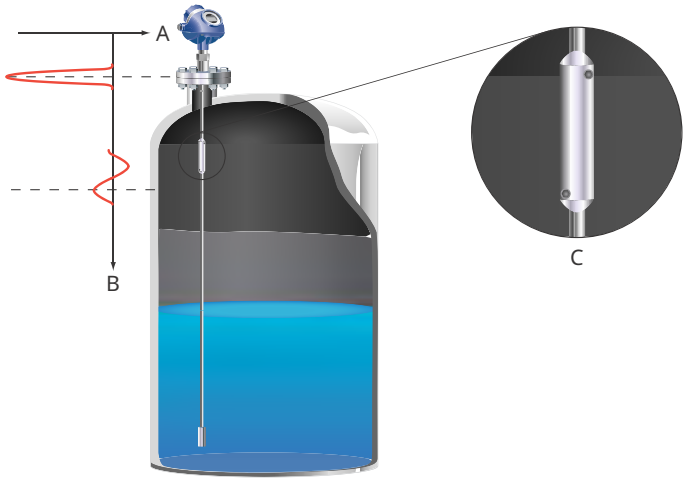
General

Transmitter diagnostics with alerts include hardware and software errors, electronics temperature, probe missing, and invalid measurement and configuration error diagnostics. In addition to this, echo curve and variable logging including signal strength facilitate easy on-line troubleshooting.

Alerts

The transmitter is compliant with NAMUR NE 107 Field Diagnostics for standardized device diagnostic information (only available for FOUNDATION™ Fieldbus or HART®).

Diagnostics Suite



Signal Quality Metrics

Diagnostics package that monitors the relations between surface, noise and threshold. The function can be used to detect abnormal conditions in the process such as probe contamination or sudden loss of signal strength. Signal Quality Metrics parameters are available as Output Variables in Rosemount Radar Master, and can be sent to Distributed Control System (DCS) to trigger an alarm.

Proof Test Reflector

The reflector, which is available with single lead flexible probes, is used to test and continuously verify that the transmitter is functioning properly in both tank and chamber/pipe installations. Compared to traditional diagnostics that only monitor the transmitter electronics, the reflector can also be used to diagnose the upper parts of the probe inside the tank for e.g. build-up, corrosion monitoring and other process related conditions.

Figure A-10: Proof Test Reflector

A. Amplitude
B. Distance
C. Reflector

The primary use-cases for the reflector are:

- Verification of transmitter and probe (i.e. proof-testing)
- Continuous monitoring of high level condition

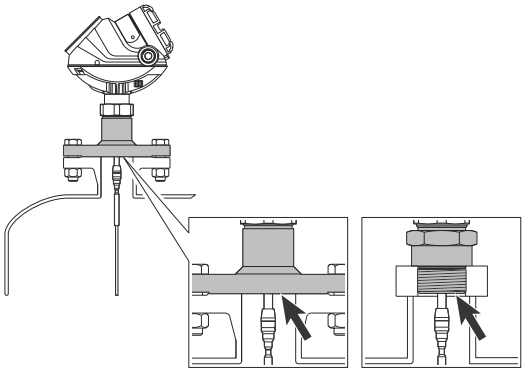
Verification

During commissioning, the location and amplitude characteristics of the reflector are stored in the transmitter. When the test procedure is later initiated, the stored reflector data is compared to the current measurement to verify the integrity of the measurement electronics and upper part of the probe.

During the test, the transmitter will output a level corresponding to the reflector position, which can be used to verify the integrity of the transmitter output.

Continuous monitoring of high level condition

Additionally, the reflector's unique echo characteristics aid the transmitter to locate a liquid surface above the reflector, thereby offering increased reliability to detect high level conditions at a user selectable limit.



The transmitter continuously monitors the status of the reflector and abnormal conditions generate alarms and alerts as appropriate.

Reflector limitations

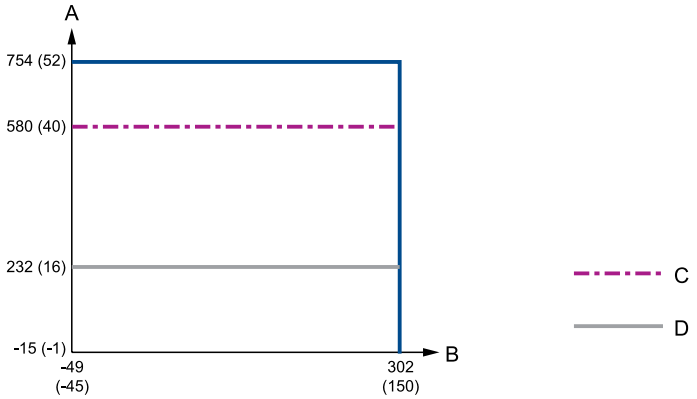
Application	Not to be used in fully submerged applications
Minimum dielectric constant	2.4 (for option code HL1) 2.0 (for option codes HL2 and HL3)

A.2.8 Process temperature and pressure rating

Process Temperature and Pressure - Max Rating gives the maximum process temperature (measured at the lower part of the flange or threaded connection) and pressure rating for the different tank connections.

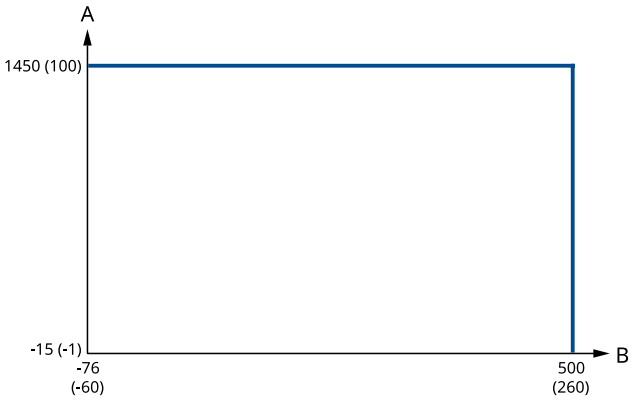
For standard tank connection, final rating may be lower depending on flange, material of construction, and O-ring selection. Table A-10 gives the temperature ranges for standard tank seals with different O-ring materials.

Table A-10: Temperature and Pressure Ranges for Standard Tank Seals with Different O-ring Material



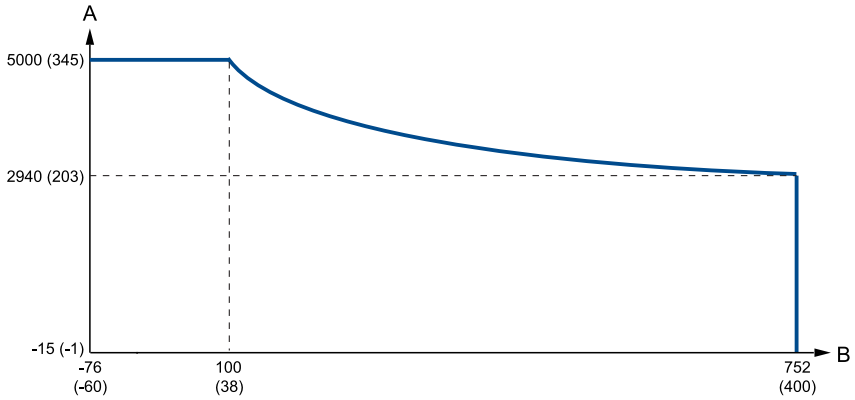
O-ring material	Temperature °F (°C) in air		Pressure psig (bar)
	Minimum(1)	Maximum	Maximum
Fluoroelastomer (FKM)	-22 (-30)	302 (150)	754 (52)
Ethylene Propylene (EPDM)	-40 (-40)	266 (130)	754 (52)
Kalrez® Perfluoroelastomer (FFKM)	14 (-10)	302 (150)	754 (52)
Nitrile Butadiene (NBR)	-31 (-35)	230 (110)	580 (40)
Fluorosilicone (FVMQ)	-49 (-45)	302 (150)	754 (52)

(1) The O-ring can be stored at lower temperatures (refer to Table A-11).

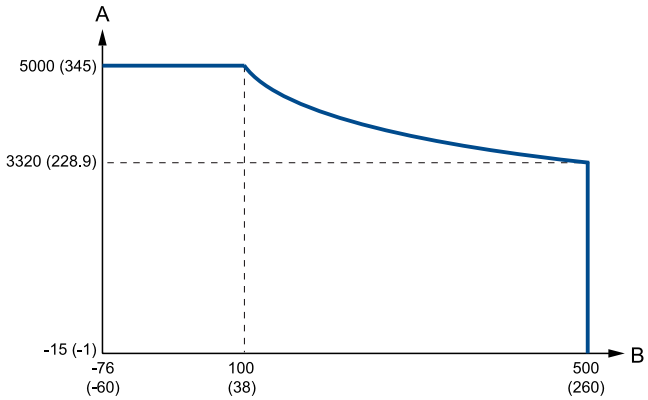


Note
Always check the chemical compatibility of the O-ring material with your application. If the O-ring material is not compatible with its chemical environment, the O-ring may eventually malfunction.

No wetted O-rings are used in the MTMP, HTHP, HP, and C versions. Final rating may be lower depending on flange and material of construction selection.



Process Temperature and Pressure - Max Rating



A. Pressure psig (bar)
B. Temperature °F (°C)
C. O-ring material code B (Nitrile Butadiene)
Overfill prevention code U1 (Overfill prevention according to WHG/TUV)
Protective plate: Alloy C-276 (Material of construction code 2) or Alloy 400 (Material of construction code 3)
D. Protective plate: PTFE (Material of construction code 7)

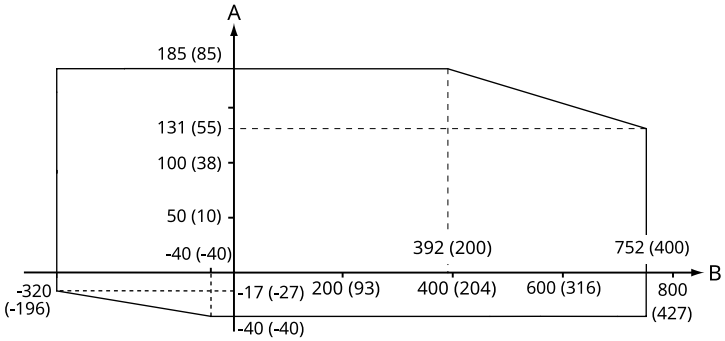
B. Temperature °F (°C)

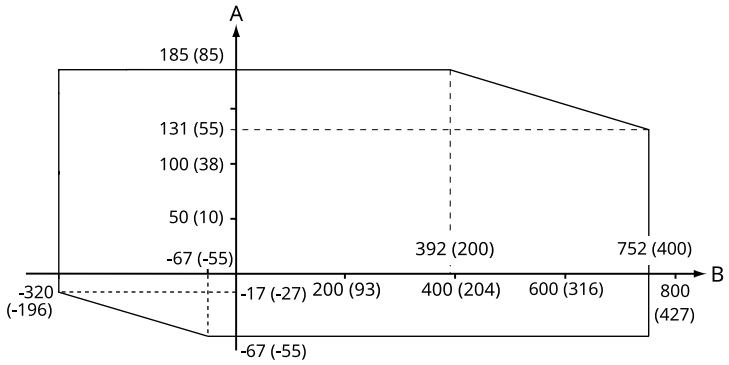
A. Pressure psig (bar)
B. Temperature °F (°C)

A. Pressure psig (bar)
B. Temperature °F (°C)



A. Pressure psig (bar)
B. Temperature °F (°C)

A.2.9 Temperature limits



The maximum and minimum ambient temperature for the electronics depends on the process temperature (as described by Figure A-16 and Figure A-17) and on the approval (see Product certifications).

Figure A-16: Ambient Temperature vs. Process Temperature

A. Ambient temperature °F (°C)
B. Process temperature °F (°C)

For additional information, refer to Table A-11.

A. Ambient temperature °F (°C)
B. Process temperature °F (°C)

Note
Nozzle insulation for the HTHP version (Operating Temperature and Pressure code H) should not exceed 4 in. (10 cm) of height above the flange.

Note
In applications where the ambient temperature exceeds the limits of the electronics, a Remote Mounting connection can be used. The maximum temperature for the Remote Mounting connection at the vessel connection point is 302 °F (150 °C).

The heat sink installation option is mandatory for flanges Class 2500/PN250 or higher in Dynamic Vapor Compensation applications. For flanges Class 1500/PN160 the heat sink option is highly recommended.

Table A-11: Ambient Temperature Limits

Description	Operating limit	Storage limit
Without integral display	-40 °F to 185 °F (-40 °C to 85 °C)	-58 °F to 194 °F (-50 °C to 90 °C)
With integral display	-40 °F to 158 °F (-40 °C to 70 °C)(1)	-40 °F to 185 °F (-40 °C to 85 °C)
Option code BR5 without integral display	-67 °F to 185 °F (-55 °C to 85 °C)	-76 °F to 194 °F (-60 °C to 90 °C)
Option code BR5 with integral display	-67 °F to 158 °F (-55 °C to 70 °C)(1)	-76 °F to 185 °F (-60 °C to 85 °C)

(1) Integral display may not be readable and device display updates will be slower at temperatures below -4 °F (-20 °C).

A.2.10 Flange rating

ASME flange rating

316 up to Class 1500 flanges according to ASME B16.5 Table 2-2.2 and 316L for Class 2500 flanges according to ASME B16.5 Table 2-2.3:

- Standard: Maximum 302 °F/754 psig (150 °C/52 Bar)
- MTMP: Maximum 500 °F/1450 psig (260 °C/100 Bar)
- HP: Class 2500 up to maximum 500 °F (260 °C)
- C: Class 2500 up to maximum 392 °F (200 °C)

- HTHP: Class 2500 up to maximum 752 °F (400 °C)

Alloy C-276 (UNS N10276) according to ASME B16.5 Table 2-3.8:

- Standard: Maximum 302 °F/754 psig (150 °C/52 Bar)
- HP: Class 1500 up to maximum 500 °F (260 °C)
- HTHP: Class 1500 up to maximum 752 °F (400 °C)

Alloy 825 (UNS N08825) according to ASME B16.5 Table 2-3.8:

- Standard: Maximum 302 °F/754 psig (150 °C/52 Bar)
- HP: Class 1500 up to maximum 500 °F (260 °C)
- HTHP: Class 1500 up to maximum 752 °F (400 °C)

Duplex 2205 (UNS S31803) according to ASME B16.5 Table 2-2.8:

- Standard: Maximum 302 °F/754 psig (150 °C/52 Bar)
- HP: Class 1500, -51 °F (-46 °C) up to maximum 500 °F (260 °C)
- HTHP: Class 1500, -51 °F (-46 °C) up to maximum 599 °F (315 °C)

EN flange rating

EN 1.4404 according to EN 1092-1 material group 13E0:

- Standard: Maximum 302 °F/754 psig (150 °C/52 Bar)
- MTMP: Maximum 500 °F/1450 psig (260 °C/100 Bar)
- HP: PN 320 up to maximum 500 °F (260 °C)
- C: PN 320 up to maximum 392 °F (200 °C)
- HTHP: PN 320 up to maximum 752 °F (400 °C)

Alloy C-276 (UNS N10276) according to EN 1092-1 material group 12E0:

- Standard: Maximum 302 °F/754 psig (150 °C/52 Bar)
- HP: PN 320 up to maximum 500 °F (260 °C)
- HTHP: PN 320 up to maximum 752 °F (400 °C)

Duplex 2205 (EN 1.4462) according to EN 1092-1 material group 16E0:

- Standard: Maximum 754 psig (52 Bar), -22 °F (-30 °C) up to maximum 302 °F (150 °C)[13]
- HP: PN 320, -22 °F (-30 °C) up to maximum 482 °F (250 °C)[13]
- HTHP: PN 320, -22 °F (-30 °C) up to maximum 482 °F (250 °C)[13]

JIS flange rating

316 according to JIS B2220 material group 2.2:

- Standard: Maximum 302 °F/754 psig (150 °C/52 Bar)
- MTMP: Maximum 500 °F/1450 psig (260 °C/100 Bar)
- HP: Maximum temperature 260 °C. Final rating depends on flange.
- C: Maximum temperature 200 °C. Final rating depends on flange.
- HTHP: Maximum temperature 400 °C. Final rating depends on flange.

(13) Minimum and maximum temperature limit due to EN13445-2.

Fisher and Masoneilan flange rating

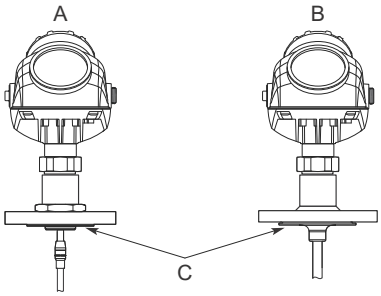
316 according to ASME B16.5 Table 2-2.2:

- Standard: Maximum 302 °F/754 psig (150 °C/52 Bar)
- MTMP: Maximum 500 °F/1450 psig (260 °C/100 Bar)
- HP: Class 600 up to maximum 260 °C
- C: Class 600 up to maximum 200 °C
- HTHP: Class 600 up to maximum 400 °C

A.2.11 Tri Clamp rating

Tri Clamp is available for the standard temperature and pressure seal.

Table A-12: Tri Clamp Rating



Size	Maximum pressure(1)
1½-in. (37.5 mm)	232 psig (16 bar)
2-in. (50 mm)	232 psig (16 bar)
3-in. (75 mm)	145 psig (10 bar)
4-in. (100 mm)	145 psig (10 bar)

(1) The final rating depends on the clamp and gasket.

A.2.12 Plate design

Certain models of flanged alloy and PTFE covered probes have a tank connection design with a protective flange plate that prevents the backing flange from being exposed to the tank atmosphere. The protective flange plate is manufactured in the same material as the probe. The backing flange is made of 316L/EN 1.4404 for alloy probes, and 316/1.4404 for PTFE covered probes.

Figure A-18: Protective Plate

A. Alloy probe and protective plate
B. PTFE covered probe and protective plate
C. Protective plate

PTFE protective plate

Flange rating according to SST backing flange ASME B16.5 Table 2-2.2, EN 1092-1 material group 13E0, and JIS B2220 material group 2.3.

- Standard: Maximum 302 °F/232 psig (150 °C/16 Bar)

Alloy C-276 protective plate

Flange rating according to SST backing flange ASME B16.5 Table 2-2.3, EN 1092-1 material group 13E0, and JIS B2220 material group 2.3.

- Standard: Maximum 302 °F/580 psig (150 °C/40 Bar). Flange plate design is available up to Class 300/PN 40
- HP: Maximum temperature 260 °C. Flange plate design is available up to Class 600/PN 63
- HTHP: Maximum temperature 400 °C. Flange plate design is available up to Class 600/PN 63

Alloy 400 protective plate

Flange rating according to SST backing flange ASME B16.5 Table 2-2.3, EN 1092-1 material group 13E0, and JIS B2220 material group 2.3.

- Standard: Maximum 302 °F/580 psig (150 °C/40 Bar). Flange plate design is available up to Class 300/PN 40

A.2.13 Conditions used for flange strength calculations

See Table A-13 to Table A-17 for the conditions used for flange strength calculations.

Table A-13: 316/316L Flanges

Standard	Bolting material	Gasket		Flange material	Hub material

A.2.14 Interface measurements

The Rosemount 5302 is a good choice for measuring the interface of oil and water, or other liquids with significant dielectric differences.

It is also possible to measure interface with a Rosemount 5301 in applications where the probe is fully submerged in the liquid, using the submerged probe mode.

Rosemount 5302 with the large coaxial probe provides the ability to continuously keep track of both level and interface level in fully submerged applications. The product level and interface level mode must be selected.

Figure A-19: Interface Level Measurement

A. Rosemount 5302
B. Rosemount 5301
C. Rosemount 5302 with large coaxial probe
D. Product level
E. Interface level
F. Product level and interface level
G. Interface level with submerged probe
H. Product level and interface level with submerged probe

Interface measurement considerations

If interface is to be measured, follow these criteria:

- The dielectric constant of the upper product should be known and should not vary. The Rosemount Radar Master software has a built-in dielectric constant calculator to help the user estimate the upper product dielectric constant.
- The dielectric constant of the upper product must have a lower dielectric constant than the lower product to have a distinct reflection.
- The difference between the dielectric constants for the two products must be larger than 6.
- The maximum dielectric constant for the upper product is 7 for the single lead probes and 10 for the coaxial probes.

Table A-18: Minimum Detectable Upper Product Thickness

Probe type	Minimum Detectable Upper Product Thickness
Large coaxial	1 in. (2.5 cm)(1)
Single lead	2.4 in. (6 cm)
Coaxial (standard/MTMP/HP/C)	2.8 in. (7 cm)
Coaxial (HTHP)	8 in. (20 cm)

(1) Depending on application characteristics such as the upper product dielectric constant.

Related information

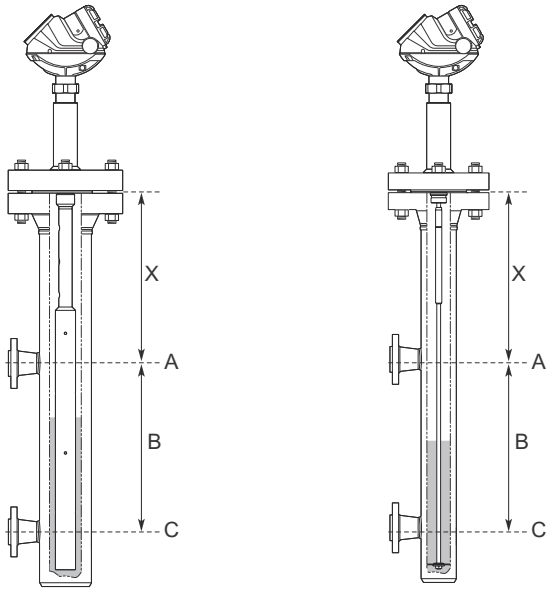
Interface measuring range

Emulsion layers

Sometimes there is an emulsion layer (mix of the products) between the two products which can affect interface measurements. For guidelines on emulsion situations, consult your local Emerson representative.

A.2.15 High pressure steam applications

Considerations



Saturated steam under high pressure can influence radar level transmitter measurements. Rosemount 5301 with Dynamic Vapor Compensation will automatically compensate for this and maintain the level accuracy.

- Probe type 3V (for 3- to 4-in. chambers) or 4U (for 2-in. chambers) must be used.
- Mount in a 2-, 3-, or 4-in. bypass chamber with flanges appropriately sized for the pressure and temperature of the application.
- Dynamic Vapor Compensation requires a minimum distance X from the flange to the surface level in order to measure the change in the vapor dielectric constant. If the level rises within this area, the unit switches over to static compensation, using the last known vapor dielectric constant.

Table A-19: Minimum Distance X

Reference reflector type		Minimum distance X
Length	**Option code**	
Short, 14 in. (350 mm)	R1	22 in. (560 mm)
Long, 20 in. (500 mm)	R2	28 in. (710 mm)

Figure A-20: Minimum Distance X and Minimum Measuring Span

A. Level: 100%
B. Minimum measuring span: 12 in. (300 mm)
C. Level: 0%

- Always ensure there are no disturbances from inlets etc. close to the reference reflector end when using probe type 4U.

Select reference reflector

- The long reflector, 20 in. (500 mm), has the best accuracy and is recommended for all chambers where the dimensions of the chamber allow for it.
- If the distance from the flange to the upper inlet is less than 28 in. (710 mm), the short reflector should be chosen. This distance is a minimum when dynamic compensation is required within the whole measuring range from the lower to the upper inlet. If this is not required, the long reflector can be used and dynamic compensation is possible up to 28 in. (710 mm) from the flange.

A.3 Physical specifications

A.3.1 Material selection

Emerson provides a variety of Rosemount products with various product options and configurations, including materials of construction that can be expected to perform well in a wide range of applications. The Rosemount product information presented is intended as a guide for the purchaser to make an appropriate selection for the application. It is the purchaser's sole responsibility to make a careful analysis of all process parameters (such as all chemical components, temperature, pressure, flow rate, abrasives, contaminants, etc.), when specifying product, materials, options, and components for the particular application. Emerson is not in a position to evaluate or guarantee the compatibility of the process fluid or other process parameters with the product, options, configuration, or materials of construction selected.

A.3.2 Engineered solutions

When standard model codes are not sufficient to fulfill requirements, please consult the factory to explore possible Engineered Solutions. This is typically, but not exclusively, related to the choice of wetted materials or the design of a process connection. These Engineered Solutions are part of the expanded offerings and may be subject to additional delivery lead time. For ordering, factory will supply a special R-labeled numeric option code that should be added at the end of the standard model string.

A.3.3 Housing and enclosure

Type

- Dual compartment (terminal compartment and the electronics are completely separated).
- Two entries for conduit or cable connections.
- The transmitter housing is separable from probe assembly.
- The transmitter housing can be rotated in any direction.

Electrical connection

½ - 14 NPT for cable glands or conduit entries.

Optional: M20 x 1.5 conduit / cable adapter, M12 4-pin male eurofast® connector or A size Mini 4-pin male minifast® connector.

Recommended output cabling is twisted shielded pairs, 24-12 AWG.

Housing material

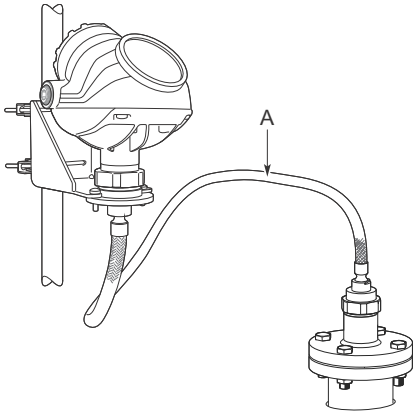
Polyurethane-covered Aluminum (Aluminum alloy A360, maximum 0.6 percent Cu), or Stainless Steel Grade CF8M (ASTM A743)

Ingress protection

NEMA® 4X, IP 66, IP67

Factory sealed

Yes



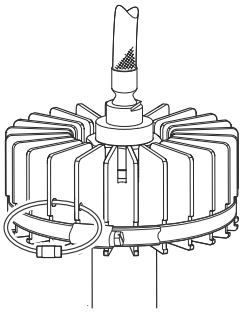
Weight

- Aluminum transmitter head: 4.4 lb (2 kg)
- SST transmitter head: 10.8 lb (4.9 kg)

A.3.4 Remote housing mounting

Kit that includes a flexible armored extension cable and a bracket for wall or pipe mounting.

Figure A-21: Remote Housing Mounting



A. Remote Housing Mounting Cable: 3, 6, or 9 ft (1, 2, or 3 m)

A.3.5 Heat sink

The heat sink is used for remote housing mounting to keep the temperature at the vessel connection point at a maximum of 302 °F (150 °C). The heat sink installation option is available for Rosemount 5300 with Dynamic Vapor Compensation (DVC). Heat sink is mandatory for DVC probes with flanges Class 2500/PN250 or higher and highly recommended for Class 1500/PN160.

Figure A-22: Heat Sink

A.3.6 Tank connection

The tank connection consists of a tank seal, a flange, Tri Clamp, or NPT or BSPP (G) threads.

A.3.7 Flange dimensions

Follows ASME B16.5, JIS B2220, and EN 1092-1 standards for blind flanges.

Related information

Standard flanges

Proprietary flanges

A.3.8 Vented flanges

Available with Masoneilan and Fisher vented flanges. Vented flanges must be ordered as accessories with a 1½-in. NPT threaded process connection (code RA). As an alternative to a vented flange, it is possible to use a flushing connection ring on top of the standard nozzle.

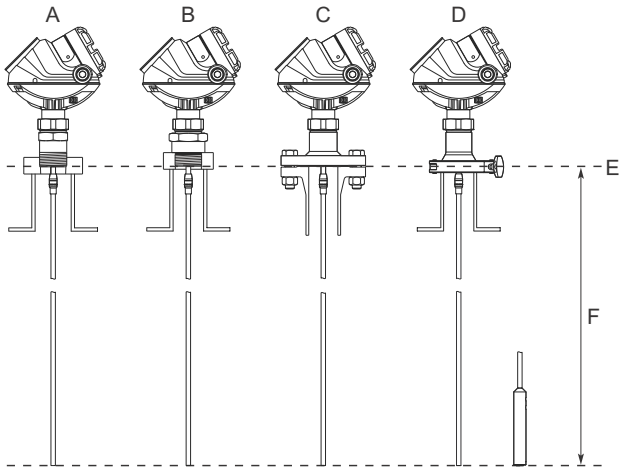
A.3.9 Tri Clamp connection

Follows ISO 2852 standard.

A.3.10 Pressure Equipment Directive (PED)

Complies with 2014/68/EU article 4.3

A.3.11 Probes



Probe versions

Coaxial, large coaxial, rigid single lead, segmented rigid single lead, and flexible single lead. Probes can be ordered in different materials and options for extreme temperatures and pressure.

Total probe length

This is defined from the Upper Reference Point to the end of the probe (weight included, if applicable).

Figure A-23: Total Probe Length

A. NPT
B. BSPP (G)
C. Flange
D. Tri Clamp
E. Upper reference point
F. Total probe length

Select the probe length according to the required measuring range (the probe must be hung and fully extended through the entire distance where level readings are desired).

Cut-to-fit probes

All probes can be cut in field, except for the HTHP coaxial probe and the PTFE covered probe.

However, there are some restrictions for the standard and MTMP/HP/C coaxial probes: Probes over 4.1 ft. (1.25 m) can be cut up to 2 ft. (0.6 m). Shorter probes can be cut to the minimum length of 1.3 ft. (0.4 m).

Flexible single lead probes can be cut to the minimum length of 3.3 ft. (1.0 m).

Minimum and maximum probe length

Probe type	Probe length
Flexible single lead	3.3 to 164 ft. (1 to 50 m)
Rigid single lead (0.3 in./8 mm)	1.3 to 9.8 ft. (0.4 to 3 m)
Rigid single lead (0.5 in./13 mm)	1.3 to 19.7 ft. (0.4 to 6 m)
Segmented rigid single lead	1.3 to 32.8 ft. (0.4 to 10 m)
Coaxial	1.3 to 19.7 ft. (0.4 to 6 m)
Large coaxial	1.0 to 19.7 ft. (0.3 to 6 m)

Probe angle

0 to 90 degrees from vertical axis

Note
Models with QT option code should not be installed in angled probe installations.

Tensile strength

- 0.16 in. (4 mm) Flexible single lead SST: 2698 lb (12 kN)
- 0.16 in. (4 mm) Flexible single lead Alloy C-276: 1574 lb (7 kN)
- 0.16 in. (4 mm) Flexible single lead Alloy 825: 1574 lb (7 kN)
- 0.16 in. (4 mm) Flexible single lead Alloy 400: 1124 lb (5 kN)
- 0.16 in. (4 mm) Flexible single lead Duplex 2205: 1349 lb (6 kN)
- 0.24 in. (6 mm) Flexible single lead SST: 6519 lb (29 kN)

Collapse load

- 0.16 in. (4 mm) Flexible single lead SST: 3597 lb (16 kN)
- 0.16 in. (4 mm) Flexible single lead Alloy C-276: 1798 lb (8 kN)
- 0.16 in. (4 mm) Flexible single lead Alloy 825: 1798 lb (8 kN)
- 0.16 in. (4 mm) Flexible single lead Alloy 400: 1349 lb (6 kN)
- 0.16 in. (4 mm) Flexible single lead Duplex 2205: 1574 lb (7 kN)
- 0.24 in. (6 mm) Flexible single lead SST: 7868 lb (35 kN)

Sideway capacity

- Rigid single lead/Segmented rigid single lead: 4.4 ft. lbf, 0.44 lb at 9.8 ft. (6 Nm, 0.2 kg at 3 m)
- Coaxial/Large coaxial: 73.7 ft. lbf, 3.7 lb at 19.7 ft. (100 Nm, 1.67 kg at 6 m)

A.3.12 Material exposed to tank atmosphere

Table A-20: Standard Probe (Operating Temperature and Pressure Code S)

Material of construction code	Material exposed to tank atmosphere
1 (probe types 6A and 6B)	316L/316 (EN 1.4404)(1), Duplex 2507 (UNS S32750/EN 1.4410), PTFE, PFA, silicone grease, and O-ring materials
1 (all other probe types)	316L/316 (EN 1.4404)(1), PTFE, PFA, silicone grease, and O-ring materials
2 and H	Alloy C-276 (UNS N10276), PTFE, PFA, silicone grease, and O-ring materials
3	Alloy 400 (UNS N04400), Alloy K500 (UNS N05500), PTFE, PFA, silicone grease, and O-ring materials
7	PTFE (1 mm PTFE cover)
8	316L/316 (EN 1.4404), PTFE, silicone grease, and O-ring materials
D	Duplex 2205 (UNS S31803/EN 1.4462), Duplex 2507 (UNS S32750/EN 1.4410), PTFE, PFA, silicone grease, and O-ring materials

Table A-20: Standard Probe (Operating Temperature and Pressure Code S) *(continued)*

Material of construction code	Material exposed to tank atmosphere
E	Alloy 825 (UNS N08825), PTFE, PFA, silicone grease, and O-ring materials

(1) For flexible single lead probes only.

Table A-21: MTMP Probe (Operating Temperature and Pressure Code M)

Material of construction code	Material exposed to tank atmosphere
1	316L/316 (EN 1.4404)(1), Ceramic (Al_2O_3), Graphite, PFA, PTFE, Alloy C-276 (UNS N10276), and Alloy 718 (UNS N07718)

(1) For flexible single lead probes only.

Table A-22: HTHP Probe (Operating Temperature and Pressure Code H)

Material of construction code	Material exposed to tank atmosphere
1 (probe types 3V and 4U)	316L/316 (EN 1.4404), Ceramic (Al_2O_3), Graphite, and Alloy C-276 (UNS N10276)
1 (all other probe types)	316L/316 (EN 1.4404)(1), Ceramic (Al_2O_3), Graphite, Alloy C-276 (UNS N10276), and Alloy 718 (UNS N07718)
2 and H	Alloy C-276 (UNS N10276), Ceramic (Al_2O_3), Graphite, and Alloy 718 (UNS N07718)
D	Duplex 2205 (UNS S31803/EN 1.4462), Ceramic (Al_2O_3), Graphite, Alloy C-276 (UNS N10276), and Alloy 718 (UNS N07718)
E	Alloy 825 (UNS N08825), Ceramic (Al_2O_3), Graphite, Alloy C-276 (UNS N10276), and Alloy 718 (UNS N07718)

(1) For flexible single lead probes only.

Table A-23: HP Probe (Operating Temperature and Pressure code P)

Material of construction code	Material exposed to tank atmosphere
1 (probe type 3C)	316L/316 (EN 1.4404), Ceramic (Al_2O_3), Graphite, PTFE, and Alloy C-276 (UNS N10276)
1 (all other probe types)	316L/316 (EN 1.4404)(1), Ceramic (Al_2O_3), Graphite, PFA, PTFE, Alloy C-276 (UNS N10276), and Alloy 718 (UNS N07718)
2 and H	Alloy C-276 (UNS N10276), Ceramic (Al_2O_3), Graphite, PFA, PTFE, and Alloy 718 (UNS N07718)
D	Duplex 2205 (UNS S31803/EN 1.4462), Ceramic (Al_2O_3), Graphite, PFA, PTFE, Alloy C-276 (UNS N10276), and Alloy 718 (UNS N07718)
E	Alloy 825 (UNS N08825), Ceramic (Al_2O_3), Graphite, PFA, PTFE, Alloy C-276 (UNS N10276), and Alloy 718 (UNS N07718)

(1) For flexible single lead probes only.

Table A-24: Cryogenic Probe (Operating Temperature and Pressure code C)

Material of construction code	Material exposed to tank atmosphere
1 (probe type 3C)	316L/316 (EN 1.4404), Ceramic (Al_2O_3), Graphite, PTFE, and Alloy C-276 (UNS N10276)
1 (all other probe types)	316L/316 (EN 1.4404)(1), Ceramic (Al_2O_3), Graphite, PFA, PTFE, Alloy C-276 (UNS N10276), and Alloy 718 (UNS N07718)

(1) For flexible single lead probes only.

A.3.13 Weight

Table A-25: Flange and Probes

Item	Weight
Flange	Depends on flange size
Flexible single lead probe	0.05 lb/ft. (0.08 kg/m)
Rigid single lead probe (0.3-in./8 mm)	0.27 lb/ft. (0.4 kg/m)
Rigid single lead probe (0.5-in./13 mm)	0.71 lb/ft. (1.06 kg/m)
Segmented rigid single lead probe	0.71 lb/ft. (1.06 kg/m)
Coaxial probe	0.67 lb/ft. (1 kg/m)
Large coaxial probe	1.48 lb/ft. (2.2 kg/m)

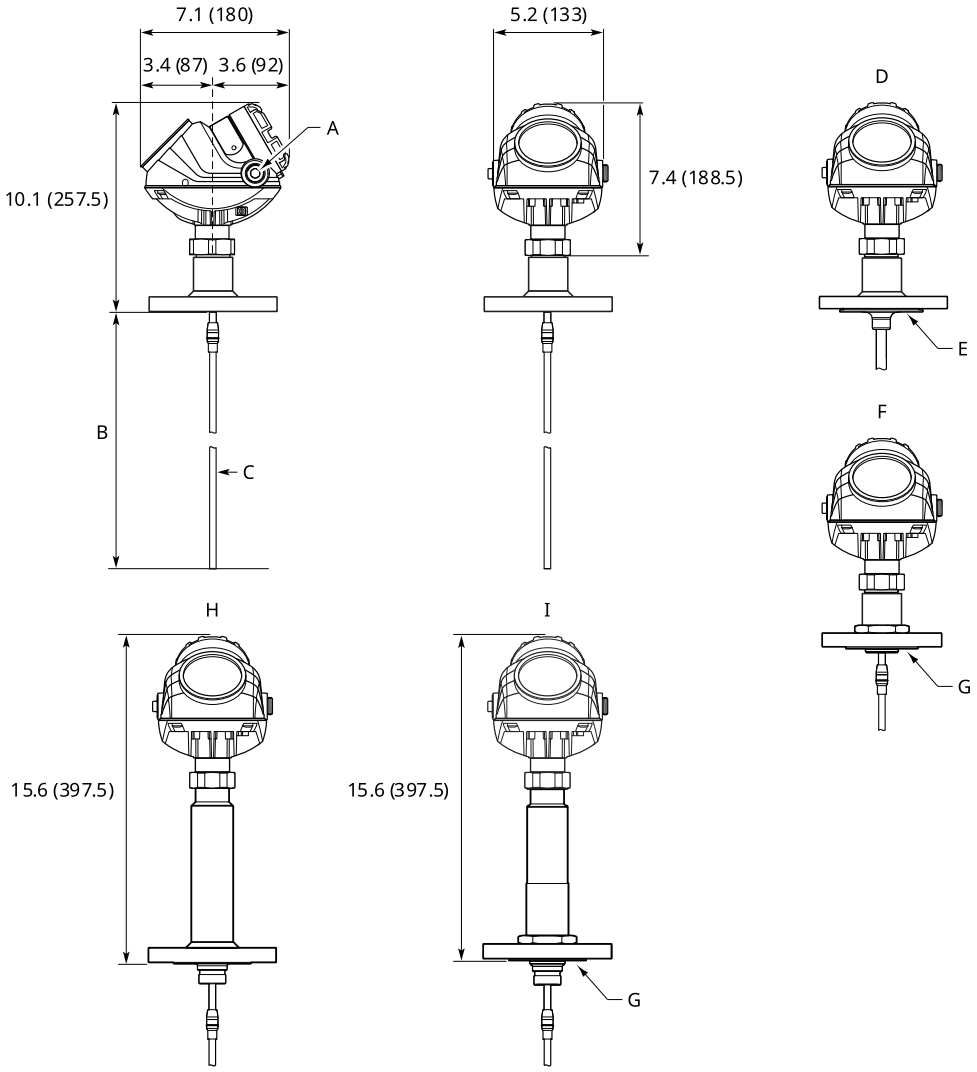


Table A-26: End Weight

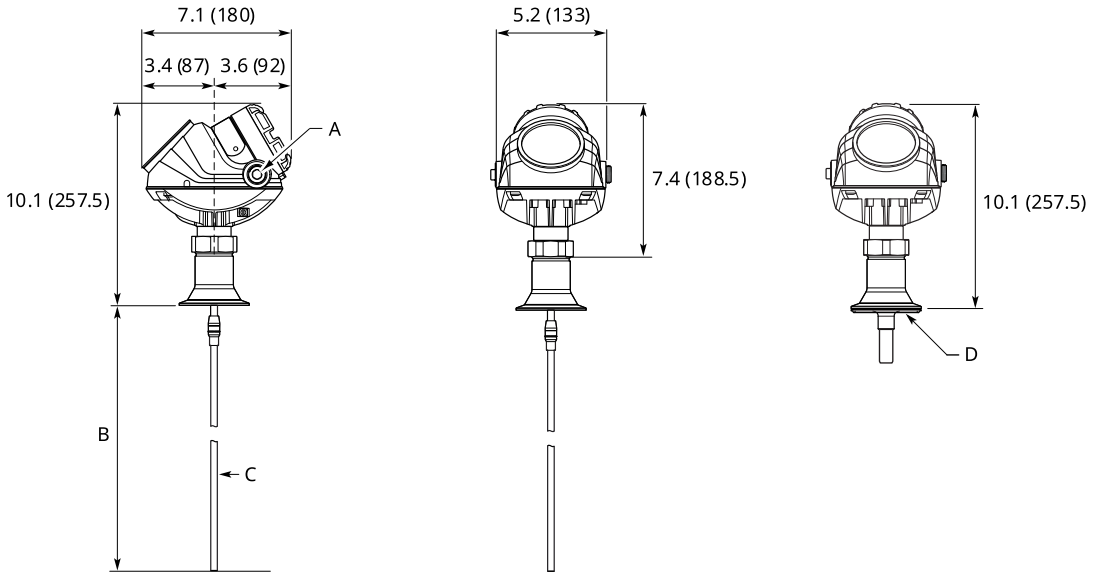
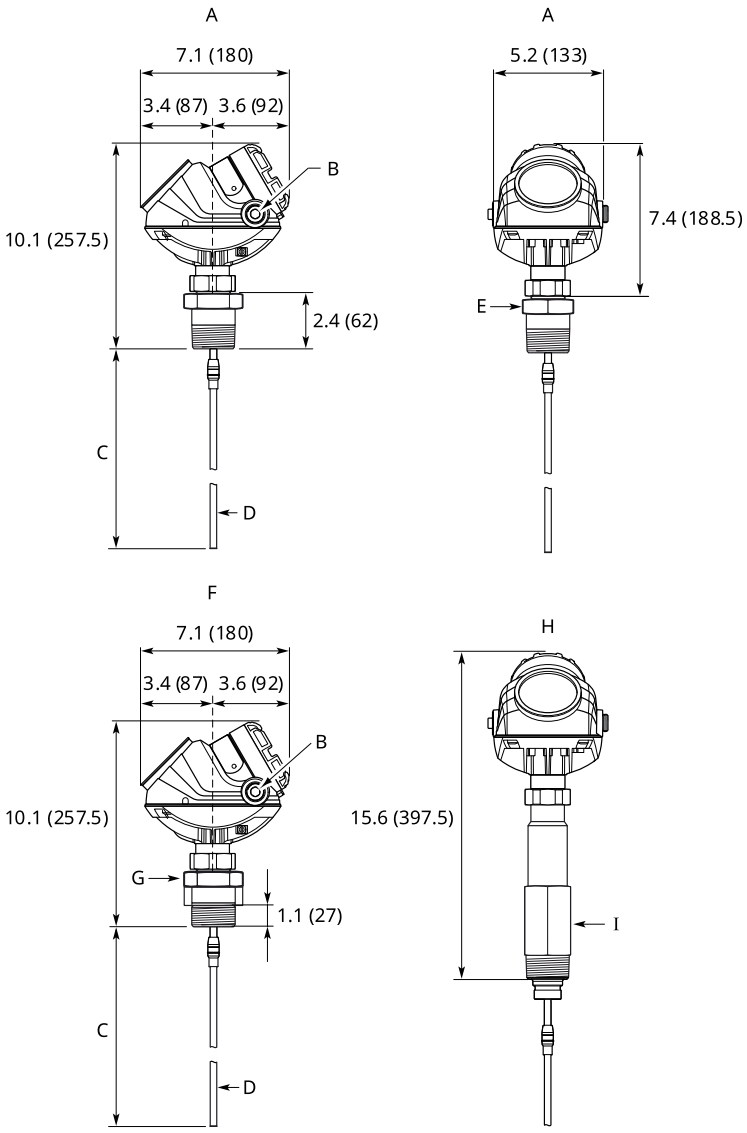
Item	Weight
Standard weight for flexible single lead probe (0.16-in./4 mm)	0.88 lb (0.40 kg)
Short weight (W2) for flexible single lead probe (0.16-in./4 mm)	0.88 lb (0.40 kg)
Heavy weight (W3) for flexible single lead probe (0.16-in./4 mm)	2.43 lb (1.10 kg)
Weight for flexible single lead probe (0.24-in./6 mm)	1.2 lb (0.55 kg)
Weight for PTFE covered flexible single lead	2.2 lb (1 kg)

A.3.14 End weight options



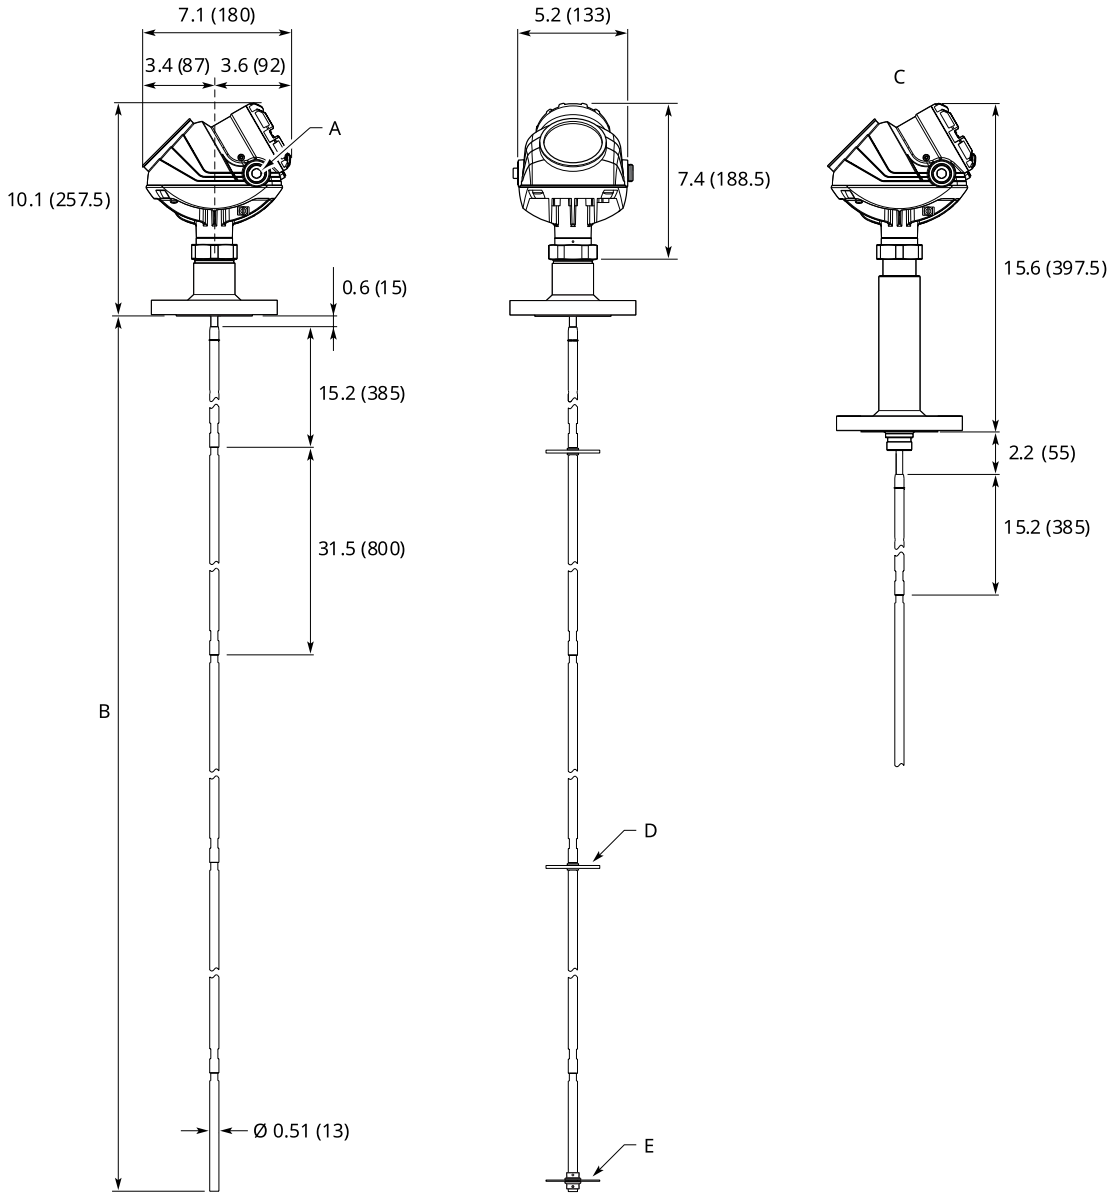
A short weight is available for the single flexible probe. It is used for measuring close to the probe end and shall be used where the measuring range must be maximized. The height is 2 in. (50 mm) and the diameter is 1.5 in. (37.5 mm). The option code is W2.

A.4 Dimensional drawings



A. ½ - 14 NPT; optional adapters: M20x1.5, eurofast® and minifast®
B. L ≤ 10 ft. (3 m) for Ø 0.31 (8); L ≤ 20 ft. (6 m) for Ø 0.51 (13)
C. Ø 0.31 (8); Ø 0.51 (13); Ø 0.47 (12) for PTFE covered probe
D. PTFE covered probe and protective plate
E. Protective plate design (Material of construction code 7)
F. Alloy probe and protective plate
G. Protective plate design (Material of construction code 2 or 3)
H. MTMP/HTHP/HP/C version
I. HTHP/HP Plate Design (Option for Alloy versions)

Dimensions are in inches (millimeters).



A. ½ - 14 NPT; optional adapters: M20x1.5, eurofast and minifast
B. L ≤ 10 ft. (3 m) for Ø 0.31 (8); L ≤ 20 ft. (6 m) for Ø 0.51 (13)
C. Ø 0.31 (8); Ø 0.51 (13); Ø 0.47 (12) for PTFE covered probe
D. The PTFE covered probe is designed with a protective plate
Protective plate design (Material of construction code 7)

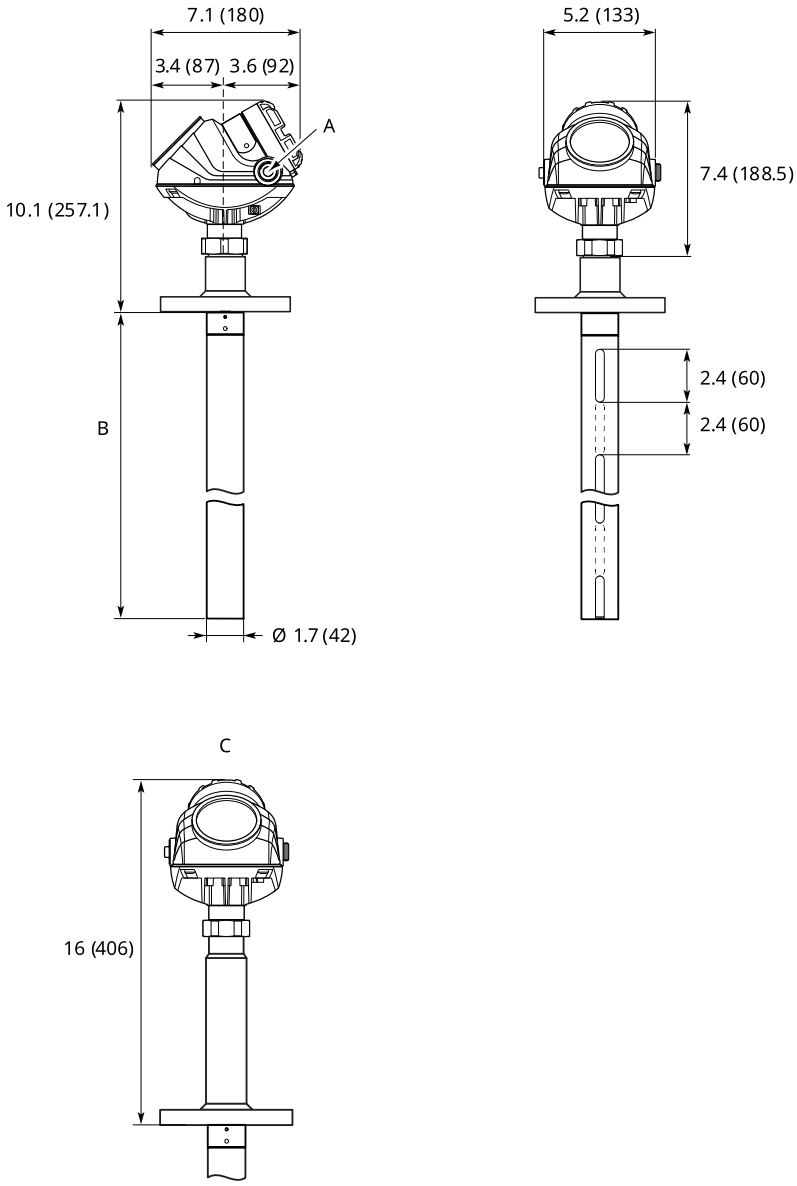
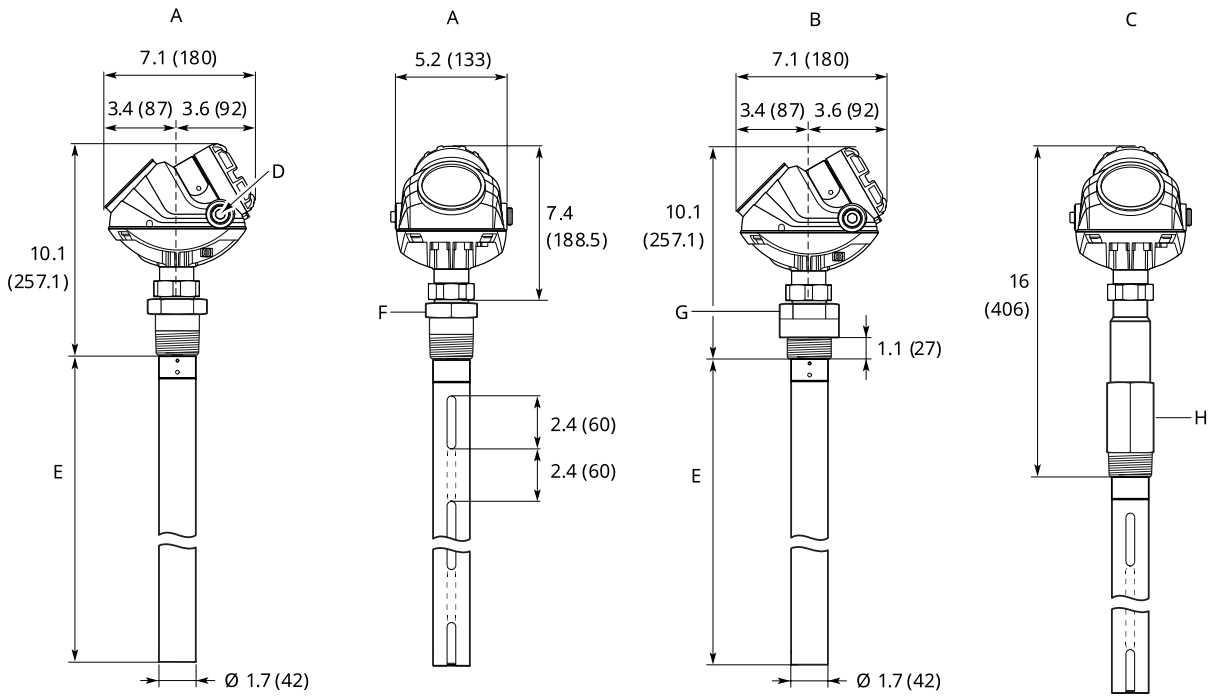
M. NPT: s50; G: s60
N. Short weight (option W2)
O. Heavy weight (option W3)
P. Chuck

Dimensions are in inches (millimeters).



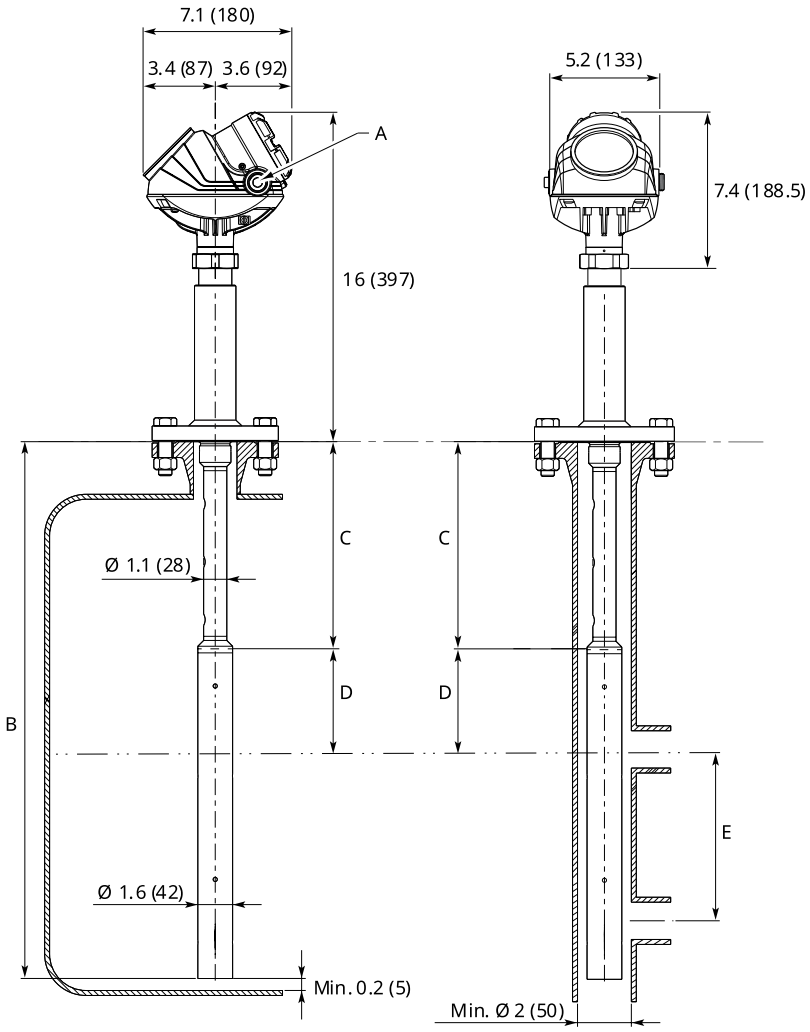
A. ½ - 14 NPT; optional adapters: M20x1.5, eurofast and minifast
B. L ≤ 20 ft. (6 m)
C. MTMP/HTHP/HP/C version
D. HTHP/HP Plate Design (Option for Alloy versions)
E. Protective plate design (Material of construction code 2 or 3)
F. Probe type: Coaxial, perforated (code 3B)
G. Probe type: Coaxial (code 3A)

Dimensions are in inches (millimeters).



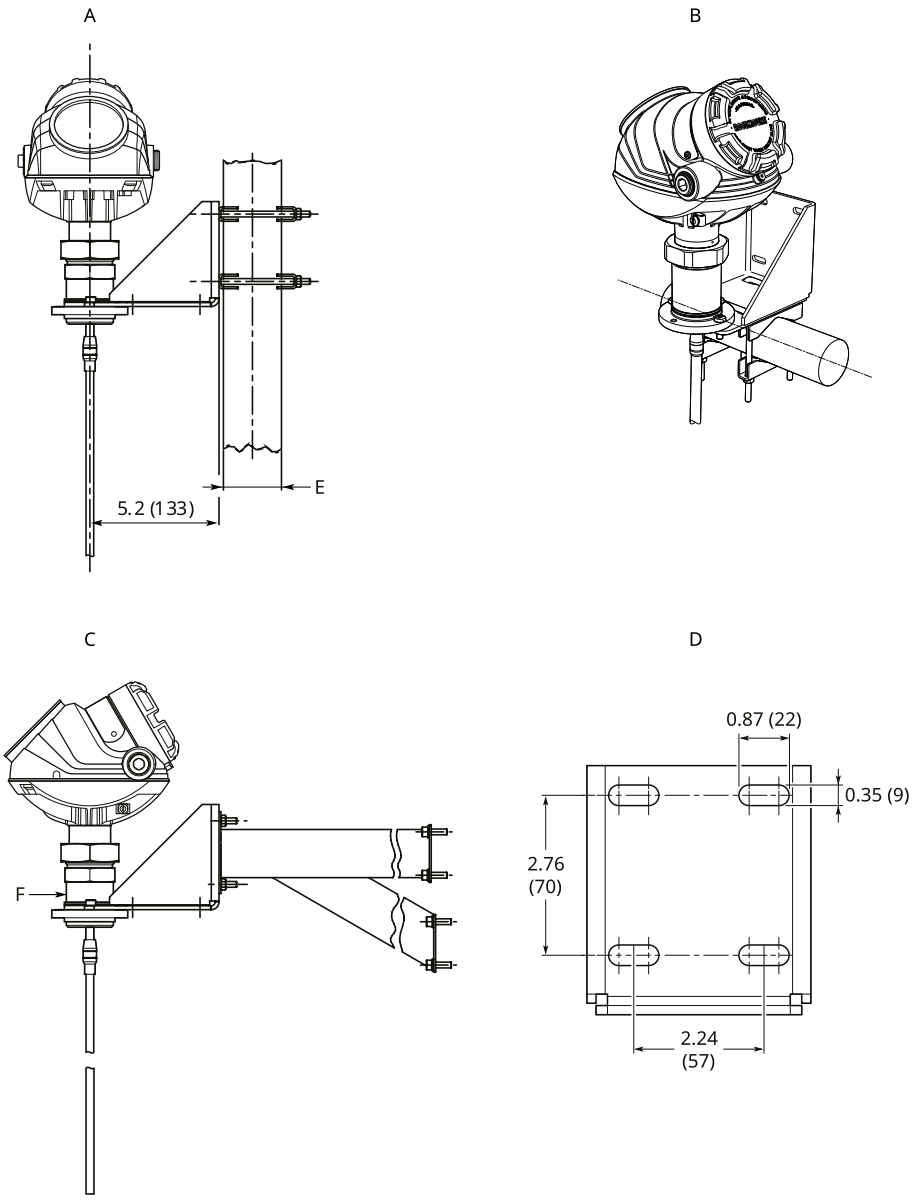
A. NPT 1/1½/2 in.
B. G 1/1½ in.
C. NPT 1½, G 1½ inch (MTMP/HTHP/HP/C version)
D. ½ - 14 NPT; optional adapters: M20x1.5, eurofast and minifast
E. L ≤ 20 ft (6 m)
F. 1 in., 1½ in.: s52; 2 in.: s60
G. 1 in.: s52; 1½ in.: s60
H. NPT: s50; G: s60
I. Probe type: Coaxial, perforated (code 3B)
J. Probe type: Coaxial (code 3A)

Dimensions are in inches (millimeters).



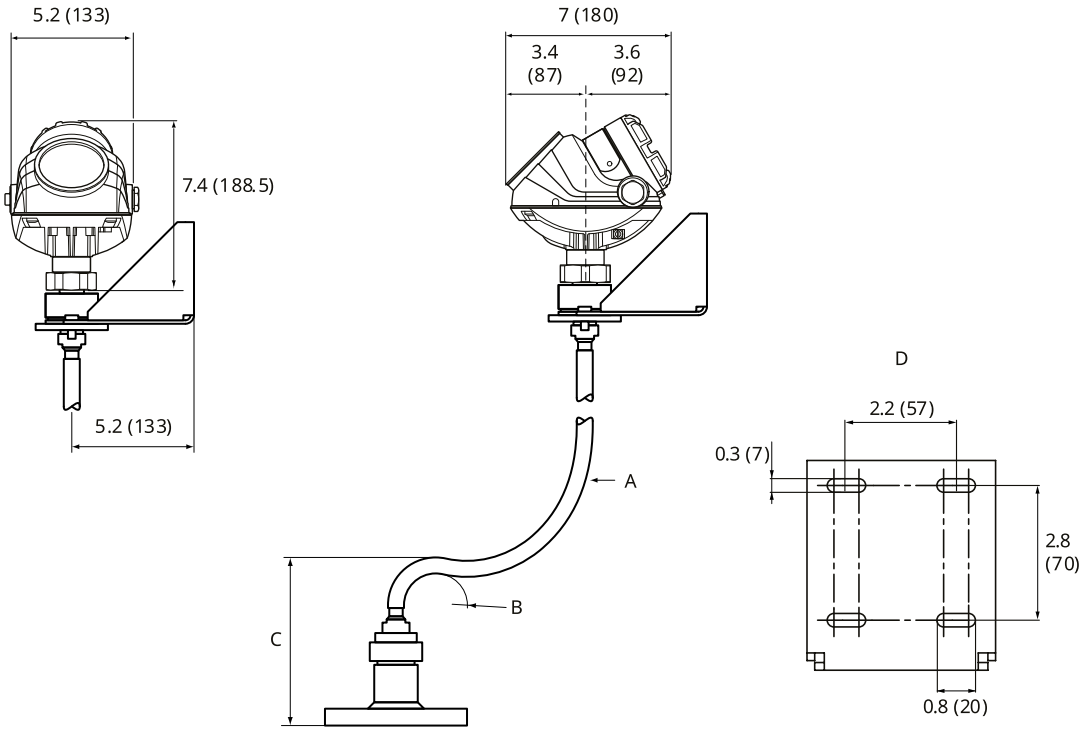
A. ½ - 14 NPT; optional adapters: M20x1.5, eurofast and minifast
B. L ≤ 20 ft. (6 m)
C. HP/C version

Dimensions are in inches (millimeters).



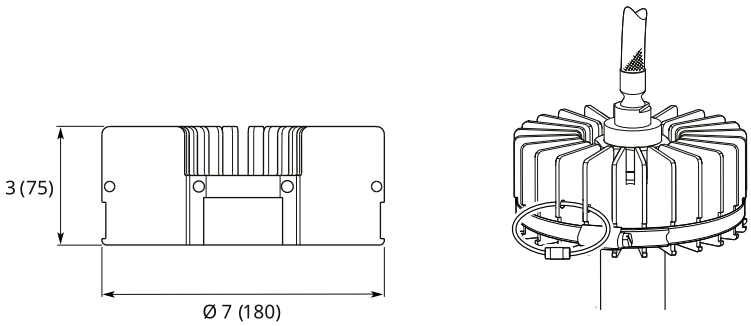
A. NPT 1½/2 in.
B. G 1½ in.
C. NPT 1½, G 1½ in. (HP/C version)
D. ½ - 14 NPT; optional adapters: M20x1.5, eurofast and minifast
E. L ≤ 20 ft. (6 m)
F. 1½ in.: s52; 2 in.: s60
G. 1½ in.: s60
H. NPT: s50; G: s60

Dimensions are in inches (millimeters).



A. ½ - 14 NPT; optional adapters: M20x1.5, eurofast and minifast
B. L ≤ 13 ft. 1 in. (4 m)
C. Short reflector: 13.8 (350); Long reflector: 19.7 (500)
D. Minimum 8.3 in. (210 mm) distance between water surface and reflector end
E. Minimum 12 in. (300 mm)

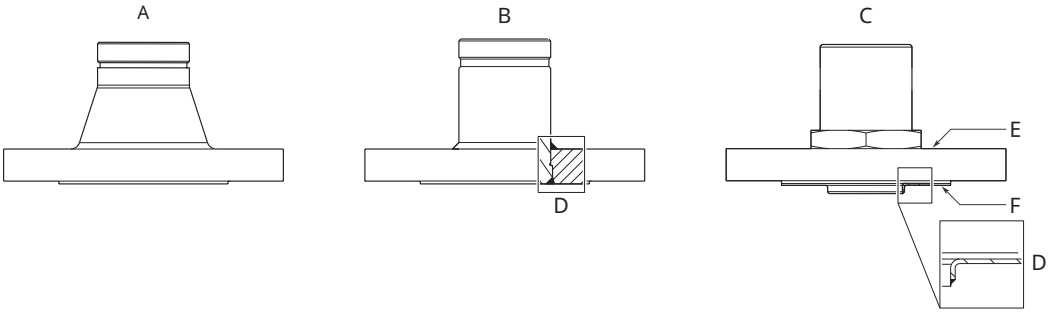
Dimensions are in inches (millimeters).



A. Pipe mounting (vertical pipe)
B. Pipe mounting (horizontal pipe)
C. Wall mounting
D. Hole pattern for wall mounting
E. Pipe diameter: max 2.5 in. (64 mm)
F. NPT 1½-in.

Dimensions are in inches (millimeters).

A. 3, 6, 9 ft. (1, 2, or 3 m)
B. R_{min}: 1.4 (35)
C. H_{min}: 7.3 (185) for Standard variant; 12.8 (325) for HTHP/HP/C variant
D. Hole pattern for remote housing wall mounting



Dimensions are in inches (millimeters).

Dimensions are in inches (millimeters).

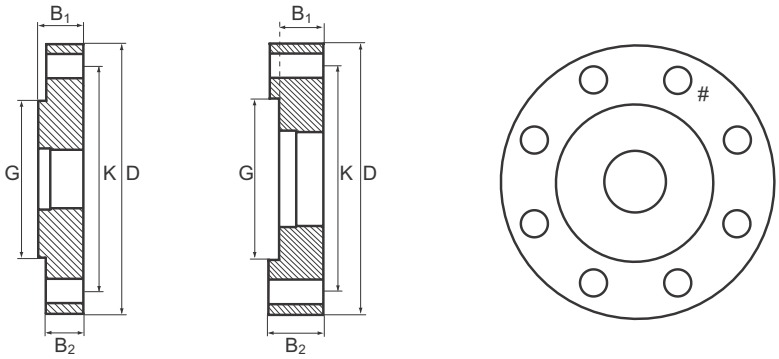
A.5 Standard flanges

Figure A-41: Flange Connection

A. Forged one-piece
B. Welded construction
C. Protective plate design
D. Weld
E. Backing flange
F. Protective plate

Table A-27: Standard Flanges

Standard	Face type(1)	Plate surface finish, R_a
ASME B16.5	Raised face	125-250 µin
	Ring type joint	< 63 µin
EN 1092-1	Type A flat face	3.2-12.5 µm
	Type B2 raised face	0.8-3.2 µm
	Type C tongue face	0.8-3.2 µm
	Type E spigot face	3.2-12.5 µm
JIS B2220	Raised face	3.2-6.3 µm



(1) Face gasket surface is serrated per mating standard.

Table A-28: Standard Flanges, Protective Plate

Standard	Face type including protective plate	Plate surface finish, R_a
ASME B16.5	Raised face	3.2-6.3 µm
EN 1092-1	Raised face	3.2-6.3 µm
JIS B2220	Raised face	3.2-6.3 µm

A.6 Proprietary flanges

Figure A-42: Proprietary Flanges

D: Outside diameter

B_1: Flange thickness with gasket surface

B_2: Flange thickness without gasket surface

$F=B_1-B_2$: Gasket surface thickness

G: Gasket surface diameter

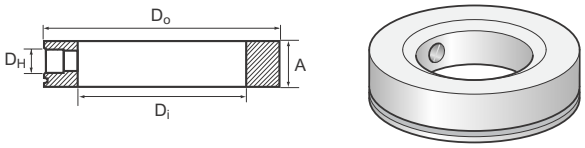
Bolts: Number of bolts

K: Bolt hole circle diameter

Dimensions are in inches (millimeters).

Note
Dimensions may be used to aid in the identification of installed flanges. It is not intended for manufacturing use.

Table A-29: Dimensions of Proprietary Flanges



Special flanges(1)	D	B_1	B_2	F	G	# Bolts	K
Fisher™ 249B/259B(2)	9.00 (228.6)	1.50 (38.2)	1.25 (31.8)	0.25 (6.4)	5.23 (132.8)	8	7.25 (184.2)
Fisher 249C(3)	5.69 (144.5)	0.94 (23.8)	1.13 (28.6)	-0.19 (-4.8)	3.37 (85.7)	8	4.75 (120.65)
Masoneilan™(2)	7.51(191.0)	1.54 (39.0)	1.30 (33.0)	0.24 (6.0)	4.02 (102.0)	8	5.87 (149.0)

(1) These flanges are also available in a vented version. Vented flanges must be ordered with a 1½-in. NPT threaded process connection (code RA).
(2) Flange with raised face.
(3) Flange with recessed face.

For information about flange temperature and pressure ratings, see Fisher and Masoneilan flange rating.

A.7 Flushing connection rings

Figure A-43: Flushing Connection Rings

A. Height: 0.97 in. (24.6 mm)

Table A-30: Dimensions of Flushing Connection Rings

Flushing connection rings	D_i	D_o	D_H
2-in. ANSI(1)	2.12 (53.8)	3.62 (91.9)	¼-in. NPT
3-in. ANSI(1)	3.60 (91.4)	5.00 (127.0)	¼-in. NPT
4-in. ANSI(1)/DN100	3.60 (91.4)	6.20 (157.5)	¼-in. NPT
DN50	2.40 (61.0)	4.00 (102.0)	¼-in. NPT
DN80	3.60 (91.4)	5.43 (138.0)	¼-in. NPT

(1) Up to Class 2500.

C4	NAMUR alarm and saturation levels, high alarm	★
C5	NAMUR alarm and saturation levels, low alarm	★
C8[(1)]	Standard Rosemount alarm and saturation levels, low alarm	★

(1) The standard alarm setting is high.

Special quality assurance

Code	Description	
Q4	Calibration data certificate	★

Safety certifications

Only available with HART 4-20 mA output (output code H).

Code	Description	
QS	Prior-use certificate of FMEDA Data	★
QT	Safety-certified to IEC 61508 with certificate of FMEDA data	★

Related information

Rosemount 5300 Safety Manual

Marine / shipboard approvals

Transmitters with aluminum housing are not approved for open deck installations.

Code	Description	
SBS	American Bureau of Shipping Type Approval	★
SDN	Det Norske Veritas (DNV) Type Approval	★
SLL	Lloyd's Register Type Approval	★
SKR	Korean Register Type Approval	★
SBV	Bureau Veritas Type Approval	★
SNK	Nippon Kaiji Kyokai Type Approval	★

Transient protection

Code	Description	
T1	Transient Protection Terminal Block. Selectable with HART 4-20 mA output (output code H). Already included in all FOUNDATION Fieldbus variations.	★

Diagnostic functionality

Code	Description	
D01	FOUNDATION Fieldbus Diagnostics Suite (includes Signal Quality Metrics diagnostics(1))	★
DA1	HART Diagnostics Suite (includes Signal Quality Metrics diagnostics(1))	★

(1) Signal Quality Metrics diagnostics is not compatible with interface measurement where the probe is fully submerged.

Cold temperature

Code	Description	
BR5(1)(2)(3)(4)	-67 °F (-55 °C) cold temperature	

(1) Only available for end-destination countries within the EAC Economic Union (Russia, Belarus, Kazakhstan, Armenia, and Kyrgyzstan).
(2) Consider any temperature limitations dependent on Material of construction, Hazardous locations certifications, and/or O-ring selection.
(3) Not available with option code QS or U1.
(4) For ambient temperatures between -67 °F (-55 °C) and -40 °F (-40 °C), the ambient temperature effect is ± 0.012 in. (0.3 mm) /°K or ± 45 ppm/°K of measured value, whichever is greatest. Other performance specifications apply to ambient temperatures between –40 °F (–40 °C) and 185 °F (85 °C).

Overfill prevention

Code	Description	
U1	Overfill prevention according to WHG/TUV	★

Extended product warranty

Code	Description	
WR3	3-year limited warranty	★
WR5	5-year limited warranty	★

Remote housing

Not available with Marine/shipboard approvals.

Code	Description	
B1	1 m/3.2 ft. Remote housing mounting cable and 316L bracket	
B2	2 m/6.5 ft. Remote housing mounting cable and 316L bracket	
B3	3 m/9.8 ft. Remote housing mounting cable and 316L bracket

Operating temperature and pressure

Process seal rating. Final rating depends on Material of construction, Flange, and O-ring selection.

Code	Description		Probe type	
Standard (Std)				
S	Design and operating temperature: -40 to 302 °F (-40 to 150 °C)	Design and operating pressure: -15 to 754 psig (-1 to 52 bar)[1]	3A, 3B, 3C, 4A, 4B, 4S, 5A, and 5B	★
Medium Temperature and Medium Pressure (MTMP)				
M[2]	Design and operating temperature: -76 to 500 °F (-60 to 260 °C)	Design and operating pressure: -15 to 1450 psig (-1 to 100 bar)	3A, 3B, 4A, 4B, 4S, 5A, and 5B	★

Code	Description		Probe type	
High Pressure (HP)				
P[3]	Design temperature: -76 to 752 °F (-60 to 400 °C)[4] Operating temperature: -76 to 500 °F (-60 to 260 °C)[5]	Design and operating pressure: -15 to 5000 psig (-1 to 345 bar)	3A, 3B, 3C, 4A, 4B, 4S, 5A, and 5B	★
High Temperature / High Pressure (HTHP)				
H[3][6]	Design and operating temperature: -76 to 752 °F (-60 to 400 °C)	Design and operating pressure: -15 to 5000 psig (-1 to 345 bar)	3A, 3B, 3V, 4A, 4B, 4S, 4U, 5A, and 5B	★
Cryogenic Temperature (C)				
C[3]	Design and operating temperature: -320 to 392 °F (-196 to 200 °C)	Design and operating pressure: -15 to 5000 psig (-1 to 345 bar)	3A, 3B, 3C, 4A, 4B, 4S, 5A, 5B (Only SST)	

(1) Maximum pressure is 580 psig (40 bar) for O-ring material code B (Nitrile Butadiene), Overfill prevention code U1, and Material of construction code 2 or 3.
(2) Available with ATEX, IECEx approvals, or without hazardous locations approvals.
(3) Requires option None for sealing (no O-ring).
(4) Pressure retaining parts are designed for up to 752 °F (400 °C), maximum operating temperature is 500 °F (260 °C).
(5) Maximum operating temperature is 482 °F (250 °C) for option code U1.
(6) For applications where operating temperature cycles exclusively below 500 °F / 260 °C, and other applications where a large amount of contamination is present, the High Pressure (HP), Medium Temperature and Medium Pressure (MTMP), or Standard (Std) seal should be used, if process conditions allow.

E	Ethylene Propylene (EPDM)	★
K	Kalrez® Perfluoroelastomer (FFKM)	★
B	Nitrile Butadiene (NBR)	★
F	Fluorsilicone (FVMQ)	★

(1) Requires Operating Temperature and Pressure code M, H, P, or C.

Probe type

Code	Description	Process connections	Probe lengths	
3B	Coaxial, perforated. For level and interface measurement.	Flange / 1-in.(1), 1½-in., 2- in.(1) Thread	Min: 1 ft. 4 in. (0.4 m) Max: 19 ft. 8 in. (6 m)	★
3C(2)	Large coaxial, perforated. For level and interface measurement.	Flange / 1½-in., 2- in.(1) Thread	Min: 1 ft. (0.3 m) Max: 19 ft. 8 in. (6 m)	★
3V(3)(4)(5)	Integrated Still Pipe Vapor Probe. For 3-in. chambers and above. Refer to "Options" to specify reference reflector length.	Flange	Min: 2 ft. 11 in. (0.9 m) for the short reflector (R1 option) Min: 3 ft. 7 in. (1.1 m) for the long reflector (R2 option) Max: 13 ft. 1 in. (4 m)	★
4A	Rigid Single Lead (8 mm)	Flange / 1- in.(1), 1½-in., 2- in.(1) Thread / Tri Clamp	Min: 1 ft. 4 in. (0.4 m) Max: 9 ft. 10 in. (3 m)	★
4B	Rigid Single Lead (13mm)	Flange / 1-in., 1½-in., 2-in. Thread / Tri Clamp	Min: 1 ft. 4 in. (0.4 m) Max: 19 ft. 8 in. (6 m)	★
4U(3)(4)(5)	Single Rigid Vapor Probe (equip with a 1½-in. centering disc). For 2-in. chambers. Refer to "Options" to specify reference reflector length.	Flange / 1½-in. Thread	Min: 2 ft. 11 in. (0.9 m) for the short reflector (R1 option) Min: 3 ft. 7 in. (1.1 m) for the long reflector (R2 option) Max: 9 ft. 10 in. (3 m)	★
5A(6)	Flexible Single Lead with weight	Flange / 1-in.(1), 1½-in., 2-in.(1) Thread / Tri Clamp	Min: 3 ft. 4 in. (1 m) Max: 164 ft. (50 m)(7)(8)	★
5B(9)	Flexible Single Lead with chuck	Flange / 1-in.(1), 1½-in., 2-in.(1) Thread / Tri Clamp	Min: 3 ft. 4 in. (1 m) Max: 164 ft. (50 m)(7)	★
3A(10)	Coaxial (for level measurement)	Flange / 1-in.(1), 1½-in., 2-in.(1) Thread	Min: 1 ft. 4 in. (0.4 m) Max: 19 ft. 8 in. (6 m)	
4S	Segmented Rigid Single Lead (13mm)	Flange / 1-in., 1½-in., 2-in.Thread / Tri Clamp	Min: 1 ft. 4 in. (0.4 m) Max: 32 ft. 9 in. (10 m)	
6A(11)	Flexible Single Lead with weight, 6 mm	Flange / 1-in., 1½-in., 2-in.Thread	Min: 3 ft. 4 in. (1 m) Max: 164 ft. (50 m)	★
6B(11)	Flexible Single Lead with chuck, 6 mm	Flange / 1-in., 1½-in., 2-in.Thread	Min: 3 ft. 4 in. (1 m) Max: 164 ft. (50 m)	★

(1) Only available with Operating Temperature and Pressure code S.
(2) Requires firmware version 2.L3 or later.
(3) Only available with Operating Temperature and Pressure code H.
(4) Not available with Remote housing code B1 or B2.
(5) Probe type 3V or 4U together with flanges Class 2500/PN250 or higher requires installation option code HS (Heat sink).
(6) 0.79 lb (0.36 kg) standard weight for flexible single lead probe. L=5.5 in. (140 mm). For PTFE covered probes: 2.2 lb (1 kg) standard weight for flexible single lead probe. L=17.1 in. (434 mm).
(7) Maximum probe length for Duplex 2205 probes is 105 ft (32 m).
(8) Maximum probe length for PTFE covered probes is 98 ft (30 m).
(9) Extra length for fastening is added in factory.
(10) Requires model 5301.
(11) 1.2 lb (0.56 kg) standard weight for flexible single lead probe. L=5.5 in. (140 mm).

Probe length units

Code	Description	
E	English (feet, inches)	★
M	Metric (meters, centimeters)	★

Total probe length (feet/m)

Probe weight included if applicable. Give the total probe length in feet and inches or meters and centimeters, depending on selected probe length unit. If tank height is unknown, please round up to an even length when ordering. Probes can be cut to exact length in field. Maximum allowable length is determined by process conditions.

Code	Description	
XXX	0-164 ft. or 0-50 m	★

Code	Description	
Special process connection		
XX	Special Process Connection	

(1) Design according to ASME B31.3. No code stamp or ASME certificate available.
(2) Forged one-piece flange provided for Standard (Std) seal together with Material of construction code 1, 7 or 8, and Probe type code 3A, 3B, 3V, 4A, 4B, 4U, 4S, 5A, or 5B. Welded construction provided for other combinations.
(3) Follows ISO 2852 standard.

Hazardous locations certifications

Code	Description	
NA	Not Applicable	★

A.9.2 Additional options

Hydrostatic testing

Available for tank connection with flange.

Code	Description	
P1	Hydrostatic testing, including certificate	★

Welding procedure qualification record documentation

Only applies to flanged process connections with welded construction or protective plate design.

Weldings in accordance with EN/ISO standards.

Code	Description	
Q66	Welding Procedure Qualification Record (WPQR)	★
Q67	Welder Performance Qualification (WPQ)	★
Q68	Welding Procedure Specification (WPS)	★

Material traceability certification

Certificate includes all pressure retaining wetted parts.

Code	Description	
Q8	Material traceability certification consistent with ISO10474-3.1:2013 / EN10204-3.1:2004	★

Positive material identification certificate

Code	Description	
Q76	Positive material identification certificate of conformance	★

Country certification

Code	Description	
J1	Canadian Registration Number (CRN)	★
J2[1]	ASME B31.1	★

(1) Design and manufacturing according to ASME B31.1. No code stamp or ASME certificate available. Welding in accordance with ASME IX.

Dye penetration test certificate

Only applies to flanged process connections with welded construction or protective plate design.

Code	Description	
Q73	Certificate of liquid penetrant inspection	★

Materials certification

Available for probe type 3A, 3B, 3C, 4A, 4B, 4S, and PTFE-coated 5A.

Code	Description	
N2	NACE® material recommendation per NACE MR0175/ISO 15156 and NACE MR0103/ISO 17945	★

Installation options

Code	Description	
LS[1]	Long stud 9.8 in (250 mm) for flexible single lead probe to prevent contact with wall/nozzle. Standard stud length is 3.9 in (100 mm) for probes 5A and 5B.Standard stud length is 5.9 in (150 mm) for probes 6A and 6B.	★
BR	316L Mounting Bracket for 1½-in. NPT Process Connection (RA)	
HS[2]	Heat sink	

(1) Not available with PTFE covered probes.
(2) Requires Remote housing code B3, and Probe type code 3V or 4U.

Assemble/consolidate to chamber

Selecting the XC option code on the Rosemount 5300 and a Rosemount chamber will result in matching, consolidating, configuring, and shipping of the two products in one crate. Note that the flange bolts are only hand-tightened. Long rigid single lead probes (>8 ft./2.5 m) are ship separately in order to reduce transportation risk damage.

A.10.10 HART modem and cables

Item number	Description	
03300-7004-0002	MACTek® VIATOR® HART Modem and cables (USB connection)	★
03300-7004-0001	MACTek VIATOR HART Modem and cables (RS232 connection)	★

A.10.11 Remote housing mounting spare part kit

Item number	Description	
03300-7006-0001	1 m / 3.2 ft. Remote Housing Mounting Cable and 316L Bracket	
03300-7006-0002	2 m / 6.5 ft. Remote Housing Mounting Cable and 316L Bracket	
03300-7006-0003	3 m / 9.8 ft. Remote Housing Mounting Cable and 316L Bracket	

A.10.12 Heat sink

Item number	Description	
05300-7001-0001	Heat sink	

A.10.13 Proof Test Reflector spare part kit

Requires Rosemount 5300 firmware version 2.H0 or later.

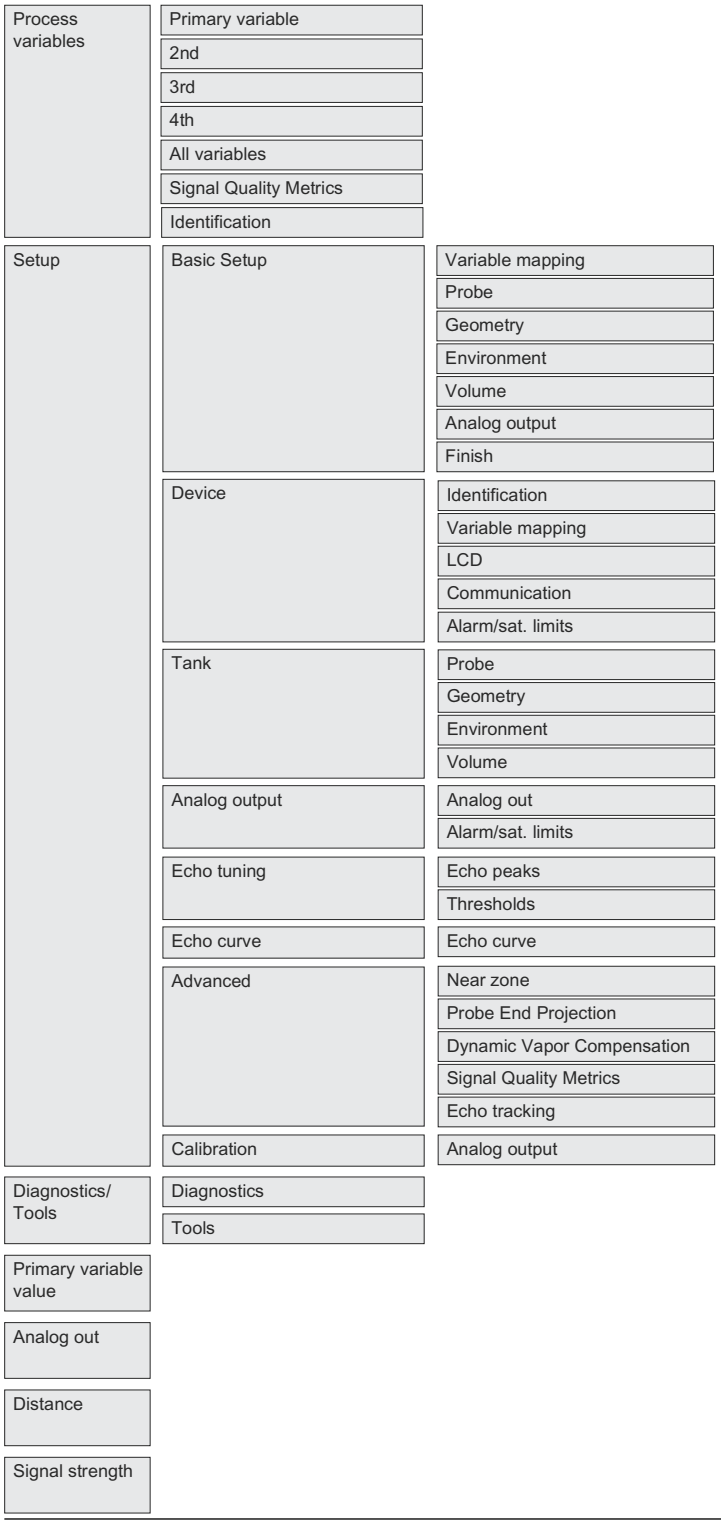
Item number	Description	
05300-7200-0001	For 3- to 8-in. pipe/chamber (inner diameter)	
05300-7200-0002	For tanks or 10-in. pipe/chamber (inner diameter) or wider	

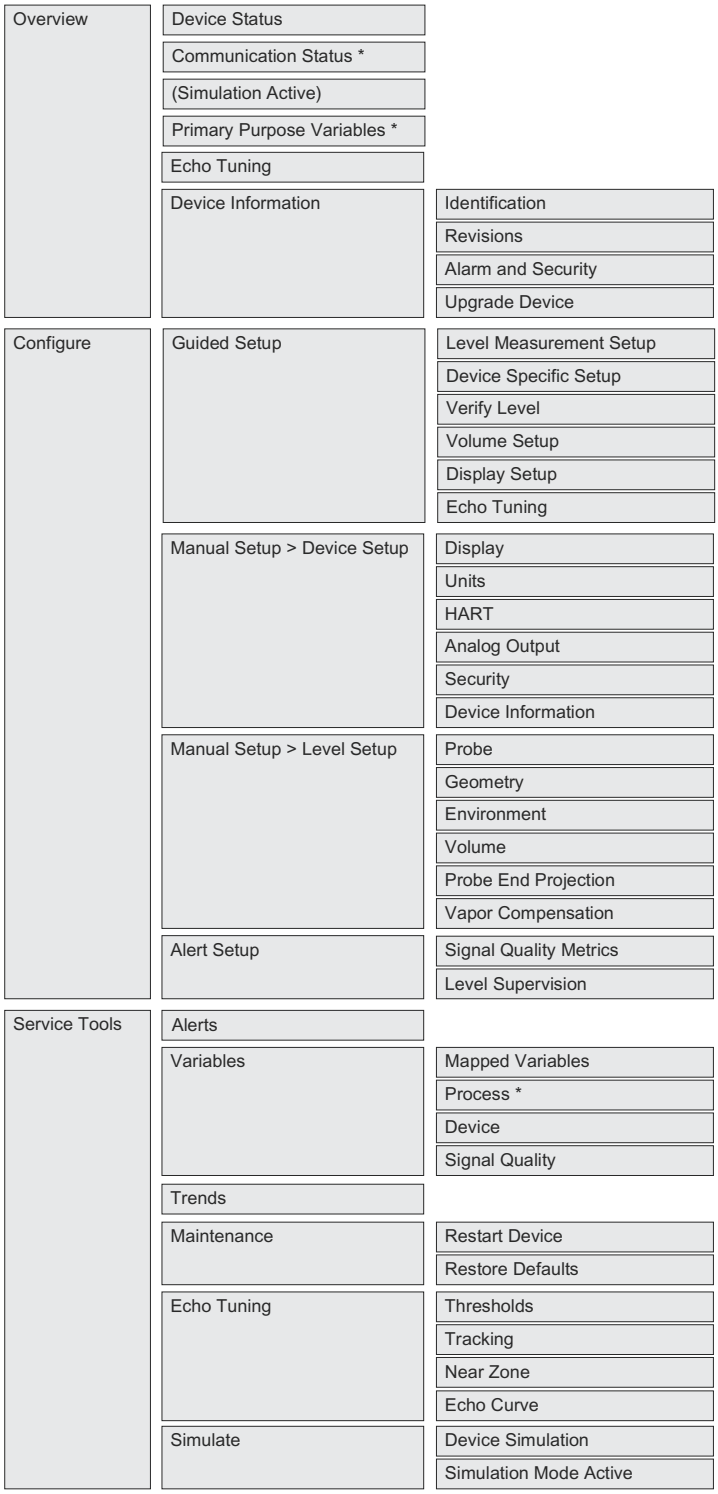
B Configuration parameters

B.1 Menu tree

This section provides the menu tree structure with various configuration parameters for AMS Device Manager and handheld communicator:

Figure B-1: Menu Tree for Field Communicator – HART 5 (DD 0303)





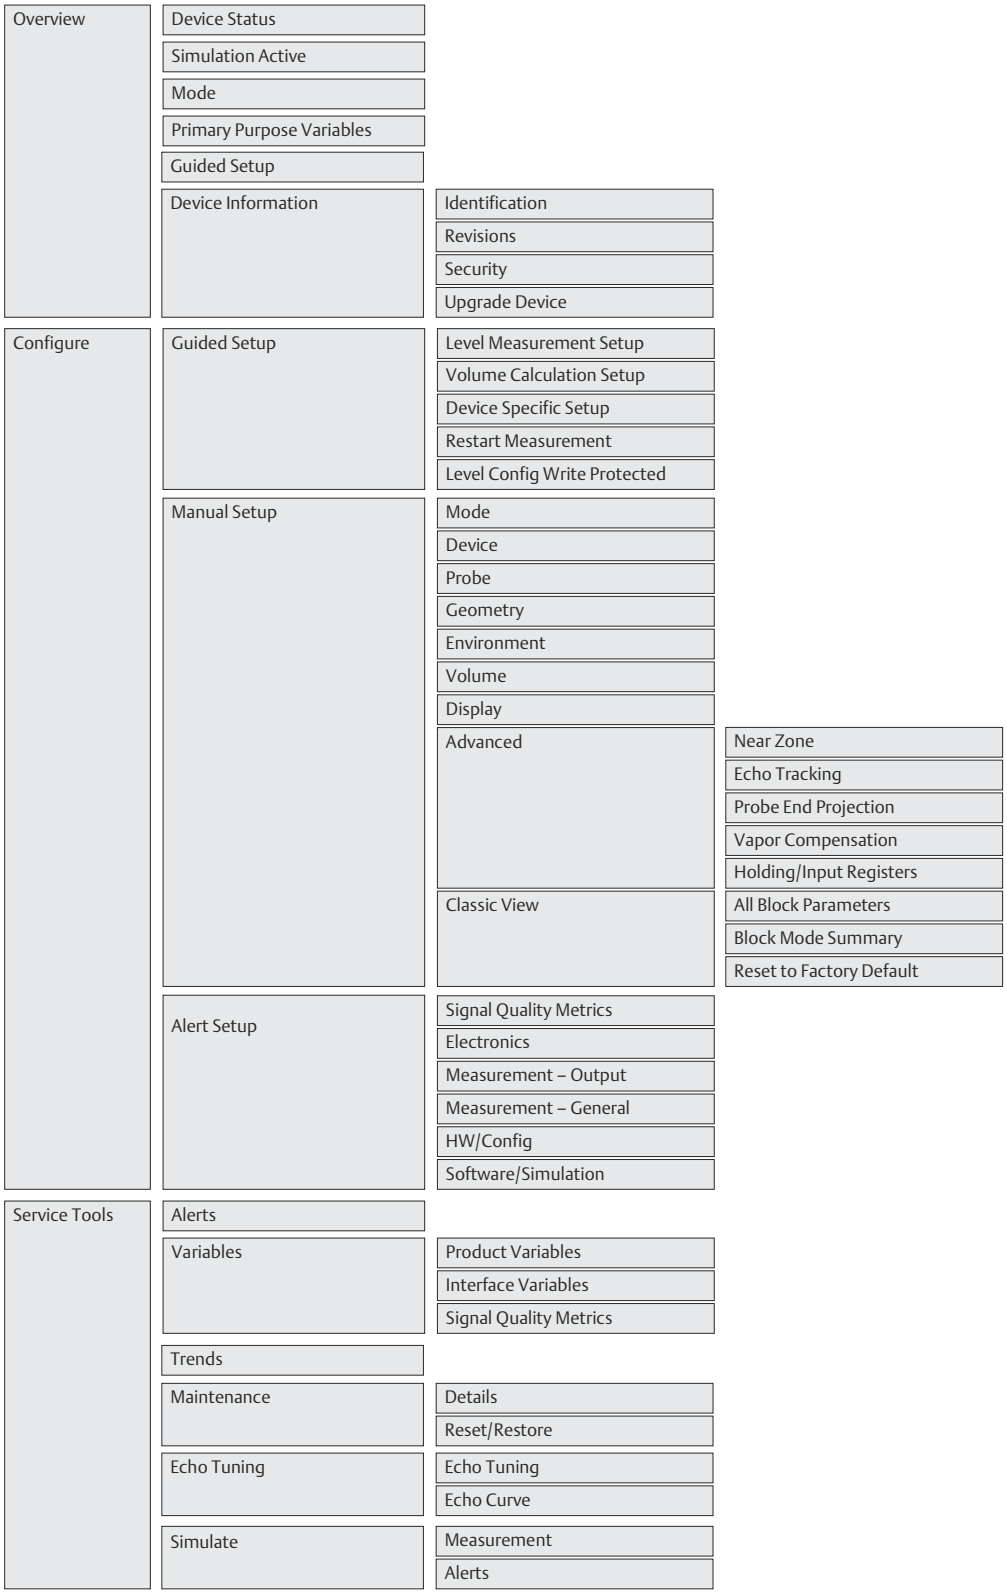


Figure B-2: Menu Tree for AMS Device Manager and Handheld Communicator – HART 5 (DD 0305) and HART 7 (DD 0404)

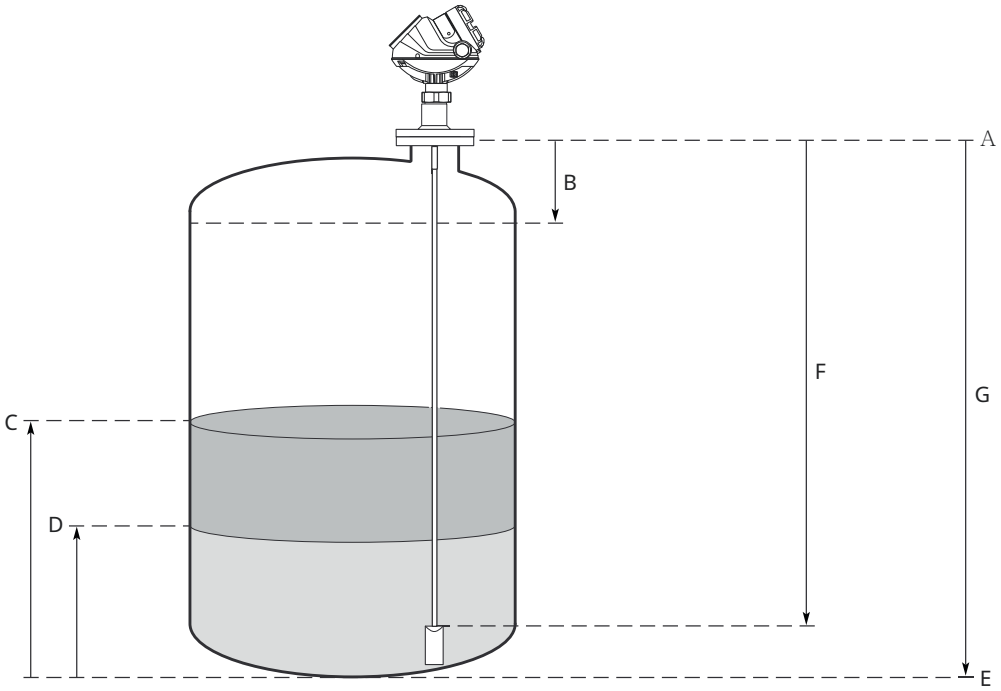
* HART7 only.

Figure B-3: Menu Tree for AMS Device Manager and Handheld Communicator – FOUNDATION™ Fieldbus (DD 0404)

B.2 Basic configuration parameters

This section describes basic configuration parameters for a Rosemount™ 5300 Level Transmitter. Basic configuration is only needed for the Rosemount 5300 Level Transmitters which are not pre-configured at the factory. Factory configuration is normally specified in the Configuration Data Sheet.



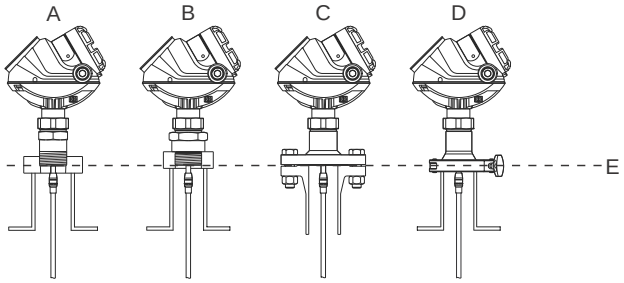
B.2.1 Measurement units

Measurement units can be specified for presentation of level/interface level, level rate, volume, and temperature values.

B.2.2 Tank and probe geometry

The basic transmitter configuration includes setting the tank geometry parameters.

Figure B-4: Tank Geometry



A. Upper reference point
B. Hold Off Distance/Upper Null Zone (UNZ)
C. Product level
D. Interface level
E. Zero reference point
F. Probe length
G. Tank height

Upper Reference Point

The Upper Reference Point is located at the underside of the threaded adapter, transmitter flange, or Tri Clamp®, as illustrated in Figure B-5.

Figure B-5: Upper Reference Point

A. NPT
B. BSPP (G)
C. Flange
D. Tri Clamp
E. Upper Reference Point

Tank height

The Tank Height is the distance from the Upper Reference Point to the bottom of the tank (Zero Reference Point). The transmitter measures the distance to the product surface and subtracts this value from the Tank Height to determine the level.

Ensure the Tank Height is as accurate as possible, since a Tank Height error results in a corresponding level value offset error.

When setting the Tank Height, keep in mind that this value is used for all level measurements performed by transmitter. The Tank Height must be set in linear (level) units, such as feet or meters, regardless of primary variable assignment.

Mounting type

Enter the type of mounting for the device. This configuration optimizes the device for the respective mounting type.

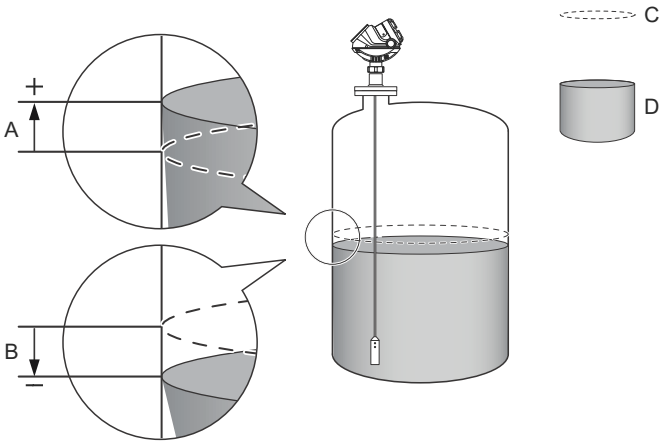
Table B-1: Mounting Types

Option	Description
Unknown	Default factory setting for mounting type, and can also be used if the mounting type is unknown.
Pipe/chamber	Select this option if the device is mounted on a chamber/ bridle or in a pipe. When selecting this alternative, enter the corresponding Inner Diameter as well.
Nozzle	Select this if the device is installed on a nozzle. When selecting this alternative, configure the Inner Diameter and the Nozzle Height as well.
Direct/bracket	When the device is mounted directly on the tank roof with no traditional nozzle, this is the alternative to use. With this selection, no inner diameter or height is required, thus those selections are disabled.

Inner diameter

Used with pipe, chamber, and nozzle installations.

Nozzle height



For nozzle installations

Calibration distance

Difference between surface distance measured by transmitter and the same distance measured by, for example, hand-dipping with a measurement tape. A positive Calibration Distance value will increase the presented level value.

It is recommended to run the Verify Level tool to match the product level reported by the transmitter to a reference measurement.

Figure B-6: Calibration Distance

A. Positive Calibration Distance value
B. Negative Calibration Distance value
C. Reported level
D. Actual level

Non-metallic (e.g. plastic) vessels and installation geometry may introduce an offset for the zero reference point. This offset may be up to ± 1 in. (25 mm). The offset can be compensated for by using Calibration Distance.

Related information

Run verify level

Probe length

The probe length is the distance between the Upper Reference Point and the end of the probe. If a weight is used at the end of the probe, it should not be included.

For flexible single lead probes anchored with chuck, the Probe Length should be configured as the distance from the Upper Reference Point to the top of the chuck.

For flexible single lead probes anchored with clamps, the Probe Length should be configured as the distance from the Upper Reference Point to the upper clamp.

This parameter is pre-configured at factory. The probe length must be changed if the probe is shortened, or if you have ordered a spare transmitter head.

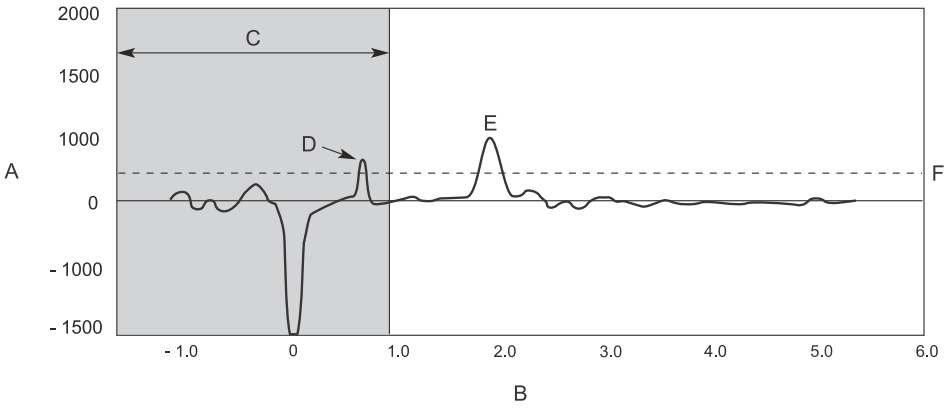
Related information

Upper Reference Point

Anchor the probe

Probe type

The transmitter is designed to optimize measurement performance for each probe type. The transmitter automatically makes an initial calibration based on the type of probe that is used.



This parameter is pre-configured at factory and only needs to be set if the probe is changed to another type, or if you have installed a spare transmitter.

Select the type of probe that is mounted to the transmitter. Select User Defined probe if your probe can not be found in the list or if you have done modifications to a standard probe.

Hold off distance/upper null zone (UNZ)

The Hold Off Distance/UNZ defines how close to the device's Upper Reference Point a level value is accepted. You can extend Upper Null Zone to block out disturbing echoes close to the tank top, caused by for example a narrow nozzle with rough walls, obstacles close to the probe, or a nozzle that protrudes into the tank.

Figure B-7: Identifying the Hold Off Distance/UNZ in the Echo Curve Plot

A. Amplitude, mV
B. Distance, m
C. Hold Off Distance/UNZ
D. Disturbance
E. Surface peak
F. Surface Threshold

By adjusting the Hold Off Distance/UNZ, the measuring range is reduced. The Hold Off Distance/UNZ is equal to zero in the default configuration.

Related information

Change the hold off distance/upper null zone

B.2.3 Tank environment

Measurement mode

Normally, the measurement mode does not need to be changed. The transmitter is pre-configured according to the specified model:

Table B-2: List of Measurement Modes for Different Rosemount 5300 Models

Model	Measurement mode
Rosemount 5301	• Liquid product level (1) • Interface level with submerged probe
Rosemount 5302	• Liquid product level • Product level and interface level(1) • Interface level with submerged probe • Solid product level
Rosemount 5303	• Solid product level(1)

(1) Default setting.

The measurement mode Interface level with submerged probe is used for applications where the probe is fully submerged in liquid. In this mode, the transmitter ignores the upper product level. See Interface level with submerged probe for more information.

Note
Only use Interface level with submerged probe for applications where the interface is measured with a fully submerged probe.

Rapid level changes

Optimize the transmitter for measurement conditions where the level changes quickly due to filling and emptying of the tank. As a default standard, a Rosemount 5300 Level Transmitter is able to track level changes of up to 1.5 in./s (40 mm/s). When the Rapid Level Changes check-box is marked, the transmitter can track level changes of up to 8 in./s (200 mm/s).

The Rapid Level Changes check-box should not be used in normal conditions when the product surface moves slowly.

Product dielectric range

Note
Applicable to “Liquid Product Level” and “Solid Product Level” measurement modes.

Enter the range of the dielectric constant (DC) for the product in the tank. The selected range of dielectric constant is used for setting the automatically calculated amplitude thresholds.

Upper product dielectric constant

Note
Applicable to “Interface Level with submerged” and “Product Level and Interface Level” measurement modes.

The Upper Product Dielectric Constant (DC) should be entered as accurately as possible. The dielectric constant of the upper product is essential for calculating the interface level and the upper product thickness. In addition, this value is used for setting the automatically calculated amplitude thresholds.

If the dielectric constant of the lower product is significantly smaller than the dielectric constant of water, you may need to make special adjustments. The dielectric constant of water is 80.

Related information

Interface measurements
Example 2: Interface peak not found

Use the dielectric constant chart in Rosemount Radar Master

The Dielectric Constant Chart lists the dielectric constant of a large number of products.

Procedure

1. Select **Setup** → **Tank**.
2. Select the **Environment** tab.
3. Select the **Dielectric Constant Chart** button.

Use the upper product dielectric constant calculator in Rosemount Radar Master

The Upper Product Dielectric Constant Calculator lets you calculate the dielectric constant of the upper product based on the following input:

- Actual upper product thickness
- The dielectric constant value stored in the transmitter
- The upper product thickness presented by the transmitter

Procedure

1. Select **Setup** → **Tank**.
2. Select the **Environment** tab.
3. Select the **Upper Product Dielectric Constant Calculator** button.

B.2.4 Volume

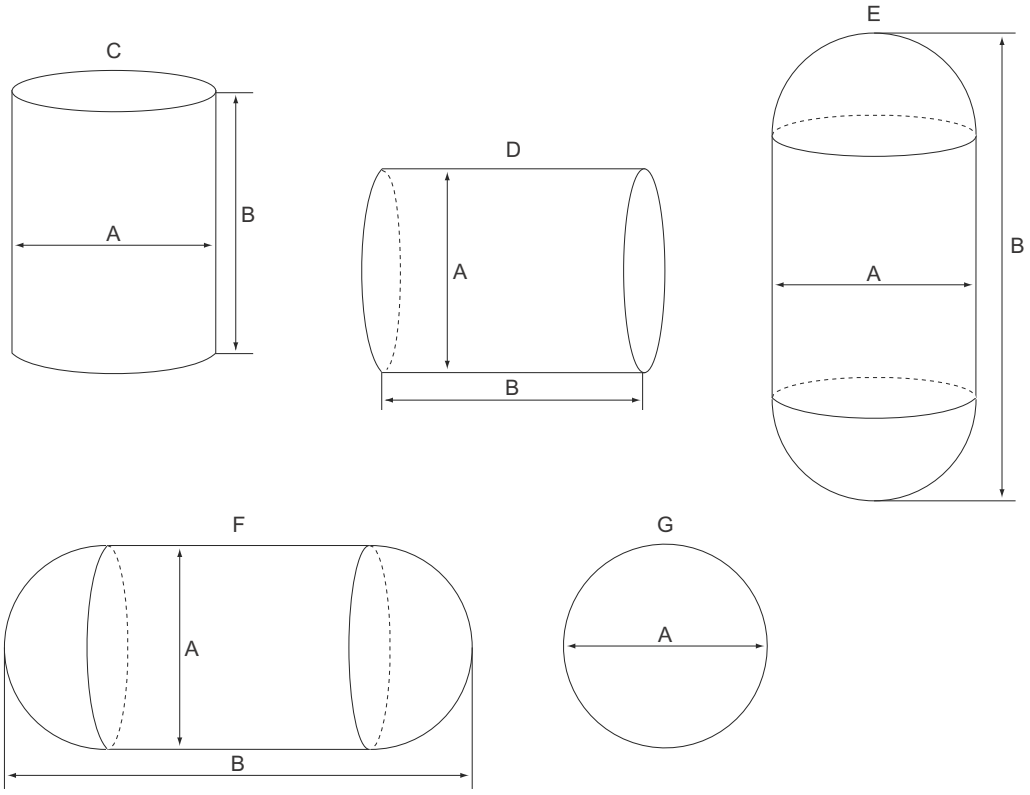
Volume calculation method

Select if the volume measurement should be calculated from the configured tank dimensions or a strapping table.

Tank type

You can choose one of the following options:

- Strap table
- Vertical cylinder
- Horizontal cylinder
- Vertical bullet
- Horizontal bullet
- Sphere
- None



Strapping table

Strapping tables can be used for irregularly shaped tanks, to eliminate errors due to bulging when product is added to a tank, or if a pre-defined tank type does not provide sufficient accuracy.

Strapping table requires entering level-volume pairs in a table (maximum 20 points). Use most of the strapping points in regions where the tank shape is non-linear. Starting at the bottom of the tank, for each new point, enter the total volume up to the specified level value.

Standard tank shapes

Figure B-8: Standard Tank Shapes

A. Diameter
B. Height
C. Vertical cylinder
D. Horizontal cylinder
E. Vertical bullet
F. Horizontal bullet
G. Sphere

Vertical cylinder

Vertical cylinder tanks are specified by diameter, height, and volume offset.

Horizontal cylinder

Horizontal cylinders are specified by diameter, height, and volume offset.

Vertical bullet

Vertical bullet tanks are specified by diameter, height, and volume offset. The volume calculation model for this tank type assumes that the radius of the bullet end is equal to the diameter/2.

Horizontal bullet

Horizontal bullets are specified by diameter, height, and volume offset. The volume calculation model for this tank type assumes that the radius of the bullet end is equal to the diameter/2.

Sphere

Spherical tanks are specified by diameter and volume offset.

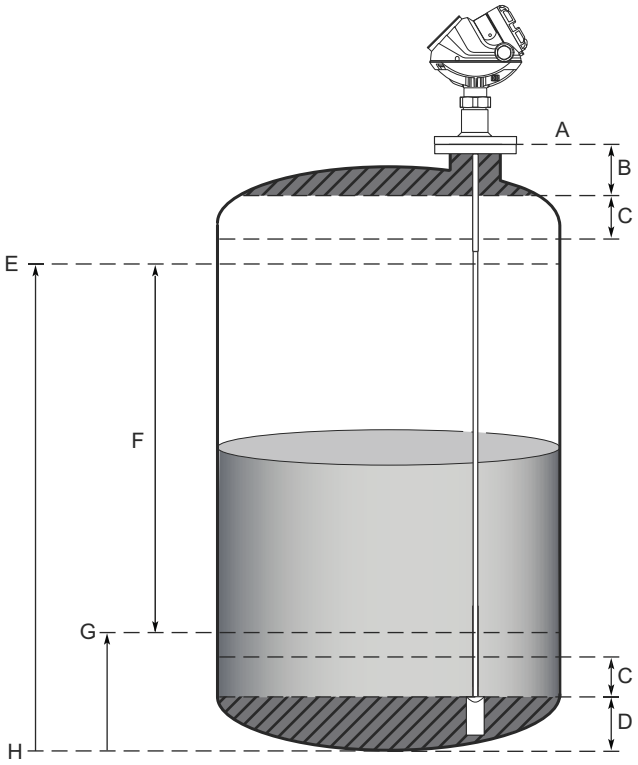
Volume offset

Use this parameter to add a volume to each calculated volume value, for example a sump volume below the Zero Level in the tank.

B.2.5 Analog output (HART®)

The output source (Primary Value), range values, and alarm mode are specified for the analog output.

Output source/primary variable



Specify the source to control the analog output. Typically, the Primary Value is configured to be the product level.

For Rosemount 5300 with Modbus protocol, ensure the measurement unit of the Primary Variable (PV) , matches the configuration of the Modbus Host since the transmitter output value does not include any information on associated measurement units.

Upper/lower range value

Enter the range values that correspond to the analog output values 4 and 20 mA. If a measured value goes beyond the measurement range, the transmitter enters saturation mode (limit alarm is disabled) or alarm mode depending on the current configuration.

Figure B-9: Example of Range Value Settings

A. Upper Reference Point
B. Upper Blind Zone
C. Reduced accuracy
D. Lower Blind Zone
E. 20 mA, Upper Range Value = 100%
F. Range 0 -100 %
G. 4 mA, Lower Range Value = 0%
H. Zero Reference Point (Level=0)

Note
Measurements may not be possible in the Blind Zones, and measurements close to the Blind Zones will have reduced accuracy. Therefore, the 4-20 mA points should be configured outside these zones.

Also ensure the 20 mA value is below the Hold Off Distance/Upper Null Zone (UNZ).

Alarm mode

The alarm mode specifies the analog output state when there is a failure or a measurement error:

Table B-3: Alarm Modes

Option	Description
High	The output current is set to the high alarm limit.
Low	The output current is set to the low alarm limit

Table B-3: Alarm Modes *(continued)*

Option	Description
Freeze current	The output current is set to the last valid value at the time when the error occurs.

Default settings for alarm mode:

- Measurement errors: output current = high
- Measured value out of range: transmitter enters saturation mode (if limit alarm is disabled).

Table B-4: Analog Output: Standard Alarm Values vs. Saturation Values

Level	4–20 mA saturation values	4–20 mA alarm value
Low	3.9 mA	3.75 mA
High	20.8 mA	21.75 mA

Table B-5: Analog Output: NAMUR-Compliant Alarm Values vs. Saturation Values

Level	4–20 mA saturation values	4–20 mA alarm value
Low	3.8 mA	3.6 mA
High	20.5 mA	22.5 mA

C Advanced configuration

C.1 Safety messages

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that potentially raises ⚠). Refer to the following safety messages before performing an operation preceded by this symbol.

⚠ WARNING

Failure to follow safe installation and servicing guidelines could result in death or serious injury.

Ensure the transmitter is installed by qualified personnel and in accordance with applicable code of practice.

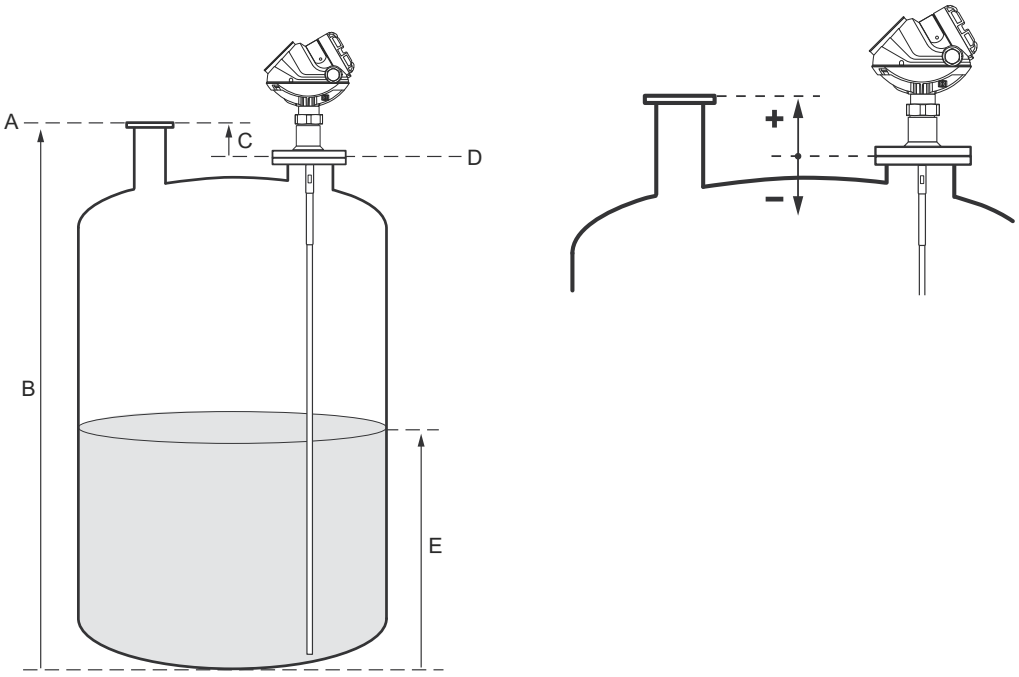
Use the equipment only as specified in this manual. Failure to do so may impair the protection provided by the equipment.

Do not perform any services other than those contained in this manual unless you are qualified.

⚠ WARNING

Explosions could result in death or serious injury.

Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.



Before connecting a handheld communicator in an explosive atmosphere, ensure that the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.

Do not remove the gauge cover in explosive atmospheres when the circuit is alive.

C.2 Set user defined upper reference point

An Upper Reference Point other than the standard Transmitter Reference Point can be specified by setting the Distance Offset parameter as illustrated in Figure C-1.

Figure C-1: Specify Upper Reference Point Using Distance Offset Parameter

A. Upper Reference Point
B. Tank Height
C. Distance Offset
D. Transmitter Reference Point
E. Product Level

Procedure

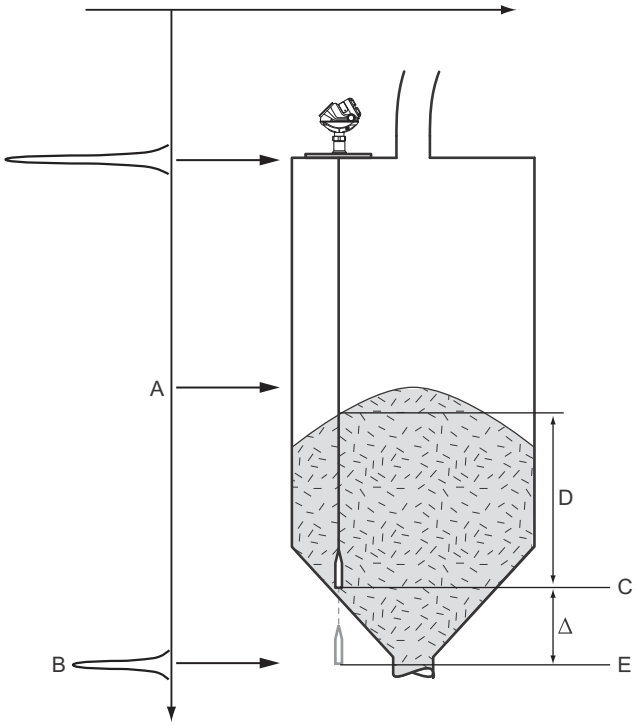
1. Adjust the Tank Height to the distance from the tank bottom to the desired Upper Reference Point.
2. Add the distance between the Upper Reference Point and the Transmitter Reference Point to the Distance Offset value that is stored in the transmitter database.
   a) FDI/DD/DTM: Select **Configure** → **Manual Setup** → **Level Setup**.
   Rosemount Radar Master: Select **Setup** → **Tank**.
   b) FDI/DD/DTM: Select the **Geometry** tab.
   Rosemount Radar Master: Select the **Geometry** tab, and click the **Advanced** button.
   c) In the ***Distance Offset*** (G) box, type the desired value.

C.3 Probe end projection

Probe End Projection is used for two purposes:

- Use the probe end echo as reference, in case the surface echo is lost, to calculate the surface echo position.

- Use the probe end echo as reference when the surface echo is close to the probe end to enhance accuracy of the surface echo position.



By using the Probe End Projection function, the device is capable of measuring the product level even if the surface echo is lost. The Probe End Projection is suited for challenging applications with very poor reflectivity (low dielectric constant). Due to the poor reflectivity of the product, situations may occur where the surface pulse is invisible to the transmitter at long measuring ranges.

If the surface becomes invisible, the device will revert to use the probe end, and the most recently estimated value of the dielectric constant to calculate the surface. Once the surface reappears, the device will immediately use direct measurement on the surface again. The calculated surface value is less accurate than the value with direct measurement.

When the microwaves emitted by the Rosemount 5300 Transmitter propagate through the product in the tank, the probe end echo appears to be located below the actual probe end. The apparent displacement of the probe end echo peak is a consequence of the reduced propagation speed of the measurement signal through the product compared to the speed through air. The displacement of the probe end pulse can be observed by using the Echo Curve Analyzer in the Rosemount Radar Master (see Use the echo curve analyzer in RRM).

For products with very low dielectric constants the product surface level can be determined by comparing the actual probe end position as given by the Probe Length value, with the apparent position of the probe end echo peak. The difference is related to the properties of the product, i.e. the Dielectric Constant, and the distance D travelled by the measurement signal through the product, see Figure C-2.

Figure C-2: The Probe End Projection Function

The product Level is given by the relation between Probe End displacement Δ, the Dielectric Constant of the product, and distance D.

A. Surface pulse is missing due to low product reflectivity
B. Probe End pulse
C. Actual Probe End position
D. Distance
E. Apparent Probe End position

Note
It is important that the Probe Length and product Dielectric Constant are given with high accuracy.

C.3.1 Setup the probe end projection

Prerequisites

Note
Assure that the Mounting Type, Probe Type, and Probe Length have been assigned correct values before configuring the Probe End Projection.

Note
This function is only available for liquid/solid product level measurement modes (i.e. not available for interface or fully submerged interface measurement modes) and a well defined probe end echo (i.e. ensure that the probe end/centering disc/weight is either always in contact with the tank wall or never in contact with the tank wall).

Probe End Projection can be configured using a guide. When the tank is empty, the guided setup will be able to accurately calibrate probe end offset and probe end pulse polarity.

You will be asked to insert an initial value for the Product DC. This is the value for the product dielectric constant that the device uses as a start point for estimation. This value must be as accurate to the actual value of the dielectric constant as possible.

When the tank is filled, the guided setup will be able to estimate the Product DC. This value is used as an initial value for future estimation of the Product DC.

For best performance, complete the guided setup with an empty tank and then a second time with a filled tank, but do not overwrite the empty tank calibration.

Procedure

1. FDI/DD/DTM: **Configure** → **Manual Setup** → **Level Setup**.
   Rosemount Radar Master: Select **Setup** → **Advanced**.
2. Select the **Probe End Projection** tab.
3. Select **Guided Probe End Projection Setup** and follow the on-screen instructions.

Optional configurations

DC estimation limit

This is a limit for the product dielectric constant estimation. The limit is a percentage, saying how much the estimated product DC is allowed to differ from the initial product DC value. If the estimation goes outside this limit, a warning will be generated.

Used product DC

This is the estimated product dielectric constant that the device will use for Probe End Projection.

Reset DC estimation

Resets DC estimation to the configured initial value, forcing the device to start over estimating the product DC.

Use static product DC

Check this setting if you do not want the device to estimate the product DC. This will force the device to use the configured initial product DC.

C.4 Adjust the echo tracking settings

Measurement with the Rosemount 5300 is based on the fact that the radar signal pulses are reflected by the product surface. Different parameters are used to track the measurement signal to achieve a reliable and stable measurement. Normally, the echo tracking parameters are automatically set by the transmitter, and no manual settings are needed. However, due to the properties of the product, in rare cases it may be necessary to adjust the echo tracking settings for optimum measurement performance.

Procedure

1. FDI/DD/DTM: Select **Service Tools** → **Echo Tuning**.
   Rosemount Radar Master: Select **Setup** → **Advanced**.
2. FDI/DD/DTM: Select the **Tracking** tab.
   Rosemount Radar Master: Select the **Echo Tracking** tab.
3. To adjust the echo tracking settings, clear the **Use automatic echo tracking settings** checkbox.
4. Set **Echo Timeout** and **Close Distance** to the desired values.

5. FDI/DD/DTM: Select **Send**.
   Rosemount Radar Master: Select **Store**.

C.4.1 Use automatic echo tracking settings

When this check-box is selected, the transmitter automatically sets the echo tracking parameters to a constant value based on the configured tank environment and measurement mode.

C.4.2 Echo time out

This parameter defines the time in seconds before the device should start to search for a surface echo outside the Close Distance window after it was lost. After an echo was lost, the device does not start searching (or set Invalid Level) until the specified time has elapsed. In some applications, especially with solid products or applications with foam, the surface echo may disappear for periods of time. This value can be increased to prevent the device from entering alarm mode too early after the surface is lost.

C.4.3 Close distance

The Close Distance defines a window centered at the current surface position where new surface echo candidates can be selected. The size of the window is ±Close Distance. Echoes outside this window will not be considered as surface echoes. The device will without delay jump to the strongest echo within this window. This value can be increased if there are rapid level changes in the tank. If the value is too large the device might select an invalid echo as the surface echo.

C.4.4 Damping value

This parameter defines how fast the transmitter reacts to a change of the level value (step response). The default value is 2 seconds.

A high value makes the level reading steady, while a low value allows the transmitter to respond to rapid level changes (but the presented level value may be less steady).

C.5 Dielectric constant settings

C.5.1 Vapor dielectric constant

In some applications, there is heavy vapor above the product surface having a significant influence on the level measurement. In such cases the vapor dielectric can be entered to compensate for this effect.

The default value is equal to 1, which corresponds to the dielectric constant of vacuum. Normally this value does not need to be changed since the effect on measurement performance is very small for most vapors.

For applications with a varying pressure and/or temperature, certain models of the Rosemount 5300 Level Transmitter have a built-in function that automatically compensates for varying vapor dielectric constants.

C.5.3 Adjust the vapor dielectric constant using FDI/DD/DTM

Procedure

1. Select **Configure** → **Manual Setup** → **Level Setup**.
2. Select the **Environment** tab.
3. Select the **Advanced Environment Options** button.
4. In the *Vapor Dielectric Constant* box, enter the desired value.

C.5.4 Adjust the vapor dielectric constant using RRM

Procedure

1. Select **Setup** → **Tank**.
2. Select the **Environment** tab.
3. Select the **Advanced** button for more options.
4. In the *Vapor Dielectric Constant* box, the desired value. You may also use the Vapor Dielectric Calculator or the Vapor Dielectric Chart to find the correct value.

C.5.5 Adjust the lower product dielectric range using FDI/DD/DTM

If the dielectric constant of the lower product is significantly smaller than the dielectric constant of water, you may need to adjust the Lower Product Dielectric Range.

Prerequisites

Special adjustments can also be made by trimming the appropriate amplitude thresholds. See Example 2: Interface peak not found for further information.

Procedure

1. Select **Configure** → **Manual Setup** → **Level Setup**.
2. Select the **Environment** tab.
3. Select the **Advanced Environment Options** button.
4. In the *Lower Product Dielectric Range* list, select the desired range.

C.5.6 Adjust the lower product dielectric range using RRM

If the dielectric constant of the lower product is significantly smaller than the dielectric constant of water, you may need to adjust the Lower Product Dielectric Range.

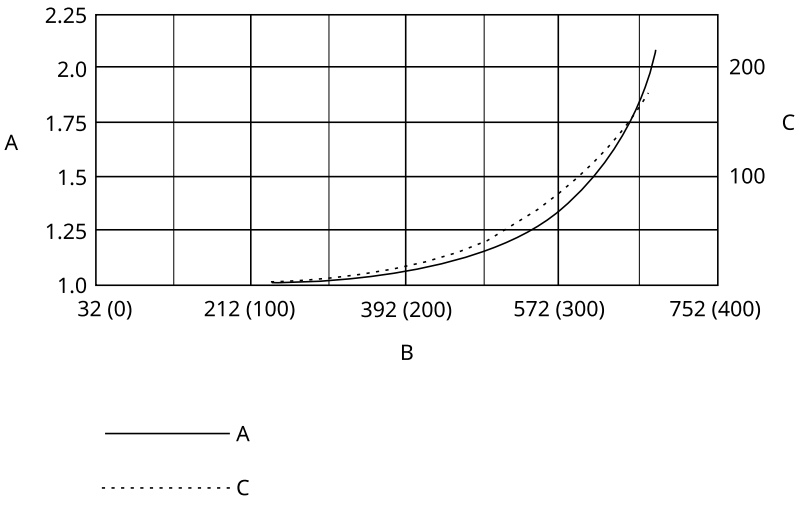
Prerequisites

Special adjustments can also be made by trimming the appropriate amplitude thresholds. See Example 2: Interface peak not found for further information.

Procedure

1. Select **Setup** → **Tank**.
2. Select the **Environment** tab.
3. Select the **Advanced** button for more options.
4. In the *Lower Product Dielectric Range* list, select the desired range.

C.6 Dynamic Vapor Compensation



Rosemount 5300 Level Transmitter is based on the Time Domain Reflectometry (TDR) technology where low power nanosecond microwave pulses are guided down a probe submerged in the process media. When a radar pulse reaches a media with a different dielectric constant, part of the energy is reflected to the transmitter. The time difference between the transmitted pulse and the reflected pulse is converted into a distance from which the total level or interface level is calculated.

For radar level gauging, the actual measured quantity is the propagation time through the empty space between the radar level transmitter and the liquid surface. For typical radar level transmitter accuracy, the propagation speed of the radar signal should be close to the velocity of light in vacuum. However, in some important cases, the deviation is not negligible and must be taken into account for accuracy. High tank pressure in combination with certain gases is an example.

High pressure water steam can influence radar level transmitter measurements. This is due to the high pressure as well as the polar structure of water molecules. In such cases, the Rosemount 5300 Level Transmitter can be configured for compensation for this effect.

Water has high critical temperature and pressure (705 °F / 374 °C and 3205 psi / 221 bar, respectively). However, Dynamic Vapor Compensation has a maximum temperature and pressure of 676 °F / 358 °C and 2610 psi / 180 bar. Above these limits, level measurement may not be possible since the separation between gas and liquid becomes indistinct.

In a closed vessel containing water liquid and water vapor, existing databases (referred to as a Mollier diagram) have been used to calculate pressure and vapor density, and deduce the dielectric constant of the vapor from this. The dielectric constant changes as given in Figure C-3.

A. Dielectric constant
B. Temperature (°F/°C)
C. Pressure (bar)

The standard version of a Rosemount 5300 Level Transmitter can be configured for static compensation of vapor by manually entering the dielectric constant of vapor. For applications with a varying pressure and/or temperature, certain models of the

Rosemount 5300 have a built-in function (Dynamic Vapor Compensation) that automatically compensates for varying vapor dielectric constants.

The Rosemount 5300 uses a reference reflector mounted on the probe at a certain distance to estimate the dielectric constant of the vapor. The transmitter knows where the reference reflector pulse should have been if there were no vapor present. However, since there is vapor in the tank, the reference reflector pulse will appear beyond the actual reflector point. The distance between the actual reflector point and the apparent reflector point will be used to calculate the vapor dielectric constant. The calculated dielectric constant is then dynamically used to compensate for changes in vapor dielectric constant, resulting in a final accuracy down to ± 2% of measured distance (ullage). The accuracy may be reduced to ± 6% in certain conditions, such as rapid changes in temperature, pressure, and dielectric constant.

C.6.1 Check if Dynamic Vapor Compensation function is supported in model code

To check if the Dynamic Vapor Compensation function is supported:

Procedure

Check that 3V or 4U is mentioned in the model code on the transmitter head.

Model Code: 530xxxxxxx3Vxxxxxxxxx or 530xxxxxxx4Uxxxxxxxxx

C.6.2 Check if Dynamic Vapor Compensation function is supported using FDI/DD/DTM

Prerequisites

Note
Vapor compensation is supported for Product Level measurement mode only.

Procedure

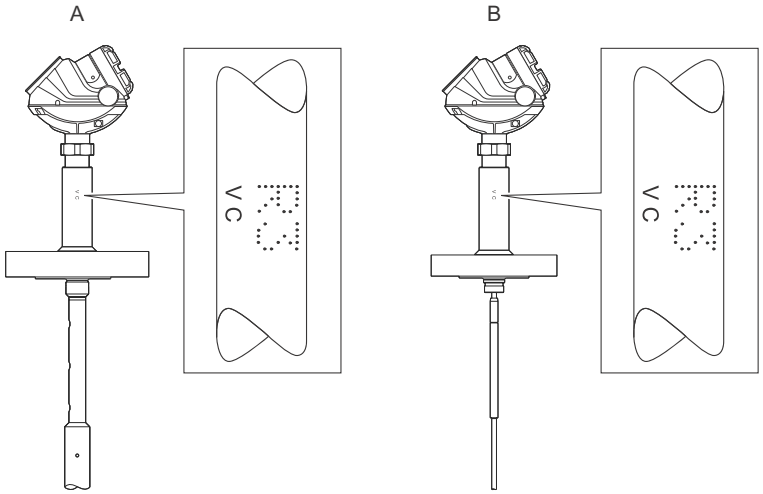
1. Select **Overview** → **Device Information**.
2. Select the **Upgrade Device** tab.
3. Check that the **Diagnostics Suite** check box is selected in the *Available Hardware/ Software Options* list.

C.6.3 Check if Dynamic Vapor Compensation function is supported using RRM

Prerequisites

Note
Vapor compensation is supported for Product Level measurement mode only.

Procedure



1. Start Rosemount Radar Master and connect to device.
2. Right-click on the device and select **Properties**.
3. Check that “Vapor Compensation” is mentioned in the *Device Software Configuration 2* list.

C.6.4 Review installation guidelines

The following installation guidelines should be considered when mounting the transmitter:

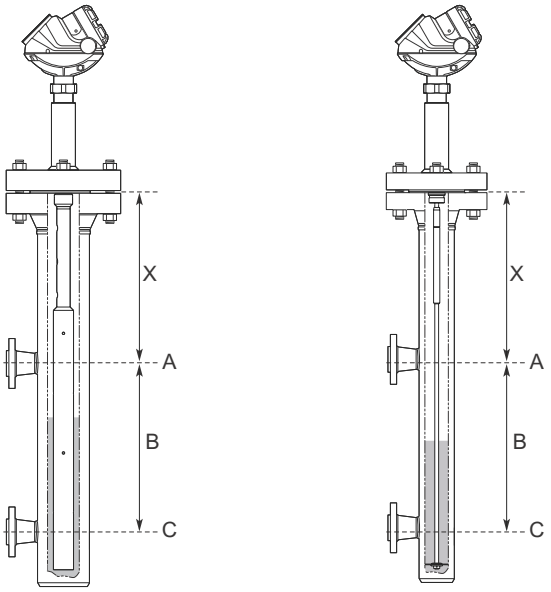
- Only probe type 3V or 4U must be used. Check the “VC” and “R3” marking on the seal.

Figure C-4: “VC” and “R3” Marking

A. Probe type 3V (coaxial) for 3-4 in. chambers
B. Probe type 4U (rigid single) for 2 in. chambers

- The maximum probe length is 13 ft. 1 in. (4 m) for probe type 3V and 9 ft. 10 in. (3 m) for probe type 4U.
- Pipe/Chamber is the only supported mounting type. See below for supported pipe inner diameters:

Probe type	Chamber size	Supported pipe inner diameter
3V	3 to 4 in.	Minimum 2 in. (50 mm)
4U	2 in.	1.5 to 2.05 in. (38 to 52 mm)



- Probe End Projection is disabled when Vapor Compensation is enabled.
- Trim Near Zone shall not be used when Dynamic Vapor Compensation is used.
- Dynamic Vapor Compensation requires a minimum distance X from the flange to the surface level to measure the change in the vapor dielectric constant. If the level rises within this area, the unit switches over to static compensation, using the last known vapor dielectric constant.

Table C-1: Minimum Distance X

Reference reflector type		Minimum distance X
Length	**Option code (1)**	
Short, 14 in. (350 mm)	R1	22 in. (560 mm)
Long, 20 in. (500 mm)	R2	28 in. (710 mm)

(1) Check model code on the transmitter label.

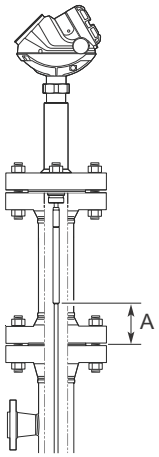


Figure C-5: Minimum Distance X and Minimum Measuring Span

A. Level: 100%
B. Minimum measuring span: 12 in. (300 mm)
C. Level: 0%

- The minimum measuring span for the Dynamic Vapor Compensation functionality is 12 in. (300 mm).
- The long reflector, 20 in. (500 mm), has the best accuracy and is recommended for all chambers where the dimensions of the chamber allow for it.
- If the distance from the flange to the upper inlet is less than 28 in. (710 mm), the short reflector should be chosen. This distance is a minimum when dynamic compensation is required within the whole measuring range from the lower to the upper inlet. If this is not required, the long reflector can be used and dynamic compensation is possible up to 28 in. (710 mm) from the flange.
- If a Rosemount 5300 GWR transmitter is ordered from Rosemount together with a Rosemount 9901 Chamber, these space requirements are met by using the option code G1 or G2 for the chamber. G1 is used with the short reference reflector and G2 is used with the long reference reflector.
  If an existing chamber is used, which does not meet these space requirements, a spool piece can be added. For the 4U probe, the spool piece needs to be at least 2 in. (50 mm) longer or shorter than the reference reflector, to ensure that there are no disturbances from welds close to the reference reflector end. For a spool piece with the 3V probe, this is not a requirement.

Figure C-6: Spool Piece Requirement for the 4U Probe

A. For the 4U probe, the spool piece needs to be at least 2 in. (50 mm) longer or shorter than the reference reflector.

C.6.5 Calibrate Dynamic Vapor Compensation function

Check if calibration is needed on-site

Type	Action
Probe type 3V (coaxial) with/without remote housing	The Dynamic Vapor Compensation function of this Rosemount 5300 Level Transmitter has been calibrated at factory. Calibration is only needed if: • The transmitter is reset to factory settings. Reset removes pre-calibration of the Dynamic Vapor Compensation function. • A spare or replacement Rosemount 5300 Transmitter head is mounted on the supplied Dynamic Vapor Compensation probe.
Probe type 4U (rigid single)	Calibration is always needed on-site during the commission phase.

Note
When installing a device with Dynamic Vapor Compensation, do not upload a backup file from another device.

Perform calibration using FDI/DD/DTM

Prerequisites

- The surface level must be at least 20 in. (0.5 m) below the end of the reference reflector. (It is recommended to empty the chamber.)
- Perform the calibration at ambient pressure and temperature conditions (i.e. when the vapor dielectric constant is close to one).
- When using remote housing, confirm it is fully assembled before calibrating the Vapor Compensation function.

Procedure

1. Verify the basic configuration for device has been performed.
2. Ensure the correct probe type is selected.
   a) HART®: Select **Configure** → **Manual Setup** → **Level Setup**.
   FOUNDATION™ Fieldbus: Select **Configure** → **Manual Setup**.
   b) Select the **Probe** tab.
   c) In the *Probe type* list, select **Coaxial HTHP** for probe type 3V or **Rigid Single HTHP 0.3″ (8mm)** for probe type 4U.
   d) Select **Send**.
3. Check that Mounting Type is set to Pipe/Chamber and select inner diameter.
   a) HART: Select **Configure** → **Manual Setup** → **Level Setup**.
   FOUNDATION Fieldbus: Select **Configure** → **Manual Setup**.
   b) Select the **Geometry** tab.
   c) In the *Mounting Type* list, select **Pipe/Chamber**.
   d) In the *Inner Diameter, Pipe/Chamber/Nozzle* list, select the corresponding inner diameter.
   e) Select **Send**.
4. HART: Select **Configure** → **Manual Setup** → **Level Setup**.
   FOUNDATION Fieldbus: Select **Configure** → **Manual Setup** → **Advanced**.
5. HART: Select the **Vapor Compensation** tab.
   FOUNDATION Fieldbus: Select the **Vapor Compensation Setup** button.
6. In the *Reference Reflector Type* list, select reference reflector as appropriate, and then select **Next**.

Option	Description
Coax, l=350 mm (RR B3 in old DD versions)	Use this option for probe type 3V with short reflector
Coax, l=500 mm (RR B4 in old DD versions)	Use this option for probe type 3V with long reflector
d=13 mm, l=350 mm (RR A6 in old DD versions)	Use this option for probe type 4U with short reflector
d=13 mm, l=500 mm (RR B2 in old DD versions)	Use this option for probe type 4U with long reflector

7. HART: Select the **Use Vapor Compensation** checkbox, and then select **Send**.
   FOUNDATION Fieldbus: In the *Use Vapor Compensation* list, select **Yes**, and then select **Next**.

8. Select the **Calibrate Vapor Compensation** button and follow the on-screen instructions.

   Note
   When the Dynamic Vapor Compensation function has been calibrated, ensure the Probe Type, Mounting Type, Inner Diameter, Reference Reflector Type, and remote connection (if used) remain set as they were during calibration.

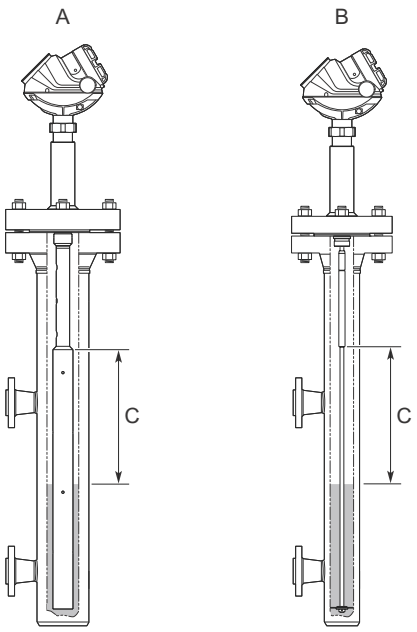
   If changing the configuration of these parameters, the Dynamic Vapor Compensation function will be deactivated, and the device error "Vapor Compensation Not Factory Calibrated" appears. Correct the parameter that has been changed, and restart the device.

9. When the calibration is finished, restart the device.
   a) Select **Service Tools** → **Maintenance**.
   b) (FOUNDATION Fieldbus only) Select the **Reset/Restore**.
   c) Select **Restart Device**.

Postrequisites

Verify the echo peak from the reference reflector is marked in the echo curve plot.

Related information



Verify the echo peak from the reference reflector using RRM

Perform calibration using RRM

Prerequisites

- The surface level must be at least 20 in. (0.5 m) below the end of the reference reflector. (It is recommended to empty the chamber.)

Figure C-7: Surface Level

A. Probe type 3V for 3- to 4-in. chambers
B. Probe type 4U for 2-in. chambers
C. Minimum 20 in. (0.5 m)

- Perform the calibration at ambient pressure and temperature conditions (i.e. when the vapor dielectric constant is close to one).
- When using remote housing, confirm it is fully assembled before calibrating the Vapor Compensation function.

Procedure

1. Verify the basic configuration for device has been performed.
2. Ensure the correct probe type is selected.
   a) Select **Setup** → **Tank**.
   b) Select the **Probe** tab.
   c) In the *Probe type* list, select **Coaxial HTHP** for probe type 3V or **Rigid Single HTHP 0.3″ (8mm)** for probe type 4U.
   d) Select **Store**.
3. Check that Mounting Type is set to Pipe/Chamber and select inner diameter.
   a) Select **Setup** → **Tank**.
   b) Select the **Geometry** tab.
   c) In the *Mounting Type* list, select **Pipe/Chamber**.
   d) In the *Inner Diameter, Pipe/Chamber/Nozzle* list, select the corresponding inner diameter.
   e) Select **Store**.
4. Select **Setup** → **Advanced**.

5. Select the **Vapor Compensation** tab.
6. In the *Reference Reflector Type* list, select reference reflector as appropriate, and then select **Store**.

Option	Description
Coax, l=350 mm	Use this option for probe type 3V with short reflector
Coax, l=500 mm	Use this option for probe type 3V with long reflector
d=13 mm, l=350 mm	Use this option for probe type 4U with short reflector
d=13 mm, l=500 mm	Use this option for probe type 4U with long reflector

7. Select the **Use Vapor Compensation** checkbox, and then select **Store**.
8. Select **Calibrate Vapor Compensation** and follow the on-screen instructions.

Note
When the Dynamic Vapor Compensation function has been calibrated, ensure the Probe Type, Mounting Type, Inner Diameter, Reference Reflector Type, and remote connection (if used) remain set as they were during calibration.

If changing the configuration of these parameters, the Dynamic Vapor Compensation function will be deactivated, and the device error "Vapor Compensation Not Factory Calibrated" appears. Correct the parameter that has been changed, and restart the device.

9. When the calibration is finished, restart the device.
   a) Select **Tools** → **Restart Device**.

Postrequisites

Verify the echo peak from the reference reflector is marked in the echo curve plot.

Related information

Verify the echo peak from the reference reflector using RRM

Verify the echo peak from the reference reflector in AMS Device Configurator

Verify that the echo peak from the reference reflector is marked "Reference Reflector" in the echo curve plot.

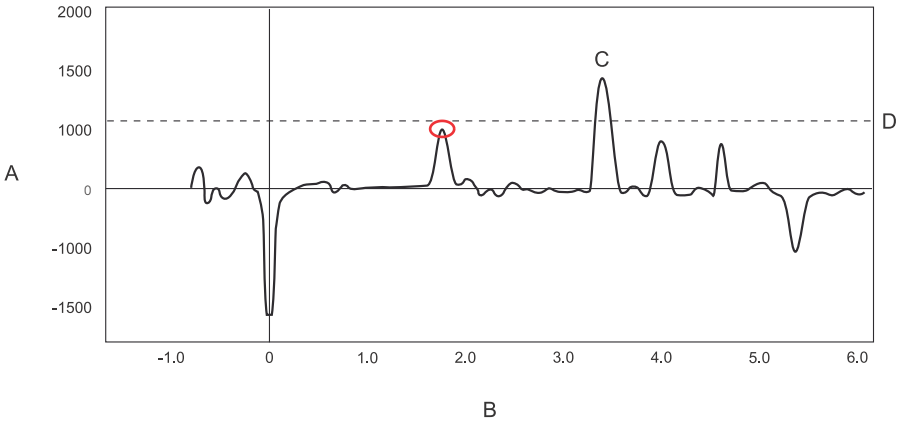
Procedure

1. Select **Service Tools** → **Echo Tuning**.
2. Select the **Echo Curve** tab.
   AMS Device Configurator reads one echo curve and then stops.
3. Verify that the echo peak from the reference reflector is marked "Reference Reflector" in the echo curve plot.
   Probes will have the reflector end either at 1.1 ft. (0.35 m) or at 1.6 ft. (0.5 m), depending on if the probe has a short or a long reflector.

Verify the echo peak from the reference reflector using RRM

Verify that the echo peak from the reference reflector is marked “P2 Reference Reflector” in the echo curve plot.

Procedure



1. In Rosemount Radar Master, select **Setup** → **Echo Curve**.
2. If the echo curve is not read automatically, select **Read**.
3. Verify that the echo peak from the reference reflector is marked “P2 Reference Reflector” in the echo curve plot.

   Probes will have the reflector end either at 1.1 ft. (0.35 m) or at 1.6 ft. (0.5 m), depending on if the probe has a short or a long reflector.

C.7 Signal Quality Metrics

Signal Quality Metrics indicates the surface signal integrity compared to the noise. It can be used to schedule maintenance to clean the probe or detect and monitor turbulence, boiling, foam and emulsions.

Figure C-8: Echo Curve Showing Surface Peak Amplitude, Noise Peak Amplitude, and Surface Threshold

A. Amplitude, mV
B. Distance, m
C. Surface peak amplitude (P1)
D. Surface Threshold=Amplitude Threshold Curve (ATC)

Signal quality

Signal Quality is a measurement of the surface peak amplitude (P1) compared to the surface threshold (ATC) and the smallest marginal between the noise and the ATC above the surface (indicated with a circle) compared to the ATC. The Signal Quality spans from 0 to 10, where 0 indicates a low margin, and 10 indicates a high margin. It indicates how much margin there is until the noise peak is indicated as the surface level.

Note
The signal amplitude and the noise margin depend on probe type and application conditions, as well as the condition of the probe. Even if the probe is clean, the Signal Quality may not be a 10.

Surface/noise margin

Surface/Noise Margin is the relationship between surface peak amplitude and the amplitude of the strongest noise peak above the surface. The Surface/Noise Margin spans from 0 to 10, where 0 indicates a low margin, and 10 indicates a high margin. It indicates how much disturbance the device can handle in the tank.

Note
The signal amplitude and the noise margin depend on probe type and application conditions, as well as the condition of the probe. Even if the probe is clean, the Surface/Noise Margin may not be a 10.

C.7.1 Check if Signal Quality Metrics is supported model code

To check if Signal Quality Metrics is supported:

Procedure

Check that DA1 or D01 is mentioned in the model code on the transmitter head.

C.7.2 Check if Signal Quality Metrics is supported using FDI/DD/DTM

To check if Signal Quality Metrics is supported:

Procedure

1. Select **Overview** → **Device Information**.
2. Select the **Upgrade Device** tab.
3. Check that the **Diagnostics Suite** check box is selected in the *Available Hardware/Software Options* list.

C.7.3 Check if Signal Quality Metrics is supported using RRM

To check if Signal Quality Metrics is supported, do one of the following:

Procedure

1. Start Rosemount Radar Master and connect to device.
2. Right-click on the device and select **Properties**.
3. Check that “Diagnostics Suite” is mentioned in the *Device Software Configuration 2* list.

C.7.4 View Signal Quality Metrics using FDI/DD/DTM

Procedure

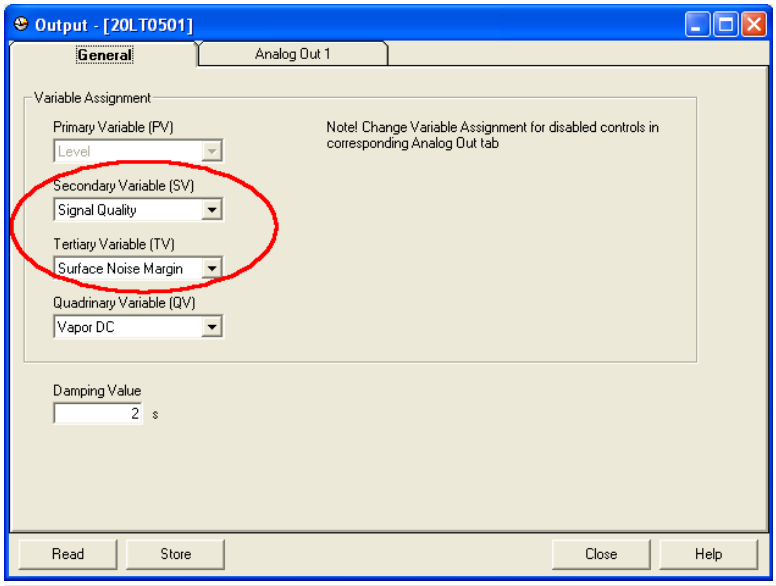
1. Select **Service Tools** → **Variables**.
2. Select the **Signal Quality** tab to view signal quality metrics.

C.7.5 View Signal Quality Metrics using RRM

Procedure

1. Select **Tools** → **Device Display**.
2. Select the **Signal Quality Metrics** tab to view signal quality metrics.

C.7.6 Configure transmitter variables for Signal Quality Metrics using Rosemount Radar Master



Signal Quality Metrics can be assigned to Transmitter Variables (SV, TV, or QV).

Variables can be sent to Distributed Control System (DCS) to trigger an alarm. Suitable trigger levels vary from application to application. Guidelines for appropriate values can be determined by logging Signal Quality Metrics over time and viewing minimum/maximum values. The Signal Quality alarm trigger value should be at least 1, but a better guideline is 2-3.

Procedure

Select **Setup** → **Output**.

Figure C-9: Configure Transmitter Variables for Signal Quality Metrics

C.8 Switch alarm limits (HART® only)

C.8.1 Switch alarm limits using FDI/DD/DTM

The alarm limits can be set to either Rosemount or NAMUR NE43 values.

Prerequisites

Requires firmware version 2.L3 or later.

Procedure

1. Select **Configure** → **Manual Setup** → **Device Setup**.
2. Select the **Analog Output** tab.
   The *Alarm Output Level* drop-down list displays the current alarm limit option.
3. Click the **Configure Alarm and Saturation Limits** button.
4. Select the desired alarm limit option, and then select **Next**.

5. Select **Finish** when the *Method Complete* message appears.

C.8.2 Switch alarm limits using handheld communicator

The alarm limits can be set to either Rosemount or NAMUR NE43 values.

Prerequisites

Requires firmware version 2.L3 or later.

Procedure

1. Select **Configure** → **Manual Setup** → **Device Setup**.
2. Select **Analog Output**.
   The current alarm limit option is presented.
3. Select **Alarm Level**.
4. Select the desired alarm limits option.
5. Select **Send** and follow the instructions.

C.9 Detecting thin interface layers

The Rosemount 5300 software uses an algorithm to enhance detection of thin interface layers. The algorithm is active for interface measurements where the upper product thickness is about 10 in. (25 cm) or less.

The thin layer detection function is enabled by default. In rare cases it might be relevant to disable thin layer detection, like the following situations:

1. Interface measurements in the upper part of HP/HTHP probes
   The thin layer detection functionality is impaired for measurement at the top of the HP/HTHP probes, approximately the top 60 cm. For interface measurements in this area the thin layer functionality may not work as desired.
2. Applications with disturbances from nozzle or other physical objects
   For interface measurements exposed to disturbances, the perfomance of the thin layer detection functionality might be affected. Tank disturbances can origin from the nozzle or objects in the tank e.g. spacers. Minor disturbances might decrease the thin layer detection accuracy. Larger disturbances can cause the thin interface detection to not work properly.

Related information

Interface measurements

C.9.1 Enable/disable thin layer detection using FDI/DD/DTM

The thin layer detection is initially enabled. It can be set to enabled or disabled.

Prerequisites

The thin layer detection is only applicable to:

- Firmware version 2.L3 or later.
- Measurement mode: Level and Interface Level.
- Probe types: Single lead or Coaxial/Large coaxial (standard/HP/C).

Note
When the thin layer detection is disabled, the minimum detectable upper product thickness is increased, typically 5.1 in. (13 cm).

Procedure

1. HART®: Select **Configure** → **Manual Setup** → **Level Setup**.
   FOUNDATION™ Fieldbus: Select **Configure** → **Manual Setup**.
2. Select the **Environment** tab.
   The *Use Thin Layer Detection* check box displays the current state of the thin layer detection, enabled or disabled.
3. Click the **Thin Layer Detection** button.
4. Select desired option to enable or disable the thin layer detection, and then select **Next**.
5. Select **Finish** when the *Method Complete* message appears.

C.9.2 Enable/disable thin layer detection using handheld communicator

The thin layer detection is initially turned on. It can be set to on or off.

Prerequisites

The thin layer detection is only applicable to:

- Firmware version 2.L3 or later.
- Measurement mode: Level and Interface Level.
- Probe types: Single lead or Coaxial/Large coaxial (standard/HP/C).

Note
When the thin layer detection is disabled, the minimum detectable upper product thickness is increased, typically 5.1 in. (13 cm).

Procedure

1. HART®: Select **Configure** → **Manual Setup** → **Level Setup** → **Environment**.
   FOUNDATION™ Fieldbus: Select **Configure** → **Manual Setup** → **Environment**.
2. Select **Thin Layer Detection**.
   The current state of the thin layer detection is presented.
3. Set thin layer detection to desired state.
4. Select **Send** and follow the instructions.

C.9.3 Enable/disable thin layer detection using RRM

The thin layer detection is initially enabled. It can be set to enabled or disabled.

Prerequisites

The thin layer detection is only applicable to:

- Firmware version 2.L3 or later.
- Measurement mode: Level and Interface Level.

- Probe types: Single lead or Coaxial/Large coaxial (standard/HP/C).

Note
When the thin layer detection is disabled, the minimum detectable upper product thickness is increased, typically 5.1 in. (13 cm).

Procedure

1. Select **Setup** → **Tank**.
2. Select the **Environment** tab.
3. Under *Advanced* select/deselect the **Thin Layer Detection** checkbox to enable/disable the thin layer detection.
4. Select **Store**.

D Remote mounting

D.1 Remote housing, new units

Remote Housing can be used to place the head apart from the probe if it is in a hot or vibrating place. With Remote Housing, you can place the transmitter head in a better position to be able to read the display, for example.

The remote housing assembly is shipped with the transmitter head mounted on the probe and the remote connection in a separate box.

The transmitter head must have the remote connection installed before functioning.

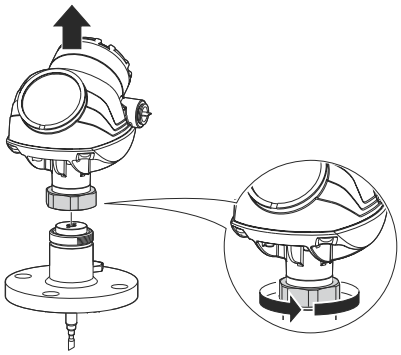
The parts in the shipping unit consist of:

- Transmitter head mounted on probe
- Remote connection
  - Bracket kit
  - Bracket (1 pcs)
  - Clamping bracket (4 pcs)
  - U-bolt (2 pcs)
  - Screw (3 pcs)
  - Nut (4 pcs)

D.2 Remote connection, field retrofit

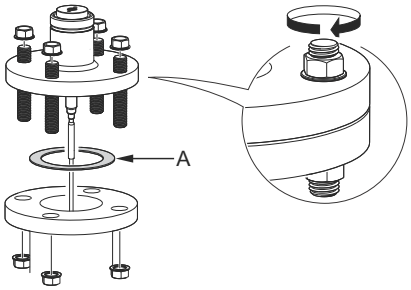
To upgrade a currently installed Rosemount™ 5300 Level Transmitter with a remote housing, the embedded software needs revision 2.A2 or later, and the Spare Part Kit (03300-7006-000X) must be ordered. The position X corresponds to the remote housing cable length in meters.

The Rosemount 5300 Level Transmitter head must be configured for remote housing to work.



The Spare Part Kit consists of:

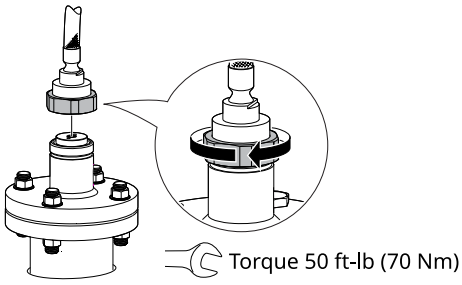
- Remote connection
- Bracket kit
  - Bracket (1 pcs)
  - Clamping bracket (4 pcs)
  - U-bolt (2 pcs)
  - Screw (3 pcs)
  - Nut (4 pcs)



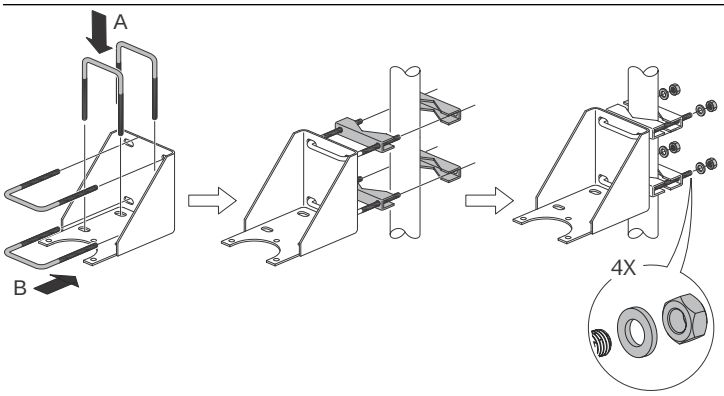
D.3 Install remote housing

Procedure

1. Carefully remove the transmitter.

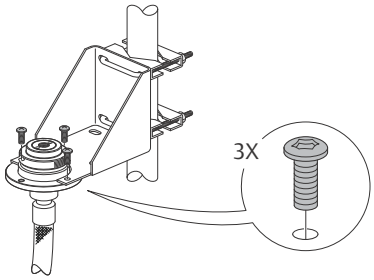


2. If installing a new unit, mount the probe on tank.



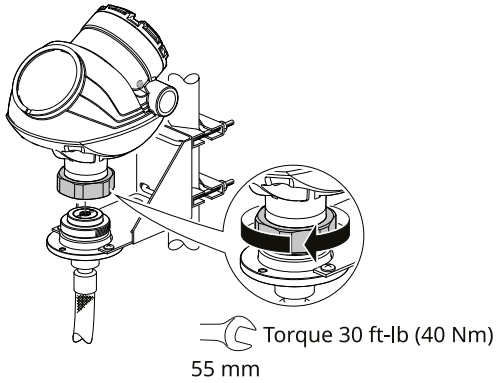
A. Gasket

3.



Note
Re-tighten after 24 hours and again after the first temperature cycle. Check at regular intervals and re-tighten if necessary.

4. Mount the bracket to the pipe.



A. Horizontal pipe
B. Vertical pipe

5. Fasten the housing support.

6.

Note
Re-tighten after 24 hours and again after the first temperature cycle. Check at regular intervals and re-tighten if necessary.

D.4 Remote housing configuration

When using remote housing, the remote connection length should be configured. If the Remote Housing is ordered with a transmitter, it is configured in the factory.

D.4.1 Configure remote housing using FDI/DD/DTM

Prerequisites

Note
When disconnecting a remote housing cable from a probe in low temperatures, -22 °F (-30 °C), the configuration tool may not show that the probe is missing.

Procedure

1. Select **Configure** → **Level Setup**.
2. Select the **Probe** tab.
3. In the *Remote Housing* list, select the remote housing length.
4. Select **Send**.

D.4.2 Configure remote housing using RRM

Prerequisites

Note
When disconnecting a remote housing cable from a probe in low temperatures, -22 °F (-30 °C), Rosemount Radar Master may not show that the probe is missing.

Procedure

1. Select **Setup** → **Tank**.
2. Select the **Probe** tab.
3. Select the **Advanced** button.
4. In the *Remote Housing* list, select the remote housing length.
5. Select **Store**.

E FOUNDATION™ Fieldbus Block Information

E.1 Resource Transducer Block

E.1.1 Resource block parameters

This section contains information on the resource block of the Rosemount 5300.

The resource block defines the physical resources of the device. The resource block also handles functionality that is common across multiple blocks. The block has no linkable inputs or outputs.

Table E-1: Resource Block Parameters

Index Number	Parameter	Description
01	ST_REV	The revision level of the static data associated with the function block.
02	TAG_DESC	The user description of the intended application of the block.
03	STRATEGY	The strategy field can be used to identify grouping of blocks.
04	ALERT_KEY	The identification number of the plant unit.
05	MODE_BLK	The actual, target, permitted, and normal modes of the block: Target: The mode to “go to” Actual: The mode the “block is currently in” Permitted: Allowed modes that target may take on Normal: Most common mode for actual
06	BLOCK_ERR	This parameter reflects the error status associated with the hardware or software components associated with a block. It is a bit string, so that multiple errors may be shown.
07	RS_STATE	State of the function block application state machine.
08	TEST_RW	Read/write test parameter - used only for conformance testing.
09	DD_RESOURCE	String identifying the tag of the resource which contains the Device Description for this resource.
10	MANUFAC_ID	Manufacturer identification number – used by an interface device to locate the DD file for the resource.
11	DEV_TYPE	Manufacturer’s model number associated with the resource - used by interface devices to locate the DD file for the resource.
12	DEV_REV	Manufacturer revision number associated with the resource - used by an interface device to locate the DD file for the resource.

Table E-1: Resource Block Parameters *(continued)*

Index Number	Parameter	Description
13	DD_REV	Revision of the DD associated with the resource - used by an interface device to locate the DD file for the resource. The DD_REV specifies the minimum DD revision that is compatible with the device (within the same device revision). A vendor can release an updated DD with the DD_REVISION higher than the DD_REV. This allows a vendor to release an updated DD files set that will be compatible with an existing device revision in the field. The host can always load a higher DD_REVISION for a given DEV_REV/DEV_REVISION. As per Foundation requirement the DD_REV will always be 01.
14	GRANT_DENY	Options for controlling access of host computers and local control panels to operating, tuning, and alarm parameters of the block. Not used by device.
15	HARD_TYPES	The types of hardware available as channel numbers.
16	RESTART	Allows a manual restart to be initiated. Several degrees of restart are possible. They are the following: 1 Run – is the passive state of the parameter 2 Restart resource – not used 3 Restart with defaults – intended to reset parameters to default values, i.e. their value before any configuration was done 4 Restart processor – does a warm start of CPU
17	FEATURES	Used to show supported resource block options. The supported features are: • SOFT_WRITE_LOCK_SUPPORT • REPORT_SUPPORT • UNICODE_SUPPORT • MULTI_BIT_ALARM • RESTART/RELINK AFTER FB ACTION
18	FEATURES_SEL	Used to select resource block options.
19	CYCLE_TYPE	Identifies the block execution methods available for this resource.
20	CYCLE_SEL	Used to select the block execution method for this resource. The Rosemount 5300 supports the following: Scheduled: Blocks are only executed based on the function block schedule. Block Execution: A block may be executed by linking to another blocks completion.
21	MIN_CYCLE_T	Time duration of the shortest cycle interval of which the resource is capable.
22	MEMORY_SIZE	Available configuration memory in the empty resource. To be checked before attempting a download.
23	NV_CYCLE_T	Minimum time interval specified by the manufacturer for writing copies of NV parameters to non-volatile memory. Zero means it will never be automatically copied. At the end of NV_CYCLE_T, only those parameters which have changed need to be updated in NVRAM.
24	FREE_SPACE	Percent of memory available for further configuration. Zero in a pre-configured device.
25	FREE_TIME	Percent of the block processing time that is free to process additional blocks.

Table E-1: Resource Block Parameters *(continued)*

Index Number	Parameter	Description
26	SHED_RCAS	Time duration at which to give up on computer writes to function block RCas locations. Shed from RCas shall never happen when SHED_ROUT = 0
27	SHED_ROUT	Time duration at which to give up on computer writes to function block ROut locations. Shed from ROut shall never happen when SHED_ROUT = 0
28	FAULT_STATE	Condition set by loss of communication to an output block, fault promoted to an output block or physical contact. When FAIL_SAFE condition is set, then output function blocks will perform their FAIL_SAFE actions.
29	SET_FSTATE	Allows the FAIL_SAFE condition to be manually initiated by selecting Set.
30	CLR_FSTATE	Writing a Clear to this parameter will clear the device FAIL_SAFE if the field condition has cleared.
31	MAX_NOTIFY	Maximum number of unconfirmed notify messages possible.
32	LIM_NOTIFY	Maximum number of unconfirmed alert notify messages allowed.
33	CONFIRM_TIME	The time the resource will wait for confirmation of receipt of a report before trying again. Retry will not happen when CONFIRM_TIME=0.
34	WRITE_LOCK	When hardware write protection is selected, WRITE_LOCK becomes an indicator of the jumper setting and is unavailable for software write protection. When software write lock is selected, and WRITE_LOCK is set, no writings from anywhere else are allowed, except to clear WRITE_LOCK. Block input will continue to be updated.
35	UPDATE_EVT	This alert is generated by any change to the static data.
36	BLOCK_ALM	The block alarm is used for all configuration, hardware, connection failure or system problems in the block. The cause of the alarm is entered in the subcode field. The first alarm to become active will set the Active status in the Status parameter. As soon as the Unreported status is cleared by the alarm reporting task, another block alarm may be reported without clearing the Active status, if the subcode has changed.
37	ALARM_SUM	The current alarm status, unacknowledged states, unreported states, and disabled states of the alarms associated with the function block.
38	ACK_OPTION	Selection of whether alarms associated with the function block will be automatically acknowledged.
39	WRITE_PRI	Priority of the alarm generated by clearing the write lock.
40	WRITE_ALM	This alert is generated if the write lock parameter is cleared.
41	ITK_VER	Major revision number of the inter operability test case used in certifying this device as interoperable. The format and range are controlled by the Fieldbus Foundation.
42	FD_VER	A parameter equal to the value of the major version of the Field Diagnostics specification that this device was designed to.
43	FD_FAIL_ACTIVE	This parameter reflects the error conditions that are being detected as active as selected for this category. It is a bit string, so that multiple conditions may be shown.
44	FD_OFFSPEC_ACTIVE	
45	FD_MAINT_ACTIVE	
46	FD_CHECK_ACTIVE	
47	FD_FAIL_MAP	This parameter maps conditions to be detected as active for this alarm category. Thus the same condition may be active in all, some, or none of the 4 alarm categories.
48	FD_OFFSPEC_MAP	

Table E-1: Resource Block Parameters *(continued)*

Index Number	Parameter	Description
49	FD_MAINT_MAP	
50	FD_CHECK_MAP	
51	FD_FAIL_MASK	This parameter allows the user to suppress any single or multiple conditions that are active, in this category, from being broadcast to the host through the alarm parameter. A bit equal to '1' will mask i.e. inhibit the broadcast of a condition, and a bit equal to '0' will unmask i.e. allow broadcast of a condition.
52	FD_OFFSPEC_MASK	
53	FD_MAINT_MASK	
54	FD_CHECK_MASK	
55	FD_FAIL_ALM	This parameter is used primarily to broadcast a change in the associated active conditions, which are not masked, for this alarm category to a Host System.
56	FD_OFFSPEC_ALM	
57	FD_MAINT_ALM	
58	FD_CHECK_ALM	
59	FD_FAIL_PRI	This parameter allows the user to specify the priority of this alarm category.
60	FD_OFFSPEC_PRI	
61	FD_MAINT_PRI	
62	FD_CHECK_PRI	
63	FD_SIMULATE	This parameter allows the conditions to be manually supplied when simulation is enabled. When simulation is disabled both the diagnostic simulate value and the diagnostic value tracks the actual conditions. The simulate jumper is required for simulation to be enabled and while simulation is enabled the recommended action will show that simulation is active. Elements: see Table E-2.
64	FD_RECOMMEN_ACT	This parameter is a device enumerated summarization of the most severe condition or conditions detected. The DD help should describe by enumerated action, what should be done to alleviate the condition or conditions. 0 is defined as Not Initialized, 1 is defined as No Action Required, all others defined by manufacturer.
65	FD_EXTENDED_ACTIVE	An optional parameter or parameters to allow the user finer detail on conditions causing an active condition in the FD_*_ACTIVE parameters.
66	FD_EXTENDED_MAP	An optional parameter or parameters to allow the user finer control on enabling conditions contributing to the conditions in FD_*_ACTIVE parameters.
67	COMPATIBILITY_REV	This parameter is used when replacing field devices. The correct value of this parameter is the DEV_REV value of the replaced device.
68	HARDWARE_REVISION	Hardware revision.
69	SOFTWARE_REV	Software revision of source code with resource block.
70	PD_TAG	PD tag description of device.
71	DEV_STRING	This is used to load new licensing into the device. The value can be written but will always read back with a value of 0.
72	DEV_OPTIONS	Indicates which miscellaneous device licensing options are enabled.
73	OUTPUT_BOARD_SN	Output board serial number. For the Rosemount 5300 this is the same as Main Label Device ID which can be found on the main label that is attached to the housing.

Table E-1: Resource Block Parameters *(continued)*

Index Number	Parameter	Description
74	FINAL_ASSY_NUM	Final assembly number given by manufacturer.
75	DOWNLOAD_MODE	Gives access to the boot block code for over-the-wire downloads. 0 = Uninitialized 1 = Run mode 2 = Download mode
76	HEALTH_INDEX	Parameter representing the overall health of the device, 100 being perfect and 1 being non-functioning. The value is based on the active PWA alarms.
77	FAILED_PRI	Designates the alarming priority of the FAILED_ALM and also used as switch b/w FD and legacy PWA. If value is greater than or equal to 1 then PWA alerts will be active in device else device will have FD alerts.
78	RECOMMENDED_ACTION	Enumerated list of recommended actions displayed with a device alert.
79	FAILED_ALM	Alarm indicating a failure within a device which makes the device non-operational.
80	MAINT_ALM	Alarm indicating the device needs maintenance soon. If the condition is ignored, the device will eventually fail.
81	ADVISE_ALM	Alarm indicating advisory alarms. These conditions do not have a direct impact on the process or device integrity.
82	FAILED_ENABLE	Enabled FAILED_ALM alarm conditions. Corresponds bit for bit to the FAILED_ACTIVE. A bit on means that the corresponding alarm condition is enabled and will be detected. A bit off means the corresponding alarm condition is disabled and will not be detected. This parameter is the Read Only copy of FD_FAIL_MAP.
83	FAILED_MASK	Mask of FAILED_ALM. Corresponds bit of bit to FAILED_ACTIVE. A bit on means that the condition is masked out from alarming. This parameter is the Read Only copy of FD_FAIL_MASK.
84	FAILED_ACTIVE	Enumerated list of failure conditions within a device. All open bits are free to be used as appropriate for each specific device. This parameter is the Read Only copy of FD_FAIL_ACTIVE.
85	MAINT_PRI	Designates the alarming priority of the MAINT_ALM
86	MAINT_ENABLE	Enabled MAINT_ALM alarm conditions. Corresponds bit for bit to the MAINT_ACTIVE. A bit on means that the corresponding alarm condition is enabled and will be detected. A bit off means the corresponding alarm condition is disabled and will not be detected. This parameter is the Read Only copy of FD_OFFSPEC_MAP.
87	MAINT_MASK	Mask of MAINT_ALM. Corresponds bit of bit to MAINT_ACTIVE. A bit on means that the condition is masked out from alarming. This parameter is the Read Only copy of FD_OFFSPEC_MASK.
88	MAINT_ACTIVE	Enumerated list of maintenance conditions within a device. This parameter is the Read Only copy of FD_OFFSPEC_ACTIVE.
89	ADVISE_PRI	Designates the alarming priority of the ADVISE_ALM.

Table E-1: Resource Block Parameters *(continued)*

Index Number	Parameter	Description
90	ADVISE_ENABLE	Enabled ADVISE_ALM alarm conditions. Corresponds bit for bit to the ADVISE_ACTIVE. A bit on means that the corresponding alarm condition is enabled and will be detected. A bit off means the corresponding alarm condition is disabled and will not be detected. This parameter is the Read Only copy of FD_MAINT_MASK & FD_CHECK_MASK.
91	ADVISE_MASK	Mask of ADVISE_ALM. Corresponds bit by bit to ADVISE_ACTIVE. A bit on means that the condition is masked out from alarming. This parameter is the Read Only copy of FD_MAINT_MASK & FD_CHECK_MASK.
92	ADVISE_ACTIVE	Enumerated list of advisory conditions within a device. All open bits are free to be used as appropriate for each specific device. This parameter is the Read Only copy of FD_MAINT_ACTIVE & FD_CHECK_ACTIVE.

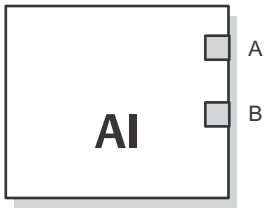


Table E-2: FD_SIMULATE elements

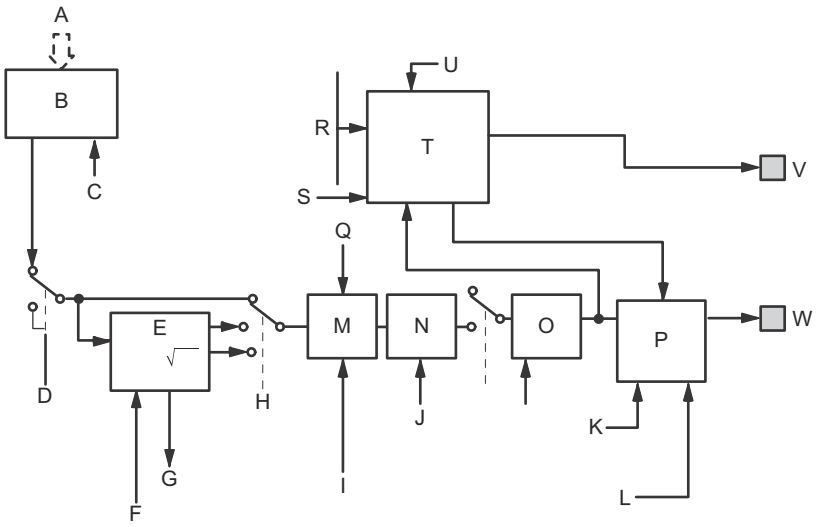
Index	Parameter	Data Type	Size	Description
1	Diagnostic Simulate Value	Bit string	4	Writable. Used for diagnostics when simulation is enabled
2	Diagnostic Value	Bit string	4	Current diagnostics detected by the device.
3	Enable	Unsigned 8	1	Enable/Disable simulation. Dynamic, so simulation will always be disabled after a device restart.

E.2 Analog-Input Block

E.2.1 Analog Input block system parameters

Figure E-1: Analog-Input Block

A. OUT_D = Discrete output that signals a selected alarm condition
B. OUT = The block output value and status



The Analog Input (AI) function block processes field device measurements and makes them available to other function blocks. The output value from the AI block is in engineering units and contains a status indicating the quality of the measurement. The measuring device may have several measurements or derived values available in different channels. Use the channel number to define the variable that the AI block processes.

The AI block supports alarming, signal scaling, signal filtering, signal status calculation, mode control, and simulation. In Automatic mode, the block's output parameter (OUT) reflects the process variable (PV) value and status. In Manual mode, OUT may be set manually. The Manual mode is reflected on the output status. A discrete output (OUT_D) is

provided to indicate whether a selected alarm condition is active. Alarm detection is based on the OUT value and user specified alarm limits.

Table E-3 lists the AI block parameters and their units of measure, descriptions, and index numbers.

Figure E-2: Analog Input Function Block Schematic

A. Analog Measurement
B. Access Analog Measurement
C. CHANNEL
D. SIMULATE
E. Convert
F. OUT_SCALE; XD_SCALE
G. FIELD_VAL
H. L_TYPE
I. IO_OPTS
J. PV_FTIME
K. MODE
L. STATUS_OPTS
M. Cutoff
N. Filter
O. PV
P. Status Calc.
Q. LOW_CUT
R. HI_HI_LIM; HI_LIM; LO_LO_LIM; LO_LIM
S. ALARM_HYS
T. Alarm Detection
U. ALARM_TYPE
V. OUT_D = discrete output that signals a selected alarm condition
W. OUT = block output value and status

Table E-3: Definitions of Analog Input Function Block System Parameters

Index Number	Parameter	Units	Description
01	ST_REV	None	The revision level of the static data associated with the function block. The revision value will be incremented each time a static parameter value in the block is changed.
02	TAG_DESC	None	The user description of the intended application of the block.
03	STRATEGY	None	The strategy field can be used to identify grouping of blocks. This data is not checked or processed by the block.
04	ALERT_KEY	None	The identification number of the plant unit. This information may be used in the host for sorting alarms, etc.
05	MODE_BLK	None	The actual, target, permitted, and normal modes of the block. Target: The mode to “go to” Actual: The mode the “block is currently in” Permitted: Allowed modes that target may take on Normal: Most common mode for target
06	BLOCK_ERR	None	This parameter reflects the error status associated with the hardware or software components associated with a block. It is a bit string, so that multiple errors may be shown.
07	PV	EU of XD_SCALE	The process variable used in block execution.
08	OUT	EU of OUT_SCALE	The block output value and status.
09	SIMULATE	None	A group of data that contains the current transducer value and status, the simulated transducer value and status, and the enable/disable bit.
10	XD_SCALE	None	The high and low scale values, engineering units code, and number of digits to the right of the decimal point associated with the channel input value.
11	OUT_SCALE	None	The high and low scale values, engineering units code, and number of digits to the right of the decimal point associated with OUT.
12	GRANT_DENY	None	Options for controlling access of host computers and local control panels to operating, tuning, and alarm parameters of the block. Not used by device.
13	IO_OPTS	None	Allows the selection of input/output options used to alter the PV. Low cutoff enabled is the only selectable option.
14	STATUS_OPTS	None	Allows you to select option for status handling and processing.
15	CHANNEL	None	The CHANNEL value is used to select the measurement value. You must configure the CHANNEL parameter before you can configure the XD_SCALE parameter.
16	L_TYPE	None	Linearization type. Determines whether the field value is used directly (Direct) or is converted linearly (Indirect).
17	LOW_CUT	%	If percentage value of transducer input fails below this, PV = 0.
18	PV_FTIME	Seconds	The time constant of the first-order PV filter. It is the time required for a 63 percent change in the IN value.
19	FIELD_VAL	Percent	The value and status from the transducer block or from the simulated input when simulation is enabled.
20	UPDATE_EVT	None	This alert is generated by any change to the static data.

Table E-3: Definitions of Analog Input Function Block System Parameters *(continued)*

Index Number	Parameter	Units	Description
21	BLOCK_ALM	None	The block alarm is used for all configuration, hardware, connection failure or system problems in the block. The cause of the alert is entered in the subcode field. The first alert to become active will set the Active status in the Status parameter. As soon as the Unreported status is cleared by the alert reporting task, another block alert may be reported without clearing the Active status, if the subcode has changed.
22	ALARM_SUM	None	The summary alarm is used for all process alarms in the block. The cause of the alert is entered in the subcode field. The first alert to become active will set the Active status in the Status parameter. As soon as the Unreported status is cleared by the alert reporting task, another block alert may be reported without clearing the Active status, if the subcode has changed.
23	ACK_OPTION	None	Used to set auto acknowledgment of alarms.
24	ALARM_HYS	Percent	The amount the alarm value must return within the alarm limit before the associated active alarm condition clears.
25	HI_HI_PRI	None	The priority of the HI HI alarm.
26	HI_HI_LIM	EU of PV_SCALE	The setting for the alarm limit used to detect the HI HI alarm condition.
27	HI_PRI	None	The priority of the HI alarm.
28	HI_LIM	EU of PV_SCALE	The setting for the alarm limit used to detect the HI alarm condition.
29	LO_PRI	None	The priority of the LO alarm.
30	LO_LIM	EU of PV_SCALE	The setting for the alarm limit used to detect the LO alarm condition.
31	LO_LO_PRI	None	The priority of the LO LO alarm.
32	LO_LO_LIM	EU of PV_SCALE	The setting for the alarm limit used to detect the LO LO alarm condition.
33	HI_HI_ALM	None	The HI HI alarm data, which includes a value of the alarm, a timestamp of occurrence and the state of the alarm.
34	HI_ALM	None	The HI alarm data, which includes a value of the alarm, a timestamp of occurrence and the state of the alarm.
35	LO_ALM	None	The LO alarm data, which includes a value of the alarm, a timestamp of occurrence and the state of the alarm.
36	LO_LO_ALM	None	The LO LO alarm data, which includes a value of the alarm, a timestamp of occurrence and the state of the alarm.
37	OUT_D	None	Discrete output to indicate a selected alarm condition.
38	ALARM_SEL	None	Used to select the process alarm conditions that will cause the OUT_D parameter to be set.
39	STDDEV	Percent	Standard deviation of the measurement.
40	CAP_STDDEV	Seconds	Capability standard deviation, the best deviation that can be achieved.

E.2.2 Modes

The AI Function Block supports three modes of operation as defined by the MODE_BLK parameter:

Manual (Man)	The block output (OUT) may be set manually.
Automatic (Auto)	OUT reflects the analog input measurement or the simulated value when simulation is enabled.
Out of Service (O/S)	The block is not processed. FIELD_VAL and PV are not updated and the OUT status is set to Bad: Out of Service. The BLOCK_ERR parameter shows Out of Service. In this mode, you can make changes to all configurable parameters. The target mode of a block may be restricted to one or more of the supported modes.

E.2.3 Configure the AI block

⚠ A minimum of four parameters are required to configure the AI block. The parameters are described below with example configurations shown at the end of this section.

CHANNEL

Select the channel that corresponds to the desired sensor measurement:

Table E-4: AI Block Channels

AI block	TB channel value	Process variable
Level	1	CHANNEL_RADAR_LEVEL
Ullage	2	CHANNEL_RADAR_ULLAGE
Level rate	3	CHANNEL_RADAR_LEVELRATE
Signal strength	4	CHANNEL_RADAR_SIGNAL_STRENGTH
Volume	5	CHANNEL_RADAR_VOLUME
Internal temperature	6	CHANNEL_RADAR_INTERNAL_TEMPERATURE
Upper product volume	7	CHANNEL_UPPER_PRODUCT_VOLUME
Lower product volume	8	CHANNEL_LOWER_ PRODUCT_VOLUME
Interface distance	9	CHANNEL_INTERFACE_ DISTANCE
Upper product thickness	10	CHANNEL_UPPER_ PRODUCT_THICKNESS
Interface level	11	CHANNEL_INTERFACE_LEVEL
Interface level rate	12	CHANNEL_INTERFACE_ LEVELRATE
Interface signal strength	13	CHANNEL_INTERFACE_ SIGNALSTRENGTH
Signal quality	14	CHANNEL_SIGNAL_QUALITY
Surface/noise margin	15	CHANNEL_ SURFACE_NOISE_MARGIN
Vapor DC	16	CHANNEL_VAPOR_DC

L_TYPE

The L_TYPE parameter defines the relationship of the transmitter measurement (level, distance, level rate, signal strength, volume, and average temperature) to the desired output of the AI block. The relationship can be direct or indirect root.

Direct	Select direct when the desired output will be the same as the transmitter measurement (level, distance, level rate, signal strength, volume, and internal temperature).
Indirect	Select indirect when the desired output is a calculated measurement based on the transmitter measurement (level, distance, level rate, signal strength, volume, and internal temperature). The relationship between the transmitter measurement and the calculated measurement will be linear.
Indirect square root	Select indirect square root when the desired output is an inferred measurement based on the transmitter measurement and the relationship between the sensor measurement and the inferred measurement is square root (e.g. level).

XD_SCALE and OUT_SCALE

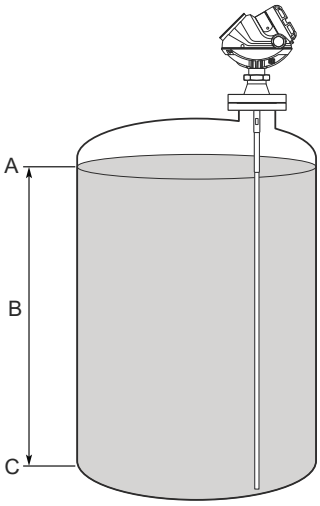
The XD_SCALE and OUT_SCALE each include three parameters: 0%, 100%, and engineering units. Set these based on the L_TYPE:

L_TYPE is direct	When the desired output is the measured variable, set the XD_SCALE to represent the operating range of the process. Set OUT_SCALE to match XD_SCALE.
L_TYPE is indirect	When an inferred measurement is made based on the sensor measurement, set the XD_SCALE to represent the operating range that the sensor will see in the process. Determine the inferred measurement values that correspond to the XD_SCALE 0 and 100% points and set these for the OUT_SCALE.
L_TYPE is indirect square root	When an inferred measurement is made based on the transmitter measurement and the relationship between the inferred measurement and sensor measurement is square root, set the XD_SCALE to represent the operating range that the sensor will see in the process. Determine the inferred measurement values that correspond to the XD_SCALE 0 and 100% points and set these for the OUT_SCALE.

Engineering units

Note
To avoid configuration errors, only select engineering units for XD_SCALE and OUT_SCALE that are supported by the device.

Related information



Supported units

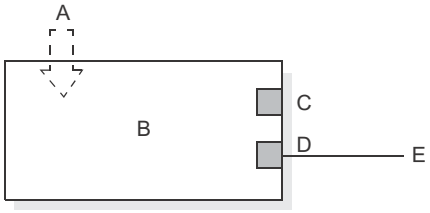
Application example 1

Radar level transmitter, level value

A level transmitter is measuring the level in a 33 ft. (10 m) high tank.

Figure E-3: Situation Diagram

A. 100%
B. 33 ft. (10 m)
C. 0%



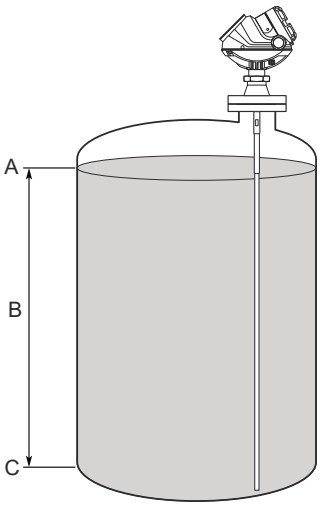
Solution

Table E-5 lists the appropriate configuration settings, and Figure E-4 illustrates the correct function block configuration.

Table E-5: Analog Input Function Block Configuration for a Typical Level Transmitter

Parameter	Configured values
L_TYPE	Direct
XD_SCALE	Not Used
OUT_SCALE	Not Used
CHANNEL	CH1: Level

Figure E-4: Analog Input Function Block Diagram for a Typical Level Transmitter



A. Level measurement
B. AI function block
C. OUT_D
D. OUT
E. To another function block

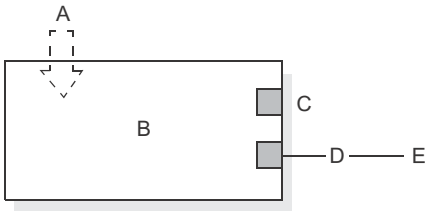
Application example 2

Radar level gauge, level value in percent (%)

The maximum level in the tank is 46 ft. (14 m). The level value is displayed in percentage of the full span (see Figure E-5).

Figure E-5: Situation Diagram

A. 100%
B. 46 ft. (14 m)
C. 0%



Solution

Table E-6 lists the appropriate configuration settings, and Figure E-6 illustrates the correct function block configuration.

Table E-6: Analog Input Function Block Configuration for a Level Transmitter Where Level Output is Scaled between 0-100%

Parameter	Configured values
L_TYPE	Indirect
XD_SCALE	0 to 14 m
OUT_SCALE	0 to 100%
CHANNEL	CH1: Level

A. Level measurement - percent
B. AI function block
C. OUT_D
D. OUT
E. 0 to 100%

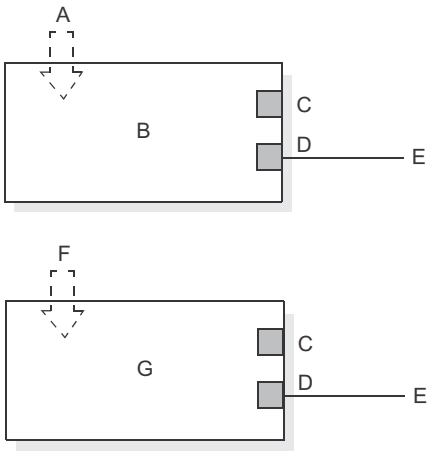
Application example 3

Radar level transmitter, product level, and interface level value

A level transmitter is measuring the product level and the interface level in a 33 ft. (10 m) high tank. The maximum interface level is 10 ft. (3 m).

Figure E-7: Situation Diagram

A. 100%
B. 10 ft. (3 m)
C. 33 ft. (10 m)
D. 0%



Solution

Table E-7 lists the appropriate configuration settings, and Figure E-8 illustrates the correct function block configuration.

Table E-7: Analog Input Function Block Configuration for a Level and Interface Transmitter

AI function block product level		AI function block interface level	
Parameter	**Configured values**	**Parameter**	**Configured values**
L_TYPE	Direct	L_TYPE	Direct
XD_SCALE	Not used	XD_SCALE	Not used
OUT_SCALE	Not used	OUT_SCALE	Not used
CHANNEL	CH1: level	CHANNEL	CH11: interface level

Figure E-8: Analog Input Function Block Diagram for a Level and Interface Transmitter

A. Level measurement
B. AI function block (product level)
C. OUT_D
D. OUT
E. To another function block
F. Interface level measurement
G. AI function block (interface level)

E.2.4 Process alarms

Process Alarm detection is based on the OUT value. Configure the alarm limits of the following standard alarms:

- High (HI_LIM)
- High high (HI_HI_LIM)
- Low (LO_LIM)
- Low low (LO_LO_LIM)

To avoid alarm chattering when the variable is oscillating around the alarm limit, an alarm hysteresis in percent of the PV span can be set using the ALARM_HYS parameter.

The priority of each alarm is set in the following parameters:

- HI_PRI

- HI_HI_PRI
- LO_PRI
- LO_LO_PRI

Alarm priority

Alarms are grouped into five levels of priority:

Table E-8: Alarm Levels of Priority

Priority number	Priority description
0	The alarm condition is not used.
1	An alarm condition with a priority of 1 is recognized by the system, but is not reported to the operator.
2	An alarm condition with a priority of 2 is reported to the operator.
3-7	Alarm conditions of priority 3 to 7 are advisory alarms of increasing priority.
8-15	Alarm conditions of priority 8 to 15 are critical alarms of increasing priority.

E.2.5 Status options

Status options (**STATUS_OPTS**) supported by the AI block are shown below:

Propagate fault forward — If the status from the sensor is **Bad, Device failure** or **Bad, Sensor failure**, then propagate it to **OUT** without generating an alarm. The use of these sub-status in **OUT** is determined by this option. Through this option, the user may determine whether alarming (sending of an alert) will be done by the block or propagated downstream for alarming.

Uncertain if limited — Set the output status of the Analog Input block to **Uncertain** if the measured or calculated value is limited.

BAD if limited — Set the output status to **Bad** if the sensor is violating a high or low limit.

Uncertain if Man mode — Set the output status of the Analog Input block to **Uncertain** if the actual mode of the block is **Man**.

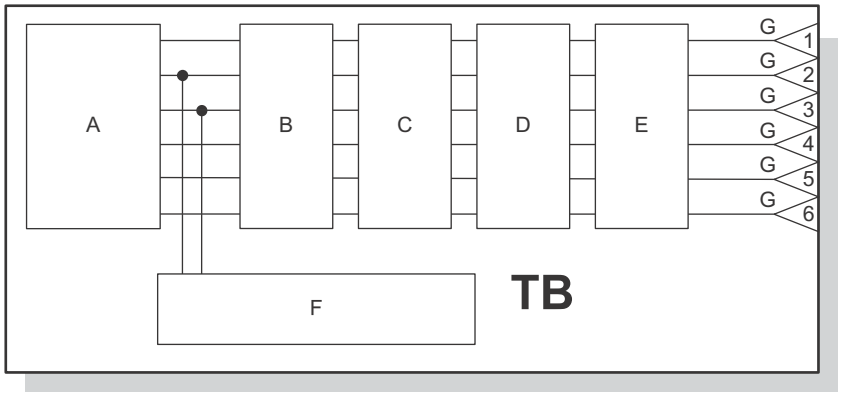
Note
The instrument must be in **Out of Service** mode to set the status option.

E.2.6 Advanced features

The AI function block provided with Fisher™-Rosemount™ fieldbus devices provides added capability through the addition of the following parameters:

ALARM_TYPE — Allows one or more of the process alarm conditions detected by the AI function block to be used in setting its OUT_D parameter.

OUT_D — Discrete output of the AI function block based on the detection of process alarm condition(s). This parameter may be linked to other function blocks that require a discrete input based on the detected alarm condition.



STD_DEV and CAP_STDDEV — Diagnostic parameters that can be used to determine the variability of the process.

E.3 Level Transducer Block

E.3.1 Overview

This section contains information on the Rosemount™ 5300 Level Transducer Block (TB). Descriptions of all Transducer Block parameters, errors, and diagnostics are listed.

Figure E-9: Transducer Block Diagram

A. Digital Signal Conversion
B. Linearization
C. Temperature Compensation
D. Damping
E. Units/Ranging
F. Diagnostics
G. Channel

Definition

The transducer block contains the actual measurement data, including a level and distance reading. Channels 1–16 are assigned to these measurements (see Figure E-9). The transducer block includes information about sensor type, engineering units, and all parameters needed to configure the transmitter.

Channel definitions

Each input has an assigned channel which can be linked to the AI block. The channels for the Rosemount™ 5300 Level Transmitter are the following:

Table E-9: Channel Assignments

Channel Name	Channel Number	Process variable
Level	1	CHANNEL_RADAR_LEVEL
Ullage	2	CHANNEL_RADAR_ULLAGE
Level Rate	3	CHANNEL_RADAR_LEVELRATE
Signal Strength	4	CHANNEL_RADAR_SIGNAL_STRENGTH
Volume	5	CHANNEL_RADAR_VOLUME
Internal Temperature	6	CHANNEL_RADAR_INTERNAL_TEMPERATURE
Upper Product Volume	7	CHANNEL_UPPER_PRODUCT_VOLUME

Table E-9: Channel Assignments *(continued)*

Channel Name	Channel Number	Process variable
Lower Product Volume	8	CHANNEL_LOWER_ PRODUCT_VOLUME
Interface Distance	9	CHANNEL_INTERFACE_ DISTANCE
Upper Product Thickness	10	CHANNEL_UPPER_ PRODUCT_THICKNESS
Interface Level	11	CHANNEL_INTERFACE_LEVEL
Interface Level Rate	12	CHANNEL_INTERFACE_ LEVELRATE
Interface Signal Strength	13	CHANNEL_INTERFACE_ SIGNALSTRENGTH
Signal Quality	14	CHANNEL_SIGNAL_QUALITY
Surface/Noise Margin	15	CHANNEL_ SURFACE_NOISE_MARGIN
Vapor DC	16	CHANNEL_VAPOR_DC

E.3.2 Level transducer block parameters

Table E-10: Level Transducer Block Parameters and Descriptions

Index Number	Parameter	Description
1	ST_REV	The revision level of the static data associated with the function block. The revision value increments each time a static parameter value in the block is changed.
2	TAG_DESC	The user description of the intended application of the block.
3	STRATEGY	The strategy field can be used to identify grouping of blocks. This data is not checked or processed by the block.
4	ALERT_KEY	The identification number of the plant unit. This information may be used in the host for sorting alarms, etc.
5	MODE_BLK	The actual, target, permitted, and normal modes of the block. Target: The mode to “go to” Actual: The mode the “block is currently in” Permitted: Allowed modes that target may take on Normal: Most common mode for target
6	BLOCK_ERR	This parameter reflects the error status associated with the hardware or software components associated with a block. It is a bit string, so that multiple errors may be shown.
7	UPDATE_EVT	This alert is generated by any change to the static data.
8	BLOCK_ALM	The block alarm is used for all configuration, hardware, connection failure or system problems in the block. The cause of the alert is entered in the subcode field. The first alert to become active will set the Active status in the Status parameter. As soon as the Unreported status is cleared by the alert reporting task, another block alert may be reported without clearing the Active status, if the subcode has changed.
9	TRANSDUCER_DIRECTORY	Directory that specifies the number and starting indices of the transducers in the transducer block.
10	TRANSDUCER_TYPE	Identifies the transducer.
11	TRANSDUCER_TYPE_VER	Transducer type version
12	XD_ERROR	A transducer block alarm subcode.
13	COLLECTION_DIRECTORY	A directory that specifies the number, starting indices, and DD Item ID’s of the data collections in each transducer within a transducer block.
14	RADAR_LEVEL	Level
15	RADAR_LEVEL_RANGE	See Table E-21
16	RADAR_ULLAGE	Distance (Ullage)
17	RADAR_LEVELRATE	Level rate
18	RADAR_LEVELRATE_RANGE	See Table E-22
19	RADAR_LEVEL_SIGNAL_STRENGTH	Signal strength
20	RADAR_LEVEL_SIGNAL_STRENGTH_RANGE	See Table E-24

Table E-10: Level Transducer Block Parameters and Descriptions *(continued)*

Index Number	Parameter	Description
21	RADAR_VOLUME	Volume
22	RADAR_VOLUME_RANGE	See Table E-25
23	RADAR_INTERNAL_TEMPERATURE	Internal temperature
24	RADAR_INTERNAL_TEMPERATURE_RANGE	Range, unit and number of decimals
25	VOLUME_UPPER	The calculated volume value of the upper product at the current level and interface
26	VOLUME_LOWER	The calculated volume value of the lower product at the current interface
27	INTERFACE_DISTANCE	The distance to the interface (from the upper reference point).
28	UPPER_PRODUCT_THICKNESS	The thickness of the upper product (from the surface value to the interface value).
29	INTERFACE_LEVEL	The current interface level value (from the zero level reference point and up to the interface).
30	INTERFACE_LEVELRATE	The current velocity at which the interface is moving. A positive value indicates the interface is moving up.
31	INTERFACE_SIGNAL_STRENGTH	The current signal strength of the interface echo.
32	PROBE_TYPE	Select the type of probe that is mounted to this device. Use User Defined probe if your probe can not be found in the list or if you have done modifications to a standard probe.
33	PROBE_LENGTH	Enter the length of the probe measured from the device's upper reference point (normally the upper side of the tank flange) down to the probe end. If a weight is used it shall not be included in the length.
34	PROBE_ANGLE	Defines the angle compared to the plumb line at which the device with probe is mounted (0°means that probe is mounted vertically).
35	PROBE_END_PULSE_POLARITY	This parameter is used for User Defined probes only. Contact Emerson™ Service Department for more information
36	PROBE_IMPEDANCE	This parameter is used for User Defined probes only. Contact Emerson Service Department for more information
37	TCL	This parameter is used for User Defined probes only. Contact Emerson Service Department for more information
38	PROPAGATION_FACTOR	This parameter is used for User Defined probes only. Contact Emerson Service Department for more information
39	REF_PULSE_AMPL	This parameter is used for User Defined probes only. Contact Emerson Service Department for more information
40	GEOM_TANK_HEIGHT	Tank height (R)
41	GEOM_HOLD_OFF_DIST	Hold off distance

Table E-10: Level Transducer Block Parameters and Descriptions *(continued)*

Index Number	Parameter	Description
42	VAPOR_DC	Enter the dielectric constant for the vapor gas in the tank. For air at 20 degC and atmospherical pressure the vapor DC is close to 1, but for high pressure/high temperature applications the DC may increase and affect the accuracy of the measurement
43	UPPER_PRODUCT_DC	Enter the Upper Product Dielectric Constant (DC) as dielectric accurate as possible. This value affects the accuracy of the interface level measurement
44	LOWER_PRODUCT_DC_RANGE	Enter the range of the dielectric constant (DC) for the lower product in the tank. If you are uncertain about the value for this parameter or are changing product in the tank on a regular basis choose Unknown
45	PRODUCT_DIELEC_RANGE	Enter the range of the Product DC for the product in the tank. If you are uncertain about the value for this parameter or are changing product in the tank on a regular basis choose Unknown
46	MEAS_MODE	Select the Measurement Mode to use in the device. Some modes require software options to be enabled in the device. You can upgrade the device to enable more software options
47	DAMPING_VALUE	Damping value
48	GEOM_OFFSET_DIST	Distance offset
49	GEOM_CALIBRATION_DIST	Calibration distance
50	LCD_SETTINGS	Use quick startup mode
51	LCD_PARAMETERS	Parameters to show
52	LCD_LANGUAGE	Language on display
53	LCD_LENGTH_UNIT	Length unit on display
54	LCD_VOLUME_UNIT	Volume unit on display
55	LCD_TEMPERATURE_UNIT	Temperature unit on display
56	LCD_VELOCITY_UNIT	Velocity unit on display
57	MAX_INTERNAL_TEMPERATURE	The maximum temperature that has been measured inside the device during operation
58	MIN_INTERNAL_TEMPERATURE	The minimum temperature that has been measured inside the device during operation
59	OPERATION TIME	The total number of hours the device has been in operation
60	ENV_ENVIRONMENT	Process condition
61	ENV_PRESENTATION	Tank presentation
62	ENV_DEVICE_MODE	Service mode
63	ENV_WRITE_PROTECT	Write protect
64	DIAGN_DEV_ALERT	Errors, Warnings, Status, Plant web alerts
65	DIAGN_VERSION	Gauge SW version
66	DIAGN_REVISION	P1451 revision

Table E-10: Level Transducer Block Parameters and Descriptions *(continued)*

Index Number	Parameter	Description
67	DIAGN_DEVICE_ID	Device ID for the gauge.
68	DIAGN_DEVICE_MODEL	Type of 5300. LF or HF
69	STATS_ATTEMPTS	The total number of messages sent to the transducer A/D board
70	STATS_FAILURES	The total number of failed A/D board message attempts
71	STATS_TIMEOUTS	The total number of timed out A/D board message attempts
72	MAX_UPPER_PRODUCT_THICKNESS	This is the maximum thickness of the upper product that the device is able to measure through. If the thickness of the upper product is larger than this value, the device will not be able to locate the interface echo
73	MEAS_STATUS	Measurement status
74	INTERFACE_STATUS	Interface status
75	REMOTE_HOUSING	Select the length of the remote housing connection used in the installation.
76	MEAS_VAPOR_DC	Measured Vapor Dielectric Constant
77	SPEC_CONFIG_TNZ	Configure Trim Near Zone
78	SPEC_CONFIG_PEP	Configure Probe End Projection
79	SPEC_CONFIG_TANK_MATERIAL	Configure Tank Material
80	SPEC_CONFIG_VC	Configure Vapor Compensation
81	VC_WARNING	Vapor Compensation Warning
82	PEP_STATUS	Probe End Projection Status
83	TANK_MATERIAL	Tank material
84	SW_SUPPORT2	Defines what options are enabled in the device.
85	MOUNTING_TYPE	Mounting type
86	PIPE_DIAMETER	Inner diameter, pipe/chamber/nozzle
87	NOZZLE_HEIGHT	Nozzle height
88	DEVICE_HW_CONFIG	
89	DEVICE_STATUS	Device status
90	VOLUME_STATUS	Volume status
91	MWM_WARNING	Sweep dump active
92	MEAS_WARNING	Probe End Projection DC est limited
93	CONFIG_WARNING	Configuration warning
94	VAPOR_COMP_STATUS	Vapor Compensation Status
95	P1451_SLAVE_STATS	
96	P1451_HOST_STATS	

Table E-10: Level Transducer Block Parameters and Descriptions *(continued)*

Index Number	Parameter	Description
97	FF_SUPPORT_INFO	
98	SENSOR_DIAGNOSTICS	
99	HEART_BEAT_COUNT	

Table E-11: Probe Type

Table E-12: Device Mode

VALUE	ENV_DEVICE_MODE
0	Normal operation
1	Spare
2	Restart device
3	Set to factory default database
4	Trim Near Zone

Table E-13: Environment

Bit Number	Value of ENV_ENVIRONMENT	Description
2	0x00000004	Turbulent
3	0x00000008	Foam
28	0x10000000	Rapid Changes

Table E-14: Presentation

Bit Number	Value of ENV_PRESENTATION	Description
28	0x10000000	Do Not Use Full Tank State
2	0x00000002	Use 3300 Full and Empty Detect Areas
3	0x00000004	Disable PEP PE Sign Change Logic
8	0x00000100	Show Negative Level as Zero
10	0x00000400	Probe End Projection
11	0x00000800	Do Not Use Automatic PEP DC Estimation
12	0x00001000	Do Not Reject Possible Double Bounces
18	0x00040000	Use Jump Filter
22	0x00400000	Show Level below Probe End as Zero
23	0x00800000	Use Vapor Compensation
24	0x01000000	Calculate Signal Quality Metrics

Table E-15: LCD Parameters

Bit Number	Value of LCD_PARAMETERS	Description
28	0x10000000	Level
1	0x00000002	Distance
2	0x00000004	Level Rate
3	0x00000008	Signal Strength
4	0x00000010	Volume
5	0x00000020	Internal Temperature
6	0x00000040	Analog Out Current
7	0x00000080	Percent Of Range
8	0x00000100	Com Quality
9	0x00000200	Interface Level
10	0x00000400	Interface Distance
11	0x00000800	Interface Level Rate
12	0x00001000	Interface Signal Strength
13	0x00002000	Upper Product Thickness
14	0x00004000	Lower Volume
15	0x00008000	Upper Volume
16	0x00010000	Signal Quality
17	0x00020000	Surface Noise Margin
18	0x00040000	Vapor DC

Table E-16: Product Dielectrical Range

VALUE	ENV_DIELECTR_CONST
0	1.4 - 1.9 (e.g. liquified gas, plastics)
1	1.9-2.5 (e.g. Oil Based)
2	2.5-4 (e.g. Oil Based)
3	4-10 (e.g. Alcohol, Acids)
4	>10 (e.g. Waterbased)
5	Unknown

Table E-17: Measurement Mode

VALUE	MEAS_MODE
0	Liquid Product Level
1	Product Level and Interface Level
2	Solid Product Level
3	Interface Level with Submerged Probe

E.3.3 Diagnostics device errors

In addition to the BLOCK_ERR and XD_ERROR parameters, more detailed information on the measurement status can be obtained via DIAGN_DEV_ALERT. Table E-18 lists the potential errors and the possible corrective actions for the given values. The corrective actions are in order of increasing system level compromises. The first step should always be to reset the gauge and then if the error persists, try the steps in Table E-18. Start with the first corrective action and then try the second.

Table E-18: Device Errors Diagnostics

Bit Number	Value of DIAGN_DEV_ALERT	Description	Corrective action
	0	No alarm active	
0	0x00000001	Reserved	
1	0x00000002	FF card to gauge comm fault	Replace gauge
2	0x00000004	Level measurement failure	Verify device installation and configuration
3	0x00000008	Temperature measurement failure	Check ambient temperature. If ambient temperature ok replace the device.
4	0x00000010	Volume measurement failure	Check volume configuration
5	0x00000020	Database Error	Load default database to the device and reconfigure the device
6	0x00000040	HW Error	Replace device
7	0x00000080	Microwave Unit Error	Replace device
8	0x00000100	Configuration Error	Load default database to the device and reconfigure the device
9	0x00000200	SW Error	Replace device
10	0x00000400	Invalid Strap Table	Check the Strapping Table configuration
11	0x00000800	Internal Temp Warning	Check ambient temperature at installation site
12	0x00001000	Database Warning	Check the device configuration
13	0x00002000	HW Warning	Check device installation and configuration
14	0x00004000	Microwave Unit Warning	Check device installation and configuration
15	0x00008000	Configuration Warning	Check the device configuration
16	0x00010000	SW Warning	Check device installation and configuration
17	0x00020000	Simulation Mode	Use Simulation Method under advanced configuration tool to get the device out of Simulation Mode
18	0x00040000	Volume Range Warning	Verify Strapping Table
19	0x00080000	Software Write Protected	

Table E-18: Device Errors Diagnostics *(continued)*

Bit Number	Value of DIAGN_DEV_ALERT	Description	Corrective action
20	0x00100000	Vapor Compensation Not Calibrated	
21	0x00200000	Vapor DC Estimation Limited	
22	0x00400000	Reference Reflector Not Found	
23	0x00800000	BaseLine too low	
24	0x01000000	BaseLine too high	
25	0x02000000	Gain control	
26	0x04000000	Unsupported Combination of Functions	
27	0x08000000		
28	0x10000000		
29	0x20000000	Probe Missing	Check probe connection
30	0x40000000	Interface Measurement Failure	Check interface measurement configuration
31	0x80000000	Hardware Write Protected	

E.4 Register Transducer block parameters

The Register Transducer block allows access to Database registers and Input registers. This makes it possible to read a selected set of register directly by accessing the memory location.

The Register Transducer block is only available with advanced service.

⚠ CAUTION

Since the Register Transducer block allows access to most registers, it should be handled with care and ONLY to be changed by trained and certified service personnel, or as guided by Emerson Automation Solutions support personnel.

Table E-19: Register Transducer Block Parameters

Index Number	Parameter	Description
1	ST_REV	The revision level of the static data associated with the function block. The revision value increments each time a static parameter value in the block is changed.
2	TAG_DESC	The user description of the intended application of the block.
3	STRATEGY	The strategy field can be used to identify grouping of blocks. This data is not checked or processed by the block.
4	ALERT_KEY	The identification number of the plant unit. This information may be used in the host for sorting alarms, etc.
5	MODE_BLK	The actual, target, permitted, and normal modes of the block. Target: The mode to “go to” Actual: The mode the “block is currently in” Permitted: Allowed modes that target may take on Normal: Most common mode for target
6	BLOCK_ERR	This parameter reflects the error status associated with the hardware or software components associated with a block. It is a bit string, so that multiple errors may be shown.
7	UPDATE_EVT	This alert is generated by any change to the static data
8	BLOCK_ALM	The block alarm is used for all configuration, hardware, connection failure or system problems in the block. The cause of the alert is entered in the subcode field. The first alert to become active will set the Active status in the Status parameter. As soon as the Unreported status is cleared by the alert reporting task, another block alert may be reported without clearing the Active status, if the subcode has changed.
9	TRANSDUCER_DIRECTORY	Directory that specifies the number and starting indices of the transducers in the transducer block.
10	TRANSDUCER_TYPE	Identifies the transducer.
11	TRANSDUCER_TYPE_VER	Transducer type version
12	XD_ERROR	A transducer block alarm sub code.
13	COLLECTION_DIRECTORY	A directory that specifies the number, starting indices, and DD Item ID’s of the data collections in each transducer within a transducer block.
14	RB_PARAMETER	

Table E-19: Register Transducer Block Parameters *(continued)*

Index Number	Parameter	Description
15-44	INP_REG_n_TYPE	Describes characteristics of input register n. Indicates requested value is displayed as a floating point (/ decimal) number.
	INP_REG_n_FLOAT	Input register n value, displayed as floating point number
	INP_REG_n_INT_DEC	Input register n value, displayed as decimal number
45-74	DB_REG_n_TYPE	Describes characteristics of holding register n. Indicates requested value is displayed as a floating point (/ decimal) number.
	DB_REG_n_FLOAT	Holding register n value, displayed as floating point number.
	DB_REG_n_INT_DEC	Holding register n value, displayed as decimal number.
75	RM_COMMAND	Defines what action to perform; Read Input/Holding Register, Restart Device, Poll Program Complete.
76	RM_DATA	RM_DATA is used by the configuration tool to read/write data from and to device.
77	RM_STATUS	Status of last executed command
78	INP_SEARCH_START_NBR	Input register search start number
79	DB_SEARCH_START_NBR	Holding register search start number

E.5 Advanced Configuration Transducer Block

E.5.1 Overview

The Advanced Configuration Transducer Block contains functions for the advanced configuration of the Rosemount™ 5300 Level Transmitter. It includes functions, such as amplitude threshold settings for filtering of disturbing echoes and noise, simulation of measurement values, Empty Tank Handling for optimizing measurements close to the tank bottom, and strapping table for volume measurements.

E.5.2 Advanced configuration transducer block parameters

Table E-20: Advanced Configuration Transducer Block Parameters

Index Number	Parameter	Description
1	ST_REV	The revision level of the static data associated with the function block. The revision value increments each time a static parameter value in the block is changed.
2	TAG_DESC	The user description of the intended application of the block.
3	STRATEGY	The strategy field can be used to identify grouping of blocks. This data is not checked or processed by the block.
4	ALERT_KEY	The identification number of the plant unit. This information may be used in the host for sorting alarms, etc.
5	MODE_BLK	The actual, target, permitted, and normal modes of the block. Target: The mode to “go to” Actual: The mode the “block is currently in” Permitted: Allowed modes that target may take on Normal: Most common mode for target
6	BLOCK_ERR	This parameter reflects the error status associated with the hardware or software components associated with a block. It is a bit string, so that multiple errors may be shown.
7	UPDATE_EVT	This alert is generated by any change to the static data.
8	BLOCK_ALM	The block alarm is used for all configuration, hardware, connection failure or system problems in the block. The cause of the alert is entered in the subcode field. The first alert to become active will set the Active status in the Status parameter. As soon as the Unreported status is cleared by the alert reporting task, another block alert may be reported without clearing the Active status, if the subcode has changed.
9	TRANSDUCER_DIRECTORY	Directory that specifies the number and starting indices of the transducers in the transducer block.
10	TRANSDUCER_TYPE	Identifies the transducer. 100 = Standard pressure with calibration
11	TRANSDUCER_TYPE_VER	Transducer type version
12	XD_ERROR	A transducer block alarm subcode.

Table E-20: Advanced Configuration Transducer Block Parameters *(continued)*

Index Number	Parameter	Description
13	COLLECTION_DIRECTORY	A directory that specifies the number, starting indices, and DD Item ID's of the data collections in each transducer within a transducer block.
14	AMPLITUDE_THRESHOLD_CURVE	ATC: filters out weak disturbance echoes and noise.
15	SIMULATION_MODE	Simulation of measurement values.
16	SET_CONSTANT_THRESHOLD	A constant amplitude threshold can be used to filter out noise.
17	RADAR_LEVEL_RANGE	See Table E-21
18	RADAR_LEVEL_ SIGNAL_STR_RANGE	See Table E-24
19	RADAR_VOLUME_RANGE	See Table E-25
20	ENV_PRESENTATION	
21	PROBE_END_THRESH	This threshold is used to locate the probe end echo. The probe end echo is used by the device to know when the tank is empty, but is sometimes also useful when no surface echo can be found.
22	REFERENCE_THRESH	This threshold is used to locate the reference echo.
23	INTERFACE_THRESH	This threshold is used to block out disturbing echoes and noise when locating the interface echo.
24	FULL_TANK_THRESH_OFFSET	By adding an offset to the Reference Threshold it is possible for the device to determine when the tank is full. If the reference echo amplitude is between the Reference Threshold and the Full Tank Threshold then the tank is considered full.
25	PEP_PRODUCT_DC	Enter the product dielectric constant for the product in the tank.
26	AUTO_CONF_MEAS_FUNC	
27	ECHO_TIME_OUT	Change this parameter to define the time in seconds before the device should start to search for a surface echo after it has been lost.
28	CLOSE_DIST	This parameter defines a window centered at the current surface position where new surface echo candidates can be selected. The size of the window is +/-Close Distance. Echoes outside this window will not be considered as surface echoes.
29	USED_PROBE_END_THRESH	Probe End Threshold currently used in the device.
30	USED_REFERENCE_THRESH	Reference Threshold currently used in the device.
31	USED_INTERFACE_THRESH	Interface Threshold currently used in the device.
32	USED_TANK_PRESENTATION	
33	USED_ECHO_TIME_OUT	Echo Timeout currently used in the device.
34	USED_CLOSE_DIST	Close Distance currently used in the device.
35	SW_SUPPORT2	Defines what options are enabled in the device.
36	USED_HOLD_OFF_DIST	The Hold Off Distance/Upper Null Zone currently used in the device.

Table E-20: Advanced Configuration Transducer Block Parameters *(continued)*

Index Number	Parameter	Description
37	USED_PEP_PRODUCT_DC	Product Dielectric currently used in the device.
38	START_CODE	This code determines what options are available in your device. Do not change your Start Code unless you have received a valid one. Use Enter Start Codes method to change it.
39	UNIT_CODE	Unit code 1 -4 can be sent to your local Emerson™ representative in order to receive new Start Codes for upgrading your device.
40	ENV_SET_START_CODE	Set Start Code
41	PROBE_END_ANCHORING	Select if the probe end is anchored to the tank bottom or not.
42	PEP_PROBE_END_OFFSET	Probe end offset
43	USED_PEP_ PROBE_END_OFFSET	
44	VOL_VOLUME_CALC_METHOD	Choose what kind of volume calculation method to use.
45	VOL_IDEAL_DIAMETER	Diameter of the tank (only for ideal tank shapes).
46	VOL_IDEAL_LENGTH	Length/height of the tank (only for ideal tank shapes).
47	VOL_VOLUME_OFFSET	Use this parameter to add a volume to each calculated volume value. The volume can for instance correspond to a sump volume that you wish to add to your calculation.
48	VOL_STRAP_TABLE_LENGTH	Number of points to use in the strapping table.
49	VOL_STRAP_LEVEL	Strap value level 1-20 points
50	VOL_STRAP_VOLUME	Strap value volume 1-20 points
51	ECHO_UPDATE	
52	ECHO_FOUND_DISTANCE	Distance to found echo peaks
53	ECHO_FOUND_AMPLITUDE	Signal amplitude of found echo peaks
54	ECHO_FOUND_CLASS	Echo peak types
55	PEP_STATUS	Probe End Projection Status
56	PEP_PRODUCT_DC_LIMIT	Probe End Projection Dielectric Constant Limit
57	PROBE_END_PULSE_POLARITY	Probe End Pulse Polarity
58	USED_MAX_VAPOR_DC	
59	REF_REFLECTOR_TYPE	Reference Reflector Type
60	VAPOR_DC_FILTER_FACTOR	Vapor Dielectric Constant Filter Factor
61	SIGNAL_QUALITY	Product surface echo amplitude compared to surface threshold (ATC) and noise. Zero indicates a bad signal quality and 10 a good signal quality.
62	MIN_SIGNAL_QUALITY	Minimum signal quality since the last time Signal Quality Metrics were reset.
63	MAX_SIGNAL_QUALITY	Maximum signal quality since the last time ‘Signal Quality Metrics’ were reset.

Table E-20: Advanced Configuration Transducer Block Parameters *(continued)*

Index Number	Parameter	Description
64	TIME_SINCE_LAST_RESET	Operation time elapsed since the last time 'Signal Quality Metrics' were reset.
65	SURFACE_NOISE_MARGIN	Surface/Noise Margin
66	MIN_SURFACE_NOISE_MARGIN	Minimum Surface/Noise Margin
67	MAX_SURFACE_NOISE_MARGIN	Maximum Surface/Noise Margin
68	VAPOR_COMP_STATUS	Vapor Compensation Status
69	DEVICE_COMMAND	
70	DEVICE_COMMAND_STATUS

F HART® to Modbus® Converter (HMC) module

The Rosemount 5300 Level Transmitter is a Modbus compatible measurement device that supports communication with a Remote Terminal Unit (RTU) using a subset of read, write, and diagnostic commands used by most Modbus compatible host controllers. The transmitter also supports communication through Levelmaster and Modbus ASCII protocols.

The HART to Modbus Converter (HMC) module is located inside the Rosemount 5300 Level Transmitter enclosure and provides power to and communicates with the transmitter through a HART® interface.

Figure F-1: System Overview

A. Rosemount 5300 enclosure
B. Rosemount 5300 electronics
C. HART signals
D. HART to Modbus Converter
E. Modbus and Levelmaster communication
F. HART signals
G. Remote Terminal Unit
H. Rosemount Radar Master/Handheld communicator

During normal operation, the HMC "mirrors" the contents of process variables from the Rosemount 5300 Level Transmitter to the Modbus registers. To configure the Rosemount 5300 Level Transmitter, it is possible to connect a configuration tool to the HMC.

F.1 Workflow for commissioning a transmitter with Modbus® protocol

Procedure

1. Mount the transmitter on the tank.
2. Connect the power and communication wires.
3. Establish HART® communication with the transmitter. Do one of the following:
   - Connect to the MA/MB terminals (tunneling mode).
   - Connect to the HART terminals.

4. Configure the transmitter.
5. Configure the Modbus communication.
6. Configure Modbus host.
7. Verify output values as reported by the transmitter.

F.2 Modbus® communication protocol configuration

The Rosemount 5300 Level Transmitter can communicate with RTUs using Modbus RTU (often referred to as just “Modbus”), Modbus ASCII, and Levelmaster (also known as “ROS,” “Siemens,” or “Tank” protocol).

Table F-1: List of RTU Supported Protocols

RTU	Protocols
ABB Totalflow	Modbus RTU, Levelmaster
Bristol™ ControlWave™ Micro	Modbus RTU
Emerson ROC800 Series	Modbus RTU, Levelmaster(1)
Emerson FloBoss™ 107	Modbus RTU, Levelmaster(1)
Kimray® Inc. DACC™ 2000/3000	Levelmaster
ScadaPack	Modbus RTU
Thermo Electron Autopilot	Modbus RTU, Levelmaster

(1) Levelmaster protocol should be used when using the Emerson Digital Level Sensor (DLS) User Program or Application Module together with the device. Use Modbus RTU in other cases.

Modbus ASCII is not commonly used, since it doubles the amount of bytes for the same message as the Modbus RTU.

If you do not have any of these RTUs, check your RTU manual to see which protocols it supports.

F.2.1 Modbus® RTU communication setup

The Rosemount 5300 is configured with the default Modbus RTU address 246, and with the following Modbus RTU communication parameter default settings:

Table F-2: Modbus RTU Communication Parameters

Parameter	Default Value	Configurable Values
Baud Rate	9600	1200, 2400, 4800, 9600, 19200
Start Bits(1)	One	One
Data Bits(1)	Eight	Eight
Parity	None	None, Odd, Even
Stop Bits	One	One or Two
Address range	246	1-255

(1) Start Bits and Data Bits cannot be changed.

To reset the communication parameters to default Modbus RTU settings, use the following Modbus Message:

HMC

Modbus RTU parameter configuration

You want to use address 44 for the Rosemount 5300 Level Transmitter, and the following communication parameters are used by the host:

Table F-3: Communication Parameters Used by the Host (Example)

Parameter	Value
Baud Rate	4800
Start Bits	One
Data Bits	Eight
Parity	Odd
Stop Bits	Two

To configure the Rosemount 5300 Level Transmitter to communicate with the Host in this example, the following text string is written to the HART Slave 1 message area:

`HMC A44 B4800 PO S2.`

HMC These three letters are used for safety and will eliminate the risk of changing the configuration data by mistake.

A44 A indicates that the following number is the new address (address 44). Leading zeroes are not needed.

B4800 B indicates that the following number is the new baud rate (1200, 2400, 4800, 9600, 19200).

PO P identifies the following letter as parity type (O = odd, E = even, and N = none).

S2 S indicates that the following figure is the number of stop bits (1 = one, 2 = two).

Only values that differ from the current values need to be included. For example, if only the address is changed, the following text string is written into the 5300 (HART Slave 1) message area:

`HMC A127,`

indicates that 127 is the new address.

F.2.2 Levelmaster communication setup

The default and configurable parameter values can be found in Table F-4.

Table F-4: Levelmaster Communication Parameters

Parameter	Default value	Configurable value
Baud Rate	9600	1200, 2400, 4800, 9600, 19200
Start Bits	One	One
Data Bits	Seven	Seven, Eight
Parity	None	None, Odd, Even

Table F-4: Levelmaster Communication Parameters *(continued)*

Parameter	Default value	Configurable value
Stop Bits	One	One or Two
Address	1	1-99

To reset the communication parameters to default Levelmaster settings, use the following Modbus Message:

```
HMC M2
```

Levelmaster parameter configuration

You want to use address 2 for the Rosemount 5300 Level Transmitter and the host uses the following parameters:

Table F-5: Levelmaster Communication Parameters

Parameter	Value
Baud Rate	9600
Start Bits	One
Data Bits	Seven
Parity	None
Stop Bits	One

To configure the Rosemount 5300 Level Transmitter to communicate with the host in this example, the following text string is written to the Modbus message area:

```
HMC M2 A2 B9600 D7 PN S1.
```

Note
Include all the parameters when writing to the message area.

Note that an address must be unique on the bus.

HMC These three letters are used for safety and will eliminate the risk of changing the configuration data by mistake.

M2 This means that the Levelmaster protocol is to be used.

A2 A indicates that the following is the new address (address 2). Leading zeroes are not needed.

B9600 B indicates that the following number is the new baud rate (1200, 2400, 4800, 9600, 19200).

D7 D indicates that the following data bits are to be used (7 = seven, 8 = eight).

PN P identifies the following letter as parity type (O = odd, E = even, and N = none).

S1 S indicates that the following figure is the number of stop bits (1 = one, 2 = two).

Note
Start bits are not configurable and cannot be set.

Implemented Levelmaster functions

See Table F-6 for a description of the implemented Levelmaster functions in the HMC.

Table F-6: Implemented Functions of Levelmaster Protocol

Input format	Description	Output format
UnnN?	Return ID number	UnnNnnCcccc
UnnNmm	Set ID number	UnnNOKCcccc
UnnF?	Return number of floats	UnnFxCcccc
UnnFx?	Set number of floats	UnnFOKCcccc
Unn?	Return floats and other data	UnnDddd.ddFfffEeeeeWwwwCccc[1]

(1) In this case, number of floats is set to 1. If number of floats is set to 2, the Output Format would be: UnnDddd.ddDddd.ddFfffEeeeeWwwwCcccc

Note
If one float is sent, it is “Float1”. If two floats are sent, it is “Float 1” before “Float 0”.

Table F-7: Letters and Expressions

Letter	Description
nn	nn is used to identify slave to respond; nn is a number 00-99 or ** (wildcard). The EmulCtrl Address Holding register can be configured to a higher value than 99. In that case, the address will be truncated to 99.
mm	mm is the new ID number for the slave; mm is a number 00-99.
x	x is the number of floats returned when slave receives Unn?, x is a number 0-2.
cccc	Is the 16 bit CRC checksum, cccc are hexadecimal characters.
ddd.dd	ddd.dd is the distance value from slave 1. Note that the first d can also be a ‘-’ (minus).
Float 1	Slave 1 PV.
Float 0	Slave 1 SV.
fff	The temperature value. Configured by Holding Register 3208 in HMC.[1]
eeee	An error value. Bit 0: Invalid SV value (Float 0). Bit 8: Invalid Temperature value. Bit 12: Invalid PV value (Float 1).
Wwww	A warning value, not used in this implementation.

(1) Any of the four available variables from any of the five HART slaves can be selected as the temperature source. The least four significant bits (bit 0-3) select the variable number. Bits 4-7 select the HART slave address. If invalid values are used, the temperature value will be invalid, with no Error bit set. For example, if we want to use FV from HART Slave 3 as temperature source, we have to write the value 34 Hex (52 decimal).

F.2.3 Modbus ASCII communication setup

The parameter, default, and configurable values are shown in Table F-8.

Table F-8: Modbus ASCII Communication Parameters

Parameter	Default value	Configurable values
Baud Rate	9600	1200, 2400, 4800, 9600, 19200
Start Bits	One	One
Data Bits	Seven	Seven, Eight
Parity	None	None, Odd, even
Stop Bits	One	One or Two
Address	1	1-255

To reset the communication parameters to default Modbus ASCII settings, use the following Modbus message:

```
HMC M1
```

Modbus ASCII parameter configuration

You want to use address 246 for the Rosemount 5300 Level Transmitter and the host uses the following parameters:

Table F-9: Parameters Used by the Host (In Case of Modbus ASCII, Example)

Parameter	Value
Baud Rate	9600
Start Bits	One
Data Bits	Seven
Parity	None
Stop Bits	One

To configure the Rosemount 5300 Level Transmitter to communicate with the host in this example, the following text string is written to the Modbus message area:

```
HMC M1 A246 B9600 D7 PN S1.
```

Note
Include all the parameters when writing to the message area.

Note that an address must be unique on the bus.

HMC These three letters are used for safety and will eliminate the risk of changing the configuration data by mistake.

M1 This means that the Modbus ASCII protocol is to be used.

A246 A indicates that the following number is the new address (address 246). Leading zeroes are not needed.

B9600 B indicates that the following number is the new baud rate (1200, 2400, 4800, 9600, 19200).

D7 D indicates that the following data bits are to be used (7 = seven, 8 = eight).

PN P identifies the following letter as parity type (O = odd, E = even, and N = none).

S1 S indicates that the following figure is the number of stop bits (1 = one, 2 = two).

Note
Start bits are not configurable and cannot be set.

F.3 Common Modbus® host configuration

When using Modbus RTU or Modbus ASCII, the registers to receive status and variables must be configured in the host system.

The transmission of single-precision (4 bytes) IEEE 754 floating point numbers can be rearranged in different byte orders specified by the Floating Point Format Code. The format code information, stated for each Remote Terminal Unit (RTU) respectively, specifies which registers to poll from the Rosemount 5300 Level Transmitter in order for the RTU to correctly interpret floating point numbers. The byte transmission order for each format code is demonstrated in Table F-10.

Table F-10: Byte Transmission Order is Specified by the Floating Point Format Code

Format Code	Byte transmission order	Description
0	[AB] [CD]	Straight word order, most significant byte first
1	[CD] [AB]	Inverse word order, most significant byte first
2	[DC] [BA]	Inverse word order, least significant byte first
3	[BA] [DC]	Straight word order, least significant byte first

Note
Some Modbus hosts cannot read the information described here using Input Registers (Modbus function code 4). The Input Register information can also be read using Holding Register (Function code 3). In this case, Input Register number + 5000 is used as Holding Register number.

Between host system and device, it is recommended to use 60 seconds or less between polls, and three retries.

F.3.1 Input registers

The register area starting with 1300 can be configured to have any of the four format codes. The configuration is done by setting FloatingPointFormatCode register (holding register 3000) to 0-3. This configuration can be done with the Rosemount Radar Master program.

Note
Depending on the slave number the Rosemount 5300 Level Transmitter is using, different registers must be used with the default slave number being 1. Slave number is determined by the HART address.

Table F-11: Output Variables for the Configurable Floating Point Format (Default Code 1)

Register Name	Register Number	Note
Slave 1 Status Conf	1300	Bit information in bitfield. Bit 0: Invalid Measurement Slave 1 PV. Bit 1: Invalid Measurement Slave 1 Non PV. Bit 2: Invalid Measurement Slave 1 Non PV. Bit 3: Invalid Measurement Slave 1 Non PV. Bit 14: HART bus busy (slave in burst or other master present) Bit 15: HTM Task not running (option not available). **Note** Bit 1-3 is set when Invalid Measurement of Slave 1 Non PV. i.e. all three bits are set simultaneously.
Slave 1 PV Conf	1302	Primary variable from slave 1 represented in IEEE 754 format, using the byte order set in the FloatingPointFormatCode register.
Slave 1 SV Conf	1304	Secondary variable from slave 1 represented in IEEE 754 format, using the byte order set in the FloatingPointFormatCode register.
Slave 1 TV Conf	1306	Tertiary variable from slave 1 represented in IEEE 754 format, using the byte order set in the FloatingPointFormatCode register.
Slave 1 FV Conf	1308	Fourth variable from slave 1 represented in IEEE 754 format, using the byte order set in the FloatingPointFormatCode register.
Slave 2 data	1310-1318	Same data as for Slave 1.
Slave 3 data	1320-1328	Same data as for Slave 1.
Slave 4 data	1330-1338	Same data as for Slave 1.
Slave 5 data	1340-1348	Same data as for Slave 1.

The Rosemount 5300 Level Transmitter register area starting with register 2000 is used for hosts that require Floating Point Format Code 0 (see Table F-12).

Table F-12: Output Variables for Floating Point Format Code 0

Register Name	Register Number	Note
Slave 1 Status	2000	Bit information in bitfield: Bit 0: Invalid Measurement Slave 1 PV. Bit 1: Invalid Measurement Slave 1 SV. Bit 2: Invalid Measurement Slave 1 TV. Bit 3: Invalid Measurement Slave 1 FV. Bit 14: HART bus busy (slave in burst or other master present) Bit 15: HTM Task not running (option not available). **Note** Bit 1-3 is set when Invalid Measurement of Slave 1 Non PV, i.e. all three bits are set simultaneously.
Slave 1 PV	2002	Primary variable from slave 1 represented in IEEE 754 format, using Floating Point Format Code 0.
Slave 1 SV	2004	Secondary variable from slave 1 represented in IEEE 754 format, using Floating Point Format Code 0.
Slave 1 TV	2006	Tertiary variable from slave 1 represented in IEEE 754 format, using Floating Point Format Code 0.
Slave 1 FV (QV)	2008	Fourth variable from slave 1 represented in IEEE 754 format, using Floating Point Format Code 0.

Floating Point Format Codes 2 and 3 use register areas 2100 and 2200, respectively (see Table F-13 and Table F-14).

Table F-13: Output Variables for Floating Point Format Code 2

Register Name	Register Number	Note
Slave 1 Status	2100	Bit information in bitfield: Bit 0: Invalid Measurement Slave 1 PV. Bit 1: Invalid Measurement Slave 1 SV. Bit 2: Invalid Measurement Slave 1 TV. Bit 3: Invalid Measurement Slave 1 FV. Bit 14: HART bus busy (slave in burst or other master present) Bit 15: HTM Task not running (option not available). **Note** Bit 1-3 is set when Invalid Measurement of Slave 1 Non PV, i.e. all three bits are set simultaneously.
Slave 1 PV	2102	Primary variable from slave 1 represented in IEEE 754 format, using Floating Point Format Code 2.
Slave 1 SV	2104	Secondary variable from slave 1 represented in IEEE 754 format, using Floating Point Format Code 2.
Slave 1 TV	2106	Tertiary variable from slave 1 represented in IEEE 754 format, using Floating Point Format Code 2.
Slave 1 FV (QV)	2108	Fourth variable from slave 1 represented in IEEE 754 format, using Floating Point Format Code 2.

Table F-14: Output Variables for Floating Point Format Code 3

Register Name	Register Number	Note
Slave 1 Status	2200	Bit information in bitfield: Bit 0: Invalid Measurement Slave 1 PV. Bit 1: Invalid Measurement Slave 1 SV. Bit 2: Invalid Measurement Slave 1 TV. Bit 3: Invalid Measurement Slave 1 FV. Bit 14: HART bus busy (slave in burst or other master present) Bit 15: HTM Task not running (option not available). **Note** Bit 1-3 is set when Invalid Measurement of Slave 1 Non PV, i.e. all three bits are set simultaneously.
Slave 1 PV	2202	Primary variable from slave 1 represented in IEEE 754 format, using Floating Point Format Code 3.
Slave 1 SV	2204	Secondary variable from slave 1 represented in IEEE 754 format, using Floating Point Format Code 3.
Slave 1 TV	2206	Tertiary variable from slave 1 represented in IEEE 754 format, using Floating Point Format Code 3.
Slave 1 FV (QV)	2208	Fourth variable from slave 1 represented in IEEE 754 format, using Floating Point Format Code 3.

F.3.2 Measurement units

Measurement units for the various HART slaves are stored in input registers as a Unit Code presented in Table F-15.

Table F-15: Measurement Units and Corresponding Input Registers

Register Name	Register Number
Slave 1 PV Units	104
Slave 1 SV Units	108
Slave 1 TV Units	112
Slave 1 FV (QV) Units	116

Conversion from Unit Code to measurement unit is given in Table F-16.

Table F-16: Conversion of Unit Code to Measurement Unit

Measurement	Unit Code	Measurement Unit
Volume	40	US Gallon
	41	Liters
	42	Imperial Gallons
	43	Cubic Meters
	46	Barrels
	111	Cubic Yards
	112	Cubic Feet
	113	Cubic Inches
Length	44	Feet
	45	Meters
	47	Inches
	48	Centimeters
	49	Millimeters
Temperature	33	Degree Fahrenheit
	32	Degree Celsius

F.4 Specific Modbus® host configuration

The Remote Terminal Unit needs to be configured to communicate and correctly interpret data when reading input registers from the Rosemount 5300 Level Transmitter.

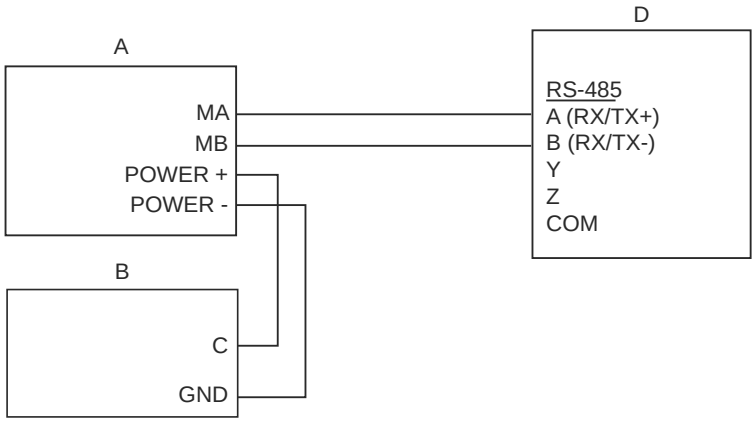
Baud rate

The specified Baud Rates are recommendations. If other Baud Rates are used, make sure the Rosemount 5300 Level Transmitter and the RTU are configured for the same communication speed.

Floating point format code

See Common Modbus® host configuration.

RTU data type



The RTU data type specifies which configuration to use in the RTU in order for the RTU to correctly interpret a floating point number transmitted from the Rosemount 5300 Level Transmitter with Modbus.

Input register base number

Data registers in the Rosemount 5300 Level Transmitter with Modbus are numbered exactly as they are transmitted in the Modbus communication. Some RTUs use different naming conventions and to configure the RTU to poll the correct registers from the Rosemount 5300 Level Transmitter Modbus, an Input Register Base Number is stated for each RTU respectively. For example, if the input register base number is 1 for the RTU, the Rosemount 5300 Level Transmitter Modbus input register 1302 has to be entered in the RTU address as input register 1303.

F.4.1 Emerson ROC800 Series

Figure F-2: Wiring Diagram for Connecting Rosemount 5300 Modbus to Emerson ROC800 Series

A. Rosemount 5300 Modbus
B. Power supply
C. + 8 to + 30 Vdc (max. rating)
D. ROC800 Series

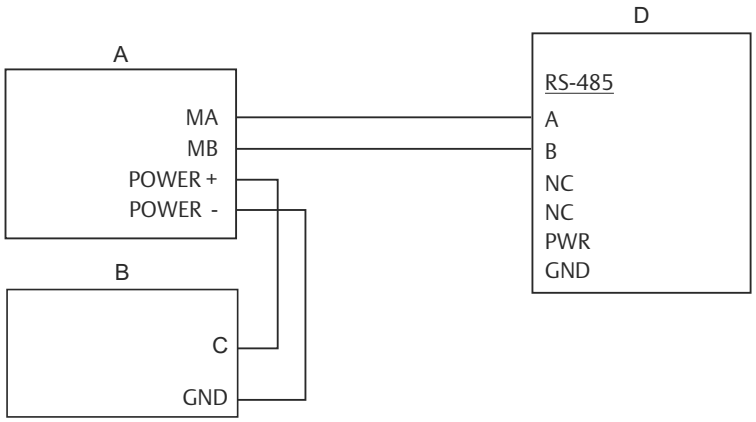


Table F-17: Parameter Values (In Case of Emerson ROC800 Series)

Parameter	Value
Baud Rate	9600
Floating Point Format Code	0
RTU Data Type	Conversion Code 66
Input Register Base Number	0

The Input Register Base Number needs to be added to the Input Register address of the Rosemount 5300 Level Transmitter. In this case, register 1300 needs to have 1300 entered as the address.

F.4.2 Emerson FloBoss 107

Figure F-3: Wiring Diagram for Connecting Rosemount 5300 Modbus to Emerson FloBoss 107

A. Rosemount 5300 Modbus
B. Power supply
C. + 8 to + 30 Vdc (max. rating)
D. FloBoss 107

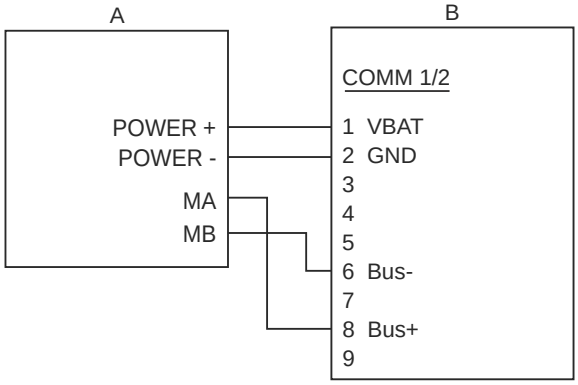

Table F-18: Parameter Values (In Case of Emerson FloBoss 107)

Parameter	Value
Baud Rate	9600
Floating Point Format Code	0
RTU Data Type	Conversion Code 66
Input Register Base Number	0

The Input Register Base Number needs to be added to the Input Register address of the Rosemount 5300 Level Transmitter. In this case, register 1300 needs to have 1300 entered as the address.

F.4.3 ABB TotalFlow

Figure F-4: Wiring Diagram for Connecting Rosemount 5300 Modbus to ABB TotalFlow

A. Rosemount 5300 Modbus
B. TOTALFLOW

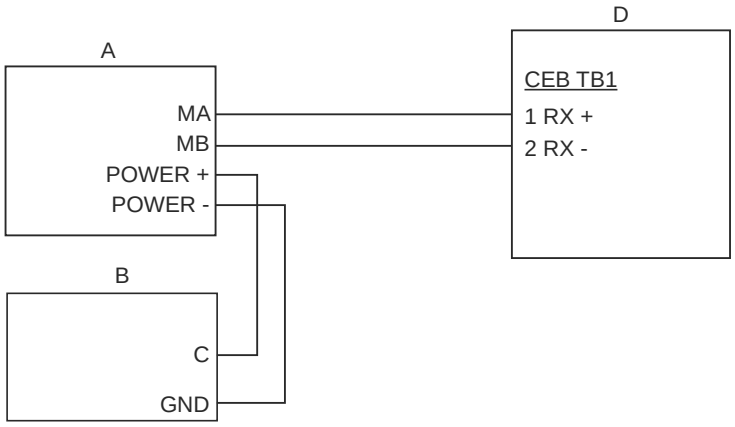

Table F-19: Parameter Values (In Case of ABB TotalFlow)

Parameter	Value
Baud Rate	9600
Floating Point Format Code	0
RTU Data Type	16 Bit Modicon
Input Register Base Number	1

The Input Register Base Number needs to be added to the Input Register address of the Rosemount 5300 Level Transmitter. In this case, register 1302 needs to have 1303 entered as the address etc.

F.4.4 Thermo Electron Autopilot

Figure F-5: Wiring Diagram for Connecting Rosemount 5300 Modbus to Thermo Electron Autopilot

A. Rosemount 5300 Modbus
B. Power supply
C. + 8 to + 30 Vdc (max. rating)
D. AutoPILOT

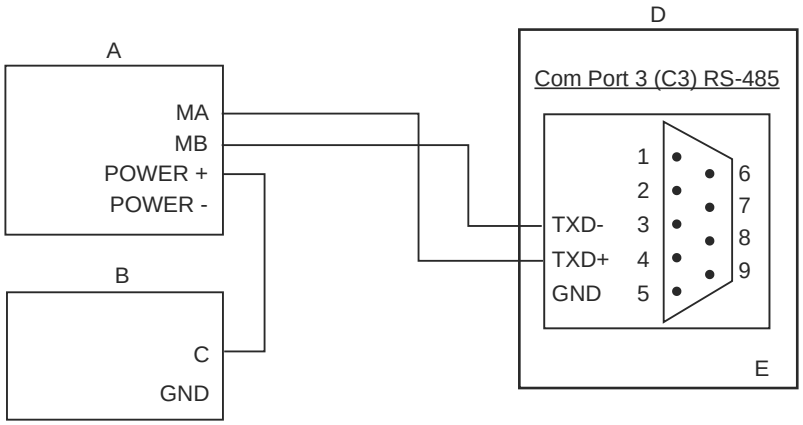

Table F-20: Parameter Values (In Case of Thermo Electron Autopilot)

Parameter	Value
Baud Rate	9600
Floating Point Format Code	1
RTU Data Type	IEEE Flt 2R
Input Register Base Number	0

The Input Register Base Number needs to be added to the Input Register address of the Rosemount 5300 Level Transmitter. In this case, register 1302 needs to have 1302 entered as the address etc.

F.4.5 Bristol ControlWave Micro

Figure F-6: Wiring Diagram for Connecting Rosemount 5300 Modbus to Bristol ControlWave Micro

A. Rosemount 5300 Modbus
B. Power supply
C. + 8 to + 30 Vdc (max. rating)
D. ControlWave Micro
E. DB9 Male

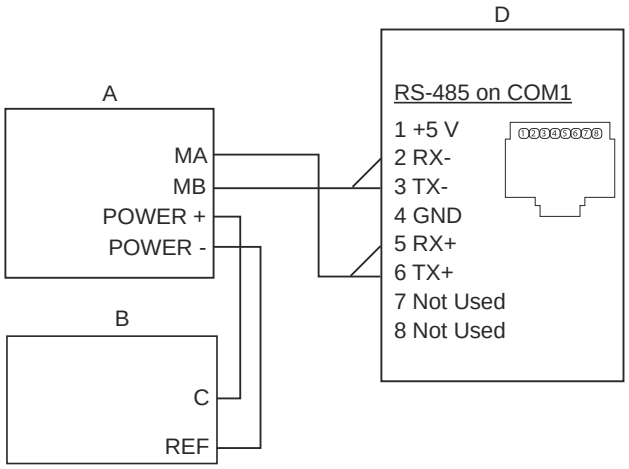

Table F-21: Parameter Values (In Case of Bristol ControlWave Micro)

Parameter	Value
Baud Rate	9600
Floating Point Format Code	2 (FC 4)
RTU Data Type	32-bit registers as 2 16-bit registers
Input Register Base Number	1

The Input Register Base Number needs to be added to the Input Register address of the Rosemount 5300 Level Transmitter. In this case, register 1302 needs to have 1303 entered as the address etc.

F.4.6 ScadaPack

Figure F-7: Wiring Diagram for Connecting Rosemount 5300 Modbus to SCADAPack 32

A. Rosemount 5300 Modbus
B. Power supply
C. + 8 to + 30 Vdc (max. rating)
D. SCADAPack32

Table F-22: Parameter Values (In Case of SCADAPack 32)

Parameter	Value
Baud Rate	9600
Floating Point Format Code	0
RTU Data Type	Floating Point
Input Register Base Number	30001

The Input Register Base Number needs to be added to the Input Register address of the Rosemount 5300 Level Transmitter. In this case, register 1302 needs to have 31303 entered as the address etc.

F.4.7 Kimray Inc. DACC 2000/3000

Table F-23 shows input types in Kimray Inc. IMI software and the corresponding value. The communication port must be configured to use “Tank Levels” protocol.

Table F-23: Kimray Inc. Input Types and Corresponding Values

Kimray Inc. Input Type	Rosemount 5300 Variable	Format
Tank Level1	PV	ddd.dd.alt. -dd.dd
Tank Level2	SV	ddd.dd.alt -dd.dd

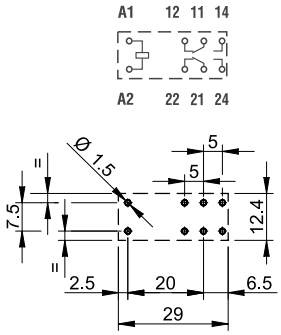
SWITCH TO THE FUTURE

REPORT

40 Series
Miniature PCB/Plug-in relays

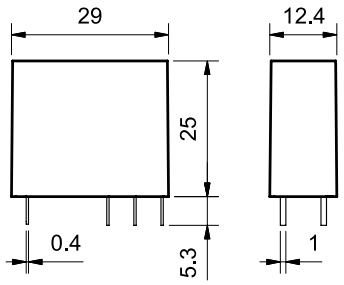
New PCB/Plug-in relays with 2 contacts 8A - $AgSnO_2$ Type 40.52



New relays with 2 CO contacts 8 A and low coil power.
$AgSnO_2$ contact guarantees much higher performance in the presence of loads with high inrush currents.

- 2 CO contacts 8 A
- $AgSnO_2$ contacts for maximum peak current up to 60 A for 5 ms
- AC and DC coils
- Complies EN 60335-1 glow wire requirements
- Ambient temperature range -40…+85°C
- 5.3 mm pin pitch for 95 Series sockets mount or PCB

Approvals



NEW

New PCB/Plug-in relays with 2 contacts 8A - $AgSnO_2$
Type 40.52

Copper side view

- 2 CO contacts rated 10 A
- Wide range of AC and DC coil voltages available
- Coil power AC, 1.2 VA (50 Hz)
  Standard DC, 650 mW
  Sensitive DC, 500 mW
- 8 mm Creepage and Clearance, 6 kV (1.2/50µs) between coil and contact
- Contact material AgNi or $AgSnO_2$
- Meets EN 60335-1 glow wire requirements
- 95 series sockets for PCB or 35 mm rail mounting (EN 60715) with Screw, Screwless or Push-in terminals
- Environmental protection: RT II - flux proof (Standard)
  RT III - wash tight (Option)

IEC/EN 60947-5-1
UL 60947-5-1
CAN/CSA-C22.2 No. 60947-5-1

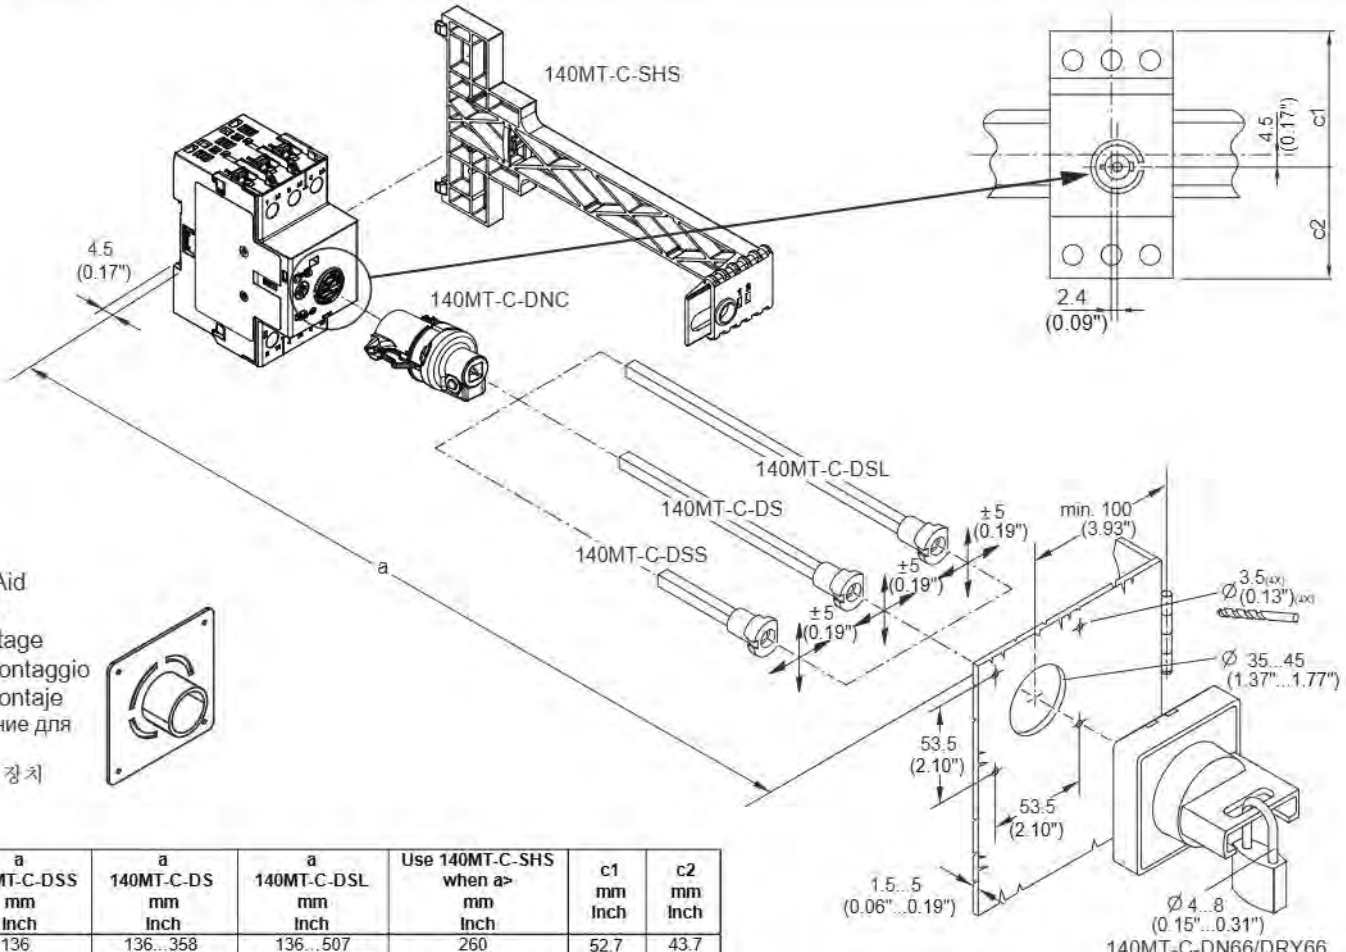
At the end of its life, this equipment should be collected separately from any unsorted municipal waste.

en ATTENTION! HAZARDOUS VOLTAGE!
The installation and the operation of this device and any maintenance must be carried out by a qualified person in accordance with specific local standards and safety regulations. Before installing this device, read these operating instructions carefully. Do not touch live parts. To avoid damages to persons and material the devices have to be replaced in case of mechanical and/or electrical damage.

de ACHTUNG! GEFÄHRLICHE SPANNUNG!
Die Installation und die Inbetriebnahme dieses Gerätes sowie jegliche Wartungsarbeiten müssen durch eine qualifizierte Fachkraft durchgeführt werden. Dabei sind lokale Normen und Sicherheitsvorschriften zu beachten. Vor der Installation des Gerätes muss diese Betriebsanleitung aufmerksam gelesen werden. Spannung führende Teile nicht berühren. Um Personen- und Sachschäden auszuschließen, müssen die Geräte im Fall einer mechanischen und/oder elektrischen Beschädigung unbedingt ausgetauscht werden.

fr DANGER! TENSION ÉLECTRIQUE DANGEREUSE !
L'installation et la mise en service de cet appareil ainsi que toute opération de maintenance doivent être réalisées par une personne qualifiée, dans le respect des normes locales et des dispositions en matière de sécurité. Avant d'installer cet appareil, lisez attentivement cette notice d'utilisation. Ne pas toucher les éléments sous tension. Afi n d'éviter des dommages corporels et matériels, les appareils doivent être remplacés en cas de dommage mécanique et/ou électrique.

it ATTENZIONE! TENSIONE PERICOLOSA!
L'installazione e la messa in esercizio di questo apparecchio e tutti gli interventi di manutenzione dovranno essere eseguiti da tecnici qualificati, in osservazione delle norme di legge locali e delle disposizioni di sicurezza. Non toccare le parti in tensione! Per escludere lesioni a persone e danni materiali, sostituire gli apparecchi in caso di danneggiamento meccanico e/o elettrico.



zh 注意！ 电压危险！
此设备的安装和运行以及任何保养工作必须由具备资格的专业人员进行，并遵守当地的有关标准和安全规则。在安装此设备前，请仔细阅读这些使用说明。不要触摸带电部件。为避免造成人员伤害和物质损坏，发生机械和/或电气损坏时必须更换设备。

es ¡ATENCIÓN! ¡TENSIÓN PELIGROSA!
La instalación y la puesta en funcionamiento de este dispositivo, así como cualquier trabajo de mantenimiento, deberán ser ejecutados por una persona competente cualificada. En esto, deberán observarse las normas locales y las normas de seguridad. No tocar piezas que se encuentren bajo tensión. Para evitar daños personales y materiales, los dispositivos deberán ser sustituidos al presentar cualquier daño mecánico y/o eléctrico.

ru ВНИМАНИЕ! ОПАСНОЕ НАПРЯЖЕНИЕ!
Монтаж и ввод в эксплуатацию данного прибора, а также любые работы по техобслуживанию, должны производиться квалифицированными специалистами. При этом, необходимо соблюдать местные нормы и правила техники безопасности. Не прикасаться к деталям, которые находятся под напряжением. Чтобы исключить нанесение травм, а также материальные ущербы, в случае механических и/или электрических повреждений приборы необходимо заменить.

pt ATENÇÃO TENSÃO PERIGOSA!
A instalação e operação deste dispositivo e qualquer manutenção devem ser feitas por pessoal qualificado, de acordo com as normas locais e regulamentações de segurança. Antes de instalar este dispositivo, leia com atenção as instruções de operação. Não toque em peças energizadas. Para evitar danos a pessoas e materiais, os dispositivos devem ser substituídos em caso de dano mecânico e/ou elétrico

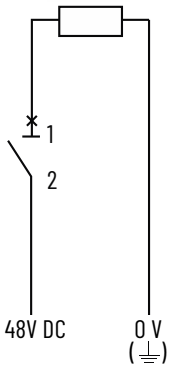
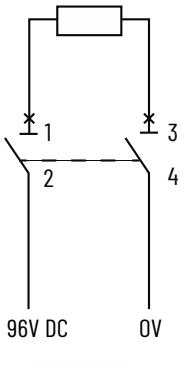
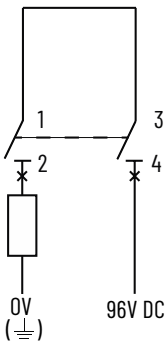
Miniature Circuit Breakers in DC Applications

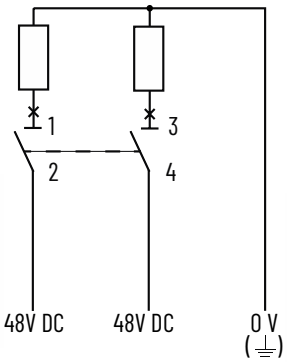
Bulletins 1489-M, 1492-SPM, and 1492-D

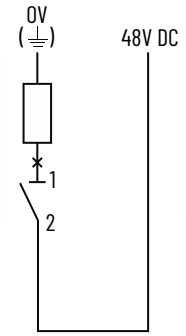
Topic	Page
Summary of Changes	2
1489-M Thermal-magnetic Miniature Circuit Breakers	3
1492-SPM Supplementary Protectors	4
1492-D DC High Voltage MCBs	5

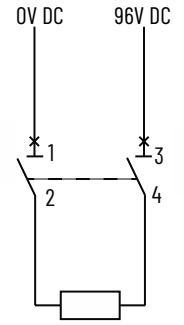


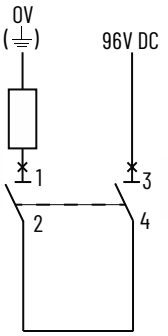


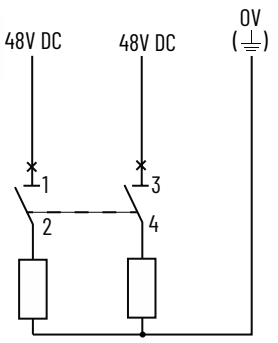








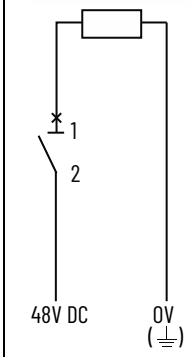


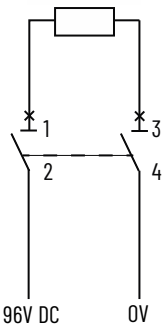


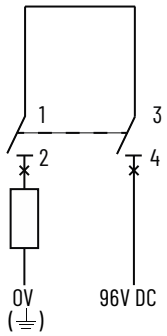
Summary of Changes

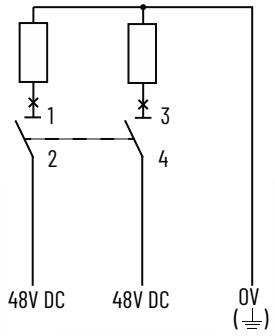
This publication contains the following new or updated information. This list includes substantive updates only and is not intended to reflect all changes.

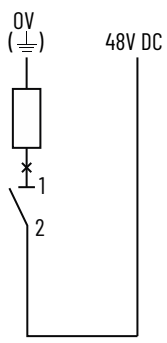
Topic	Page
Updated diagram within table for 1489-M1, 1-pole for Supply from the Top and DC clarification.	3
Updated diagram within table for 1492-SPM1, 1-pole for Supply from the Top and DC clarification.	4
Updated diagram within table for 1492-D, 1-pole for Supply from the Top and DC clarification.	5

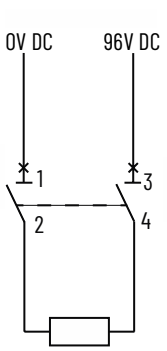


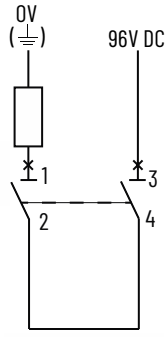


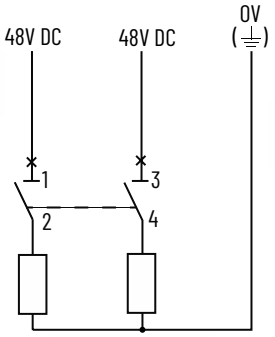












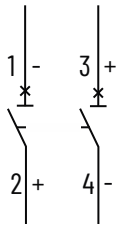
1489-M miniature circuit breakers (MCBs) can be used in the 1-pole version up to 48V DC and the 2-pole version with series connection of the two poles up to 96V DC. If voltages to earth exceeding 48V DC occur, see the 2-pole version of Bulletin 1489-M for 1-pole disconnection. During the installation process, polarity does not need to be considered. The outgoing circuit can be implemented from above or below the device. For voltage exceeding 48V DC up to 96V DC, series connection of two poles is required.

Example of Permissible Voltages between the Conductors - depending upon the number of poles and circuit layout

Description		**1489-M1, 1-pole**	**1489-M2, 2-pole**	**1489-M2, 2-pole**	**1489-M2, 2-pole**
Voltage Between Conductors	U_n	48V DC	96V DC	96V DC	96V DC
Voltages between Conductor and Earth	U_n	48V DC	48V DC	96V DC	48V DC
Supply from the Bottom					
Supply from the Top					

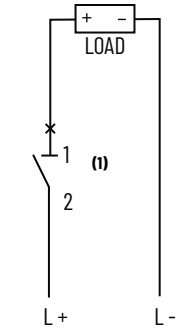
The 1492-SPM Supplementary Protectors can be used in the 1-pole version up to 48 DC and in the 2-pole version with series connection of the two poles up to 96V DC. If voltage to earth exceeding 48V DC occur, use the 2-pole version of the 1492-SPM for 1-pole disconnection. During the installation process, polarity does not need to be considered. Implement the outgoing circuit from above or below the device. For voltage exceeding 48V DC up to 96V DC, series connection of two poles is required.

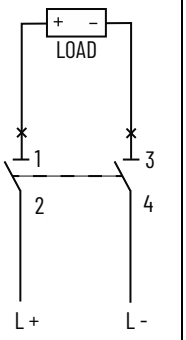
Example of Permissible Voltages between the Conductors - depending upon the number of poles and circuit layout

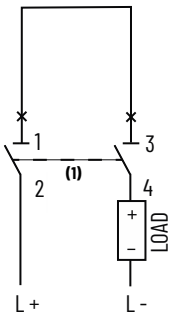


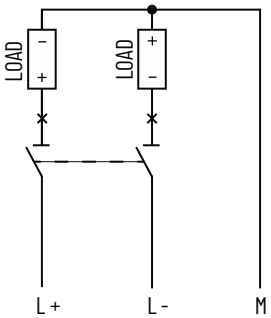
Description		1492-SPM1, 1-pole	1492-SPM2, 2-pole	1492-SPM2, 2-pole	1492-SPM2, 2-pole
Voltage between Conductors	U_n	48V DC	96V DC	96V DC	96V DC
Voltages between Conductor and Earth	U_n	48V DC	48V DC	96V DC	48V DC
Supply from the Bottom					
Supply from the Top					

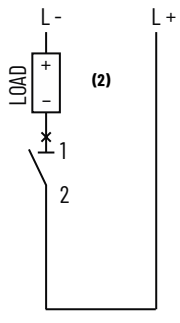
In UL and CSA Applications: The 1492-D MCB products can be used up to 250V DC in the 1-pole version and up to 500V DC in the 2-pole version when both poles are wired in series to switch a one pole DC load.

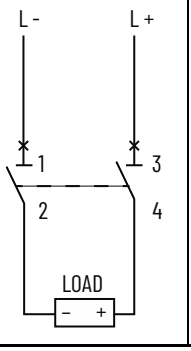


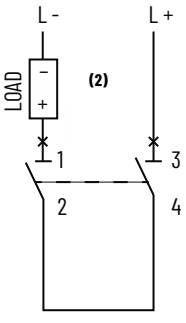


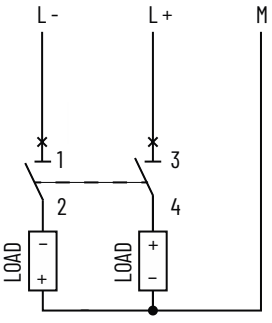










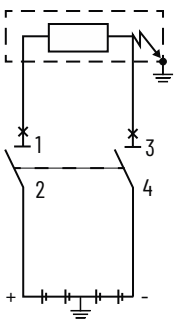


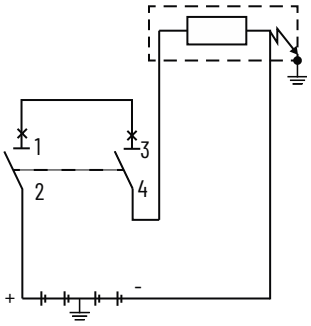
In IEC Applications: The 1492-D1 MCB products can be used up to 220V DC in the 1-pole version and up to 440V DC in the 2-pole version when wired in a series to switch a one pole DC load.

IMPORTANT Unlike the 1492-SPM, the 1492-D MCB is supplied with permanent magnets that help extinguish the arch. It is necessary to take the polarity of the 1492-D MCB and the supplied power into account during the installation process. Incorrect polarities can damage the 1492-D MCB. See the wiring diagrams below.

Polarity of 1492-D MCB

1-pole	2-pole
	





Examples of Supply Voltages and Wiring Diagram

Description	Application	1492-D 1-pole	1492-D 2-pole	1492-D 2-pole	1492-D 2-pole
Supply Voltage L+ to L-	UL/CSA	250V DC	500V DC	500V DC	500V DC
	IEC	220V DC	440V DC	440V DC	440V DC
Voltage L+ to Ground L- to Ground	UL/CSA	250V DC	250V DC	500V DC	250V DC
	IEC	220V DC	220V DC	440V DC	220V DC
Voltage Supplied from Below					
Voltage Supplied from Above					

Note No.	Information
1	The negative pole is grounded in the circuit
2	The position pole is grounded in the circuit

If voltages to earth ground exceed 250V DC (UL/CSA) or 220V DC (IEC), a 2-pole 1492-D must be used for 1-pole disconnection.

Examples for Symmetrical and Unsymmetrical Voltage Supplies - 1492-D2 2-Pole

Description		
Supply Voltage L+ to L-	500V DC All-pole Disconnection	500V DC 1-pole Disconnection
Voltage L+ to Ground, L- to Ground	250V DC Symmetrically Grounded	500V DC Unsymmetrically Grounded
Circuit Diagram Examples		

Additional Resources

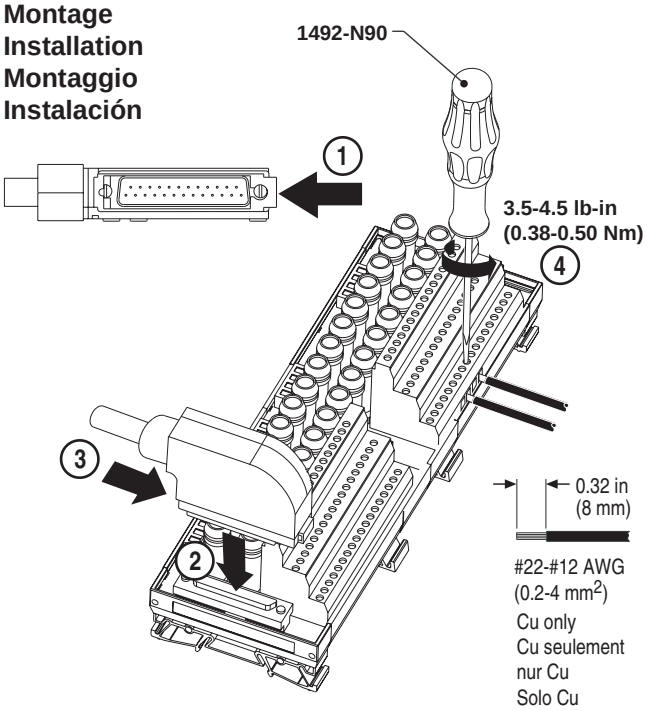
① **The 1492-TAIFM16-F-3 is designed specifically for use in a Control Logix SIL2 safety shutdown application using two 1756-IF16 analog input modules. Refer to A-B reference manual Using Control Logix in SIL2 Applications (1756-RM001_-EN-P) for details. Using this module in a non SIL2 application with 1756-IF16 modules is at the discretion of the user.**

Le 1492-TAIFM16-F-3 est conçu spécifiquement pour une utilisation dans une application d'arrêt de sécurité Control Logix SIL2 utilisant deux modules d'entrées analogiques 1756-IF16. Se reporter au manuel de référence A-B Utilisation de Control Logix dans les applications SIL2 (1756-RM001_-EN-P) pour plus de détails. L'utilisation de ce module dans une application non SIL2 avec des modules 1756-IF16 est à la discrétion de l'utilisateur.

Das 1492-TAIFM16-F-3 ist speziell für die Verwendung in einer Control Logix SIL2-Sicherheitsschaltleiste mit zwei 1756-IF 6-Analogeingangsmodulen konzipiert. Einzelheiten finden Sie im A-B-Referenzhandbuch zur Verwendung von Control Logix in SIL2-Leisten (1756-RM001_-EN-P). Die Verwendung dieses Moduls in einer anderen Leiste (nicht SIL2) mit 1756-IF 16-Modulen erfolgt auf eigenes Risiko des Benutzers.



Il modulo 1492-TAIFM16-F-3 è progettato specificamente per l'uso con un'applicazione di arresto di sicurezza SIL2 Control Logix con due moduli di ingresso analogico 1756-IF16. Per dettagli, fare riferimento alla guida Allen-Bradley Using Control Logix in SIL2 Applications (1756-RM001_-EN-P). L'uso di questo modulo in un'applicazione non di tipo SIL2 con moduli 1756-IF16 è a discrezione dell'utente.

El 1492-TAIFM16-F-3 está creado específicamente para su utilización en una aplicación de corte de seguridad ControlLogix SIL2 mediante la utilización de dos módulos de entrada analógica 1756-IF16. Para obtener más información, consulte el manual de referencia A-B Utilización de ControlLogix en aplicaciones SIL2 (1756-RM001_-EN-P). La utilización de este módulo en una aplicación que no sea SIL2 con módulos 1756-IF16 es a criterio del usuario.

Die LED zeigt eine durchgebrannte Sicherung an.

La spia LED indica la presenza di un fusibile bruciato.

Indicador de fusible fundido.

③ All Shield terminals (Row A) are common.

Toutes les bornes blindées (rangée A) sont communes.

Alle Schirmungsklemmen (Reihe A) werden gemeinsam verwendet.

Tutti i terminali di schermo (serie A) sono comuni.

Todos los terminales de protección (serie A) son comunes.

④ Terminals starting with A are the lower row of terminals, B terminals are the middle row, C terminals are the upper row. TB1 is the left terminal block, TB2 is the right terminal block.

Les bornes commençant par A sont la rangée inférieure de bornes, les bornes B sont la rangée intermédiaire et les bornes C sont la rangée supérieure. TB1 est le bloc de bornes de gauche et TB2 est le bloc de bornes de droite.

Klemmen mit Anfangsbuchstaben A befinden sich in der unteren Reihe, Klemmen mit Anfangsbuchstaben B in der mittleren Reihe, Klemmen mit Anfangsbuchstaben C in der oberen Reihe. TB1 bezeichnet den linken Klemmenblock, TB2 den rechten Klemmenblock.

I terminali che iniziano con A sono quelli della serie inferiore, i terminali B sono quelli della serie centrale e i terminali C sono quelli della serie superiore. TB1 è il blocco terminali sinistro, TB2 è il blocco terminali destro.

Los terminales que empiezan con A son la serie inferior de terminales, los terminales B son la serie intermedia, los C son la serie superior. TB1 es el bloque terminal izquierdo, TB2 es el bloque terminal derecho.

⑤ Refer to PLC manual for proper grounding.

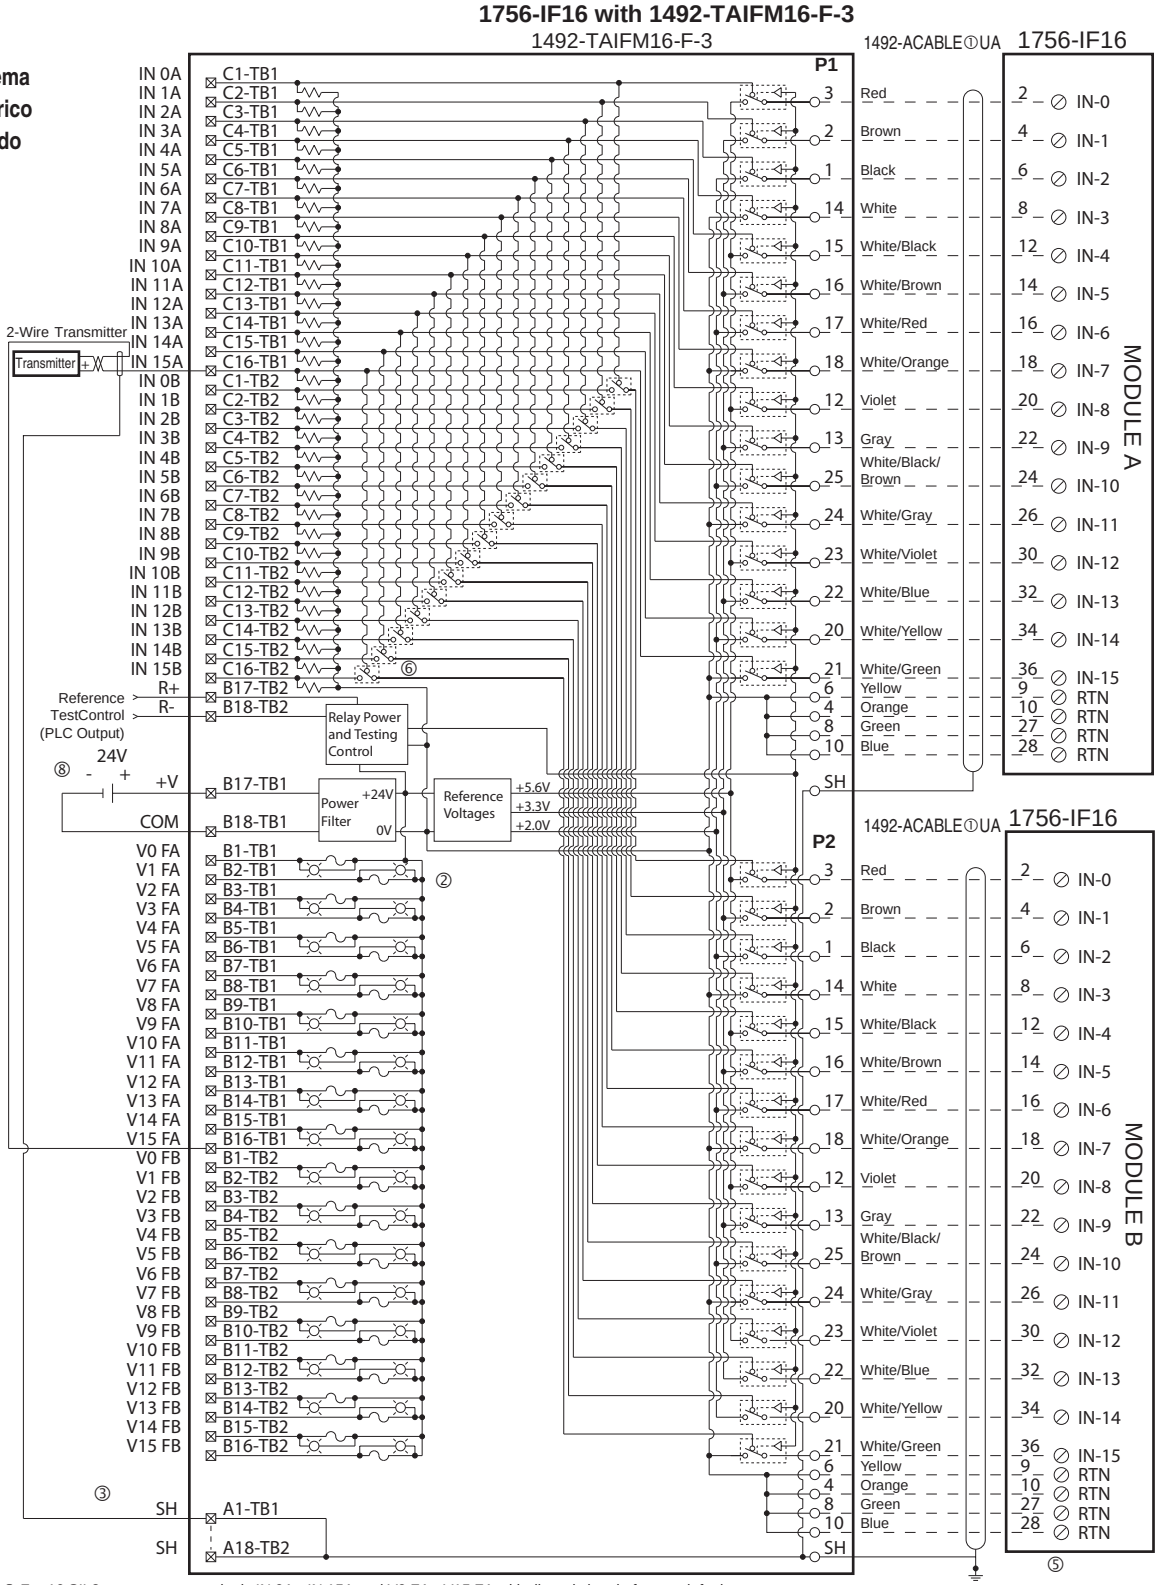
Se reporter au manuel de l'automate pour la mise à la masse appropriée.

Hinweise zur korrekten Erdung finden Sie im PLC-Handbuch.

Per il collegamento a terra, fare riferimento al manuale del modulo PLC.

Consulte el manual PLC para obtener información para la correcta conexión a tierra.

⑥ Dip switches provided to choose between 16 SIL2 sensors or 32 standard sensors. Factory Default: 16 SIL2 sensors.



Les interrupteurs DIP fournis permettent de choisir entre 16 capteurs SIL2 et 32 capteurs standard. Le réglage par défaut en usine est de 16 capteurs SIL2.

Mit dem Kippschalter wird zwischen den 16

SIL2-Sensoren und den 32 Standardsensoren ausgewählt. Standardstellung: 16 SLI2-Sensoren.

I microinterruttori consentono di scegliere tra 16 sensori SIL2 e 32 sensori standard. Impostazione di fabbrica: 16 sensori SIL2.

Conmutadores DIP disponibles de 16 sensores SIL2 o de 32 sensores estándar. Predeterminado: 16 sensores SIL2.

⑦ For 16 SIL2 sensors use terminals IN 0A - IN 15A and V0 FA - V15 FA with dip switches in factory default.

Pour 16 capteurs SIL2, utiliser les bornes IN 0A - IN 15A et V0 FA - V15 FA avec les interrupteurs DIP ayant leur réglage par défaut en usine.

Verwenden Sie für die 16 SIL2-Sensoren die Klemmen IN 0A - IN 15A und V0 FA - V15 FA, wobei sich der Kippschalter in Standardstellung befinden muss.

Per il collegamento di 16 sensori SIL2 usare i terminali IN 0A - IN 15A e V0 FA - V15 FA con i microinterruttori configurati con le impostazioni di fabbrica.

Para 16 sensores SIL2, utilice terminales IN 0A - IN 15A y V0 FA - V15 FA con conmutadores DIP en valores predeterminados.

⑧ +24VDC input required for reference test terminals. Refer to Page 6 for specifications.

L'entrée +24VCC est nécessaire pour le test de référence de bornes. Reportez-vous en page 6 pour les spécifications.

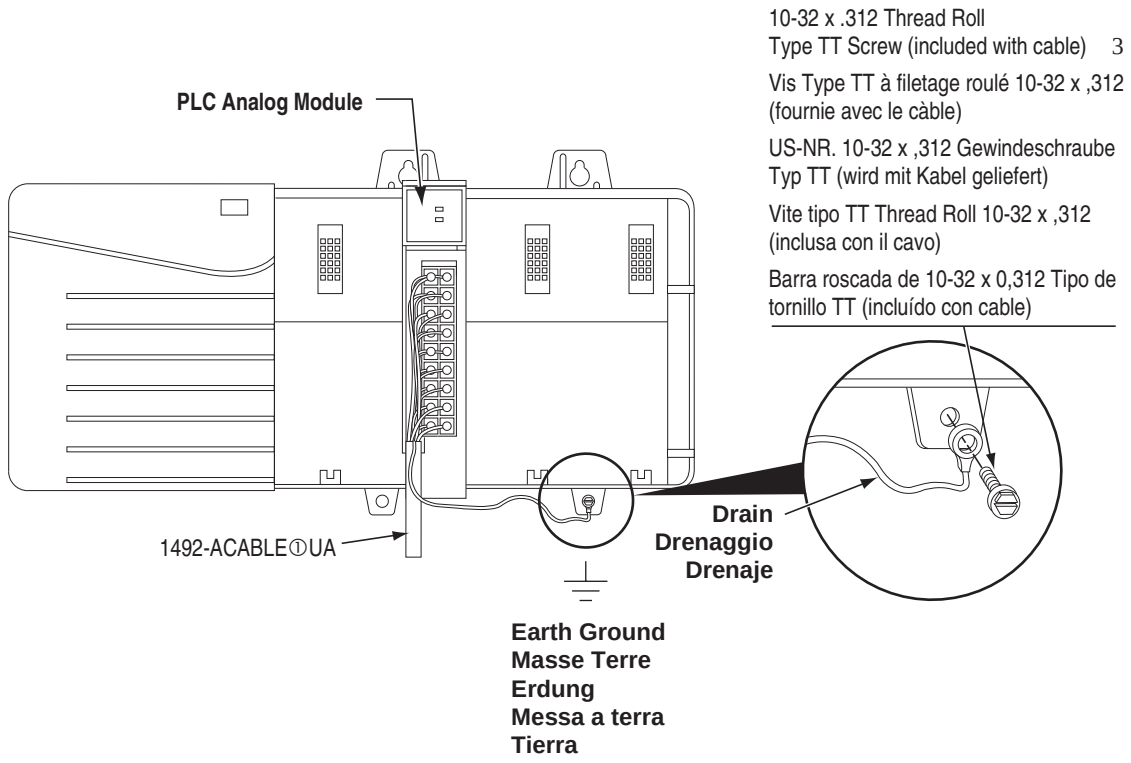
Für Bezugsmessklemmen sind + 24 V DC Eingangsspannung erforderlich. Spezifikationen siehe Seite 6

È richiesta una tensione di ingresso di +24VCC per i terminali del test di riferimento. Fare riferimento a pagina 6 per le caratteristiche.

Entrada +24 VDC necesaria para terminales de prueba de referencia. Consulte la página 6 para obtener más información.

Transmitter must be 4-20mA (TAIFM16 resistor converts to voltage) or 0-5V output. A 0-10V output will cause premature IFM failure.

L'émetteur doit avoir une sortie de 4-20mA (la résistance TAIFM16 effectue la conversion en tension) ou 0-5V. Une sortie de 0-10V provoque une défaillance IFM prématurée.



Die Ausgangsleistung des Transmitters muss 4-20 mA (vom TAIFM16-Widerstand in Spannung umgewandelt) oder 0-5 V betragen. Bei einer Ausgangsleistung von 0-10 V kommt es zu einem frühzeitigen IMF-Ausfall.

L'uscita del trasmettitore deve erogare 4-20mA (la resistenza TAIFM16 esegue la conversione in tensione) o 0-5V. Un'uscita 0-10V causerà guasti prematuri al modulo di interfaccia.

El transmisor debe tener una salida de 4-20 mA (la resistencia TAIFM16 se convierte a voltaje) o 0-5 V. Una salida de 0-10V causa fallos IFM prematuros.

1756-OB16D with 1492-TIFM40F-24-2

① Cables are available in 0.5m, 1.0m, 2.5m, and 5.0m standard lengths (005=0.5m, 010=1.0m, 025=2.5m,050=5.0m). Custom length cables are also available.

Les câbles sont disponibles dans des longueurs standard de 0,5 m, 1,0 m, 2,5 m et 5,0 m (005=0,5 m, 010=1,0 m, 025=2,5 m, 050=5,0 m). Des longueurs personnalisées sont également disponibles.

Kabel sind in 0,5 m, 1,0 m, 2,5 m und 5,0 m Standardlängen (005=0,5 m, 010=1,0 m, 025=2,5 m, 050=5,0m) erhältlich. Sonderlängen sind ebenfalls erhältlich.

I cavi sono disponibili in lunghezze standard di 0,5m, 1,0m, 2,5m e 5,0m (005=0,5m, 010=1,0m, 025=2,5m e 050=5,0m). Sono inoltre disponibili cavi su misura.

Los cables se encuentran disponibles en longitudes estándares de 0,5 m, 1,0 m, 2,5 m, y 5,0 m (005 = 0,5 m, 010 = 1,0 m, 025 = 2,5 m, 050 = 5,0 m). También se encuentran disponibles cables de longitud a medida.

② Terminals starting with A are the lower row of terminals, B terminals are the upper row.

Les terminaisons commençant par A sont situées dans la rangée du bas, celles commençant par B correspondent à la rangée du haut.

Klemmen mit Anfangsbuchstaben A befinden sich in der unteren Reihe, Klemmen mit Anfangsbuchstaben B in der oberen Reihe.

I terminali che iniziano con A sono quelli della serie inferiore, i terminali B sono quelli della serie superiore.

Los terminales que empiezan con A son la serie inferior de terminales; los terminales B son la serie superior.

③ Use of separate 24VDC PLC outputs are required to control the power interruption relays. Refer to page 4 for relay specifications. Note: there are 2 relays to remove power from the individual I/O cards separately. Energize the relays to supply power to the output cards.

L'utilisation de sorties PLC 24 V CC séparées est obligatoire pour contrôler les relais de coupure du courant. Reportez-vous en page 4 pour les spécifications de relais. Remarque : 2 relais sont à retirer de chaque carte d'E/S.

Zur Steuerung des Stromunterbrechungsrelais sind zwei separate 24VDC PLC-Ausgänge erforderlich. Relais-Spezifikationen siehe Seite 4. Achtung: Es gibt 2 Relais, die die Stromversorgung an der jeweiligen E/A-Karte unterbrechen.

Per controllare i relè di interruzione dell'alimentazione è richiesto l'uso di uscite PLC a 24 VCC separate. Fare riferimento a pagina 4 per le caratteristiche del relè. Nota: sono disponibili 2 relè per rimuovere l'alimentazione dalle singole schede I/O separatamente.

Se requiere el uso de salidas separadas PLC de 24V de corriente continua para controlar los relés de interrupción de alimentación.

Consulte la página 4 para obtener información sobre las especificaciones de relé. Nota: Existen dos relés para quitar la alimentación de cada tarjeta de E/S por separado.

④ With this module and cable combination, maximum IFM ratings are as follows: 1.5 A / Circuit 6.0 A / Module

Avec ce module et ce câble, l'ampérage IFM maximum est le suivant : 1,5 A / circuit 6,0 A / module

Bei diesem Modul und bei dieser Verkabelung gelten folgende maximale IFM-Nennwerte: 1,5 A / Schaltkreis 6,0 A / Modul

I valori IFM massimi per questa combinazione di cavi e modulo sono i seguenti: 1,5 A / Circuito 6,0 A / Modulo

Con esta combinación de cable y módulo, la capacidad máxima de IFM es: 1,5 A / circuito 6,0 A / módulo

⑤ Use of one power source is required for this module combination.

Cette combinaison de modules doit être reliée à une source d'alimentation dédiée.

Für diese Modulkombination muss eine Stromquelle verwendet werden.

Questa combinazione di modulo richiede l'uso di una sorgente di alimentazione.

Se requiere el uso de una fuente de alimentación para esta combinación de módulo.

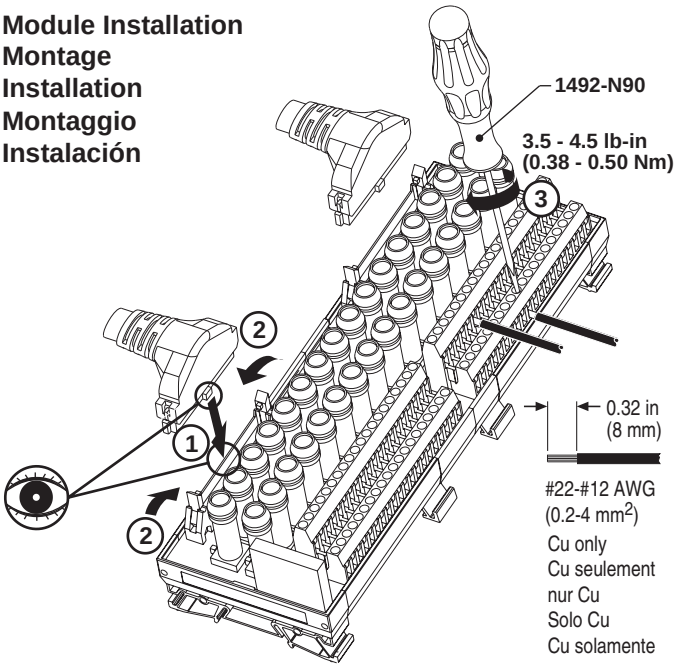
Morsetti dei fusibili e indicatori dei fusibili bruciati: vedere il montaggio/smontaggio dei fusibili a pagina 3.
Sujetadores de fusibles e indicadores de fusible fundido: Vea la página 3 para obtener información sobre la instalación/extracción de fusibles.

(1) **The 1492-TIFM40F-24A-2 is designed specifically for use in a Control Logix SIL2 safety shutdown application using two 1756-IB32 DC input modules. Refer to A-B reference manual Using Control Logix in SIL2 Applications (1756-RM001_-EN-P) for details. Using this module in a non SIL2 application with 1756-IB32 modules is at the discretion of the user.**

Le 1492-TIFM40F-24A-2 est tout spécialement conçu pour être utilisé dans un système d'arrêt d'urgence Control Logix SIL2 équipé de deux modules d'entrée 1756-IB32 CC. Pour plus d'informations, reportez-vous au manuel de référence A-B Using Control Logix in SIL2 Applications (1756-RM001_-EN-P). Toute utilisation de ce module dans une application autre que SIL2 équipée de modules 1756-IB32 est laissée à la discrétion de l'utilisateur.

Das 1492-TIFM40F-24A-2 ist speziell für die Verwendung in einer Control Logix SIL2-Sicherheitsschaltleiste mit zwei 1756-IB32 DC-Eingangsmodulen konzipiert. Einzelheiten finden Sie im A-B-Referenzhandbuch zur Verwendung von Control Logix in SIL2-Leisten (1756-RM001_-EN-P). Die Verwendung dieses Moduls in einer anderen Leiste (nicht SIL2) mit 1756-IB32-Modulen erfolgt auf eigenes Risiko des Benutzers.



Il modulo 1492-TIFM40F-24A-2 è progettato specificamente per l'uso con un'applicazione di arresto di sicurezza SIL2 Control Logix con due moduli di ingresso CC 1756-IB32. Per dettagli, fare riferimento alla guida Allen-Bradley Using Control Logix in SIL2 Applications (1756-RM001_-EN-P). L'uso di questo modulo in un'applicazione non di tipo SIL2 con moduli 1756-IB32 è a discrezione dell'utente.

1492-TIFM40F-24A-2 se ha diseñado específicamente para utilizarse en un sistema de paralización de emergencia Control Logix SIL2 con dos módulos de entrada 1756-IB32 de corriente continua. Para obtener información adicional, consulte el manual de referencia A-B "Using Control Logix in SIL2 Applications (1756-RM001_-EN-P)". Queda a discreción del usuario el uso de este módulo en un sistema distinto a SIL 2 con módulos 1756-IB32.

DH-485 module	1756-DH485	DH-485 module	21
SynchLink™	1756-SYNCH	SynchLink fiber-optic communication link	23

Communication Connections

A ControlLogix® system uses connections to establish communication links between devices. The types of connections include the following:

- Controller-to-local I/O modules or local communication modules
- Controller-to-remote I/O or remote communication modules
- Controller-to-remote I/O (rack-optimized) modules
- Produced and consumed tags
- Messages
- Controller access with the Studio 5000® environment
- Controller access with RSLinx® software for HMI or other applications

You indirectly determine the number of connections the controller uses by configuring the controller to communicate with other devices in the system. The limit of connections ultimately resides in the communication module you use for the connection. If a message path routes through a communication module, the connection that is related to the message also counts towards the connection limit of that communication module.

EtherNet/IP Network

The Ethernet Industrial (EtherNet/IP) network protocol is an open industrial-networking standard that supports both real-time I/O messaging and message exchange. The EtherNet/IP network uses off-the-shelf Ethernet communication chips and physical media.

For these requirements	Select this interface
Control I/O modules and drives Act as an adapter for I/O on remote EtherNet/IP links Communicate with other EtherNet/IP devices (messages and HMI) Bridge EtherNet/IP links to route messages to devices on other networks	1756-EN2F, 1756-EN2FK 1756-EN2T, 1756-EN2TK, 1756-EN2TXT 1756-EN2TP, 1756-EN2TPK, 1756-EN2TPXT 1756-EN2TR, 1756-EN2TRK, 1756-EN2TRXT 1756-EN4TR, 1756-EN4TRK, 1756-EN4TRXT 1756-ENBT, 1756-ENBTK
Support Device Level Ring (DLR) and linear topologies	1756-EN2TR, 1756-EN2TRK, 1756-EN2TRXT 1756-EN3TR, 1756-EN3TRK 1756-EN4TR, 1756-EN4TRK, 1756-EN4TRXT
Support Parallel Redundancy Protocol (PRP)	1756-EN2TP, 1756-EN2TPK, 1756-EN2TPXT 1756-EN4TR(1), 1756-EN4TRK(1), 1756-EN4TRXT(1)
Support redundant adapters(2)	1756-EN4TR, 1756-EN4TRK, 1756-EN4TRXT
Provide control in environments where temperatures range from -25...+70 °C (-13...+158 °F)	1756-EN2TPXT 1756-EN2TRXT 1756-EN2TXT 1756-EN4TRXT
Secure access to a control system from within the plant network	1756-EN4TR, 1756-EN4TRK, 1756-EN4TRXT

(1) 1756-EN4TR supports PRP with revision 4.001 and higher firmware.
(2) Redundant adapters require version 3.x and higher firmware.

For more information on redundant adapters and Ethernet, see the ControlLogix EtherNet/IP Network User Manual, publication 1756-UM004.

EtherNet/IP Network Specifications

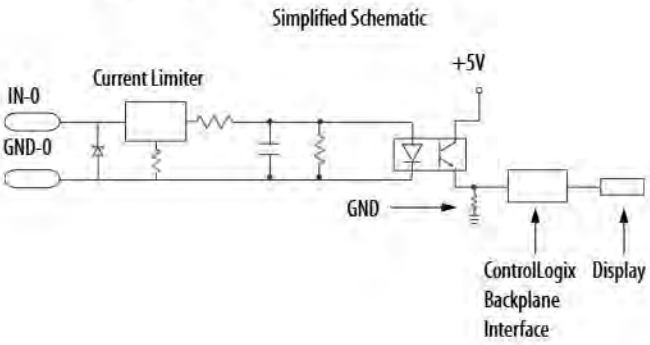

Table 1 - ControlLogix EtherNet/IP Connections Specifications(1)

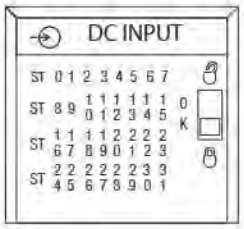
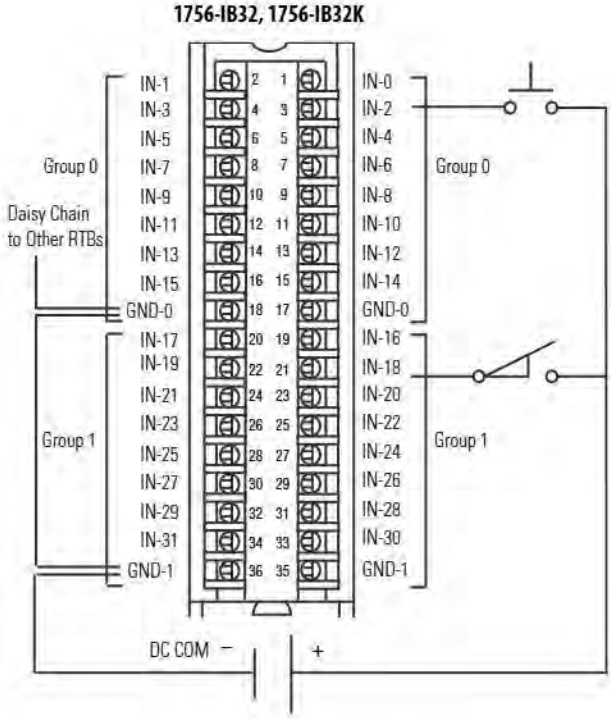


Cat. No.	Connections		CIP Unconnected Messages (backplane + Ethernet)
	TCP	CIP(2)	
1756-ENBT	64	128	64 + 64
1756-EN2F	128	256	128 + 128
1756-EN2T	128	256	128 + 128
1756-EN2TP	128	256	128 + 128
1756-EN2TR	128	256	128 + 128
1756-EN3TR	128	256	128 + 128
1756-EN4TR	512	1000 I/O 528 (3)	256+256



(1) There are 1000 CIP™ I/O connections and 528 CIP messaging connections.
(2) CIP connections can be used for all explicit or all implicit applications. For example, a 1756-ENBT module has a total of 128 CIP connections that can be used for any combination of connections.
(3) There are 1000 explicit connections and 528 implicit connections.

1756-IB32, 1756-IB32K

ControlLogix DC (10...31.2V) input module

Technical Specifications - 1756-IB32, 1756-IB32K

Attribute	1756-IB32, 1756-IB32K
Inputs	32 (16 points/group)
Voltage category	12/24V DC sink
Operating voltage range	10...31.2V DC
Input delay time (screw to backplane) Off to On On to Off	 Hardware delay: 380 µs max + filter time User-selectable filter time: 0 ms, 1 ms, or 2 ms Hardware delay: 420 µs max + filter time User-selectable filter time: 0 ms, 1 ms, 2 ms, 9 ms, or 18 ms
Current draw @ 5.1V	120 mA
Current draw @ 24V	2 mA
Total backplane power	0.66 W
Power dissipation, max	6.2 W @ 60 °C (140 °F)
Thermal dissipation	21.1 BTU/hr @ 60 °C (140 °F)
Off-state voltage, max	5V
Off-state current, max	2.27 mA
On-state current, min	4.8 mA @ 10V DC
On-state current, max	5.5 mA @ 31.2V DC

Technical Specifications - 1756-IB32, 1756-IB32K

Attribute	1756-IB32, 1756-IB32K
Inrush current, max	250 mA (decaying to < 37% in 22 ms, without activation)
Input impedance, max	5.67 kΩ @ 31.2V DC
Cyclic update time	200 µs...750 ms
Change of state	Software configurable
Time stamp of inputs	±200 µs
Isolation voltage	250V (continuous), reinforced insulation type, inputs-to-backplane 250V (continuous), basic insulation type, input group-to-group No isolation between individual group inputs
Module keying	Electronic, software configurable
Removable terminal block	1756-TBCH 1756-TBS6H
RTB keying	User-defined mechanical
Slot width	1
Wire category	1 - on signal ports(1)
Enclosure type	None (open-style)
North American temperature code	T4
IEC temperature code	T4
Reverse polarity protection	Yes

(1) Use this conductor category information for planning conductor routing as described in the system-level installation manual. See the Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.

Environmental Specifications - 1756-IB32, 1756-IB32K

Attribute	1756-IB32, 1756-IB32K
Temperature, operating IEC 60068-2-1 (Test Ad, Operating Cold), IEC 60068-2-2 (Test Bd, Operating Dry Heat), IEC 60068-2-14 (Test Nb, Operating Thermal Shock)	0...60 °C (32...140 °F)
Temperature, surrounding air, max	60 °C (140 °F)
Temperature, nonoperating IEC 60068-2-1 (Test Ab, Unpackaged Nonoperating Cold), IEC 60068-2-2 (Test Bb, Unpackaged Nonoperating Dry Heat), IEC 60068-2-14 (Test Na, Unpackaged Nonoperating Thermal Shock)	-40...+85 °C (-40...+185 °F)
Relative humidity IEC 60068-2-30 (Test dB, Unpackaged Damp Heat)	5...95% noncondensing
Vibration IEC 60068-2-6 (Test Fc, Operating)	2 g @ 10...500 Hz
Shock, operating IEC 60068-2-27 (Test Ea, Unpackaged Shock)	30 g
Shock, nonoperating IEC 60068-2-27 (Test Ea, Unpackaged Shock)	50 g
Emissions	IEC 61000-6-4
ESD immunity IEC 61000-4-2	6 kV contact discharges 8 kV air discharges

Environmental Specifications - 1756-IB32, 1756-IB32K

Attribute	1756-IB32, 1756-IB32K
Radiated RF immunity IEC 61000-4-3	10V/m with 1 kHz sine-wave 80% AM from 80...2000 MHz 10V/m with 200 Hz 50% Pulse 100% AM @ 900 MHz 10V/m with 200 Hz 50% Pulse 100% AM @ 1890 MHz 3V/m with 1 kHz sine-wave 80% AM from 2000...2700 MHz
EFT/B immunity IEC 61000-4-4	±4 kV at 5 kHz on signal ports
Surge transient immunity IEC 61000-4-5	±1 kV line-line (DM) and ±2 kV line-earth (CM) on signal ports
Conducted RF immunity IEC 61000-4-6	10V rms with 1 kHz sine-wave 80% AM from 150 kHz...80 MHz
Oscillatory surge withstand IEEE C37.90.1	3 kV

1756-IF16, 1756-IF16K

ControlLogix voltage/current analog input module

1756-IF16, 1756-IF16K Differential Current

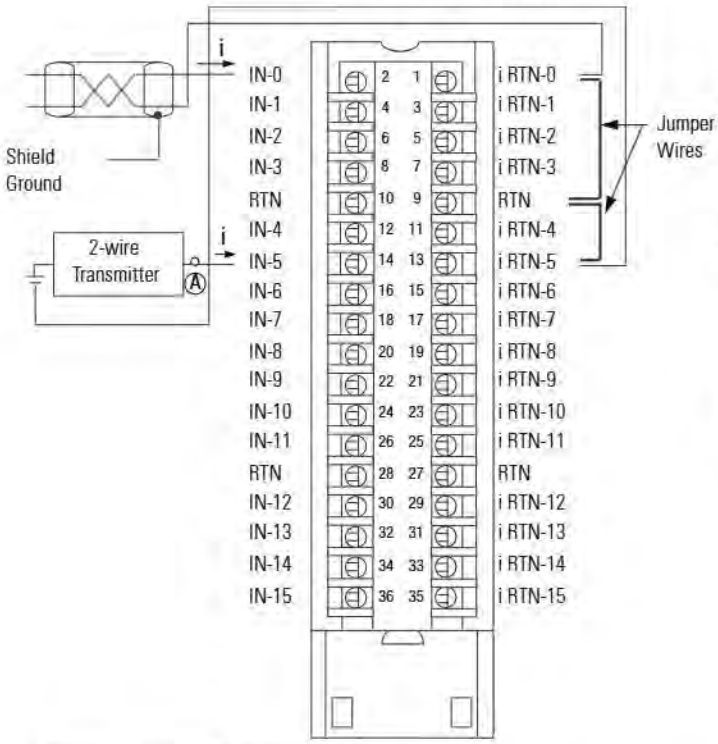
1756-IF16, 1756-IF16K Differential Voltage

Use this table when wiring your module in Differential mode.

This channel	Uses these terminals
Channel 0	IN-0 (+), IN-1 (-), i RTN-0
Channel 1	IN-2 (+), IN-3 (-), i RTN-2
Channel 2	IN-4 (+), IN-5 (-), i RTN-4
Channel 3	IN-6 (+), IN-7 (-), i RTN-6
Channel 4	IN-8 (+), IN-9 (-), i RTN-8
Channel 5	IN-10 (+), IN-11 (-), i RTN-10
Channel 6	IN-12 (+), IN-13 (-), i RTN-12
Channel 7	IN-14 (+), IN-15 (-), i RTN-14

- All terminals marked RTN are connected internally.
- A 249 Ω current loop resistor is located between IN-*x* and i RTN-*x* terminals.
- If multiple (+) or multiple (-) terminals are tied together, connect that tie point to an RTN terminal to maintain the accuracy of the module.
- Place additional loop devices (such as strip chart recorders) at the A location in the current loop.

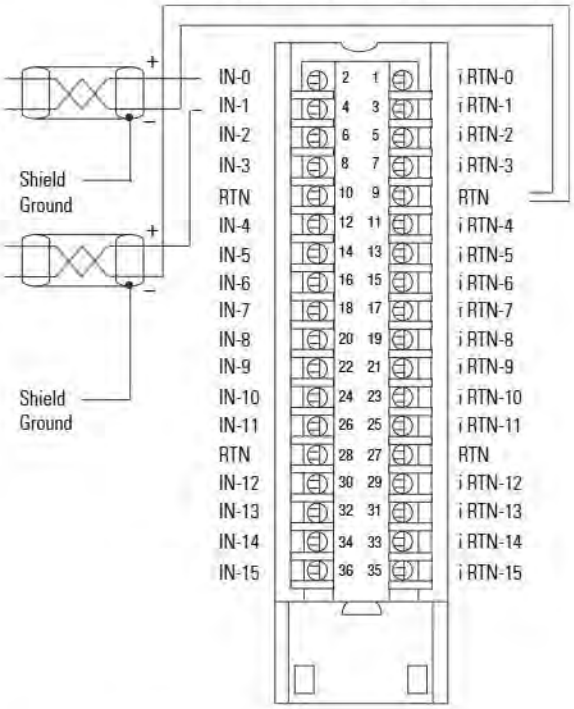
IMPORTANT: When operating in 4-channel, High-Speed mode, only use channels 0, 2, 4, and 6.



Use this table when wiring your module in Differential mode.

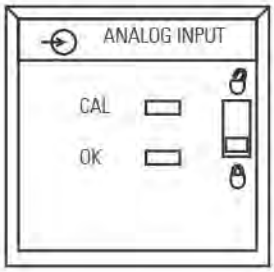
This channel	Uses these terminals
Channel 0	IN-0 (+), IN-1 (-)
Channel 1	IN-2 (+), IN-3 (-)
Channel 2	IN-4 (+), IN-5 (-)
Channel 3	IN-6 (+), IN-7 (-)
Channel 4	IN-8 (+), IN-9 (-)
Channel 5	IN-10 (+), IN-11 (-)
Channel 6	IN-12 (+), IN-13 (-)
Channel 7	IN-14 (+), IN-15 (-)

- All terminals marked RTN are connected internally.
- If multiple (+) or multiple (-) terminals are tied together, connect that tie point to an RTN terminal to maintain the accuracy of the module.
- Terminals marked RTN or i RTN are not used for differential voltage wiring.



IMPORTANT: When operating in 4-channel, High-Speed mode, only use channels 0, 2, 4, and 6.

1756-IF16, 1756-IF16K Single-ended Current



- All terminals marked RTN are connected internally.
- For current applications, all terminals marked i RTN must be wired to terminals marked RTN.
- A 249 Ω current loop resistor is located between IN-*x* and iRTN-*x* terminals.
- Place additional loop devices (such as strip chart recorders) at the A location in the current loop.

1756-IF16, 1756-IF16K Single-ended Voltage

- All terminals marked RTN are connected internally.
- Terminals marked i RTN are not used for single-ended voltage wiring.

Technical Specifications - 1756-IF16, 1756-IF16K

Attribute	1756-IF16, 1756-IF16K
Inputs	16 single ended, 8 differential or 4 differential (high speed)
Input range	±10V 0…10V 0…5V 0…20 mA
Resolution	320 µV/count (15 bits + sign bipolar) @ ±10.25V 160 µV/count (16 bits) @ 0…10.25V 80 µV/count (16 bits) @ 0…5.125V 0.32 µA/count (16 bits) @ 0…20.5 mA
Current draw @ 5.1V	150 mA
Current draw @ 24V	65 mA
Total backplane power	2.33 W
Voltage and current ratings	Backplane: 5.1V DC, 150 mA max 24V DC, 65 mA max Input Voltage Range: -10…+10V Input Current Range: 4…20mA Limited to 100VA
Power consumption	2.3 W
Power dissipation	Voltage: 2.3 W Current: 3.9 W
Thermal dissipation	Voltage: 7.84 BTU/hr Current: 13.3 BTU/hr
Input impedance	Voltage: >10 MΩ Current: 249 Ω
Open circuit detection time	Differential voltage - Positive full scale reading within 5 s Single-ended/differential current - Negative full scale reading within 5 s Single-ended voltage - Even-numbered channels go to positive full scale reading within 5 s, odd-numbered channels go to negative full scale reading within 5 s
Overvoltage protection, max	Voltage: 30V DC Current: 8V DC
Normal mode noise rejection	>80 dB @ 50/60 Hz(2)
Common mode noise rejection	>100 dB @ 50/60 Hz
Channel bandwidth	15 Hz (-3 dB)(2)
Settling time	<80 ms to 5% of full scale(2)
Calibrated accuracy 25 °C (77 °F)	Voltage: Better than 0.05% of range Current: Better than 0.15% of range
Offset drift	45 µV/°C
Gain drift with temperature	Voltage: 15 ppm/°C Current: 20 ppm/°C
Module error	Voltage: 0.1% of range Current: 0.3% of range
Module input scan time, min	16 pt single-ended: 16…488 ms 8 pt differential: 8…244 ms 4 pt differential: 5…122 ms(2)
Onboard data alarming	Yes
Scaling to engineering units	Yes
Real-time channel sampling	Yes

Technical Specifications - 1756-IF16, 1756-IF16K

Attribute	1756-IF16, 1756-IF16K
Data format	Integer mode (left justified, 2 s complement) IEEE 32-bit floating point
Module conversion method	Sigma-Delta
Isolation voltage	250V (continuous), Reinforced insulation type, Inputs-to-Backplane. No isolation between individual Inputs.
Module keying	Electronic, software configurable
Removable terminal block	1756-TBCH 1756-TBS6H
RTB keying	User-defined mechanical
Slot width	1
Wire size	1756-TBCH Single wire connection: 0.33…2.1 mm2(22…14 AWG) solid or stranded shielded copper wire, rated at 105 °C (221 °F) or greater, 1.2 mm (3/64 in.) insulation max 1756-TBS6H Single wire connection: 0.33…2.1 mm2(22…14 AWG) solid or stranded shielded copper wire, rated at 105 °C (221 °F) or greater, 1.2 mm (3/64 in.) insulation max
Terminal block torque specs	1756-TBCH: 0.5 N•m (4.4 lb•in)
Wire category(1)	2 - on signal ports
Enclosure type	None (open-style)
North American temp code	T4A
ATEX temp code	T4
IECEx temp code	T4

(1) Use this Conductor Category information for planning conductor routing. See the Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.
(2) Notch filter dependent.

Environmental Specifications - 1756-IF16, 1756-IF16K

ControlLogix 5570 Controllers

Features - ControlLogix 5570 Controllers

Feature	1756-L71, 1756-L71K, 1756-L72, 1756-L72K, 1756-L73, 1756-L73K, 1756-L74, 1756-L74K, 1756-L75, 1756-L75K
Controller tasks	• 32 tasks, including a combination of continuous (1), periodic, and event tasks • 32 programs/tasks prior to RSLogix 5000® programming software, version 15.01.00 • 100 programs/task beginning with RSLogix 5000 programming software, version 15.01.00 • 1000 programs/task beginning with Logix Designer application, version 24.00.00
Built-in communication ports	1-port USB(1)
Communication options	• EtherNet/IP • ControlNet • DeviceNet • Data Highway Plus • Remote I/O • SERCOS • Third-party process and device networks
USB port communication	Programming, configuration, firmware update, and online edits only
Controller connections supported max(2)	500
Network connections, per network module	• 528 EtherNet/IP; 512 TCP (1756-EN4TR) • 256 EtherNet/IP; 128 TCP (1756-EN2x) • 128 EtherNet/IP; 64 TCP (1756-ENBT) • 100 ControlNet (1756-CN2/A) • 40 ControlNet (1756-CNB/D, 1756-CNB/E) • 128 ControlNet (1756-CN2/B)
Controller redundancy	Full support
Integrated motion	• SERCOS interface • Analog options (encoder input, LDT input, SSI input) • Integrated Motion on the EtherNet/IP network
Programming languages	• Relay ladder logic • Structured text • Function Block Diagram • Sequential function chart (SFC)

(1) The USB port is intended for temporary local programming purposes only and not intended for permanent connection. Do not use the USB port in hazardous locations.
(2) ControlLogix 5570 controllers use connections to establish communication links between devices. For more information on how to use and calculate connections, see the ControlLogix System User Manual, publication 1756-UM001.

Technical Specifications - ControlLogix 5570 Controllers

Attribute	1756-L71, 1756-L71K	1756-L72, 1756-L72K	1756-L73, 1756-L73K	1756-L74, 1756-L74K	1756-L75, 1756-L75K
User memory	2 MB	4 MB	8 MB	16 MB	32 MB
I/O memory	0.98 MB				
Optional nonvolatile memory storage	1 GB (1784-SD1 ships with every controller) 2 GB (1784-SD2)				
Digital I/O max	128,000				
Analog I/O max	4000				
Total I/O max	128,000				
Energy storage module	• 1756-ESMCAP, 1756-ESMCAPK capacitor energy storage module (removable, ships installed with every controller) • 1756-ESMNSE, 1756-ESMNSEK capacitor energy storage module (removable, no residual WallClockTime power backup) • 1756-ESMNRM, 1756-ESMNRMK capacitor energy storage module (nonremovable, helps prevent USB connection and SD card use to help secure the controller)				
Current draw @ 1.2V DC	5 mA				
Current draw @ 5.1V DC	800 mA				
Power dissipation	2.5 W				
Thermal dissipation	8.5 BTU/hr				
Isolation voltage	30V (continuous), basic insulation type, USB port-to-system Compliant and tested according to IEC/UL 61010-1				
USB port[1]	USB 2.0, full speed (12 Mbps)				
Weight approx	0.25 kg (0.55 lb)				
Slot width	1				
Module location	Chassis-based, any slot				
Chassis	1756-A4, 1756-A4K, 1756-A7, 1756-A7K, 1756-A10, 1756-A10K, 1756-A13, 1756-A13K, 1756-A17, 1756-A17K				
Power supply, standard	1756-PA50, 1756-PA72, 1756-PA72K, 1756-PA75, 1756-PA75K, 1756-PB50, 1756-PB72, 1756-PB72K, 1756-PB75, 1756-PB75K, 1756-PH75				
Power supply, redundant	1756-PA75R, 1756-PA75RK, 1756-PB75R, 1756-PB75RK, 1756-PSCA2, 1756-PSCA2K				
Wire category[2]	3 - on USB port				
Temperature code	T4				
Enclosure type rating	None (open-style)				

(1) The USB port is intended for temporary local programming purposes only and not intended for permanent connection. Do not use the USB port in hazardous locations.
(2) Use this conductor category information to plan conductor routing. See Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.

Environmental Specifications - ControlLogix 5570 Controllers

Attribute	1756-L71, 1756-L72,1756-L73, 1756-L74, 1756-L75	1756-L71K, 1756-L72K, 1756-L73K, 1756-L74K, 1756-L75K

1756-OB16D, 1756-OB16DK

ControlLogix DC (19.2...30V) diagnostic output module

Diagnostic Specifications - 1756-OB16D, 1756-OB16DK

Attribute	1756-OB16D, 1756-OB16DK
Short trip	8 A for 180 ms, min 10 A for 120 ms, min
No load	Off-state detection only
Output verification	On-state detection only
Pulse test	Configurable maximum pulse width
Time stamp of diagnostics	±1 ms

Technical Specifications - 1756-OB16D, 1756-OB16DK

Attribute	1756-OB16D, 1756-OB16DK
Outputs	16 diagnostic (8 points/group)
Pilot duty (DC-13SQ)	2A @ 30°C (86 °F) 1A @ 60°C (140 °F)
Voltage category	24V DC source
Operating voltage range	19.2…30V DC
Output delay time Off to On On to Off	 60 µs nom/1 ms max 630 µs nom/5 ms max
Current draw @ 5.1V	250 mA
Current draw @ 24V	140 mA
Total backplane power	4.64 W
Power dissipation, max	3.3 W @ 60 °C (140 °F)
Thermal dissipation	11.25 BTU/hr
Off-state leakage current per point, max	1 mA per point
On-state voltage drop, max	1.2V DC @ 2 A
Current per point, max	2 A @ 30 °C (86 °F) linear derating 1 A @ 60 °C (140 °F) linear derating
Current per module, max	8 A @ 30 °C (86 °F) linear derating 4 A @ 60 °C (140 °F) linear derating
Surge current per point	4 A for 10 ms per point, repeatable every 1 s
Load current, min	3 mA per point
Scheduled outputs	Synchronization within 16.7 s max, reference to the Coordinated System Time
States in Fault mode per point	Hold last state, On or Off (Off is default)
States in Program mode per point	Hold last state, On or Off (Off is default)
Isolation voltage	250V (continuous), basic insulation type, outputs-to-backplane, and output group-to-group No isolation between individual group outputs
Module keying	Electronic, software configurable
Fusing	Electronically fused per point
Removable terminal block	1756-TBCH 1756-TBS6H
RTB keying	User-defined mechanical
Slot width	1
Wire category	1(1)
Enclosure type	None (open-style)
North American temperature code	T4A
IEC temperature code	T4

(1) Use this conductor category information for planning conductor routing as described in the system-level installation manual. See the Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.

Environmental Specifications - 1756-OB16D, 1756-OB16DK

Attribute	1756-OB16D, 1756-OB16DK
Temperature, operating IEC 60068-2-1 (Test Ad, Operating Cold), IEC 60068-2-2 (Test Bd, Operating Dry Heat), IEC 60068-2-14 (Test Nb, Operating Thermal Shock)	0 °C < Ta < 60 °C (32 °F < Ta < 140 °F)
Temperature, surrounding air, max	60 °C (140 °F)
Temperature, nonoperating IEC 60068-2-1 (Test Ab, Unpackaged Nonoperating Cold), IEC 60068-2-2 (Test Bb, Unpackaged Nonoperating Dry Heat), IEC 60068-2-14 (Test Na, Unpackaged Nonoperating Thermal Shock	-40…+85 °C (-40…+185 °F)

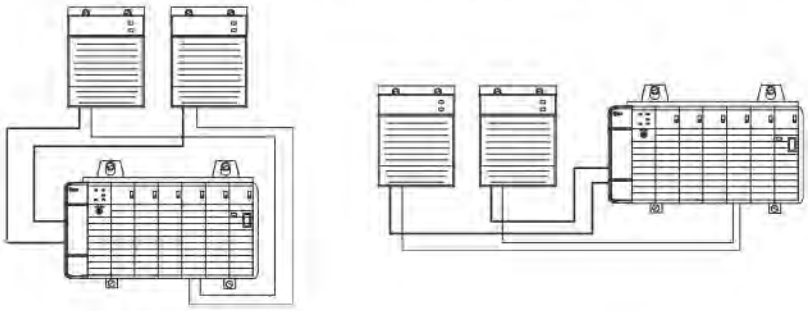
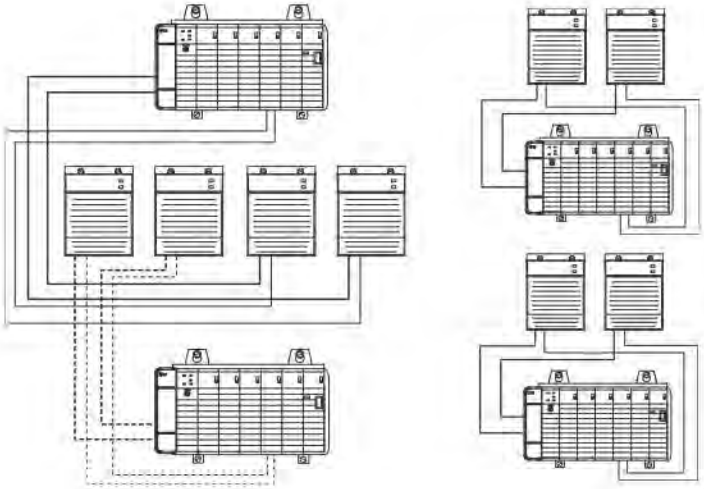
Redundant Power Supplies

To build a redundant power supply system, you need the following.



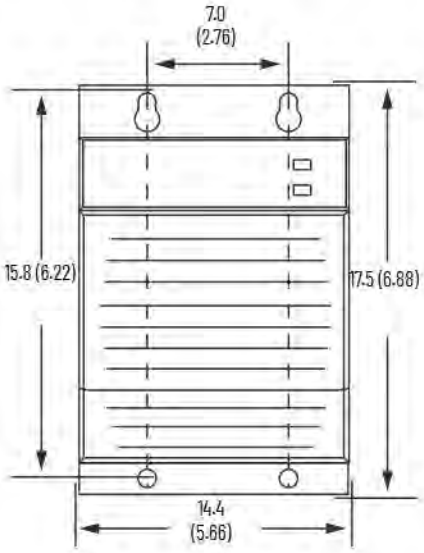
Cat. No.	Description	Amount
1756-PA75R/A, 1756-PA75RK/A, 1756-PAXTR, 1756-PB75R/A, 1756-PB75RK/A, or 1756-PBXTR	Redundant power supply	2
1756-CPR2[1] 1756-CPR2D[2] or 1756-CPR2U[2]	Redundant power supply cable (Length = 0.91 m [3 ft])	2
1756-PSCA2, 1756-PSCA2K, or 1756-PSCA2XT	Redundant power supply chassis adapter[3]	1
User-supplied	Annunciator wiring[4] (Length, max = 10 m [32.8 ft])	2

(1) Cable bend radius is 12.7 cm (5.0 in.).
(2) Requires 10.16 cm (4.0 in.) of clearance next to the chassis adapter.
(3) The 1756-PSCA2 or 1756-PSCA-2XT chassis adapter is a passive device. The adapter funnels power from the redundant power supplies to the single power connector on the ControlLogix® series B chassis backplane.
(4) Optional user-provided annunciator wiring can be connected to the solid-state relay for status and troubleshooting.

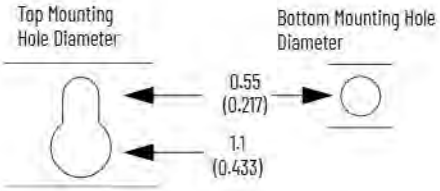


System Configuration Recommendations

We recommend that you use one of these methods to configure your redundant power supply system.



Recommended Configurations for a System That Uses One Chassis



Recommended Configurations for a System That Uses Two Chassis

Mounting Dimensions

Dimensions are in cm (in.).

Redundant Power Supply Features

The redundant power supplies offer the same features as the standard power supplies, and the following:

- Redundant operation
- Automatic chassis load sharing between the redundant power supplies
- Status indicators for visual operating status of the pair
- Solid-state relay for system recognition of supply status when wired to an input module
- The ControlLogix redundant power supply system is designed to account for operational anomalies in only the power supply (the chassis adapter and power supply cables are excluded)

Technical Specifications - ControlLogix Redundant Power Supplies

Attribute	1756-PA75R, 1756-PA75RK	1756-PB75R, 1756-PB75RK
Input voltage range	85...265V AC[1]	18...32V DC[2]
Input voltage	120V/240V AC, 50/60 Hz	24V DC
Input frequency range	47...63 Hz	–
Input power, max	120VA 115 W	110 W
Output power, max	75 W @ 0...60 °C (32...140 °F)	
Inrush current, max	20 A	30 A
Hold up time[3]	2 cycles @ 60 Hz 2 cycles @ 50 Hz	20 ms
Current capacity @ 1.2V	1.5 A	
Current capacity @ 3.3V	4 A	
Current capacity @ 5.1V	13 A	
Current capacity @ 24V	2.8 A	
Annunciator power	240V AC 50/60 Hz, 240V DC, 50 mA, resistive only	90V DC for ATEX/IECEx
Isolation voltage	250V (continuous), Reinforced Insulation Type, Power Input to Backplane, Power Input to Annunciator, Annunciator to Backplane Type tested at 3250V DC for 60 s	
Dimensions (HxWxD), approx	17.5 x 14.5 x 13.7 cm (6.9 x 5.7 x 5.4 in.)	
Weight, approx	1.45 kg (3.2 lb)	

Technical Specifications - ControlLogix Redundant Power Supplies (Continued)

Attribute	1756-PA75R, 1756-PA75RK	1756-PB75R, 1756-PB75RK
Chassis	1756-A4, 1756-A7, 1756-A10, 1756-A13, 1756-A17	
Wire size	Power: 2.5 mm^2 (14 AWG) solid or stranded copper wire that is rated at 90 °C (194 °F), or greater, 1.2 mm (3/64 in.) insulation max Annunciator: 0.25...2.5 mm^2 (22...14 AWG) solid or stranded copper wire that is rated at 90 °C (194 °F), or greater, 1.2 mm (3/64 in.) insulation max	
Wire category (4)	3 - on annunciator ports 1 - on power ports 3 - on 1756-CPR2 connections	
Pilot duty rating	Annunciator - not rated	
Conductor screw torque	0.565 N•m (5 lb•in)	
North American temperature code	T3C	T4
ATEX temperature code	-	T4
IEC temperature code	-	T4
Enclosure type rating	None (open-style)	

(1) UL certification for 120/240V AC, 50/60 Hz nominal. Rockwell Automation specified 85...265V AC, 47...63 Hz.
(2) UL certification for 24V DC nominal. Rockwell Automation specified 18...32V DC.
(3) The hold up time is the time between input voltage removal and DC power failure.
(4) Use this conductor category information to plan conductor routing. See the Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.

Controller Redundancy

In a redundant controller system, you need these components:

- Two 1756 chassis, each with the same of the following:
  - Number of slots
  - Modules in the same slots
  - Redundancy firmware revisions in each module
  - Approved module firmware revisions for use in your controller redundancy system.
- One 1756-RM2, 1756-RM2K, or 1756-RM2XT module per chassis that supports the following:
  - One or two controllers of the same family
  - as many as seven communication modules
- One or two 1756-RMCx cables

Technical Specifications - 1756-RM2, 1756-RM2K, 1756-RM2XT Redundancy Modules

Attribute	1756-RM2, 1756-RM2K	1756-RM2XT
Current draw @ 5.1V DC	1.16 A	
Current draw @ 24V DC	3.4 mA	
Power dissipation	6 W, max	
Thermal dissipation	21 BTU/hr	
Connector cables	1756-RMC1, 1 m (3.28 ft) 1756-RMC3, 3 m (9.84 ft) 1756-RMC10, 10 m (32.81 ft)	
Slot width	1 slot	
Module location	Chassis-based, any slot	
Chassis	1756-A4, 1756-A7, 1756-A10, 1756-A13, 1756-A17	1756-A7XT, 1756-A10XT, 1756-A4LXT, 1756-A5LXT, 1756-A7LXT
Controller families, supported	ControlLogix 5570, ControlLogix 5580	
Power supply, standard	1756-PA72, 1756-PA75, 1756-PB72, 1756-PB75	1756-PAXT, 1756-PBXT
Power supply, redundant	1756-PA75R, 1756-PB75R, 1756-PSCA2	None
Temperature code	T4	
Enclosure type	None (open-style)	
Weight, approx	0.29 kg (0.64 lb)	
Mounting	ControlLogix-XT™ chassis, single-slot module	

Environmental Specifications - 1756-RM2, 1756-RM2K, 1756-RM2XT Redundancy Modules

Attribute	1756-RM2	1756-RM2K	1756-RM2XT
Temperature, operating IEC 60068-2-1 (Test Ae, Operating Cold), IEC 60068-2-2 (Test Be, Operating Dry Heat), IEC 60068-2-14 (Test Nb, Operating Thermal Shock)	0...60 °C (32...140 °F)		-25...+70 °C (-13...+158 °F)
Temperature, nonoperating IEC 60068-2-1 (Test Ab, Unpackaged Nonoperating Cold), IEC 60068-2-2 (Test Bb, Unpackaged Nonoperating Dry Heat), IEC 60068-2-14 (Test Na, Unpackaged Nonoperating Thermal Shock)	-40...+85 °C (-40...+185 °F)		
Conformal Coated	No	Yes	
Corrosive Atmosphere ASTM B845-97 Method H Accelerated Test (20-Day Exposure)	—	Severity Level G3[1] per ANSI/ISA 71.04-2013, Airborne Contaminants—Gases Severity Level CX[1][2] per IEC 60721-3-3:2019, Chemically Active Substances	
Relative humidity IEC 60068-2-30 (Test Db, Unpackaged Damp Heat)	5...95% noncondensing		
Vibration IEC 60068-2-6 (Test Fc, Operating)	2 g @ 10...500 Hz		
Shock, operating IEC 60068-2-27 (Test Ea, Unpackaged Shock)	30 g		
Shock, nonoperating IEC 60068-2-27 (Test Ea, Unpackaged Shock)	50 g		
Emissions	IEC 61000-6-4		
ESD immunity IEC 61000-4-2	6 kV contact discharges 8 kV air discharges		
Radiated RF immunity IEC 61000-4-3	10V/m with 1 kHz sine wave 80% AM from 80...2000 MHz 10V/m with 200 Hz 50% Pulse 100% AM @ 900 MHz 10V/m with 200 Hz 50% Pulse 100% AM @ 1890 MHz 3V/m with 1 kHz sine wave 80% AM from 2000...2700 MHz		

(1) Port Plugs must remain installed in unused ports at all times during storage and operation for the product to meet its corrosive atmosphere rating.
(2) Up to 9.6 microns per year, corrosion rate of copper.

Certifications - 1756-RM2, 1756-RM2K, 1756-RM2XT Redundancy Modules

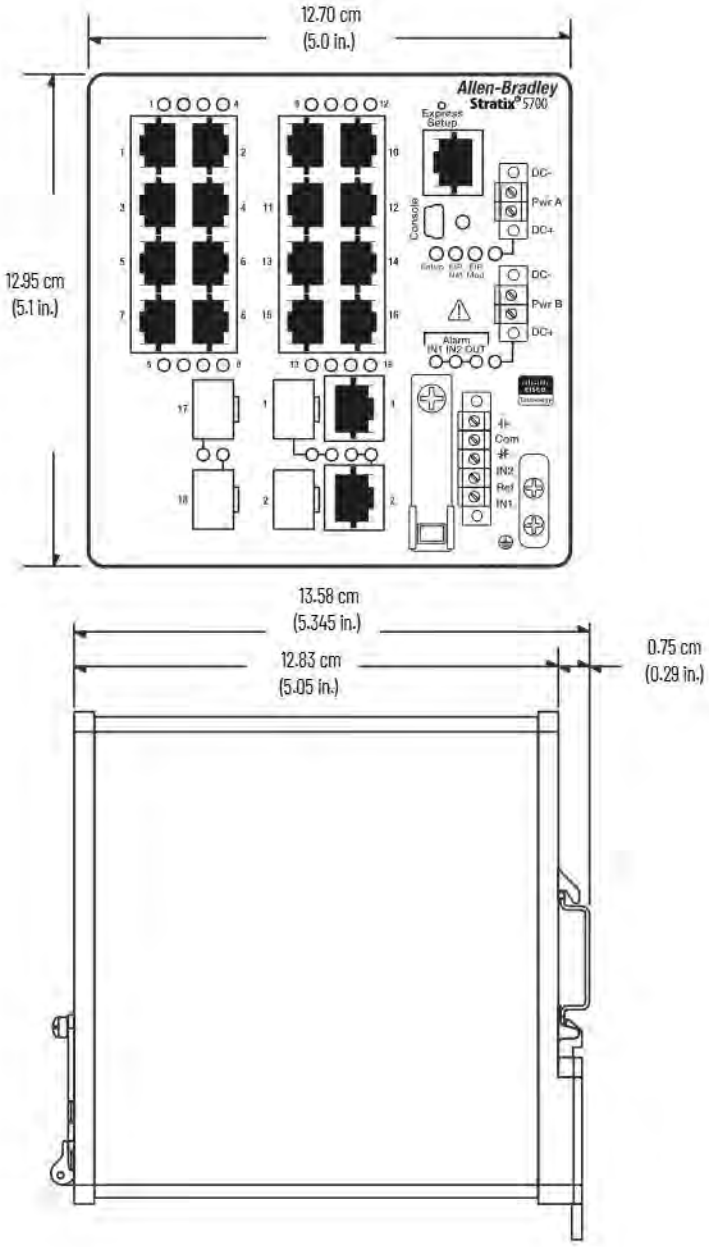
Stratix 5700 PoE Switches

Table 29 - Technical Specifications - Stratix 5700 PoE Switches

Attribute	1783-BMS12T4E2CGL, 1783-BMS12T4E2CGP, 1783-BMS12T4E2CGNK	
Ethernet data rate	10/100 Mbps	
Alarm relay	30V DC, 1 A or 48V DC, 0.5 A	
Switch power input, max	12...48V DC, 0.5...3.0 A, Class 2/SELV	
PoE power input(1)	44...57V DC, 2.5 A max	
PoE+ power input(1)	50...57V DC, 2.5 A max	
Power consumption(2)	15 W @ 24V DC 40 °C (104 °F), 30 W max	
Power dissipation	30 W	
Isolation voltage	60V (continuous), basic insulation type, DC power ports to ground, and PoE power ports to ground No isolation between individual Ethernet ports No isolation between PoE power and Ethernet ports No isolation between console port and system Type tested at 1585V DC for 60 s	
Wire size, Ethernet connection(3)	RJ45 connector according to IEC 60603-7, 2- or 4-pair Category 5e minimum cable according to TIA 568-B.1 or Category 5 cable according to ISO/IEC 24702	
Wire size, DC power connection	0.5...0.8 mm^2 (20...18 AWG) solid or stranded copper wire rated at 75 °C (167 °F) or greater, 1.2 mm (3/64 in.) insulation max, 6.3 mm (0.25 in.) ±0.5 mm (0.02 in.) strip length	
Wire size, alarm connection	0.5...0.8 mm^2 (20...18 AWG) solid or stranded, UL/CSA-rated style 1007 or 1569 twisted-pair copper appliance wiring material (AWM) wire, 6.3 mm (0.25 in.) ±0.5 mm (0.02 in.) strip length	
Wire size, ground connection	4.0 mm^2 (12 AWG) min, stranded copper wire	
Screw torque, power and alarm terminals	0.23 N•m (2.0 in•lb)	
Screw torque, ground terminals, max	0.96 N•m (8.5 in•lb)	
Weight, approx	1.11 kg (2.45 lb)	
Wiring category(4)	3 - on console and alarm ports 2 - on DC power ports 2 - on Ethernet ports	
Pilot duty rating	Alarm not rated	
Enclosure type rating	None (open-style)	
North American temp code	T4	
IEC temp code	T4	
SFP modules(5)	1783-SFP100FX 1783-SFP100LX 1783-SFP100EXC 1783-SFP100ZXC 1783-SFP100T(6)	1783-SFP1GSX(7) 1783-SFP1GLX(7) 1783-SFP1GEXE(7) 1783-SFP1GZX(7) 1783-SFP1GTE(7)
Memory card	1784-SD1	
Industry standards	Substation KEMA (IEEE 1613, IEC 61850 - 3) IEEE 1613 Electric Power Stations Communications Networking IEC 61850-3 Electric Substations Communications Networking	



(1) The initial power allocation and the maximum power allocation on a PoE port are configurable in Device Manager or the Logix Designer application. For details about PoE power budgets, see the Stratix Managed Switches User Manual, publication 1783-UM007.

(2) For PoE configurations, the power consumption values listed represent the highest values that can be configured using all ports. A general guideline is 0.5 W per 30 W PoE+ port used.
(3) See page 87 for recommended products.
(4) Use this conductor category information for planning conductor routing. Refer to Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.
(5) SFP modules are supported only on switches with combo ports or SFP slots. For SFP specifications, see page 85.
(6) The 1783-SFP100T module requires Stratix 5700 firmware revision 8.001or later.
(7) Gigabit Ethernet (GE) SFP modules work only in GE SFP slots. For a list of Stratix 5700 catalog numbers with GE SFP slots, see page 38.

Table 30 - Environmental Specifications - Stratix 5700 PoE Switches

Attribute	1783-BMS12T4E2CGL, 1783-BMS12T4E2CGP, 1783-BMS12T4E2CGNK
Temperature, operating IEC 60068-2-1 (Test Ad, Operating Cold), IEC 60068-2-2 (Test Bd, Operating Dry Heat), IEC 60068-2-14 (Test Nb, Operating Thermal Shock)	-40...+60 °C (-40...+140 °F)
Temperature, surrounding air, max	60 °C (140 °F)
Temperature, nonoperating IEC 60068-2-1 (Test Ab, Unpackaged Nonoperating Cold), IEC 60068-2-2 (Test Bb, Unpackaged Nonoperating Dry Heat), IEC 60068-2-14 (Test Na, Unpackaged Nonoperating Thermal Shock)	-40...+85 °C (-40...+185 °F)
Relative humidity IEC 60068-2-30 (Test Db, Unpackaged Damp Heat)	5...95% noncondensing
Vibration IEC 60068-2-6 (Test Fc, Operating)	2 g @ 10...500 Hz
Shock, operating IEC 60068-2-27 (Test Ea, Unpackaged Shock)	30 g
Shock, nonoperating IEC 60068-2-27 (Test Ea, Unpackaged Shock)	50 g
Emissions CISPR11 (IEC 61000-6-4)	Class A
ESD immunity IEC 61000-4-2	6 kV contact discharges 8 kV air discharges
Radiated RF immunity IEC 61000-4-3	10V/m with 1 kHz sine-wave 80% AM from 80...2000 MHz 10V/m with 200 Hz 50% pulse 100% AM at 900 MHz 10V/m with 200 Hz 50% pulse 100% AM at 1890 MHz 1V/m with 1 kHz sine-wave 80% AM from 1000...2700 MHz
EFT/B immunity IEC 61000-4-4	±4 kV at 5 kHz on DC power ports ±4 kV at 5 kHz on alarm ports ±4 kV at 5 kHz on Ethernet ports
Surge transient immunity IEC 61000-4-5	±1 kV line-line (DM) and ±2 kV line-earth (CM) on DC power ports ±2 kV line-earth (CM) on Ethernet ports
Conducted RF immunity IEC 61000-4-6	10V rms with 1 kHz sine-wave 80% AM from 150 kHz...80 MHz
Damped oscillatory wave immunity IEC 61000-4-18	±1 kV line-line (DM) and ±2.5 kV line-earth (CM) on power ports

Updated UK and European Hazardous Location Approval	3
Updated IEC Hazardous Location Approval	3
Updated Special Conditions for Safe Use	3

Rockwell Automation

ATTENTION: Read this document and the documents listed in the Additional Resources section about installation, configuration and operation of this equipment before you install, configure, operate or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice. If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

注意：在安装、配置、操作和维护本产品前，请阅读本文档以及 “其他资源” 部分列出的有关设备安装、配置和操作的相应文档。除了所有适用规范、法律和标准的相关要求之外，用户还必须熟悉安装和接线说明。

安装、调整、投运、使用、组装、拆卸和维护等各项操作必须由经过适当训练的专业人员按照适用的操作规范实施。

如果未按照制造商指定的方式使用该设备，则可能会损害设备提供的保护。

ATENCIÓN: Antes de instalar, configurar, poner en funcionamiento o realizar el mantenimiento de este producto, lea este documento y los documentos listados en la sección Recursos adicionales acerca de la instalación, configuración y operación de este equipo. Los usuarios deben familiarizarse con las instrucciones de instalación y cableado y con los requisitos de todos los códigos, leyes y estándares vigentes.

El personal debidamente capacitado debe realizar las actividades relacionadas a la instalación, ajustes, puesta en servicio, uso, ensamblaje, desensamblaje y mantenimiento de conformidad con el código de práctica aplicable. Si este equipo se usa de una manera no especificada por el fabricante, la protección provista por el equipo puede resultar afectada.

ATENÇÃO: Leia este e os demais documentos sobre instalação, configuração e operação do equipamento que estão na seção Recursos adicionais antes de instalar, configurar, operar ou manter este produto. Os usuários devem se familiarizar com as instruções de instalação e fiação além das especificações para todos os códigos, leis e normas aplicáveis.

É necessário que as atividades, incluindo instalação, ajustes, colocação em serviço, utilização, montagem, desmontagem e manutenção sejam realizadas por pessoal qualificado e especializado, de acordo com o código de prática aplicável.

Caso este equipamento seja utilizado de maneira não estabelecida pelo fabricante, a proteção fornecida pelo equipamento pode ficar prejudicada.

ВНИМАНИЕ: Перед тем как устанавливать, настраивать, эксплуатировать или обслуживать данное оборудование, прочитайте этот документ и документы, перечисленные в разделе «Дополнительные ресурсы». В этих документах изложены сведения об установке, настройке и эксплуатации данного оборудования. Пользователи обязаны ознакомиться с инструкциями по установке и прокладке соединений, а также с требованиями всех применимых норм, законов и стандартов.

Все действия, включая установку, наладку, ввод в эксплуатацию, использование, сборку, разборку и техническое обслуживание, должны выполняться обученным персоналом в соответствии с применимыми нормами и правилами.

Если оборудование используется не предусмотренным производителем образом, защита оборудования может быть нарушена.

注意：本製品を設置、構成、稼動または保守する前に、本書および本機器の設置、設定、操作についての参考資料の該当箇所に記載されている文書に目を通してください。ユーザは、すべての該当する条例、法律、規格の要件に加えて、設置および配線の手順に習熟している必要があります。

設置調整、運転の開始、使用、組立て、解体、保守を含む諸作業は、該当する実施規則に従って訓練を受けた適切な作業員が実行する必要があります。

本機器が製造メーカにより指定されていない方法で使用されている場合、機器により提供されている保護が損なわれる恐れがあります。

ACHTUNG: Lesen Sie dieses Dokument und die im Abschnitt „Weitere Informationen“aufgeführten Dokumente, die Informationen zu Installation, Konfiguration und Bedienung dieses Produkts enthalten, bevor Sie dieses Produkt installieren, konfigurieren, bedienen oder warten. Anwender müssen sich neben den Bestimmungen aller anwendbaren Vorschriften, Gesetze und Normen zusätzlich mit den Installations- und Verdrahtungsanweisungen vertraut machen.

Arbeiten im Rahmen der Installation, Anpassung, Inbetriebnahme, Verwendung, Montage, Demontage oder Instandhaltung dürfen nur durch ausreichend geschulte Mitarbeiter und in Übereinstimmung mit den anwendbaren Ausführungsvorschriften vorgenommen werden.

Wenn das Gerät in einer Weise verwendet wird, die vom Hersteller nicht vorgesehen ist, kann die Schutzfunktion beeinträchtigt sein.

ATTENTION : Lisez ce document et les documents listés dans la section Ressources complémentaires relatifs à l'installation, la configuration et le fonctionnement de cet équipement avant d'installer, configurer, utiliser ou entretenir ce produit. Les utilisateurs doivent se familiariser avec les instructions d'installation et de câblage en plus des exigences relatives aux codes, lois et normes en vigueur.

Les activités relatives à l'installation, le réglage, la mise en service, l'utilisation, l'assemblage, le démontage et l'entretien doivent être réalisées par des personnes formées selon le code de pratique en vigueur.

Si cet équipement est utilisé d'une façon qui n'a pas été définie par le fabricant, la protection fournie par l'équipement peut être compromise.

주의 : 본 제품 설치 , 설정 , 작동 또는 유지 보수하기 전에 본 문서를 포함하여 설치 , 설정 및 작동에 관한 참고 자료 섹션의 문서들을 반드시 읽고 숙지하십시오 . 사용자는 모든 관련 규정 , 법규 및 표준에서 요구하는 사항에 대해 반드시 설치 및 배선 지침을 숙지해야 합니다 .

설치 , 조정 , 가동 , 사용 , 조립 , 분해 , 유지보수 등 모든 작업은 관련 규정에 따라 적절한 교육을 받은 사용자를 통해서만 수행해야 합니다 .

본 장비를 제조사가 명시하지 않은 방법으로 사용하면 장비의 보호 기능이 손상될 수 있습니다 .

ATTENZIONE Prima di installare, configurare ed utilizzare il prodotto, o effettuare interventi di manutenzione su di esso, leggere il presente documento ed i documenti elencati nella sezione “Altre risorse”, riguardanti l'installazione, la configurazione ed il funzionamento dell'apparecchiatura. Gli utenti devono leggere e comprendere le istruzioni di installazione e cablaggio, oltre ai requisiti previsti dalle leggi, codici e standard applicabili.

Le attività come installazione, regolazioni, utilizzo, assemblaggio, disassemblaggio e manutenzione devono essere svolte da personale adeguatamente addestrato, nel rispetto delle procedure previste.

Qualora l'apparecchio venga utilizzato con modalità diverse da quanto previsto dal produttore, la sua funzione di protezione potrebbe venire compromessa.

DİKKAT: Bu ürünün kurulumu, yapılandırılması, işletilmesi veya bakımı öncesinde bu dokümanı ve bu ekipmanın kurulumu, yapılandırılması ve işletimi ile ilgili İlave Kaynaklar bölümünde yer listelenmiş dokümanları okuyun. Kullanıcılar yürürlükteki tüm yönetmelikler, yasalar ve standartların gereksinimlerine ek olarak kurulum ve kablolama talimatlarını da öğrenmek zorundadır.

Kurulum, ayarlama, hizmete alma, kullanma, parçaları birleştirme, parçaları sökme ve bakım gibi aktiviteler sadece uygun eğitimleri almış kişiler tarafından yürürlükteki uygulama yönetmeliklerine uygun şekilde yapılabilir.

Bu ekipman üretici tarafından belirlenmiş amacın dışında kullanılırsa, ekipman tarafından sağlanan koruma bozulabilir.

注意事項：在安裝、設定、操作或維護本產品前，請先閱讀此文件以及列於 「其他資源」章節中有關安裝、設定與操作此設備的文件。使用者必須熟悉安裝和配線指示，並符合所有法規、法律和標準要求。

包括安裝、調整、交付使用、使用、組裝、拆卸和維護等動作都必須交由已經過適當訓練的人員進行，以符合適用的實作法規。

如果將設備用於非製造商指定的用途時，可能會造成設備所提供的保護功能受損。

POZOR: Než začnete instalovat, konfigurovat či provozovat tento výrobek nebo provádět jeho údržbu, přečtěte si tento dokument a dokumenty uvedené v části Dodatečné zdroje ohledně instalace, konfigurace a provozu tohoto zařízení. Uživatelé se musejí vedle požadavků všech relevantních vyhlášek, zákonů a norem nutně seznámit také s pokyny pro instalaci a elektrické zapojení.

Činnosti zahrnující instalaci, nastavení, uvedení do provozu, užívání, montáž, demontáž a údržbu musí vykonávat vhodně proškolený personál v souladu s příslušnými prováděcími předpisy.

Pokud se toto zařízení používá způsobem neodpovidajícím specifikaci výrobce, může být narušena ochrana, kterou toto zařízení poskytuje.

UWAGA: Przed instalacją , konfiguracją , użytkowaniem lub konserwacją tego produktu należy przeczytać niniejszy dokument oraz wszystkie dokumenty wymienione w sekcji Dodatkowe źródła omawiają ce instalację, konfigurację i procedury użytkowania tego urzą dzenia. Użytkownicy mają obowią zek zapoznać się z instrukcjami dotyczą cymi instalacji oraz oprzewodowania, jak również z obowią zują cymi kodeksami, prawem i normami.

Działania obejmują ce instalację, regulację, przekazanie do użytkowania, użytkowanie, montaż, demontaż oraz konserwację muszą być wykonywane przez odpowiednio przeszkolony personel zgodnie z obowią zują cym kodeksem postępowania.

Jeśli urzą dzenie jest użytkowane w sposób inny niż określony przez producenta, zabezpieczenie zapewniane przez urzą dzenie może zostać ograniczone.

OBS! Läs detta dokument samt dokumentet, som står listat i avsnittet Övriga resurser, om installation, konfigurering och drift av denna utrustning innan du installerar, konfigurerar eller börjar använda eller utföra underhållsarbete på produkten. Användare måste bekanta sig med instruktioner för installation och kabeldragning, förutom krav enligt gällande koder, lagar och standarder.

Åtgärder som installation, justering, service, användning, montering, demontering och underhållsarbete måste utföras av personal med lämplig utbildning enligt lämpligt bruk.

Om denna utrustning används på ett sätt som inte anges av tillverkaren kan det hända att utrustningens skyddsanordningar försätts ur funktion.

LET OP: Lees dit document en de documenten die genoemd worden in de paragraaf Aanvullende informatie over de installatie, configuratie en bediening van deze apparatuur voordat u dit product installeert, configureert, bediend of onderhoudt. Gebruikers moeten zich vertrouwd maken met de installatie en de bedradingsinstructies, naast de vereisten van alle toepasselijke regels, wetten en normen.

Activiteiten zoals het installeren, afstellen, in gebruik stellen, gebruiken, monteren, demonteren en het uitvoeren van onderhoud mogen uitsluitend worden uitgevoerd door hiervoor opgeleid personeel en in overeenstemming met de geldende praktijkregels.

Indien de apparatuur wordt gebruikt op een wijze die niet is gespecificeerd door de fabrikant, dan bestaat het gevaar dat de beveiliging van de apparatuur niet goed werkt.

North American Hazardous Location Approval

The following information applies when operating this equipment in hazardous locations.	Informations sur l'utilisation de cet équipement en environnements dangereux.
Products marked "CL I, DIV 2, GP A, B, C, D" are suitable for use in Class I Division 2 Groups A, B, C, D, Hazardous Locations and nonhazardous locations only. Each product is supplied with markings on the rating nameplate indicating the hazardous location temperature code. When combining products within a system, the most adverse temperature code (lowest "T" number) may be used to help determine the overall temperature code of the system. Combinations of equipment in your system are subject to investigation by the local Authority Having Jurisdiction at the time of installation.	Les produits marqués "CL I, DIV 2, GP A, B, C, D" ne conviennent qu'à une utilisation en environnements de Classe I Division 2 Groupes A, B, C, D dangereux et non dangereux. Chaque produit est livré avec des marquages sur sa plaque d'identification qui indiquent le code de température pour les environnements dangereux. Lorsque plusieurs produits sont combinés dans un système, le code de température le plus défavorable (code de température le plus faible) peut être utilisé pour déterminer le code de température global du système. Les combinaisons d'équipements dans le système sont sujettes à inspection par les autorités locales qualifiées au moment de l'installation.
WARNING: **Explosion Hazard –** • Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous. • Do not disconnect connections to this equipment unless power has been removed or the area is known to be nonhazardous. Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product. • Substitution of components may impair suitability for Class I, Division 2. • If this product contains batteries, they must only be changed in an area known to be nonhazardous.	**AVERTISSEMENT:** **Risque d'Explosion –** • Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher l'équipement. • Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher les connecteurs. Fixer tous les connecteurs externes reliés à cet équipement à l'aide de vis, loquets coulissants, connecteurs filetés ou autres moyens fournis avec ce produit. • La substitution de composants peut rendre cet équipement inadapté à une utilisation en environnement de Classe I, Division 2. • S'assurer que l'environnement est classé non dangereux avant de changer les piles.

UK and European Hazardous Location Approval

The following applies to products marked Ⓔx II 3 G:

- Are Equipment Group II, Equipment Category 3, and comply with the Essential Health and Safety Requirements relating to the design and construction of such equipment given in Annex II to EU Directive 2014/34/EU and Schedule 1 of the UKEX Regulation 2016 No.1107. See the UKEX and EU Declaration of Conformity at https://www.rockwellautomation.com/global/certification/overview.page for details.
- The type of protection is Ex ec IIC T4 Gc (ETAP1F/2F).
- The type of protection is Ex ec IIC T5 Gc (ETAP).
- Equipment protection by increased safety "e", reference certificate number DEMKO 13 ATEX 1342963X and UL22UKEX2652X.
- Are intended for use in areas in which explosive atmospheres caused by gases, vapors, mists, or air are unlikely to occur, or are likely to occur only infrequently and for short periods. Such locations correspond to Zone 2 classification according to UKEX Regulation 2016 No.1107 and ATEX directive 2014/34/EU.
- May have catalog numbers followed by a "K" to indicate a conformal coating option.

ATTENTION: This equipment is not resistant to sunlight or other sources of UV radiation.

IEC Hazardous Location Approval

The following applies to products marked IECEx certification:

- Are intended for use in areas in which explosive atmospheres caused by gases, vapors, mists, or air are unlikely to occur, or are likely to occur only infrequently and for short periods. Such locations correspond to Zone 2 classification.
- The type of protection is Ex ec IIC T4 Gc (ETAP1F/2F).
- The type of protection is Ex ec IIC T5 Gc (ETAP).
- IECEx certificate number IECEx UL 14.0092X.
- May have catalog numbers followed by a "K" to indicate a conformal coating option.

Special Conditions for Safe Use

WARNING:

- This equipment is not resistant to sunlight or other sources of UV radiation.
- This equipment shall be mounted in an ATEX/IECEx Zone 2 certified enclosure with a minimum ingress protection rating of at least IP54 (in accordance with EN/IEC 60079-0) and used in an environment of not more than Pollution Degree 2 (as defined in EN/IEC 60664-1) when applied in Zone 2 environments. The enclosure must be accessible only by the use of a tool.
- This equipment shall be used within its specified ratings defined by Rockwell Automation.
- Provision shall be made to prevent the rated voltage from being exceeded by transient disturbances of more than 140% of the peak rated voltage when applied in Zone 2 environments.
- The instructions in the user manual shall be observed.
- Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product.
- Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous.

Environment and Enclosure

ATTENTION: This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in EN 60664-1), at altitudes up to 2000 m (6562 ft) without derating.
This equipment is considered Group 1, Class A industrial equipment according to IEC/CISPR 11. Without appropriate precautions, there may be difficulties with electromagnetic compatibility in residential and other environments due to conducted and radiated disturbances.

This equipment is supplied as open-type equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to prevent personal injury resulting from accessibility to live parts. The enclosure must have suitable flame-retardant properties to prevent or minimize the spread of flame, complying with a flame spread rating of 5VA, V2, V1, V0 (or equivalent) if non-metallic. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain additional information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.

In addition to this publication, see the following:

- Industrial Automation Wiring and Grounding Guidelines, Rockwell Automation publication 1770-4.1, for additional installation requirements
- NEMA 250 and EN 60529, as applicable, for explanations of the degrees of protection provided by different types of enclosures

Prevent Electrostatic Discharge

ATTENTION: This equipment is sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Follow these guidelines when you handle this equipment:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wriststrap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- Use a static-safe workstation, if available.
- Store the equipment in appropriate static-safe packaging when not in use.

Linear and Star Network Considerations

When using the tap in a linear or star network, be sure that Ring Supervisor mode is not enabled. By default, the tap is configured to be a non-supervisor ring node.

IMPORTANT For 1783-ETAP, 1783-ETAP1F, and 1783-ETAP2F modules running firmware revision 2.001 or later, DIP switch 3 is used to make the tap a ring supervisor in a DLR network. To avoid adversely impacting communication in a linear or star network, take these precautions:

- Make sure switch 3 remains in the Off position. If switch 3 is in the On position, the tap will be automatically enabled as a ring supervisor.
- Make sure that the Ring Supervisor mode is not enabled in RSLinx® Classic software or the Studio 5000 Logix Designer® application. When switch 3 is in the Off position, the programming software controls whether the tap is a ring supervisor.

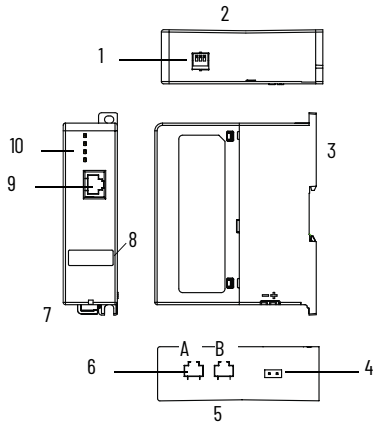
Device Level Ring (DLR) Network Considerations

When using the tap in a DLR network, consider whether the tap will be a ring supervisor. By default, the tap is configured to be a non-supervisor ring node. Use one of these methods for controlling supervisor functionality:

- Use RSLinx Classic software or the Studio 5000 Logix Designer application to set the Ring Supervisor mode and other supervisor-related parameters. This is the default method. If you choose this option, follow the procedures in the online Help that accompanies the software to enable Ring Supervisor mode.
- Use the DIP switches to automatically enable Ring Supervisor mode with the current supervisor-related parameters stored in the tap's memory.[a] See Set the DIP Switches on page 9 for additional information.

IMPORTANT Use these precautions when configuring a DLR network:

- Make sure that at least one node is acting as supervisor before connecting the last link of a DLR network and physically closing the ring.
- Do not connect nodes that do not support a DLR as members of the ring.



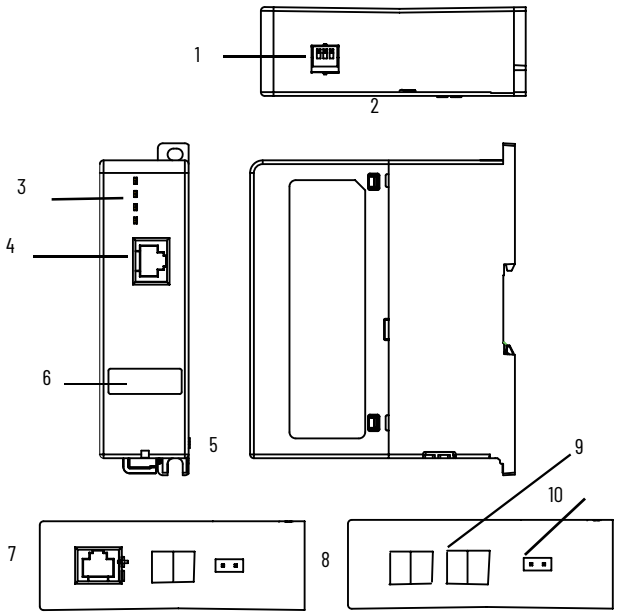
Grounding Considerations

This product is intended to be mounted to a well-grounded mounting surface, such as a metal pane or DIN rail.

ATTENTION: This product is grounded through the DIN rail to chassis ground. Use zinc-plated yellow-chromate steel DIN rail to assure proper grounding. The use of other DIN rail materials (for example, aluminum or plastic) that can corrode, oxidize, or are poor conductors, can result in improper or intermittent grounding. Secure the DIN rail to mounting surface approximately every 200 mm (7.8 in.) and use end-anchors appropriately.

See the Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1, for additional information.

(a) Using switch 3 to control Ring Supervisor mode is supported only on 1783-ETAP modules running firmware revision 2.001 or later.



1783-ETAP Module Components

Item	Description	Item	Description
1	DIP switches	6	Ports for connection to linear or ring network A: Port 1 B: Port 2
2	Top view	7	Front view
3	Side view	8	MAC ID label
4	DC connector	9	Device port on front panel
5	Bottom view	10	Status indicators

By default, the individual ports on the tap auto-negotiate link speeds (10 Mbps or 100 Mbps) and duplex setting (full or half).

IMPORTANT Configure the Ethernet port on the device that you connect to a tap so that it matches the tap's speed and duplex settings.

Failure to make the speed and duplex settings of directly connected devices match may result in higher error rates, or loss of network connectivity.

1783-ETAP1F, 1783-ETAP2F Module Components

Item	Description	Item	Description
1	DIP switches	6	MAC ID label
2	Top view	7	Bottom view, 1783-ETAP1F
3	Status indicators	8	Bottom view, 1783-ETAP2F
4	Device port on front panel	9	Ports for connection to linear or ring network(1)
5	Side view	10	DC connector

(1) The 1783-ETAP2F tap has two fiber-optic ports. The 1783-ETAP1F tap has one fiber-optic port.

By default, the 10Base-T and 100BASE-TX ports on the tap autonegotiate link speeds (10 Mbps or 100 Mbps) and duplex setting (full or half). The 100Base-FX fiber interfaces provide 100 Mbps, full-duplex operation.

IMPORTANT Configure the Ethernet port on the device that you connect to a tap so that it matches the tap's speed and duplex settings.

Failure to make the speed and duplex settings of directly connected devices match may result in higher error rates or loss of network connectivity.

Software Requirements

You must have these versions of software.

Software	Version
RSLinx® Classic	2.56.00 or later
Studio 5000 Logix Designer	21.00.00 or later

Install the Tap

WARNING: For hazardous location applications, use the supplied Phoenix MSTB 2.5/2-ST-5.08 power terminal block.

Follow these procedures to install the tap.

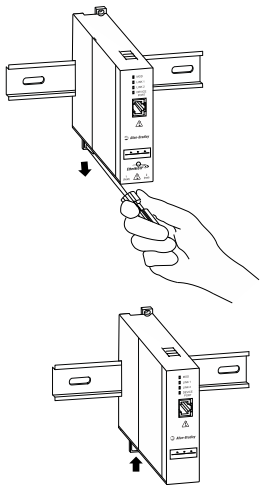
1. Mount the tap in one of these configurations:
   - Panel mount
   - DIN rail mount
2. Wire the tap.
3. Connect the Ethernet ports.
4. Download the tap Add-on Profile (AOP) if you are using the Studio 5000 Logix Designer application, version 17.01.
5. Download the EDS file for the tap.
6. Configure Internet Protocol settings.
7. Set the DIP switches.

This publication describes these steps in detail.

Mount the Tap

The 1783-ETAP, 1783-ETAP1F, and 1783-ETAP2F modules are suitable for both **vertical and horizontal mounting** orientations.

Install the tap on a DIN rail or panel-mount the tap.



IMPORTANT For 1783-ETAP modules:
When mounting the tap, allow a minimum clearance between the product and adjacent equipment of 2.54 cm (1 in.) on all sides.

IMPORTANT For 1783-ETAP1F, 1783-ETAP2F modules:
- When mounting the tap, be sure to provide 7.62 cm (3 in.) of space on the bottom of the tap and 2.54 cm (1 in.) of space on the remaining sides of the tap.
- Allow at least 5.08 cm (2 in.) for the fiber cable bend radius. Contact the cable manufacturer for more information on recommended cable bend radii.

WARNING: EXPLOSION HAZARD
An electric arc can occur if you connect or disconnect the following:
- Communication cable with power that is applied to this module or any device on the network
- Wiring while the field-side power is on

This could cause an explosion in hazardous location installations. Be sure that power is removed or the area is nonhazardous before proceeding.
For hazardous location applications, use the supplied Phoenix MSTB 2.5/2-ST-5.08 power terminal block.

DIN Rail Mounting

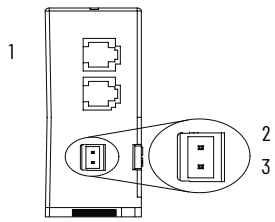
To install the tap on a DIN rail, proceed as follows.

1. Mount your DIN rail.
2. Use a screwdriver to open the latch at the bottom of the tap.
3. Hook the latch over the DIN rail while holding the latch open with your screwdriver.
4. Remove the screwdriver and push the latch to close.

The top figure shows using a screwdriver to open the latch so that you can remove the tap from the DIN rail. The bottom figure shows the latch at the bottom of the tap in the open position.

Panel Mounting

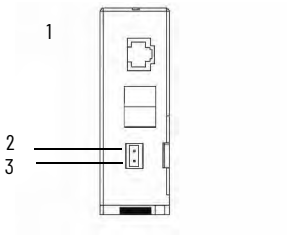
To panel mount a tap, proceed as follows.



1. Use the tap as a template and mark pilot holes on your panel.
2. Drill the pilot holes for M4 or #8 screws.

Wire the Tap

ATTENTION: To comply with the CE Low Voltage Directive (LVD), this equipment must be powered from a source compliant with safety extra low voltage (SELV) or protected extra low voltage (PELV).
To comply with UL restrictions, this equipment must be powered from a source compliant with Class 2.

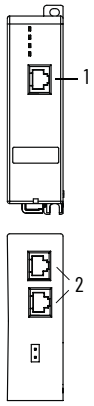


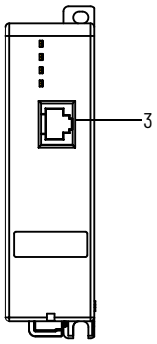
Provide DC power to the tap by using the DC connector at the bottom of the tap.

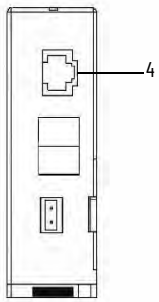
ATTENTION: Do not wire more than two conductors on any single terminal.

1783-ETAP Terminals

Item	Description
1	Tap bottom
2	DC- (0V DC) terminal
3	DC+ (24V DC nom) terminal







1783-ETAP1F, 1783-ETAP2F Terminals

Item	Description
1	Tap bottom
2	DC- (0V DC) terminal
3	DC+ (24V DC nom) terminal

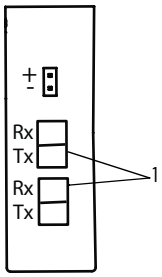
Connect the RJ45 Ports

Follow these steps to connect the copper Ethernet ports on the tap.

1. Locate the copper Ethernet RJ45 ports on the front and bottom of the tap, as shown in the figure.

1783-ETAP	1783-ETAP1F	1783-ETAP2F
		

Item	Description
1	Device port on 1783-ETAP module front panel
2	Ports on 1783-ETAP module bottom for connection to the linear or ring network
3	Device port on 1783-ETAP1F module front panel
4	RJ45 port on 1783-ETAP2F module bottom for connection to a linear, star, or ring network



2. Connect one end of an Ethernet cable to the front panel port used as a device port.
3. Connect the other end of the Ethernet cable to the appropriate device in your network.
4. Connect one end of a second Ethernet cable to a port at the bottom of the tap and connect the other end of the Ethernet cable to the linear or ring network.
5. Repeat with the other port at the bottom of the tap if the port is used by your network.

IMPORTANT When configuring a DLR network, refer to Device Level Ring (DLR) Network Considerations on page 4 to avoid adversely impacting your network.

Connect the 1783-ETAP1F and 1783-ETAP2F Fiber Ethernet Ports

Follow these steps to connect the fiber Ethernet ports on 1783-ETAP1F and 1783-ETAP2F modules.

ATTENTION: Do not look at the optical port. The optical port can expose the eye beyond the maximum permissible exposure recommendations and presents a hazard.

Item	Description
1	Fiber ports on tap bottom for connection to the ring network

1. Locate the fiber Ethernet ports on the bottom of the tap, as shown in the figure (1783-ETAP2F tap shown).
2. Connect the duplex LC connector end of the fiber-optic cable, in the proper orientation, to the fiber-optic Ethernet port on the bottom of the tap.
3. Connect the other end of the fiber-optic cable to the linear or ring network.
4. Repeat step 2 and step 3 with the remaining fiber-optic Ethernet port at the bottom of the tap, if used by your network.

Download the EDS File

To use RSLinx® Classic communication software to configure the tap, follow these steps to download the EDS file for the tap.

IMPORTANT	If the port on your personal computer that is connected to the tap is configured to obtain its IP address automatically, expect a wait time of up to two minutes before communication is established after connecting the tap to a computer. If two or more taps are connected to one another, and each tap is using the default IP address, the computer is only able to communicate with the tap to which it is directly connected.

1. Obtain the EDS file from rok.auto/pcdc.
2. From the Network pull-down menu, choose the EtherNet/IP™ network.
3. From the Device Type pull-down, choose Communication Adapter.
4. In the Bulletin/catalog number field, type 1783-ETAP.
5. Click Search.
6. Click Download to download the EDS file for the tap.
7. Save the file to an appropriate location on your computer.
8. Use your configuration software to register the downloaded file.

   If you are using RSLinx Classic communication software, use the EDS Hardware Installation Tool.

   Choose Start > All Programs > Rockwell Software > RSLinx > Tools.

Configure Internet Protocol Settings

Configure Internet Protocol (IP) settings, such as the IP address, in one of these ways:

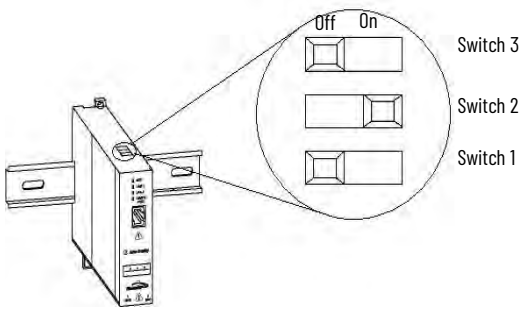
- Use the tap's default IP address of 169.254.1.1 by connecting the tap directly to a computer. To establish communication between a computer and the tap's default IP address, you have the following options:
  - Enter a unique IP address in the local area connection properties for your computer. The computer's IP address must be on the same subnet as the tap's default IP address, such as 169.254.1.2.
  - Configure your computer to obtain its IP address automatically.
- Use IP settings that are configured in RSLinx Classic software or the Studio 5000 Logix Designer application.
- Acquire IP settings from a DHCP server.
- Acquire IP settings from a BOOTP server.

Use the DIP switches on the tap to select the configuration method to use for IP settings. Refer to Set the DIP Switches on page 9.

Use the DHCP/BOOTP Server

If your network infrastructure does not provide DHCP/BOOT functionality, you may download our DHCP/BOOTP server software to a personal computer running a Microsoft Windows® operating system. You can use this computer as the DHCP/BOOTP server.

To set the network address by using the Rockwell Automation DHCP/BOOTP server, follow these steps.



1. Access the DHCP/BOOTP utility at https://ab.rockwellautomation.com.
2. Download the version 2.3.2 DHCP/BOOTP utility.
3. Extract the zipped files to a temporary directory.
4. In the temporary directory, double-click setup.exe to install the DHCP/BOOTP utility.
5. Run the utility.
6. See the following chart, which describes what happens next, depending on whether DHCP/BOOTP is enabled on the tap.

DHCP/BOOTP Status	Result
Enabled	Tap asks for an IP address from a DHCP/BOOTP server. Consult the online help available in the BOOTP/DHCP application to configure the server to provide the desired IP address for your tap.
Not enabled	Tap uses the IP settings that are stored in nonvolatile memory. The default IP address that is stored in memory is 169.254.1.1.

Set the DIP Switches

Use the DIP switches on the tap to do the following:

- Specify the method for configuring Internet Protocol (IP) settings, such as the IP address.
- Enable the Ring Supervisor mode with its current parameters.
- Restore the factory default settings.

See the illustration to understand DIP switch On and Off positions.

Use this procedure to set the DIP switches.

1.Move the switches to the desired position, and then cycle power to the tap.

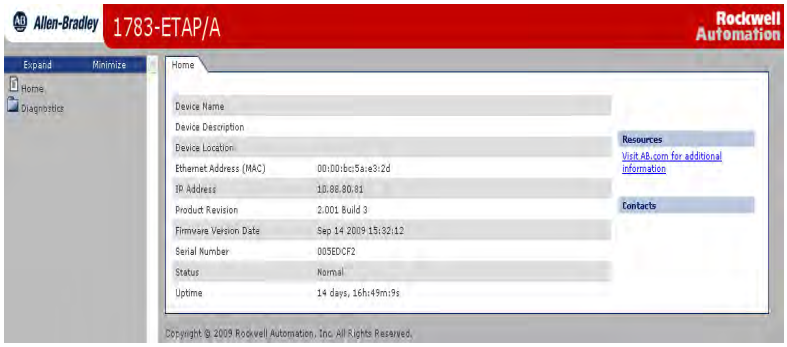
IMPORTANT The switch settings take effect only at power-up. The tap's behavior will not be modified by switch changes until the tap is power cycled.

Power-up Behavior		Switch 1	Switch 2	Switch 3
Internet Protocol settings	Uses the IP settings that are configured by software[1] or Uses the default IP address of 169.254.1.1 if settings have not been configured by software	Off	Off	The position of switch 3 does not affect IP settings
	Uses the IP settings that are acquired by a BOOTP server	On	Off	
	Uses the IP settings that are acquired by a DHCP server	Off	On	
Ring Supervisor mode	Enables Ring Supervisor mode with the current supervisor-related parameters[2]	The positions of switches 1 and 2 do not affect Ring Supervisor mode		On[3]
	Allows Ring Supervisor mode and supervisor-related parameters to be enabled and configured by software			Off
Restores the factory default settings and then suspends operation		On	On	On or Off

(1) RSLinx Classic software or the Studio 5000 Logix Designer application is required.
(2) For information about supervisor-related parameters, refer to the EtherNet/IP Device Level Ring Application Technique, publication ENET-AT007.
(3) Using switch 3 to control Ring Supervisor mode is supported only on 1783-ETAP modules running firmware revision 2.001 or later.

2. Observe these guidelines for use of the DIP switches:
   - Out of the box, all three switches are in the Off position. In this state, the tap is configured to be a non-supervisor ring node and will respond to the default IP address of 169.254.1.1. If your application does not require access to the tap's diagnostic information or configuration, no further action is required. Otherwise, select alternate DIP switch settings or configure the tap by using RSLinx Classic software or the Studio 5000 Logix Designer application.
   - When a switch is pushed to the left, it is in the Off position.
   - When a switch is pushed to the right, it is in the On position.
   - To select BOOTP, move switch 1 to the On position and switch 2 to the Off position.
   - To select DHCP, move switch 1 to the Off position and switch 2 to the On position.
   - To enable Ring Supervisor mode with the current supervisor-related parameters, move switch 3 to the On position.
   - To restore the factory default settings and suspend operation, move both switch 1 and 2 to the On position. When both switches 1 and 2 are in the On position, the position of switch 3 is ignored. When operation is suspended, the OK status indicator blinks red. To resume normal operation, move the switches to the desired positions and then cycle power to the tap.

Use the Web Interface



The tap supports a Web interface that provides diagnostic read-only information. Follow these steps to access the Web interface.

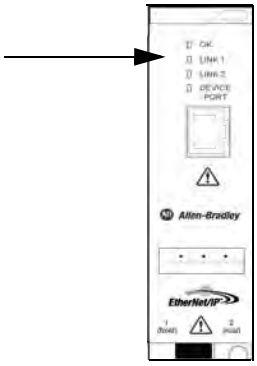
1. Connect a computer to any of the tap's Ethernet ports.
2. Browse to the tap by entering the tap's IP address (the out-of-the-box default is 169.254.1.1) in your web browser's address bar.

If you configure the tap with an IP address, you can also access the tap Web interface from any computer that is connected to the network.

3. Click Enter.

   You see the 1783-ETAP tap page, which provides general information about the tap.

4. In the left pane, click Diagnostics.
   You see links to these pages:
   - Diagnostic Overview
   - Network Settings
   - Ethernet Statistics
   - Ring Statistics



Webpage	Topics
Diagnostic Overview	• Module resource utilization • Web server read and write hits • Module settings • Ring status • Network management features
Network Settings	• Network interface details, such as IP address and subnet mask • Ethernet Interface configuration method • Ethernet port details
Ethernet Statistics	• Ethernet counters • Ethernet port details • Error information
Ring Statistics	Ring supervisor, configuration, and fault details

1783-ETAP Status Indicators

Indicator	Status	Description
OK	Off	Tap is not powered.
	Flashing green	Tap is not configured.
	Steady green	Tap is powered, configured, and operating correctly.
	Flashing red	Recoverable fault, such as duplicate IP address or update in progress, is detected.
	Steady red	Unrecoverable fault detected.
LINK1, LINK2	Off	One of these conditions exists: • No link. • Port administratively disabled. • Port that is disabled because of rapid ring fault condition, and this tap is the active ring supervisor (LINK 2). • Ring network has encountered a rare, partial network fault, and this tap is the active supervisor (LINK 2).
	Green	One of these conditions exists: • A 100 Mbps (full or half-duplex) link exists. • The ring network is operating normally and this tap is the active supervisor (LINK 2).
	Flashing green	A 100 Mbps link exists and there is activity.
	Steady yellow	One of these conditions exists: • A 10 Mbps (full or half-duplex) link exists. • Ring network is operating normally, and this tap is the active supervisor (LINK 2).
	Flashing yellow	A 10 Mbps link exists and there is activity.

1783-ETAP1F, 1783-ETAP2F Status Indicators

Indicator	Status	Description
OK	Off	Tap is not powered.
	Flashing green	Tap is not configured.
	Steady green	Tap is powered, configured, and operating correctly.
	Flashing red	Recoverable fault, such as duplicate IP address detected, or an update in progress, is detected.
	Steady red	Unrecoverable fault detected.
LINK 1, LINK 2	Off	One of these conditions exists: • No link. • Port administratively disabled. • Ring network has encountered a rare, partial network fault, or rapid ring fault condition, and this tap is the active supervisor (LINK 2).
	Steady green	One of these conditions exists: • RJ45 port: a 100 Mbps (full or half-duplex) link exists, and there is no activity. • Fiber port: a 100 Mbps (full-duplex) link exists, and there is no activity. • Ring network is operating normally, and this tap is the active supervisor (LINK 2).
	Flashing green	A 100 Mbps link exists and there is activity.
	Steady yellow	RJ45 port only. One of these conditions exists: • A 10 Mbps (full or half-duplex) link exists. • Ring network is operating normally, and this tap is the active supervisor (LINK 2).
	Flashing yellow	RJ45 port only. A 10 Mbps link exists and there is activity.

Specifications

Attribute	1783-ETAP, 1783-ETAPK	1783-ETAP1F, 1783-ETAP1FK	1783-ETAP2F, 1783-ETAP2FK

DC power connections	• One 0.33...3.3 mm^2 (22...12 AWG) • Two 0.33...1.3 mm^2 (22...16 AWG) solid • Stranded copper wire rated at 75 °C (167 °F) or greater • 1.2 mm (3/64 in.) insulation max		
Torque	0.6...0.8 N•m (5...7 lb•in) on power connector		
Temperature, operating IEC 60068-2-1 (Test Ad, Operating Cold) IEC 60068-2-2 (Test Bd, Operating Dry Heat) IEC 60068-2-14 (Test Nb, Operating Thermal Shock)	-25 °C ≤ Ta ≤ +70 °C (-13 °F ≤ Ta ≤ +158 °F)	-25 °C ≤ Ta ≤ +60 °C (-13 °F ≤ Ta ≤ +140 °F)	
Temperature, surrounding air, Ta, max	70 °C (158 °F)	60 °C (140 °F)	

WARNING: This product is a class A equipment:
- This product must not be used in residential areas.
- This product may cause interference if used in residential areas. Such use must be avoided unless the user takes special measures to reduce electromagnetic emissions to prevent interference to the other devices.

<警告使用者>此為甲類資訊技術設備，於居住環境中使用時，可能會造成射頻擾動，在此種情況下，使用者會被要求採取某些適當的對策。

Additional Resources

These documents contain additional information concerning related products from Rockwell Automation.

Resource	Description
Stratix Ethernet Switches Specifications, publication 1783-TD001	Contains technical specifications, environmental specifications, certifications, and other information pertaining to Stratix® Ethernet switches.

You can view or download publications at https://www.rockwellautomation.com/literature/. To order paper copies of technical documentation, contact your local Allen-Bradley distributor or Rockwell Automation sales representative.

Rockwell Automation maintains current product environmental information on its website at https://www.rockwellautomation.com/rockwellautomation/about-us/sustainability-ethics/product-environmental-compliance.page.

Rockwell Automation Support

The PanelView™ Plus 7 Performance terminals are operator interface devices. They monitor and control devices that are attached to ControlLogix® and CompactLogix™ 5370 controllers on an EtherNet/IP™ network. Animated graphic and text displays provide operators a view into the operating state of a machine or process. Operators interact with the control system by using touch screen or keypad input.

The PanelView Plus 7 Performance terminals include these features and capabilities:

- FactoryTalk® View Machine Edition software provides a familiar environment for creating HMI applications
- Connection to ControlLogix or CompactLogix 5370 controllers
- Ethernet communication that can support Device Level Ring (DLR), linear, or star network topologies
- Conformal coating available for all DC power, touch-only terminals, and the 15-in. DC power, keypad and touch terminal
- Stainless steel, hygienic, brandless, DC-power, and conformal coating are available for the touch-only units in the 9-in. wide screen, 10-in., 12-in. wide screen, and 15-in. terminal sizes
- On-machine mounting available for the 12.1-in. wide screen, touch-only terminals

Summary of Changes

This publication contains new and updated information as indicated in the following table.

Topic	Page
Added 10-in. and 15-in. stainless steel catalog numbers and information	Throughout
Corrected the Corrosive Atmosphere rating information in the Environmental Specifications table	3
Updated the CE (LVD), KDD, and RoHS information in the Certifications table	4

Catalog Numbers

This publication is applicable to these currently available PanelView Plus 7 Performance terminals.

PanelView Plus 7 Performance	2711P-T7C22D9P, 2711P-B7C22D9P, 2711P-T9W22D9P, 2711P-T10C22D9P, 2711P-B10C22D9P, 2711P-T12W22D9P, 2711P-T15C22D9P, 2711P-B15C22D9P, 2711P-T19C22D9P
PanelView Plus 7 Performance Conformal Coated	2711P-T7C22D9PK, 2711P-T9W22D9PK, 2711P-T10C22D9PK, 2711P-T12W22D9PK, 2711P-T15C22D9PK, 2711P-T19C22D9PK, 2711P-B15C22D9PK
PanelView Plus 7 Performance Brandless	2711P-T7C22D9P-B, 2711P-B7C22D9P-B, 2711P-T9W22D9P-B, 2711P-T10C22D9P-B, 2711P-B10C22D9P-B, 2711P-T12W22D9P-B, 2711P-T15C22D9P-B, 2711P-B15C22D9P-B, 2711P-T19C22D9P-B
PanelView Plus 7 Performance Stainless Steel	2711P-T9W22D9P-BSHK, 2711P-T10C22D9P-BSHK, 2711P-T12W22D9P-BSHK, 2711P-T15C22D9P-BSHK
ArmorView Plus 7	2711P-T12W22D9P-BM001, 2711P-T12W22D9P-BM002, 2711P-T12W22D9P-BM003, 2711P-T12W22D9P-BM004, 2711P-T12W22D9P-BM005, 2711P-T12W22D9P-BM006, 2711P-T12W22D9P-BM007, 2711P-T12W22D9P-BM008, 2711P-T12W22D9P-BM009, 2711P-T12W22D9P-BM010, 2711P-T12W22D9P-BM011, 2711P-T12W22D9P-BM012, 2711P-T12W22D9P-BM013, 2711P-T12W22D9P-BM014, 2711P-T12W22D9P-BM015, 2711P-T12W22D9P-BM016

This publication is also applicable to these discontinued PanelView Plus 7 Performance terminals.

PanelView Plus 7 Performance	2711P-T7C22A9P, 2711P B7C22A9P, 2711P-T9W22A9P, 2711P-T10C22A9P, 2711P-B10C22A9P, 2711P-T12W22A9P, 2711P-T15C22A9P, 2711P-B15C22A9P, 2711P-T19C22A9P
PanelView Plus 7 Performance Brandless	2711P-T7C22A9P-B, 2711P-B7C22A9P-B, 2711P-T9W22A9P-B, 2711P-T10C22A9P-B, 2711P-B10C22A9P-B, 2711P-T12W22A9P-B, 2711P-T15C22A9P-B, 2711P-B15C22A9P-B, 2711P-T19C22A9P-B

PanelView Plus 7 Performance terminal catalog numbers ending in:

- 'K' are conformal coated for extended protection in harsh, corrosive environments
- '-B' exclude the Allen-Bradley brand marking. You can put your own brand labels on these terminals
- 'BSHK' are conformal coated, brandless, and feature a stainless-steel 316 bezel

Environmental Specifications

This table lists environmental specifications for the PanelView Plus 7 Performance and ArmorView™ Plus 7 terminals.

Environmental Specifications

Attribute	Value
Temperature, operating	6.5-in., 9-in., 10.4-in., 12.1-in., and 15-in. terminals 0…55 °C (32…131 °F) 19-in. terminals (Series A) 0…50 °C (32…122 °F) 19-in. terminals (Series B) 0…55 °C (32…131 °F) ArmorView Plus 7 terminals 0…50 °C (32…122 °F) ambient(1)
Temperature, nonoperating	-25…+70 °C (-13…+158 °F)(2)
Heat dissipation	Typical BTU measurements were taken at 25 °C (77 °F): 6.5-in. DC (touch, and touch with keypad), 51 BTU (typical) (Series B, 38 BTU) 6.5-in. AC (touch, and touch with keypad), 53 BTU (typical) 9-in. DC, 55 BTU (typical) Series A (Series B for stainless steel) 9-in. DC, 41 BTU (typical) Series B (Series C for stainless steel) 9-in. AC, 58 BTU (typical) 10.4-in. DC (touch, and touch with keypad) Series A, 51 BTU (typical) 10.4-in. DC (touch, and touch with keypad) Series B (Series C for stainless steel), 48 BTU (typical) 10.4-in. AC (touch, and touch with keypad), 56 BTU (typical) 12.1-in. DC Series A (Series B for stainless steel), 60 BTU (typical) 12.1-in. DC Series B (Series C for stainless steel), 49 BTU (typical) 12.1-in. AC, 67 BTU (typical) 15-in. DC (touch, and touch with keypad) Series A, 61 BTU (typical) 15-in. DC (touch, and touch with keypad) Series B (Series C for stainless steel), 71 BTU (typical) 15-in. AC (touch, and touch with keypad), 68 BTU (typical) 19-in. DC, 114 BTU (typical) (Series B, 92 BTU) 19-in. AC, 119 BTU (typical)
Altitude, operating	2000 m (6562 ft)(2)
Relative humidity	5…95% without condensation(2)
Vibration	6.5-in., 9-in., 10.4-in., 12.1-in. terminals, and 12.1-in. terminal in the ArmorView Plus 7 enclosure 0.012 pk-pk, 10…57 Hz 2 g peak at 57…500 Hz 15-in. and 19-in. terminals 0.006 pk-pk, 10…57 Hz 1 g peak at 57…640 Hz
Shock, operating	15 g at 11 ms(3)
Shock, nonoperating	30 g at 11 ms(3)
Enclosure ratings	NEMA and UL Type 12, 13, 4X, also rated IP66 as Classified by UL(4) (5)
Corrosive Atmosphere(6) ASTM B845-97 Method K Accelerated Test (20-Day Exposure)	Severity Level G3(7)(8) per ANSI/ISA 71.04-2013, Airborne Contaminants—Gases Severity Level CX(7) per IEC 60721-3-3:2019, Chemically Active Substances

(1) The optional I/O plate (included in the VESA Mounting Kit—2711P-RVESA01) is rated to 0…45 °C (32…113 °F).
(2) These values are the same for the ArmorView Plus 7 terminals.
(3) These values are the same for the ArmorView Plus 7 terminals when the VESA mount is used. When the arm mount coupling is used, the values are 5 g at 11 ms.
(4) The ArmorView Plus 7 terminals enclosure ratings are 12, 13, 4, or 4X (see the ArmorView Plus 7 Installation Instructions, publication 2711P-IN013 for more detail) and IP66 as classified by UL.
(5) The PanelView Plus 7 Performance Stainless Steel Series B and Series C terminals are also rated IP69 as Classified by UL and tested for IP69K according to ISO 20653.
(6) Only applicable to terminals that have a 'K' or "BSHK" in the catalog number.
(7) Port plugs/covers must remain installed in unused ports at all times during storage and operation for the product to maintain its corrosive atmosphere rating.
(8) Up to 86.4 g/(m^2·yr), mass loss of copper due to corrosion.

Resistance to Chemicals

The outer surfaces of the terminal including the bezel, touch screen overlay, and panel gasket seal are tested for chemical resistance. Some of the chemicals can cause discoloration, but they do not interfere with the operation of the terminal.

For more information on the chemical resistance of the product, go to https://rockwellautomation.custhelp.com and search the Knowledgebase using the keywords, 'Chemical Resistance PanelView Plus'.

IMPORTANT Do not operate the terminal in direct sunlight. Direct exposure to ultraviolet light can discolor the touch screen.

Certifications

This table lists certifications for the PanelView Plus 7 Performance terminals.

Certification[1]	Value
CE (EMC)	European Union 2014/35/EU EMC Directive, compliant with: EN 61000-6-2; Industrial Immunity EN 61000-6-4; Industrial Emissions EN 61131-2; Programmable Controllers
CE (LVD)[2]	European Union 2014/30/EU Low Voltage Directive, compliant with: EN 61010-2-201; Safety Requirements for Control Equipment
c-UL-us	Both ArmorView Plus 7 (E113724) and PanelView Plus 7 Performance (UL Category Control Number E10314) terminals hold the following certifications: • c-UL-us Listed Industrial Control Equipment for US and Canada per standards UL 61010-1, UL 61010-2-201, CSA-C22.2 No. 61010-1, and CSA-C22.2 No. 61010-2-201. • Enclosure type ratings per UL50 and CSA C22.2 No. 94.2. • Enclosure ingress protection that is classified by UL per IEC 60529. In addition, PanelView Plus 7 Performance (E10314) terminals hold the following certifications: • cULus Listed Industrial Control Equipment for use in Hazardous Locations per standards ANSI/ISA 12.12.01 and CSA C22.2 No. 213 rated: – Class I, Div 2, Groups A, B, C, D – Class II, Div 2, Groups F and G – Class III, Div 1 and 2
EtherNet/IP	ODVA conformance that is tested to EtherNet/IP specifications
KCC	Certificate of compliance R-R-RAA-2711P-12BM for ArmorView Plus 7 MSIP-REM-RAA-2711P-X22XP for PanelView Plus 7 Performance
NSF	Stainless Steel Series B and C Terminals only, compliant with: • NSF/ANSI/3-A 14159-1; Hygiene Requirements for the Design of Meat and Poultry Processing Equipment • NSF/ANSI 169; Special Purpose Food Equipment and Devices
RCM	Australian Radiocommunications Act, compliant with: AS/NZS CISPR 11; Industrial Emissions
RoHS	China RoHS, Türkiye RoHS, KSA RoHS, UAE RoHS, European RoHS 2011/65/EU (incorporating 2015/863)
UKCA	BS EN 61010-2-201; Safety Requirements for Control Equipment BS EN 61131-2; Programmable Controllers
Morocco	NM EN 61010-2-201; Safety Requirements for Control Equipment NM EN 61131-2; Programmable Controllers

(1) When marked. See the Product Certification link at rok.auto/certification for Declarations of Conformity, Certificates, and other certification details.
(2) This EU directive does not apply to PanelView products with a voltage rating under 50 Vac or 75 Vdc.

Technical Specifications

PanelView Plus 7 Performance Terminals

Technical Specifications - PanelView Plus 7 Performance 7-in and 9-in Terminals

Attribute	6.5-in. Touch		6.5-in. Touch with Keypad		9-in. Touch

(1) DC-powered terminals support safety extra low voltage (SELV) and protective extra low voltage (PELV) 24V DC power supplies such as cat. nos. 1606-XLP95E, 1606-XLP100E, 2711P-RSACDIN.

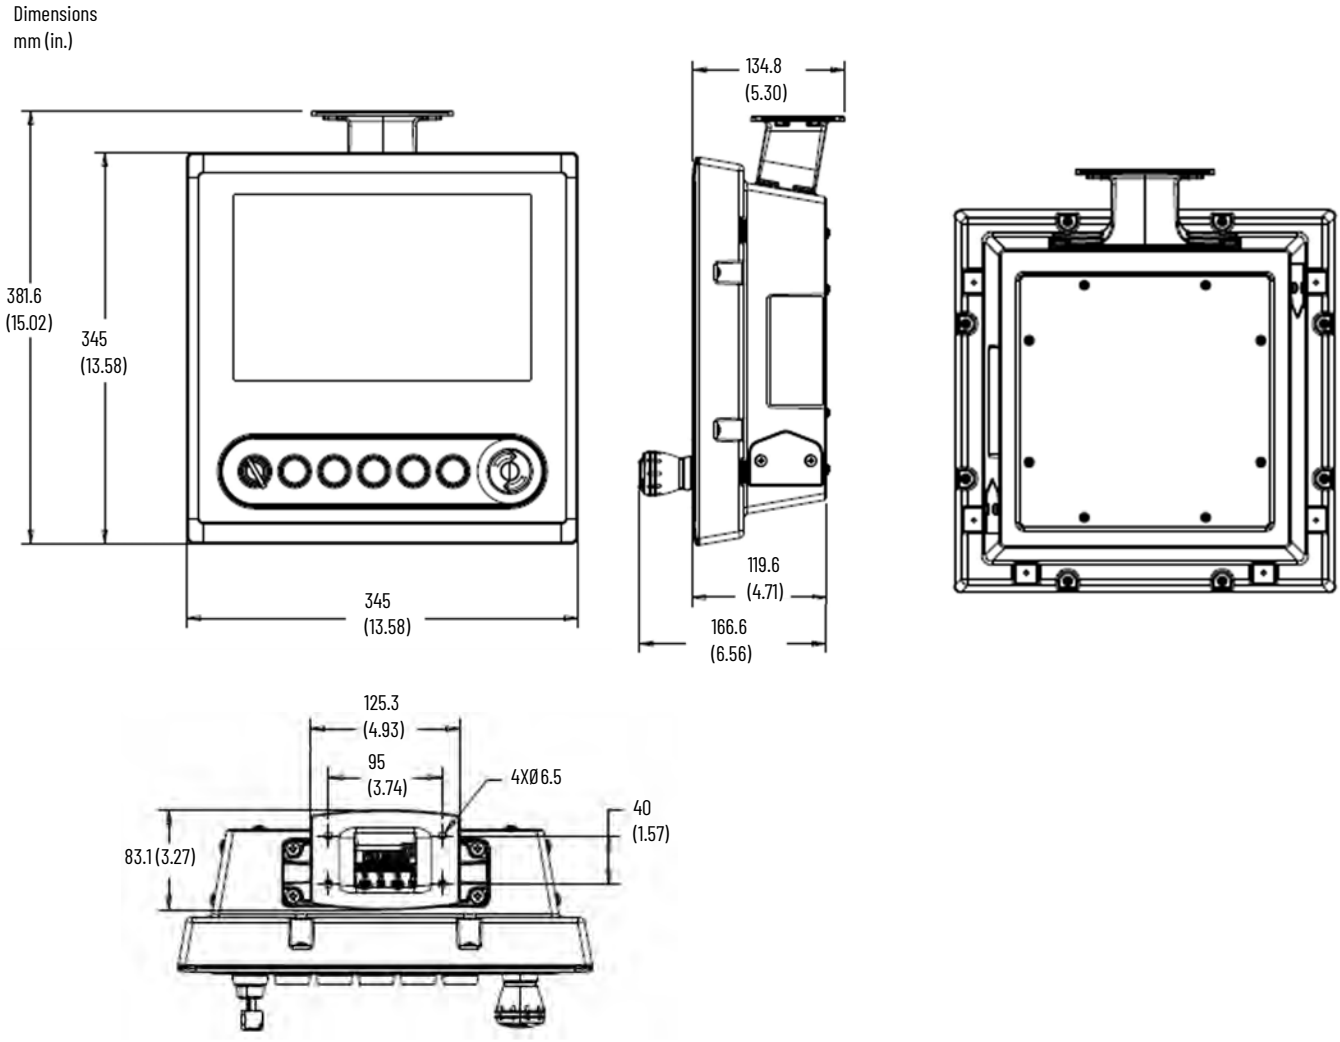
Product Dimensions

PanelView Plus 7 Performance Terminals

This section provides product dimensions for the PanelView Plus 7 Performance terminals. The PanelView Plus 7 Performance 10.4-inch touch and combination keypad with touch devices are shown for illustrative purposes. Stainless steel terminals use different mounting clips, but the dimensions are the same. Dimensions for the 12.1-in. ArmorView Plus 7 terminals can be found on page 11.

PanelView Plus 7 Performance Terminal Dimensions - 10.4-in. Model

PanelView Plus 7 Performance Terminal Dimensions



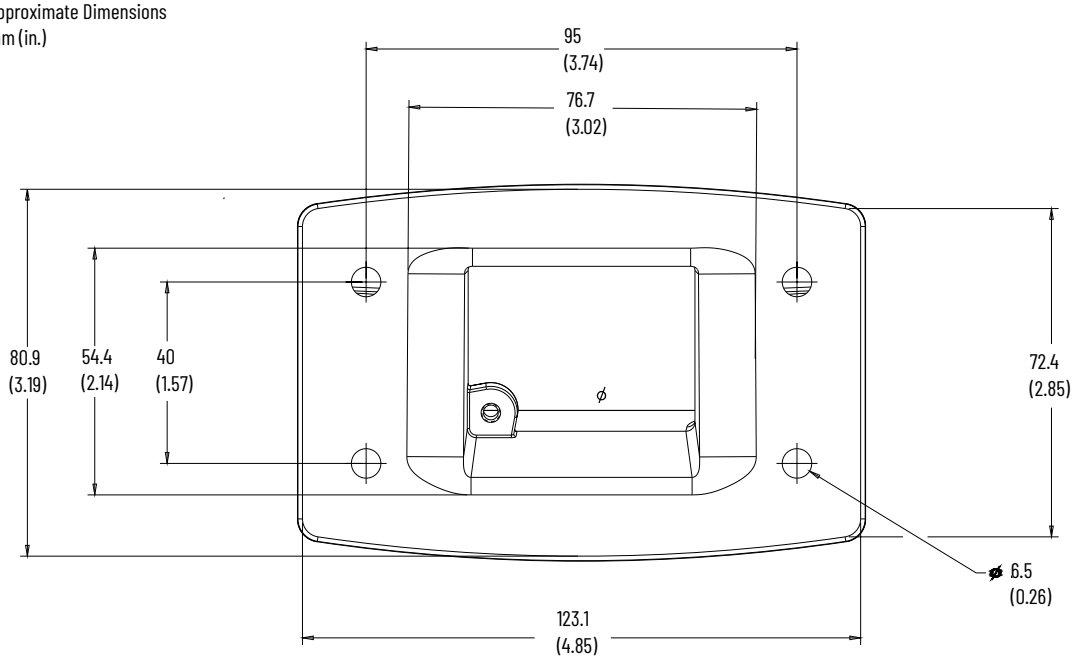
Terminal Size	Input Type	Height (a) mm (in.)	Width (b) mm (in.)	Overall Depth (c) mm (in.)	Mounted Depth (d) mm (in.)
6.5-in.	Key/touch	179 (7.05)	285 (11.22)	69.6 (2.74)	63.6 (2.50)
	Touch	170 (6.69)	212 (8.35)		
9-in.	Touch	190 (7.48)	280 (11.02)		
10.4-in.	Key/touch	252 (9.92)	385 (15.16)		
	Touch	252 (9.92)	297 (11.69)		
12.1-in.	Touch	246 (9.69)	340 (13.39)		
15-in.	Key/touch	322 (12.68)	484 (19.06)		
	Touch	318 (12.52)	381 (15.00)		
19-in.	Touch	411 (16.18)	485 (19.09)		

When mounted in a panel, the front of the bezel extends less than 6.36 mm (0.25 in.) from the front of the panel.

ArmorView Plus 7 Terminals

This section provides product dimensions for the ArmorView Plus 7 terminals. This terminal provides options for mounting on an arm mount system, a pedestal, or VESA bracket (with the use of an optional VESA kit).

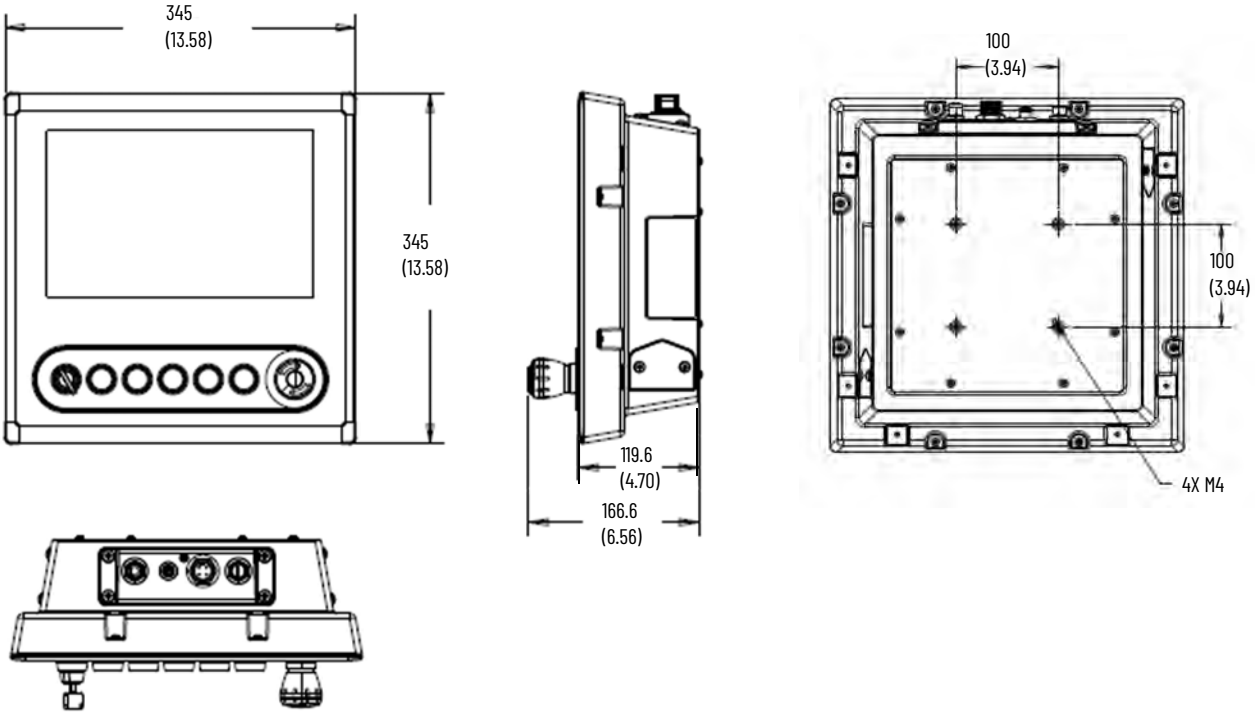
ArmorView Plus 7 Terminals Dimensions with Arm Adapter



The ArmorView Plus 7 product is designed to be used with couplers that have the same mounting pattern, such as those shown in the table. For information about the dimensions of the arm mount adapter, see Arm Mount Adapter Dimensions on page 12.

	Rittal	Hoffman	Other
Supported Coupling	CP 6501.130 (CP40 120x65) CP 6206.340 (CP60 swivel) CP 6206.360 (CP60 rigid)	S1MFC	Any compatible coupling(1)
Supported Arm Systems	CP40 (steel) CP60 (extruded aluminum)	Syspend 180	
Supported Pedestal Systems	CP 6106.500 with these CP60 couplings: CP 6206.340 CP 6206.360	–	

(1) The arm mount adapter accommodates coupling with four M6 mounting screws 95 mm (3.74 in.) x 40 mm (1.58 in.) with a seal that is contained in 80.9 mm (3.19 in.) x 123.1 mm (4.85 in.). The product will only meet specified NEMA, UL Type, and IEC ratings with user-installed accessories (stack light, buttons, indicators, and so on), if the accessories have equivalent ratings and are installed properly.



Arm Mount Adapter Dimensions

Approximate Dimensions
mm (in.)

ArmorView Plus 7 Terminals Dimensions with VESA Mount and I/O Plate

Approximate Dimensions
mm (in.)

ArmorView Plus 7 Terminals Dimensions

ArmorView Plus 7 Terminals	Height mm (in.)	Width mm (in.)	Overall Depth without E-stop mm (in.)	Overall Depth with E-stop mm (in.)
With Arm Adapter	381.6 (15.02)	345 (13.58)	119.6 (4.71)	166.6 (6.56)
With VESA Mount and I/O Plate	345 (13.58)	345 (13.58)	119.6 (4.71)	166.6 (6.56)

Accessories

This section describes accessories for the PanelView Plus 7 Performance and ArmorView Plus 7 terminals.

Protective Overlays

Cat. No. (1)	Display Size	Operator Input		Quantity
		Touch	Key and Touch	
2711P-RGT7SP	6.5-in.	•		3
2711P-RGB7P			•	
2711P-RGT9SP	9-in. (wide)	•		
2711P-RGT10SP	10.4-in.	•		
2711P-RGB10P			•	
2711P-RGT12SP(2)	12.1-in. (wide)	•		
2711P-RGT15SP	15-in.	•		
2711P-RGB15P			•	
2711P-RGT19P	19-in.	•		

(1) The use of protective overlays may not be compatible in all hygienic applications. Consult the standards and protocols for your hygienic applications before you use a protective overlay on a stainless-steel terminal.
(2) On ArmorView Plus 7 terminals, the protective overlay covers only the touch screen portion of the product.

Power Supplies and Power Terminal Blocks

Cat. No.	Description	Quantity
1606-XLP95E	DIN rail power supply, 24…28V DC output voltage, 95 W	1
1606-XLP100E	DIN rail power supply, 24…28V DC output voltage, 100 W	1
2711P-RSACDIN	DIN rail power supply, AC-to-DC, 85…265V AC, 47…63 Hz	1
2711P-RTBAP	3-pin AC power terminal block	10
2711P-RTBDSP	3-pin DC power terminal block	10

Mounting Hardware

Cat. No.	Description	Quantity
2711P-RMCP(1)	Replacement mounting levers (black)	16
2711P-RTMC(2)	Replacement mounting clips (only for stainless-steel terminals)	8

(1) Catalog number 2711P-RMCP mounting levers are used with PanelView Plus 7 Performance terminals. Do not use gray mounting levers; they are not compatible with PanelView Plus 7 Performance terminals.
(2) Catalog number 2711P-RTMC mounting clips are used for stainless-steel terminals, catalog numbers 2711P-T9W22D9P-BSHK 2711P-T10C22D9P-BSHK, 2711P-T12W22D9P-BSHK, or 2711P-T15C22D9P-BSHK. **NOTE:** 2711P-T12W22D9P-BSHK requires 10 mounting clips and 2711P-T15C22D9P-BSHK requires 12 mounting clips. If you need more than eight clips, order two 2711P-RTMC mounting clip kits.

Secure Digital (SD) Cards(1)

Cat. No.	Description	Quantity
1784-SD1	1 GB SD card	1
1784-SD2	2 GB SD card	1
1784-SDHC8	8 GB High Capacity SD card	1
1784-SDHC32	32 GB High Capacity SD card	1
2711C-RCSD	USB to SD adapter for SD card	1

(1) To help reduce the chance of corruption when you use SD Cards or USB drives with the terminal, Rockwell Automation recommends that you use only the above SD card catalog numbers.

Battery Replacement

Cat. No.	Description	Quantity
2711P-RY2032	Lithium coin cell battery, CR2032 equivalent	1

IMPORTANT Before you select the appropriate replacement gasket, you must identify the series of your PanelView Plus 7 Performance Stainless Steel terminal. The terminal series information can be found on the product nameplate label.

The gaskets that are listed for use on Series B or Series C terminals are not certified for use on Series A terminals, and the gaskets that are listed for use on Series A terminals are not certified for use on Series B or Series C terminals.

Hygienic Gasket Replacement Kits for Stainless Steel Terminals

Cat. No.	Description[1]	Terminal Series	Quantity
2711P-RGST9W	Hygienic gasket, blue silicone For 9-in. Series A stainless-steel terminals	A	1
2711P-RGST12W	Hygienic gasket, blue silicone For 12-in. Series A stainless-steel terminals	A	1
2711P-RGST9WB	Hygienic gasket, blue, silicone, with ribs For 9-in. Series B and Series C stainless-steel terminals	B or C	1
2711P-RGST12WB	Hygienic gasket, blue, silicone, with ribs For 12-in. Series B and Series C stainless-steel terminals	B or C	1
2711P-RGST10	Hygienic gasket, blue, silicone, with ribs For 10-in. Series C stainless-steel terminals	C	1
2711P-RGST15	Hygienic gasket, blue, silicone, with ribs For 15-in. Series C stainless-steel terminals	C	1

(1) Gasket material is compliant with FDA 21 CFR 177.2600.

VESA Kit for ArmorView Plus 7 Terminals

Cat. No.	Description	Quantity
2711P-RVESA01	VESA access cover, I/O plate fitted with these cables: • Power to terminal • Connection to E-stop button • Ethernet (I/O Plate to Ethernet I/O Module) • Ethernet (I/O Plate to PanelView terminal)[1] • Ground wire • M16 hole plug[2]	1

(1) For units that don't have an Ethernet I/O module and require a DLR connection, you must remove the Ethernet I/O module cable and replace it with the Ethernet I/O module to terminal cable.
(2) For terminals that do not have an E-stop on the I/O plate, you can replace the connector with the M16 hole plug.

Handle Kit for ArmorView Plus 7 Terminals

Cat. No.	Description	Quantity
2711P-RHNDL01[1]	One-handle	1

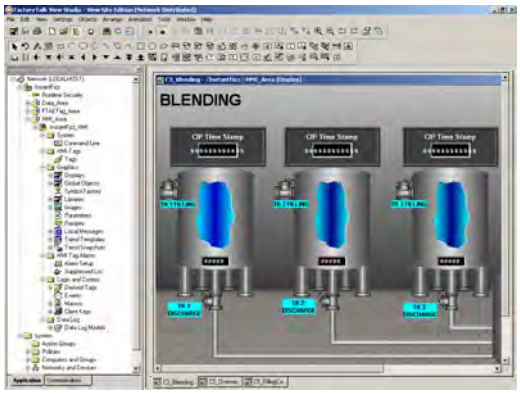
(1) You can install one, two, or three handles to an ArmorView Plus 7 terminal. Indentations for installing the handle are located opposite the arm mount adapter (or the I/O plate), and on both sides. To install more than one handle, order multiple handle kits.

Stack Light for ArmorView Plus 7 Terminals

Cat. No.	Description	Quantity
854J-BVMC (vertical mount)[1]	Stack light	1

(1) You can install a stack light on either side of an ArmorView Plus 7 terminal. To install two stack lights, order two stack light kits.

Cables for ArmorView Plus 7 Terminals



Cat. No.	Description	Quantity
2711P-RIOIN3M	Input point cable for customer-installed switch (3-pin male Pico™ style connector for Ethernet I/O module)	1
2711P-RIOUT3M	Output point cable for customer-installed indicator light (3-pin male Pico style connector for Ethernet I/O module)	1

HMI Software

All PanelView Plus 7 terminals are configured with FactoryTalk View Studio software and have an integrated runtime system called FactoryTalk View Machine Edition Station.

Machine Edition Station runs projects that are developed with FactoryTalk View Studio software and is included on all PanelView Plus 7 terminals.

Two versions of FactoryTalk View Studio software support application development for PanelView Plus 7 terminals.

Cat. No.[1]	Description
9701-VWSTMENE	FactoryTalk View Studio for Machine Edition software - Configuration software for developing and testing machine-level human machine interface (HMI) applications. Includes FactoryTalk Linx and KEPServer Enterprise software.
9701-VWSTENE	FactoryTalk View Studio software - Configuration software for developing and testing machine-level and supervisory-level human machine interface (HMI) applications.

(1) To order localized versions of the software, replace EN in the catalog number with DE for German, FR for French, JP for Japanese, or ZH for Chinese.

You can import PanelView Standard/PanelBuilder® 32 and PanelView applications into FactoryTalk View Studio software as Machine Edition applications by using the Machine Edition Import Wizard. The Import Wizard steps you through a few options such as scaling to a new screen resolution size, and then converts objects, text, tags, and communication configurations to ones that are available in Machine Edition.

FactoryTalk ViewPoint software, an Add-On to FactoryTalk View Studio software, allows plant managers, production supervisors, system integrators, and other key personnel to view and control real-time plant floor operations remotely from a web browser. FactoryTalk ViewPoint enabled displays are fully scalable and animated in the browser. You can also view displays that are not the active display of the terminal from a remote location.

Each PanelView Plus 7 terminal contains one license that supports one client connection to the terminal. No additional software is required.

For a complete list of available HMI software, visit https://www.rockwellautomation.com/en-us/products/software.html#hmi.

Additional Resources

These documents contain more information about related products from Rockwell Automation.

Resource	Description
PanelView Plus 7 Performance Terminals User Manual, publication 2711P-UM008	Provides instructions on how to install, configure, and operate the PanelView Plus 7 Performance terminals.
ArmorView Plus 7 Installation Instructions, publication 2711P-IN013	Provides instructions on how to install the ArmorView Plus 7 components.
Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1	Provides general guidelines on how to install a Rockwell Automation industrial system.
Product Certifications website, rok.auto/certifications.	Provides declarations of conformity, certificates, and other certification details.

You can view or download publications at rok.auto/literature.

Rockwell Automation Support

Use these resources to access support information.

Technical Support Center	Find help with how-to videos, FAQs, chat, user forums, Knowledgebase, and product notification updates.	rok.auto/support
Local Technical Support Phone Numbers	Locate the telephone number for your country.	rok.auto/phonesupport
Technical Documentation Center	Quickly access and download technical specifications, installation instructions, and user manuals.	rok.auto/techdocs

A protective feed through terminal block is an electrical conductor for the purpose of safety and is used in many applications. To establish the electrical and mechanical connection between copper conductors and the mounting support plate, PE terminal blocks are used. They have one or more contact points for connection with and/or bifurcation of protective earth conductors.

General ordering data

Version	PE terminal, Screw connection, Green/yellow, 2.5 mm², 800 V, Number of connections: 2, Number of levels: 1, TS 35, V-0, Wemid
Order No.	1010000000
Type	WPE 2.5
GTIN (EAN)	4008190143640
Qty.	100 pc(s).

To feed through power, signal, and data is the classical requirement in electrical engineering and panel building. The insulating material, the connection system and the design of the terminal blocks are the differentiating features. A feed-through terminal block is suitable for joining and/or connecting one or more conductors. They could have one or more connection levels that are on the same potential or insulated against one another.

In some applications it is useful to protect the feed through connection with a separate fuse. Fuse terminal blocks are made up of one terminal block bottom section with a fuse insertion carrier. The fuses vary from pivoting fuse levers and pluggable fuse holders to screwable closures and flat plug-in fuses.

General ordering data

Version	Fuse terminal, Screw connection, dark beige, 2.5 mm², 6.3 A, 36 V, Number of connections: 2, Number of levels: 1, TS 35
Order No.	1763950000
Type	WTR 2.5/SI LD 36V

In some applications it makes sense to add a test point or a disconnect element to the feed through terminal for testing and safety purposes. With test disconnect terminals you measure electric circuits in the absence of voltage. While the disconnecting points clearance and creepage distance is not assessed in dimensional terms, the specified rated impulse voltage strength must be proven.

General ordering data

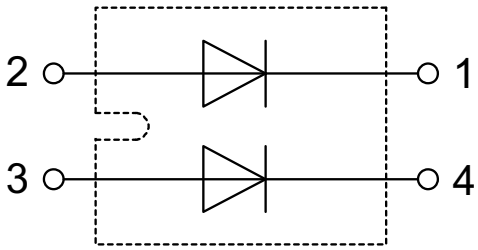
High Performance Fast Recovery Diode
Low Loss and Soft Recovery
Parallel legs



Part number

DSEP2x91-03A

Backside: isolated

E72873

Features / Advantages:

- Planar passivated chips
- Very low leakage current
- Very short recovery time
- Improved thermal behaviour
- Very low Irm-values
- Very soft recovery behaviour
- Avalanche voltage rated for reliable operation
- Soft reverse recovery for low EMI/RFI
- Low Irm reduces:
  - Power dissipation within the diode
  - Turn-on loss in the commutating switch

Applications:

- Antiparallel diode for high frequency switching devices
- Antisaturation diode
- Snubber diode
- Free wheeling diode
- Rectifiers in switch mode power supplies (SMPS)
- Uninterruptible power supplies (UPS)

Package: SOT-227B (minibloc)

- Isolation Voltage: 3000 V~
- Industry standard outline
- RoHS compliant
- Epoxy meets UL 94V-0
- Base plate: Copper internally DCB isolated
- Advanced power cycling

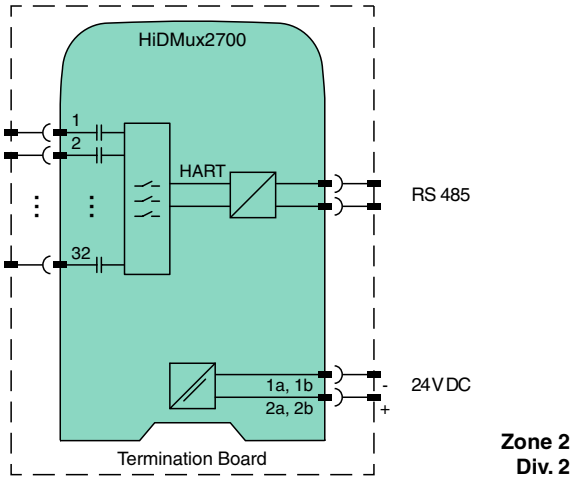
HART Multiplexer

HiDMux2700



- 32-channel
- 24 V DC supply
- HART field device input (revision 5 to 7)
- RS-485 interface
- Up to SIL 3 acc. to IEC/EN 61508

HART Multiplexer

Function

The HART multiplexer provides 32 signal channels for connection to SMART transmitters or control devices supporting digital communication according to the HART standard.
Full three-port isolation is included and each input channel has dual capacitor isolation for freedom of loop connection.
Each HART multiplexer is networked simply by connecting the high-speed RS 485 output in a multidrop configuration.
The device interrogates each field device, under the supervision of the workstation, retrieving information for storage in its internal database, which is then easily accessed.
This module is intended to mount on an HiD Termination Board or HART Communcation Board. Also special boards for DCS integration are available.
For additional information, refer to the manual and www.pepperl-fuchs.com.

Connection

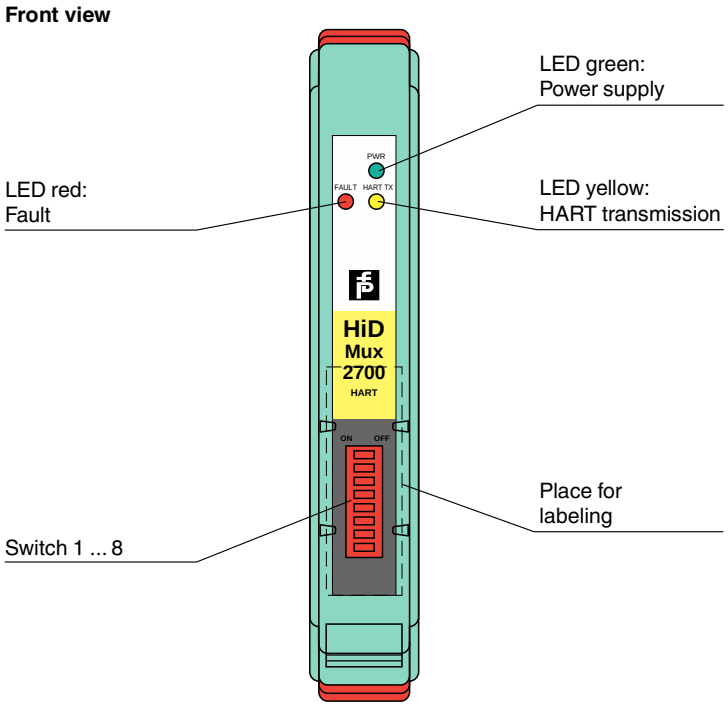
Technical Data

Functional safety related parameters		
Safety Integrity Level (SIL)		SIL 3
Supply		
Connection		SL1: 1a, 1b(-); 2a, 2b(+)
Rated voltage	U_r	20.4 ... 30 V DC via Termination Board
Rated current	I_r	28 mA at 24 V , RS-485, quiescent current
Power dissipation		0.7 W at 24 V
HART signal channels (non-intrinsically safe)		
Number of channels		32

Release date: 2024-11-20 Date of issue: 2024-11-20 Filename: 211968_eng.pdf

Technical Data

Conformity	HART field device input (revision 5 to 7)
Signal range	0.12 V_{pp} < signal < 1.5 V_{pp}
Leakage current	< 3 µA at -20 ... 85 °C (-4 ... 185 °F)
Terminating resistor	external 230 ... 500 Ω standard (up to 1000 Ω possible)
Output voltage	≥ 400 mV_{ss} (with the terminator resistance specified above)
Output resistance	100 Ω or smaller, capacitive coupling
DC isolation	dual capacitor each channel
Common mode voltage	up to 30 V
Input impedance	> 5 kΩ , according to HART specification
Input voltage range	0.12 ... 1.5 V_{ss}
Common mode voltage	max. 30 V
Differential mode clamping	± 5.2 V , for transient or AC signals
Common mode clamping	± 10 V , for transient or AC signals
Carrier detect level	signal > 0.12 V_{pp}, carrier detection activated signal < 0.08 V_{pp}, carrier detection not activated
Transmit amplitude	200 Ω load, 0.43 V_{pp} < signal < 0.49 V_{pp} 500 Ω load, 1.1 V_{pp} < signal < 1.2 V_{pp}
Device type	DC isolated bus device
Impedance	high impedance
Data link type	HART primary and secondary
Field multi point support	option available upon request
Interface	
Transfer rate	9600 MBit/s, 19200 MBit/s or 38400 MBit/s, selectable via switch
Address	1 ... 31 , adjustable via DIP switch
Type	RS-485 , differential pair and grounding
Topology	multi point, primary module/secondary module connection
Galvanic isolation	
Interface/power supply	500 V_{rms}
Interface/field channels	1000 V_{eff}
Power supply/field channels	1000 V_{eff}
Indicators/settings	
Display elements	LEDs LED PWR ON (power supply), one green LED LED HART TX (HART transmission), one yellow LED LED FAULT (lead fault), one red LED
Control elements	DIP switches at the housing side for: - secondary module address - baud rate - test mode on/off
Configuration	via DIP switches
Labeling	space for labeling at the front
Directive conformity	
Electromagnetic compatibility	
Directive 2014/30/EU	EN 61326-1:2013 (industrial locations)
Conformity	
Electromagnetic compatibility	NE 21:2012 For further information see system description.
Degree of protection	IEC 60529:2001
Ambient conditions	
Ambient temperature	-20 ... 60 °C (-4 ... 140 °F)
Relative humidity	5 ... 95 %, noncondensing
Mechanical specifications	
Degree of protection	IP20
Mass	approx. 140 g
Dimensions	18 x 114 x 130 mm (0.7 x 4.5 x 5.1 inch) (W x H x D)
Mounting	on termination board



Release date: 2024-11-20 Date of issue: 2024-11-20 Filename: 211968_eng.pdf

Assembly

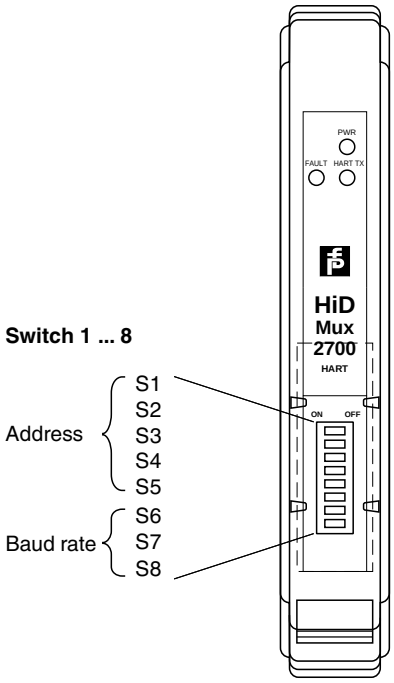
Front view

Additional Information

Conformity
The HART MUX primary module generally complies with the HART FSK physical layer specification rev. 8.0 available from the HART Communication Foundation. HART is a registered trademark of the HART Communication Foundation.
High Specification Front End Design
Two decoupling capacitors are provided, one for each signal connection. Both the positive (+Ue) and the negative (-Ue) signal wires are therefore decoupled from DC signal. Only the high frequency digital HART protocol signal passes through to the internal multiplexer circuitry.
Failure of any one capacitor from either a short circuit or open circuit means that availability of 4 ... 20 mA control signal will not be affected.
- no DC loading of 4 ... 20 mA control signal
- no single point of failure
- high noise immunity

The max. 30 V DC input voltage (specified between all terminals, both belonging to the same channel or not) makes it possible to connect any multiplexer terminal to whatever voltage level can be derived from a 24 V DC supply, +20 % tolerance included.
3 Port Isolation
The 3 port isolation structure of the primary module is depicted in the previous page. As you can see, both the 24 V supply input and the RS-485 serial interface are isolated from the HART section, i. e. from the HART signals on the field devices. This is full galvanic isolation, implemented either by transformer or by optocoupler.
Self Contained Architecture
Each primary module is a stand alone device containing all necessary hardware to communicate with up to 32 HART protocol enabled field devices and a host PC via RS-485 interface. The advantages are:

Release date: 2024-11-20 Date of issue: 2024-11-20 Filename: 211968_eng.pdf



Additional Information

- Fast polling
- One module design
- RS-485 interface direct from module
- No communications bottleneck
- Ideal for valve diagnostics

Wide Software Compatibility
The primary module is fully compatible with F-R AMS (ver 5.0 is also an OPC server), Valve Link and Cornerstone.
Additional compatibility extends to HART OPC server software available from HCF (HART Communication Foundation). Allowing users to write dedicated applications for their specific needs.
Fully tested, by all key PAM vendors.

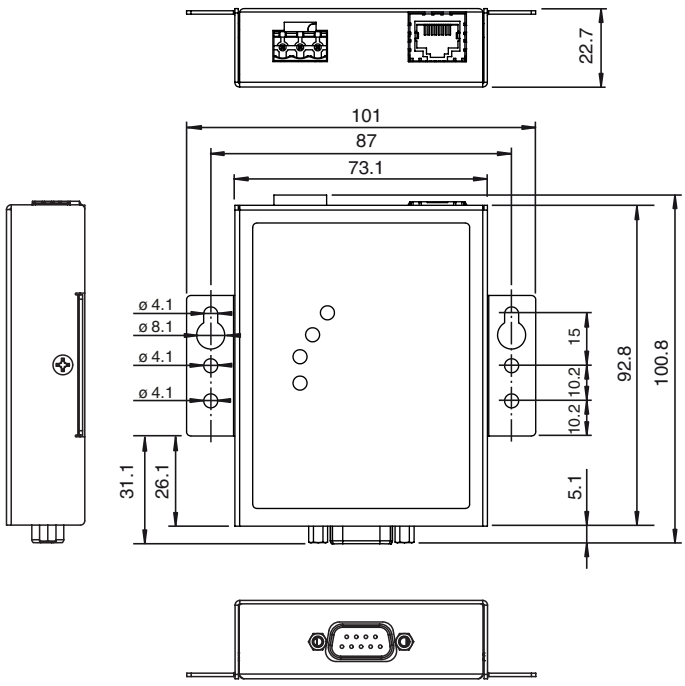
EtherNet/IP Gateway

ICDM-RX/EN-DB9/RJ45-PM



- Panel mounting and DB9 serial connector
- EtherNet/IP to serial and Ethernet TCP/IP raw/ASCII devices.
- RS-232/422/485 software selectable interfaces
- Web-based configuration

EtherNet/IP 1-port panel mount DB9

Function

The ICDM-RX/EN product family enables the connection of serial devices (RS-232 / RS-422 / RS-485) or Ethernet TCP/IP devices to an Industrial EtherNet/IP network. Highly advanced raw/ASCII device interface functionality simplifies PLC programming and ensures robust operation. These features greatly simplify connecting devices such as barcode scanners, RFID readers, weigh scales, vision systems, printers, encoders, and sensors to PLCs. The integrated webserver enables complete configuration of all module parameters like serial interface, baud rate, parity, data bits, stop bits, flow control, or delimiting characters.
Products are available in different versions for DB9 or screw terminal connection.

1. GENERAL CHARACTERISTICS

Legrand modular distribution blocks with staggered bars enable safe and rapid two-pole or four-pole distribution. Compliant with standard EN 60947-1, they combine electrical performance and mechanical robustness, as well as ergonomic design to facilitate the use of this key component of electrical distribution systems.

Thanks to a maximized cabling space, an optimized bars orientation and an adapted sizing of screw connections, cabling and connection are facilitated. Moreover, the input and large sections outputs are staggered between each bar to avoid overlapping of large conductors.

The connection points are also sufficiently spaced to allow the use of standard ferrules without problem related to insulating part.

A transparent insulating protection equips each brass bar for maximum safety. Moreover, a system integrated to this protection brakes the accidental unscrewing of the screws of unconnected connections.

A protection also isolates the rear of the distribution block from the mounting rail.

A transparent protective cover, removable and rotating 180° (up to 125 A) makes it possible to adapt to all wiring situations.

2. RANGE

Two-pole

Cat. N°	Rated operational current 40°C (1)	Input	Number of outputs (2)	Number of modules
4 004 00	40 A	Internal	12	6

DATASHEET

Modbus TCP/IP Client/Server Enhanced Communication Module for ControlLogix®

MVI56E-MNET/MNETXT

The MVI56E Modbus TCP/IP Client/Server Enhanced Communication Module allows Rockwell Automation® ControlLogix processors to interface easily with Modicon Programmable Automation Controllers (PACs) and a wide variety of Modbus TCP/IP-compatible instruments and devices.

MVI56E enhancements include local and remote configuration and diagnostics through the module's Ethernet port, and CIPconnect® technology for bridging through Rockwell Automation ControlNet and EtherNet/IP networks.

The MVI56E-MNET and MVI56E-MNETXT are functionally the same. The MVI56E-MNET is designed for standard process applications. The MVI56E-MNETXT is designed for the Logix-XT™ control platform, allowing it to operate in extreme environments. It tolerates higher operating temperatures, and has a conformal coating to protect it from harsh or caustic conditions.

Features	Benefits
Backward-Compatible	♦ Upgrade earlier MVI56-MNET modules without changing existing ladder logic programs or module configurations ♦ Enhanced features and flexibility without incurring expensive reprogramming costs
For Extreme Environments (MVI56E-MNETXT only)	♦ Conforms to the EN60079-0 and EN60079-15 standards for applications in caustic and extreme temperature environments ♦ Operates in temperature extremes from -25°C to 70°C (-13°F to 158°F) ♦ Conformal coating protects against caustic or corrosive environmental elements
RSLogix 5000 Integrated	♦ Module communication is integrated within RSLogix™ 5000 using a sample (AOI) or sample ladder logic file
Graphical User Interface Software	♦ ProSoft Configuration Builder (PCB) provides online or offline configuration and diagnostics using the high-speed Ethernet port ♦ CIPconnect®-enabled, allows remote configuration and diagnostic access across multiple bridged EtherNet/IP™ and ControlNet™ networks using Rockwell Automation 1756-ENxT and 1756-CNB network interface modules
ProSoft Discovery Service	♦ Software utility to locate MVI56E modules on the network and assign a temporary IP address for easy configuration

Configuration

ProSoft Configuration Builder (PCB) provides a graphical configuration tool for quick management of module configuration files, as well as viewing communication and module diagnostic information.

CIPconnect technology routes connections over multiple EtherNet/IP or ControlNet paths, allowing you to manage the module from remote locations.

The MVI56E-MNET/MNETXT Setup Guide, with the sample configuration, provides step-by-step instructions on how to move data through the module from the Modbus TCP/IP network to the processor.

General Specifications

- Backward compatible with previous MVI56-MNET versions
- Single-slot 1756 ControlLogix backplane compatible
- 10/100 Mbps auto crossover detection Ethernet configuration and application port
- User-definable module data memory mapping of up to 5000 16-bit registers
- CIPconnect-enabled network configuration and diagnostics monitoring using ControlLogix 1756-ENxT and 1756-CNB modules and EtherNet/IP pass-through communication
- ProSoft Configuration Builder (PCB) software supported, a Windows-based graphical user interface providing simple product and network configuration
- Sample ladder logic and Add-On Instructions (AOI) are used for data transfer between module and processor
- 4-character, alpha-numeric, scrolling LED display of status and diagnostics data in plain English – no cryptic error or alarm codes to decipher
- ProSoft Discovery Service (PDS) software used to locate the module on the network and assign temporary IP address
- Personality Module - a non-volatile, industrial-grade Compact Flash (CF) card used to store network and module configuration, allowing quick in-the-field product replacement by transferring the CF card

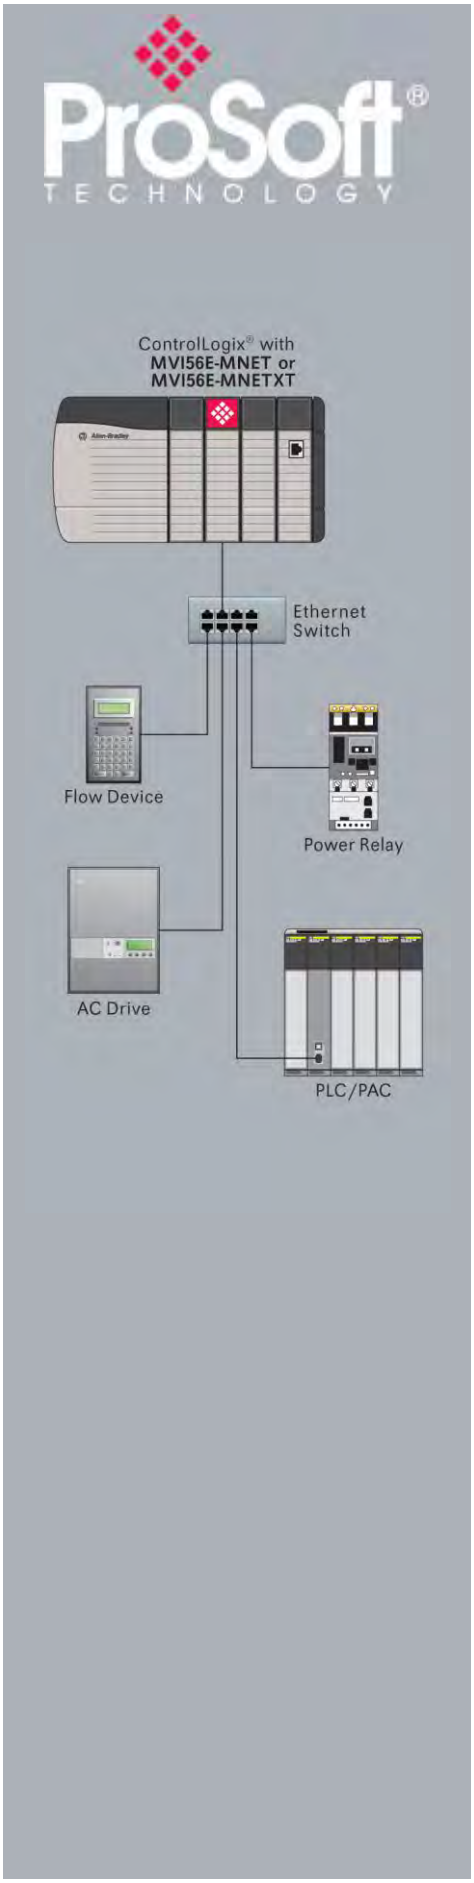
Modbus TCP/IP Specifications

- ProSoft Technology's Modbus TCP/IP implementation (MNET) includes both Client (Master) and server (slave) capabilities
- Modbus data types overlap in the module's memory database, so the same data can be conveniently read or written as bit-level or register-level data.
- Configurable floating-point data movement is possible, including support for Enron or Daniel® floating-point formats

Modbus TCP/IP Server (Slave)

- Supports ten independent server connections for Service Port 502 (MBAP)
- Supports ten independent server connections for Service Port 2000 (Encapsulated)
- Accepts Modbus Function Codes 1, 2, 3, 4, 5, 6, 8, 15, 16, 17, 22 and 23
- Module data can be derived from other Modbus server devices on the network through the Client or from the ControlLogix processor

Modbus TCP/IP Client (Master)



- Actively reads data from and writes data to Modbus TCP/IP devices, using MBAP or Encapsulated Modbus message formats
- Transmit Modbus Function Codes 1, 2, 3, 4, 5, 6, 7, 15, and 16
- Offers one Client connection with up to 100 commands to talk to multiple servers
- ControlLogix processor can be programmed to use special functions to control the activity on the Client by actively selecting commands to execute from the command list (Command Control) or by issuing commands directly from the ladder logic (Event Commands)

Status Data

- Error codes, counters, and module status available from module memory through the server, through the Client, or through the ladder logic and controller tags in RSLogix™ 5000

Functional Specifications

- The MVI56E-MNETand MVI56E-MNETXT are functionally identical. The MVI56E-MNET is for normal process and control environments. The MVI56E-MNETXT is conformal coated for extra protection in harsh or caustic environments and operates in extreme high or low temperature environments.
- Both modules transfer data in the largest possible I/O image block sizes, which optimizes data through-put and update time.
- Both modules appear to the ControlLogix processor as input/output (I/O) modules, rather than communication modules.
- Both modules work well in local rack applications and may be used in remote rack applications. (For information on a remote rack optimized, reduced data block version of the MNET module, look for the MVI56E-MNETR.)
- Retrieving module status and executing special functions (command control, event commands, etc.) are supported in ladder logic by special block transfer codes.

Hardware Specifications

Specification	Description

Industrial Automate Telecom Network EV

Features

- Universal AC input / Full range
- Built-in active PFC function
- High efficiency up to 91%
- Forced air cooling by built-in DC fan
- Output voltage programmable
- Active current sharing up to 6000W (3+1)
- Built-in remote ON-OFF control / remote sense / auxiliary power / power OK signal
- Protections: Short circuit / Overload / Over voltage / Over temperature
- Optional conformal coating
- 5 years warranty

Applications

- Factory control or automation apparatus
- Test and measurement instrument
- Laser related machine
- Burn-in facility
- Digital broadcasting
- RF application

Description

RSP-1500 is a 1.5KW single output enclosed type AC/DC power supply. This series operates for 90~264VAC input voltage and offers the models with the DC output mostly demanded from the industry. Each model is cooled by the built-in fan working for the temperature up to 70℃. Moreover, RSP-1500 provides vast design flexibility by equipping various built-in functions such as the output programming, active current sharing, remote ON-OFF control, auxiliary power, etc.

Model Encoding / Order Information

RSP - 1500 - 48

- 48 — Output voltage (5V/12V/15V/24V/27V/48V)
- 1500 — Output wattage
- RSP — Series name

1500W Single Output Power Supply — RSP-1500 series

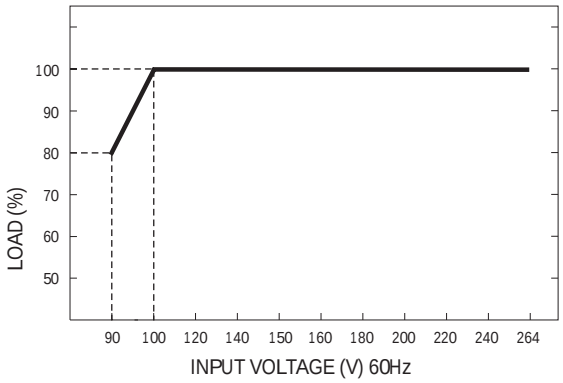
	DIMENSION	278*127*83.5mm (L*W*H)					
	PACKING	3.0Kg; 4pcs/13Kg/1.19CUFT					

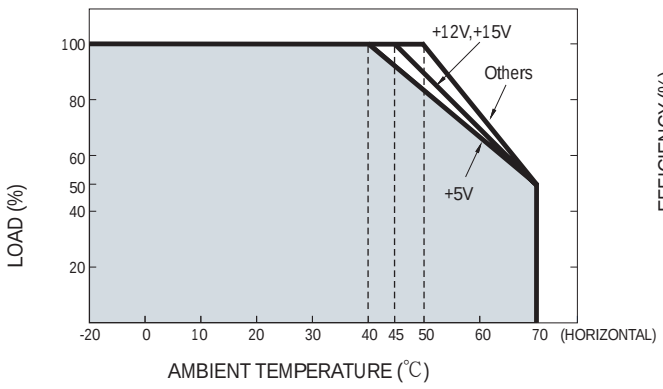
NOTE



1. All parameters NOT specially mentioned are measured at 230VAC input, rated load and 25℃ of ambient temperature.
2. Ripple & noise are measured at 20MHz of bandwidth by using a 12" twisted pair-wire terminated with a 0.1uf & 47uf parallel capacitor.
3. Tolerance : includes set up tolerance, line regulation and load regulation.
4. Derating may be needed under low input voltages. Please check the derating curve for more details.
5. The power supply is considered a component which will be installed into a final equipment. All the EMC tests are been executed by mounting the unit on a 720mm*360mm metal plate with 1mm of thickness. The final equipment must be re-confirmed that it still meets EMC directives. For guidance on how to perform these EMC tests, please refer to “EMI testing of component power supplies.” (as available on https://www.meanwell.com//Upload/PDF/EMI_statement_en.pdf)
6. The ambient temperature derating of 3.5℃/1000m with fanless models and of 5℃/1000m with fan models for operating altitude higher than 2000m(6500ft).

※ Product Liability Disclaimer : For detailed information, please refer to https://www.meanwell.com/serviceDisclaimer.aspx

Block Diagram



Static Characteristics

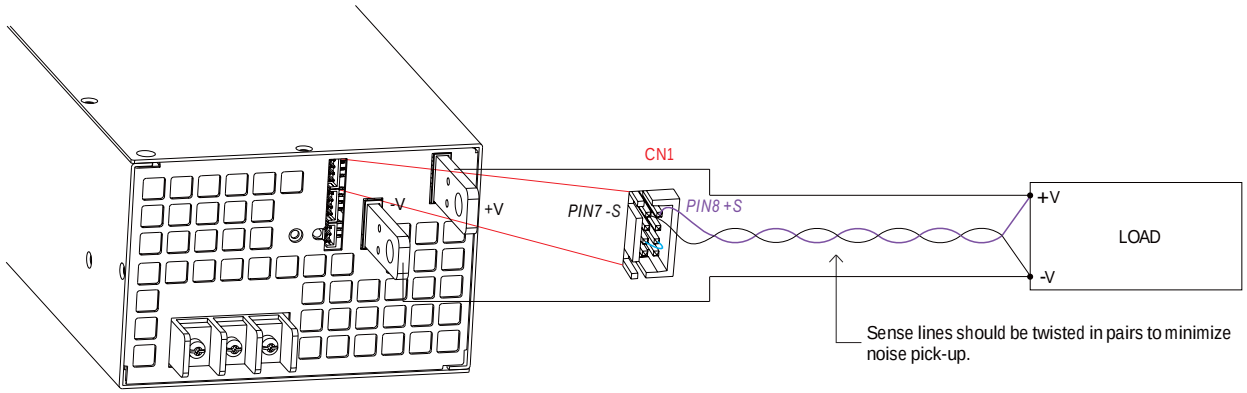
90VAC	960W 192A	1200W 100A	1200W 80A
INPUT \ MODEL	24V	27V	48V
100~264VAC	1512W 63A	1512W 56A	1536W 32A
90VAC	1209.6W 50.4A	1209.6W 44.8A	1228.8W 25.6A

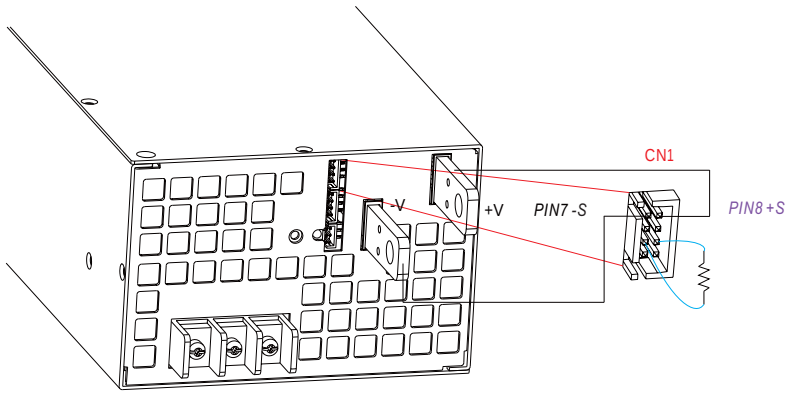
Derating Curve

Efficiency vs Load (48V Model)



◎ The curve above is measured at 230VAC.

■ Function Manual



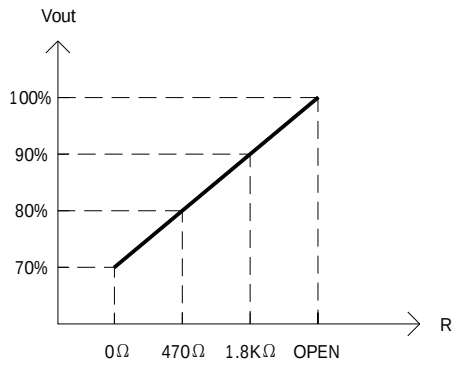
1. Remote Sense

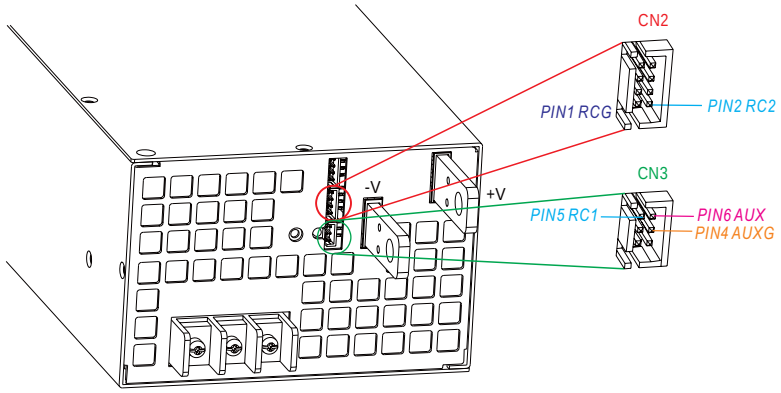
※ The Remote Sense compensates voltage drop on the load wiring up to 0.3V

2. Output Voltage Programming (or, PV / remote voltage programming / remote adjust / margin programming / dynamic voltage trim)

※ In addition to the adjustment via the built-in potentiometer, the output voltage can be trimmed to 70~100%(Typ.) of the nominal voltage by applying EXTERNAL RESISTANCE

◎ Connect an external resistor between *TRIM(pin4)* & *-S(pin3 or pin4 or pin5)* on CN1 or CN2, and +S & +V, -S & -V also need to be connected.





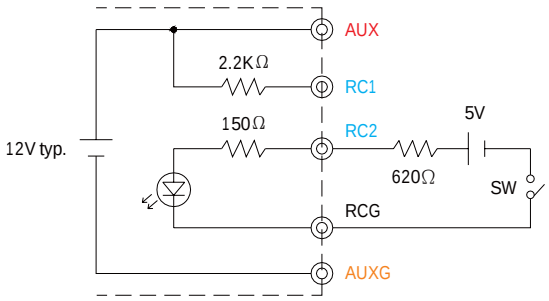


Fig. 2.2 External Resistance (Typical)

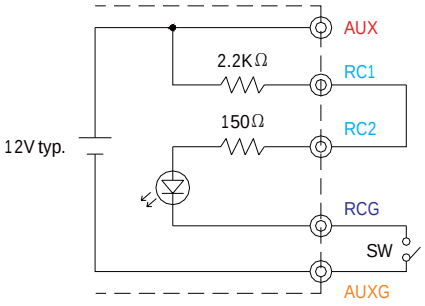
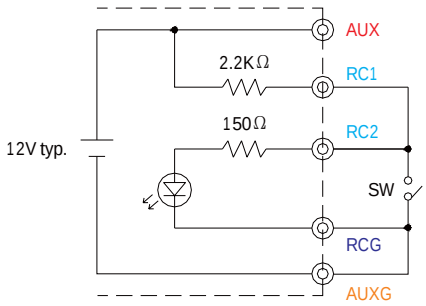
3.Remote ON-OFF



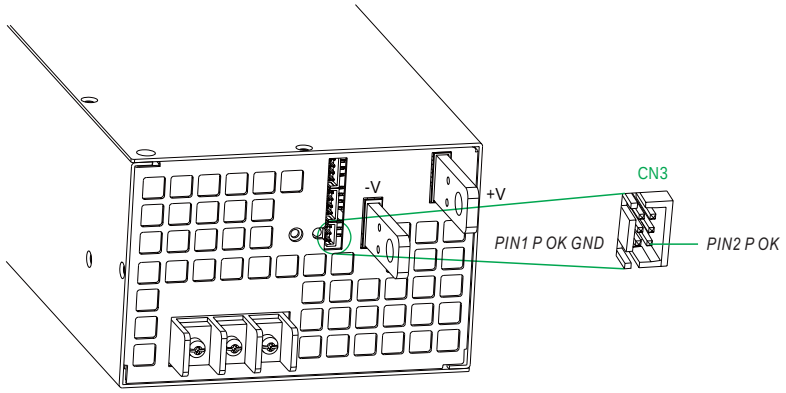
※ Remote ON-OFF is activated by the configuration with respect to CN1,CN2 and CN3 as shown in the following diagram.



Example 3.2(A): Using external voltage source

Example 3.2(B): Using internal 12V auxiliary output

Example 3.2(C): Using internal 12V auxiliary output



◎ Connection Method

		Fig. 3.2(A)	Fig. 3.2(B)	Fig. 3.2(C)
SW Logic	Output on	SW Open	SW Open	SW Close
	Output off	SW Close	SW Close	SW Open

4.Alarm Signal Output

※ Alarm signal is sent out through "*P OK*" & "*P OK GND*" and pins on CN3. Please acknowledge an external voltage source is required for this function.

Function	Description	Output of alarm(P OK)
P OK	The signal is "Low" when the power supply is above 65% of the rated output voltage, or say, Power OK	Low (0.5V max at 10mA)
	The signal turns to be "High" when the power supply is under 65% of the rated output voltage, or say, Power Fail	High or open (External applied voltage 10mA max.)

Table 4.1 Explanation of alarm

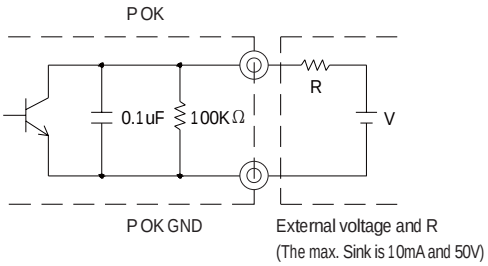


Fig. 4.1 Internal circuit of P OK (Open collector method)

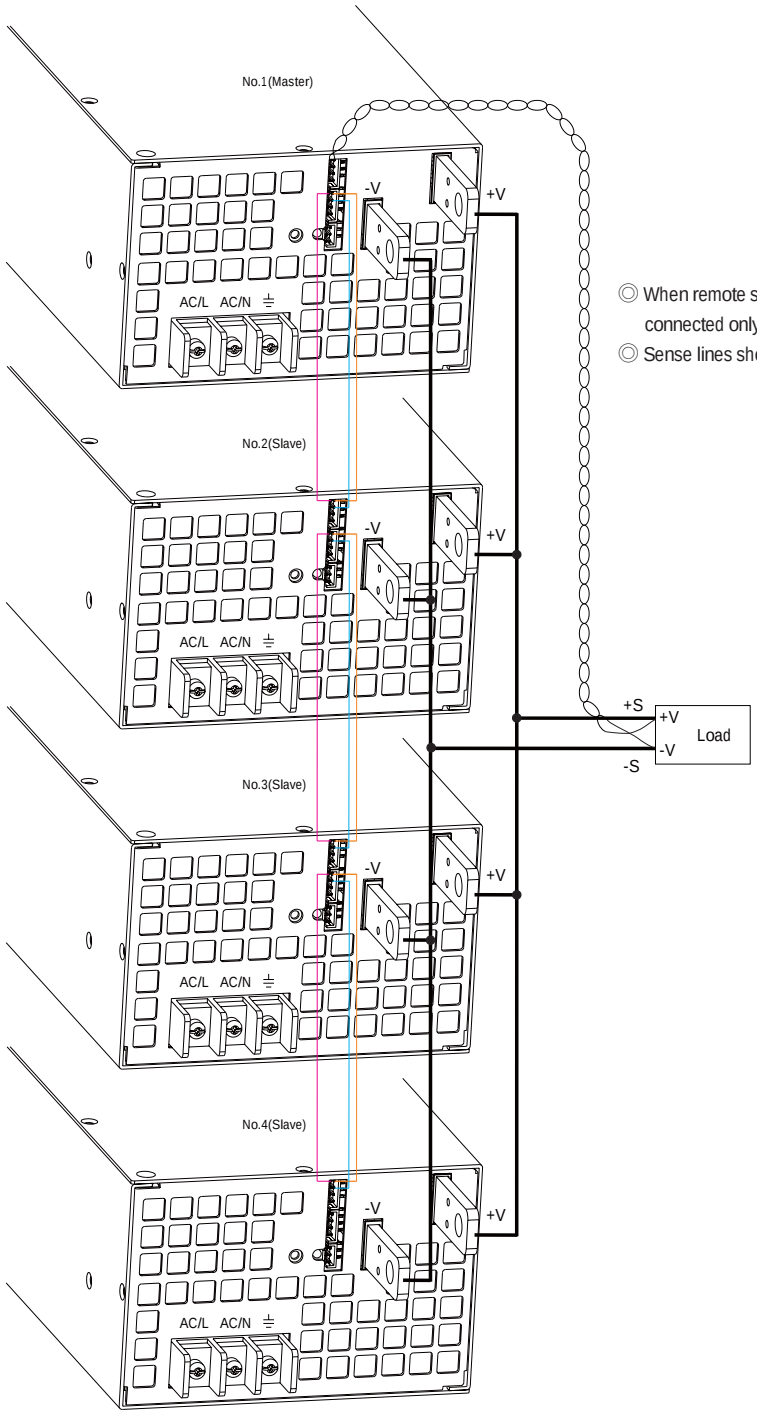
5.Current Sharing with Remote Sense



RSP-1500 has the built-in active current sharing function and can be connected in parallel, up to 4 units, to provide higher output power as exhibited below:

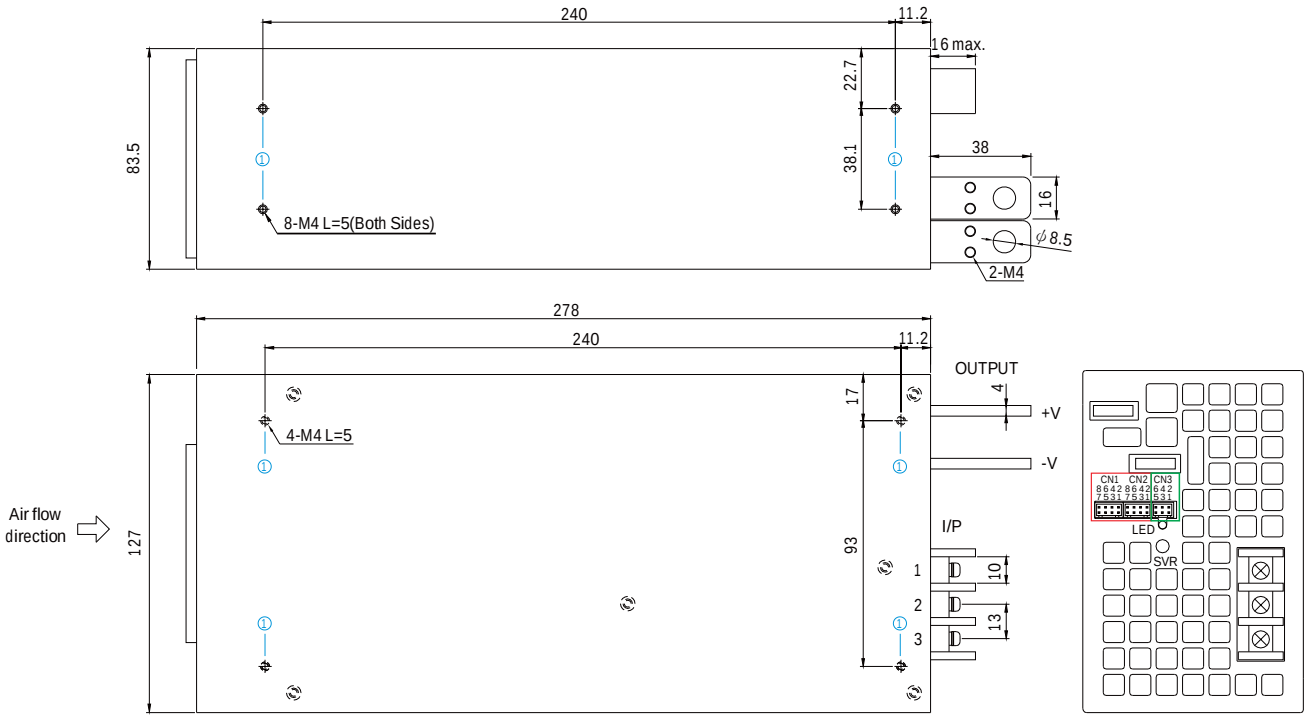
※ The power supplies should be paralleled using short and large diameter wiring and then connected to the load.

※ Difference of output voltages among parallel units should be less than 0.2V.

※ The total output current must not exceed the value determined by the following equation:

Maximum output current at parallel operation=(Rated current per unit)×(Number of unit)×0.9

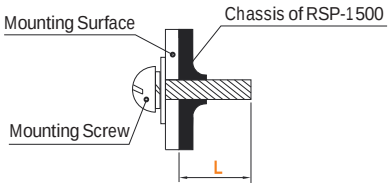
◎ When remote sensing is used in parallel operation, the sensing wire must be connected only to the master unit



◎ Sense lines should be twisted in pairs to minimize noise pick-up.

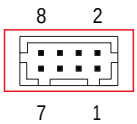
◎ +S,-S and CS are connected mutually in paralle.

■ Mechanical Specification



(Unit: mm , tolerance ±1mm)

Case No.943A



※ Mounting Instruction

Hole No.	Recommended Screw Size	MAX. Penetration Depth L	Recommended mounting torque

SK 3110.000
Thermostat

State: 12/03/2025 (Source: rittal.com/com-en)

SK 3110.000 - Thermostat Enclosure internal thermostat

Particularly suitable for controlling fans, heaters and heat exchangers, this thermostat can also be used as a signal generator for monitoring the enclosure internal temperature.

Features

Model No.	SK 3110.000
Product description	Particularly suitable for controlling fans, heaters and heat exchangers, this thermostat can also be used as a signal generator for monitoring the enclosure internal temperature.
Benefits	Time-saving connection technique using a terminal strip with a screw connection from the outside. Flexible mounting on a vertical or horizontal 35 mm support rail to EN 50 022, and snap fastening in the enclosure section or on the mounting plate using the supplied adaptor
Technical specifications	Bi-metal controller as a temperature-sensitive element with thermal feedback Contact population: Single-pole change-over contact as a quick-break contact Permissible contact load: Category 5 – 3 (heating) AC 10 (4) A (inductive load at cos φ = 0.6)/category 5- 4 (cooling): AC 5 (4) A (inductive load at cos φ = 0.6)/DC = max. 30 W Switching difference: approx. 1 K ± 0.8 K
Colour	RAL 7035
Dimensions	Width: 71 mm Height: 71 mm Depth: 33.5 mm
Setting range	5 °C...60 °C
Rated operating voltage	24 V - 230 V, 1~ 24 V - 60 V (DC)
Packs of	1 pc(s).
Net weight	0.095
Gross weight	0.12

SK 3240.110

TopTherm fan-and-filter units

State: 12/03/2025 (Source: rittal.com/com-en)

ENCLOSURES | POWER DISTRIBUTION | CLIMATE CONTROL | IT INFRASTRUCTURE | SOFTWARE & SERVICES

FRIEDHELM LOH GROUP

SK 3240.110 - TopTherm fan-and-filter units

Complete fan unit for tool-free mounting on surfaces. Air throughput from 20 - 900 m³/h, standard protection category IP 54.

Features

Model No.	SK 3240.110
Design	wall-mounted
Product description	Fan-and-filter units with diagonal fan technology have superior pressure stability and ensure a more constant air throughput. The diagonal direction of outflow ensures more even heat dissipation from the enclosure.
Colour	RAL 7035
Supply includes	Complete unit ready to install, including chopped-fibre filter mat
Fan	Diagonal, shaded pole motor
Air throughput, unimpeded airflow (with chopped-fibre filter)	At 50 Hz: 175 m³/h At 60 Hz: 155 m³/h
Air throughput, unimpeded airflow (with pleated filter)	At 50 Hz: 218 m³/h At 60 Hz: 188 m³/h
Air throughput with outlet filter including chopped-fibre filter mat (quantity x order number)	1 x 3240200: 130/110 m³/h 2 x 3240200: 159/135 m³/h
Rated operating voltage	115 V, 1~, 50 Hz/60 Hz
Power consumption Pel	At 50 Hz: 35 W At 60 Hz: 34 W
Rated current max.	At 50 Hz: 0.42 A At 60 Hz: 0.38 A
Dimensions	Width: 255 mm Height: 255 mm
Installation depth	107 mm
Mounting cut-out	Cut-out width: 224 mm Cut-out height: 224 mm

Features

IP protection category to IEC 60 529	IP 54 with chopped-fibre filter/pleated filter IP 55 with pleated filter and absorber mat IP56 with chopped-fibre filter/pleated filter and hose-proof hood
Protection category NEMA	Type 12 with chopped-fibre filter/pleated filter Type 3 Type 3R Type 4 Type 4X with chopped-fibre filter/pleated filter and hose-proof hood
Pre-fuse	Miniature circuit-breaker/fuse: 4 A
Note	To increase the air throughput, a pleated filter may optionally be used (see characteristic curve). Suitable for use with fan-and-filter units, roof-mounted fans and outlet filters. With the fan-and-filter unit 3237.XXX, electrical connection is made via two single wires (length approx. 300 mm) on the unit, for all other fan-and-filter units, a screwless spring terminal is used
Service life of fans (L10, 40 °C)	At 50 Hz: 72,000 h At 60 Hz: 76,000 h
Operating temperature range	-30 °C...55 °C
Storage temperature range	-30 °C...70 °C
Noise level	At 50 Hz: 51 dB(A) At 60 Hz: 46 dB(A)

FRIEDHELM LOH GROUP

SZ 2500.314 - LED system light

LED system light – the first light especially for enclosures! Highly innovative LED technology for even more light into the very last corner.

Features

Model No.	SZ 2500.314
Design	with socket, with motion detector
Benefits	Optimum illumination of the entire enclosure Optionally with clip, screw and magnetic attachment A configuration to suit every application
Design	Motion sensor Socket 90° rotating connector Adjustable light direction Adjustable light distribution
Material	Light body: Extruded aluminium Light cover: Polycarbonate Light ends: PC-ABS
Colour	Enclosure: RAL 7016
Supply includes	Assembly screws
Power consumption	13 W
Connection options	Infeed, 3-pole Through-wiring, 3-pole
Motion detector	Yes
Overvoltage category	II
Protection class	II (all-insulated)
Light – installation type	Screw-fastening Clip attachment
Rated impulse withstand voltage, phase to earth	2500 V AC
Rated insulation voltage	300 V AC

Features

Installation options	Directly onto the enclosure section with 25 mm pitch pattern
Luminous flux	1,200 lm
Light colour	4000 K (neutral white)
Note	Connection accessories should be ordered separately
Dimensions	Width: 437 mm Height: 85 mm Depth: 44 mm
Operating temperature range	-20 °C...55 °C
Sockets	USA/CDN (type B, NEMA 5-15)
Rated operating voltage	100 V - 125 V, 1~, 50 Hz/60 Hz

TS 8601.860 - Earthquake base/plinth for VX, TS

For stable attachment of the earthquake-resistant enclosure to the subsurface. External metric M6 thread for a stable connection to the subsurface from the outside.

Features

Model No.	TS 8601.860
Product description	For stable attachment of the earthquake-resistant enclosure to the subsurface. External metric M6 thread for a stable connection to the subsurface from the outside.
Material	Corner pieces: Sheet steel 5 mm Trim panels: Sheet steel 2 mm
Surface finish	Powder-coated
Colour	RAL 7022
Supply includes	Base/plinth, fully assembled 4 corner pieces 2 depth stays 1 trim panel front/rear
Note	Meets earthquake zone 4 to Telcordia GR-63-Core in conjunction with a comfort handle and an earthquake kit.
Dimensions	Height: 100 mm
To fit	Enclosure type: VX TS Width: = 800 mm Depth: = 600 mm
Packs of	1 pc(s).

Features

Net weight	15.06
Gross weight	15.87
PCF per pack (cradle-to-gate)	60.6 kg CO2 eq (Cat B)

Enclosure (baying system) single door

Housing:
symmetrical frame construction, consisting of
closed an profiled hollow section with 25 mm
pitch pattern.
Frame with integrated blind rivet nut M6 enables for
protection class oriented fixing
of fitting parts at the profile.
All sections have chamfered edges.
Horizontal sections have a protection lip above the seal.
Circumferential equal profiles with two mounting levels
accessible from inside and outside of the frame for
space-saving and fast interior installation.
The entire square perforation enables the use of cage nuts
and metrical screws up to M8.
Welded base frame with integrated base reinforcement
allows to fasten the enclosure on the underground through
the inner side of the enclosure.
Mounted three-piece gland plate, removable and exchangable.
Bayable on all sides.
Load capacity up to 15.000 N.
Door:
with foamed-in seal, with removable tubular door frame
with holes on a 25 mm pitch pattern and
integrated cable clamping.
4-point latch locking rod, double-bit insert to DIN 43668,
Door hinge may be swapped from right to left.
Hinges with captive hinge pins, door opening angle 130°
tool-less retrofittable to 180°. Floor clearance 17 mm.
Rear panel and roof plate:
With foamed-in seal, removable. Rear panel and
roof plate screw-fastened and removable. Rear panel
with positioning aid. Roof with roof fastening screws M12.
Mounting plate:
C-folded on the sides, depth-adjustable via integral
plastic sliders and with re-usable mounting rails,
depth-adjustable in a 25 mm pitch pattern. Including
mounting pattern for easy positioning of components.

© Rittal 2025

Flat parts:
Roof, door and rear panel included in the scope of supply.
Side panels are available as separate accessory.
Rear panel, roof and gland plates are electrically conductive connected with the frame (automatic potential equalisation) to DIN 62 208 and prepared for the additional attachment of earthing straps.
QR Code:
Printed QR Code on roof, door, mounting plate, rear panel and type plate for unambiguous marking and for easy recall of relevant product information and documentation, as well as clear traceability of single parts.
Material:
Enclosure frame, rear panel and roof: 1.5 mm sheet steel
Door: 2 mm sheet steel
Mounting plate: 3 mm sheet steel, zinc-plated
Surface Finish:
Triple surface treatment ensures optimum protection against corrosion and is resistant to mineral oils, lubricants, machining emulsions and solvents:
nanoceramic coating,
electro-phoretic dipcoat-priming,
textured powder coating in RAL 7035 for outside surfaces.
Protection category to IEC 60 529 (with mounted side panels): IP 55
Protection category to UL 508A: Type 1, 12
Impact protection to IEC 62 262: IK10
Dimensions (W x H x D): 800x2000x800 mm

Product image

To feed through power, signal, and data is the classical requirement in electrical engineering and panel building. The insulating material, the connection system and the design of the terminal blocks are the differentiating features. A feed-through terminal block is suitable for joining and/or connecting one or more conductors. They could have one or more connection levels that are on the same potential or insulated against one another.

General ordering data

Version	Multi-tier modular terminal, Screw connection, dark beige, 4 mm², 800 V, 800 V, Number of connections: 4, Number of levels: 2, TS 35, V-0, Wemid
Order No.	1041910000
Type	WDK 4N V
GTIN (EAN)	4032248138753
Qty.	50 pc(s).

7.17 IOM for Insulation

PAROC Pro Section 140

Certification Number	0809-CPR-1016 / Eurofins Expert Services Ltd, Kivimiehentie 4, FI-02150 Espoo. Finland
Designation Code	MW-EN 14303-T8/T9-ST(+)680-WS1-CL10
Short Description	Stone wool pipe section
Application	Thermal insulation of industrial pipework in higher temperature. In ships thermal insulation of pipes in higher temperature. Also possible to use with facings AluCoat, G4 and G7. See "Facings".

The notified body Eurofins Expert Services Ltd. (0809) performed and issued the certificates:
Type-Examination (Module B) certificate No. VTT-C-12177-15-17

Nominal Density	140 kg/m³

PAROC stone wool products are capable of withstanding high temperatures. The binder starts to evaporate when its temperature exceeds approximately 200°C. The insulating properties remain unchanged, but the compressive stress weakens. The softening temperature of stone wool products is over 1000°C.

Dimensions

Dimensions

7.18 IOM for Heat Tracing

PETK

Power and End Termination Kit

INSTALLATION PROCEDURES

- ☐ **PETK-1D** **for BSX, RSX, VSX-HT**
- ☐ **PETK-2D** **for KSX, HTSX, USX**
- ☐ **PETK-3D** **for HPT, FP**

Order separately to be used in conjunction with Thermon connection kits

PETK

Receiving, Storing and Handling

1. Inspect materials for damage incurred during shipping.
2. Report damages to the carrier for settlement.
3. Identify parts against the packing list to ensure the proper type and quantity has been received.
4. Store in a dry location.

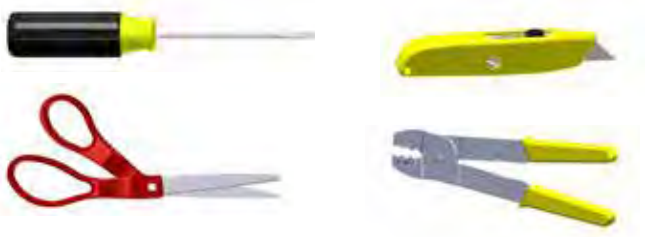
PETK Power and End Termination Kits (per cable)	
PETK-1D	for BSX, RSX, VSX-HT
PETK-2D	for KSX, HTSX, USX
PETK-3D	for HPT, FP

Kit Contents

Item	Qty.	Description
1	1	RTV Tube
2	1	Power Connection Boot
3	1	End Cap
4	1	Tape Strip (PETK-3D Only)
5	1	End Termination Caution Label
6	1	GRW-G Grommet (For PETK-3D Terminator kits only)

Installation Precautions

- To minimize the potential for arcing and fire caused by product damage or improper installation use ground-fault protection. The National Electrical Code (NEC) and Canadian Electrical Code (CEC) require ground-fault protection of equipment for each branch circuit supplying electric heat tracing.
- Installation must comply with Thermon requirements and be installed in accordance with the NEC, CEC, or any other applicable national and local codes.
- Component approvals and performance ratings are based on the use of Thermon specified parts only.
- De-energize all power sources before opening enclosure.
- Keep ends of heating cable and kit components dry before and during installation.
- Individuals installing these products are responsible for complying with all applicable safety and health guidelines. Proper Personal Protective Equipment (PPE) should be utilized during installation. Contact Thermon if you have any additional questions.



PETK Certifications/Approvals[1]

FM Approved

Note:

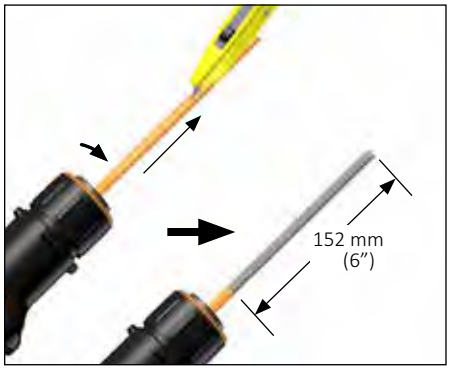
1. These sets have been evaluated as components of Thermon's Approved connection kits, such that the area use ratings depend on the rating of the connection kits.

Tools Required

IMPORTANT!

Heating cable must be properly installed within expediter assembly and mounted to pipe prior to terminating with PETK kit.

See Terminator and/or TracePlus Installation Instructions for expediter mounting details.



Terminator: Route cable through base entry and mount expediter to pipe using pipe band. Do not band over cable.

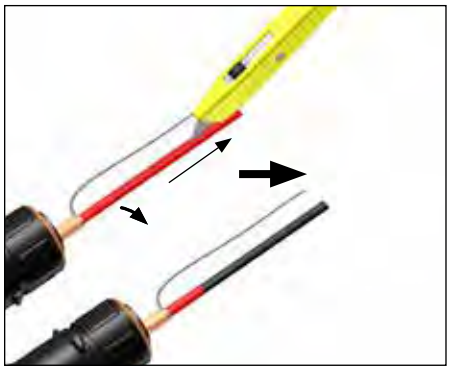
Note: For HPT and FP cable exchange grommet in Terminator with GRW-G provided in PETK-3D.

TracePlus: Route cable through base entry and mount expediter to pipe using pipe band. Do not band over cable.

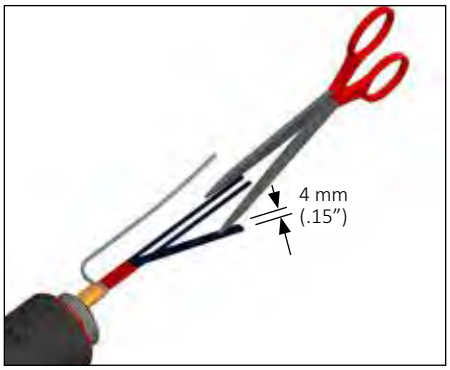
Step 1: Remove Heating Cable Overjacket and Separate Metallic Braid to Form Pigtail

1a. Cut and remove heating cable overjacket.

Do not cut metallic braid.

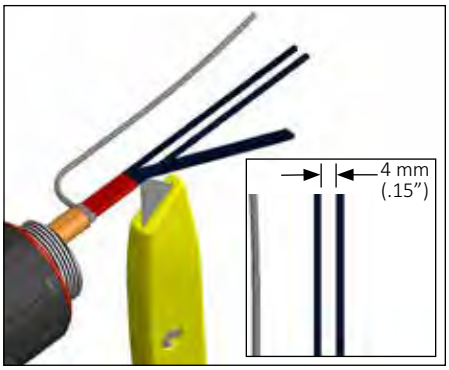


1b. Separate braid strands at edge of overjacket and pull cable through opening in braid.



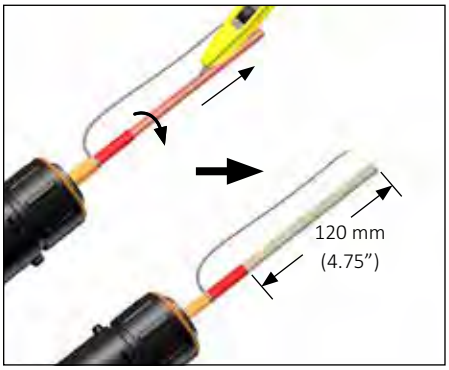
1c. Twist braid into a pigtail. Trim ends of braid.

Step 2: Matrix Removal for BSX, RSX, HTSX, KSX, USX, and VSX-HT Cables



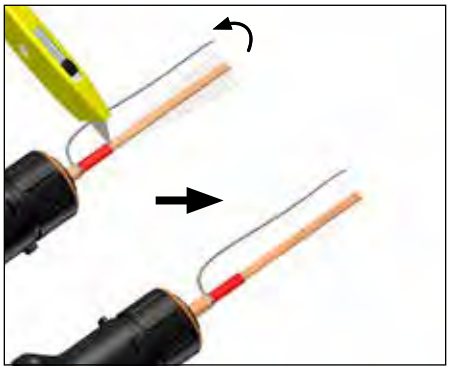
2a. Cut and remove primary insulation jacket (BSX and RSX cables only).

2b. Cut a 4 mm strip of conductive matrix between the conductors.



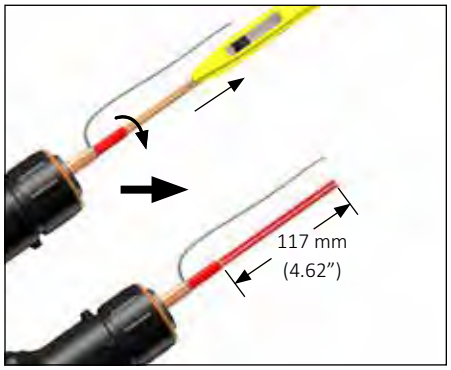
Do not cut bus wire strands.

2c. Cut and remove the 4 mm matrix strip.



PETK

Step 2: Heating Element Removal for HPT and FP Cables



2a. Cut and remove primary insulation jacket.

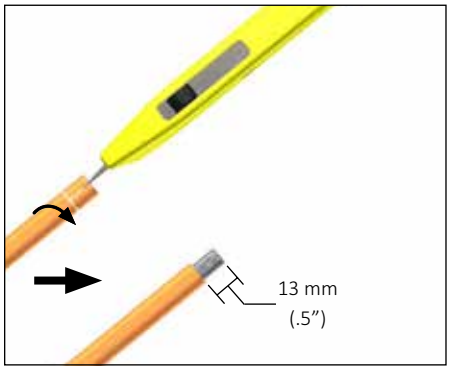
NOTE: Bus connection must be no more than 50 mm (2") from pipe as addressed in connection kit instructions.

2b. Cut and remove fiberglass overlay and heating element. Push any remaining heating element wire under the primary insulation jacket.

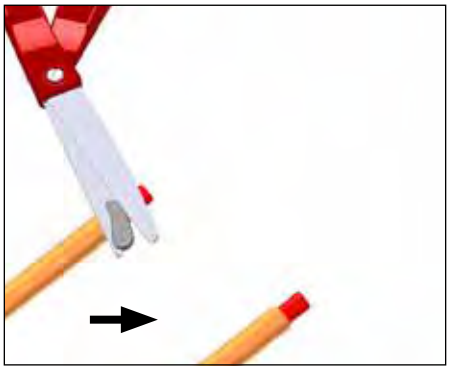
2c. Cut and remove pairing jacket.

Do not cut bus wire insulation.

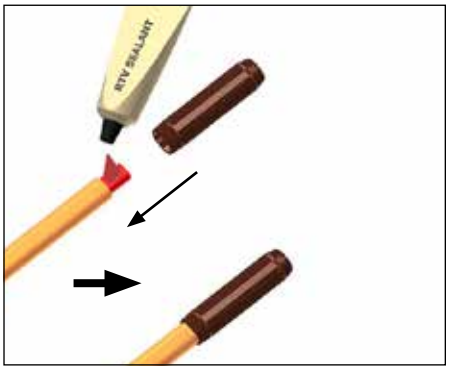
Step 3: Install Power Boot on Heating Cables



3a. Apply RTV sealant to cable to cover distance of at least 3 mm and slide boot onto the end of the cable.

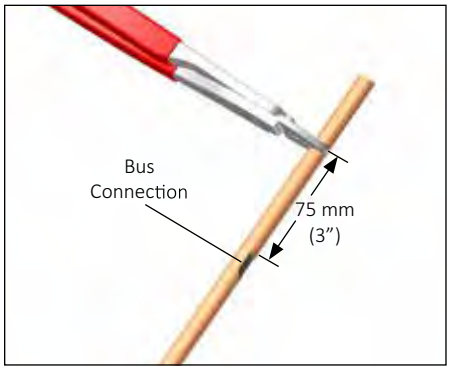


3b. Slide boot onto the end of the cable. Expose 13 mm (0.5") of bus wire.

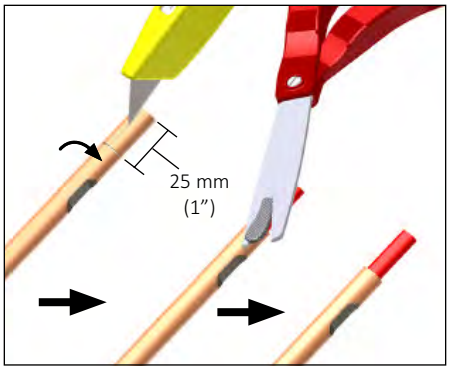


Step 4: End Termination for BSX, RSX, HTSX, KSX, USX, and VSX-HT

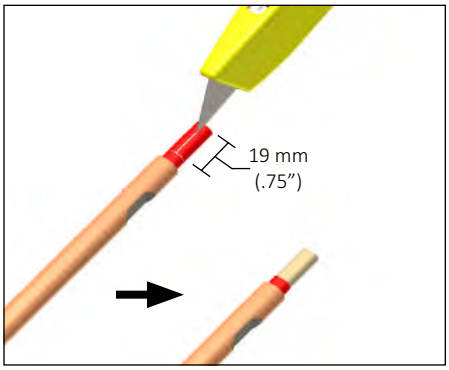
4a. Cut and remove heating cable overjacket.



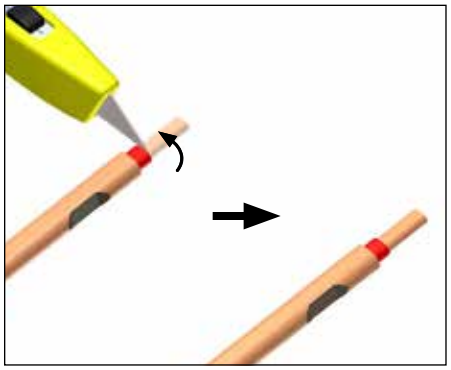
4b. Trim away exposed braid from cable.



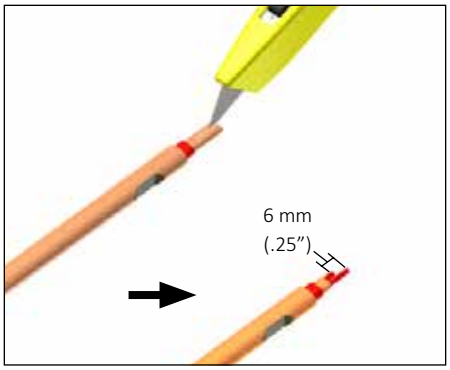
4c. Fill the end cap with RTV sealant and apply a circumferential bead to cable [minimum of 3 mm (0.12") wide]. Slide end cap onto end of cable.



Step 4: End Termination for HPT and FP

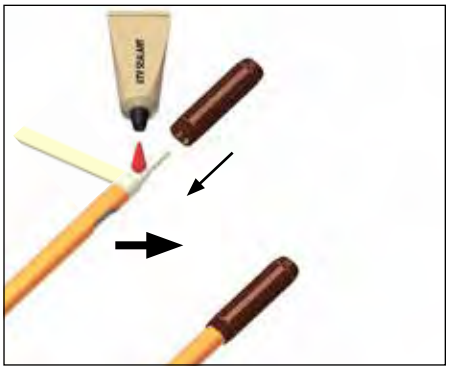


4a. Trim the cable 75 mm (3") from the bus connection.

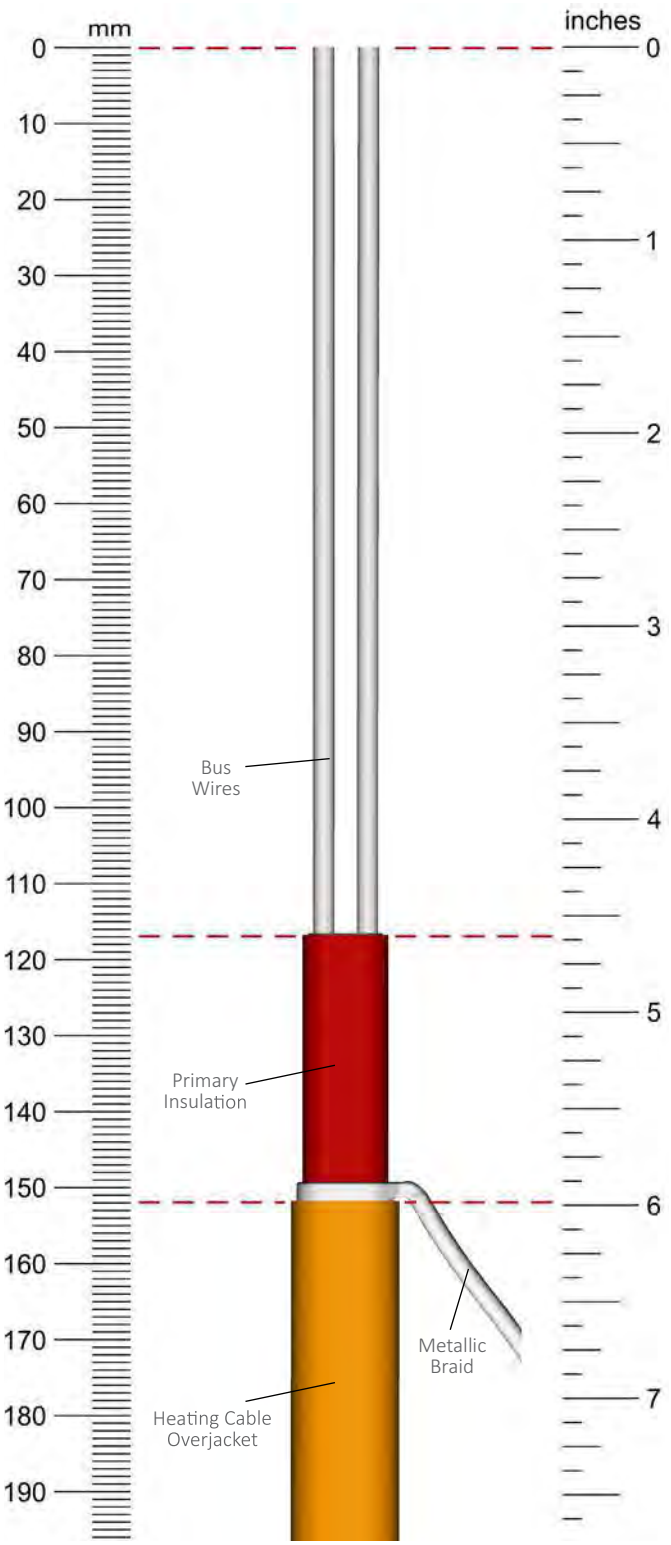


4b. Cut and remove overjacket and trim away exposed braid from cable.

4c. Cut and remove primary insulation jacket.

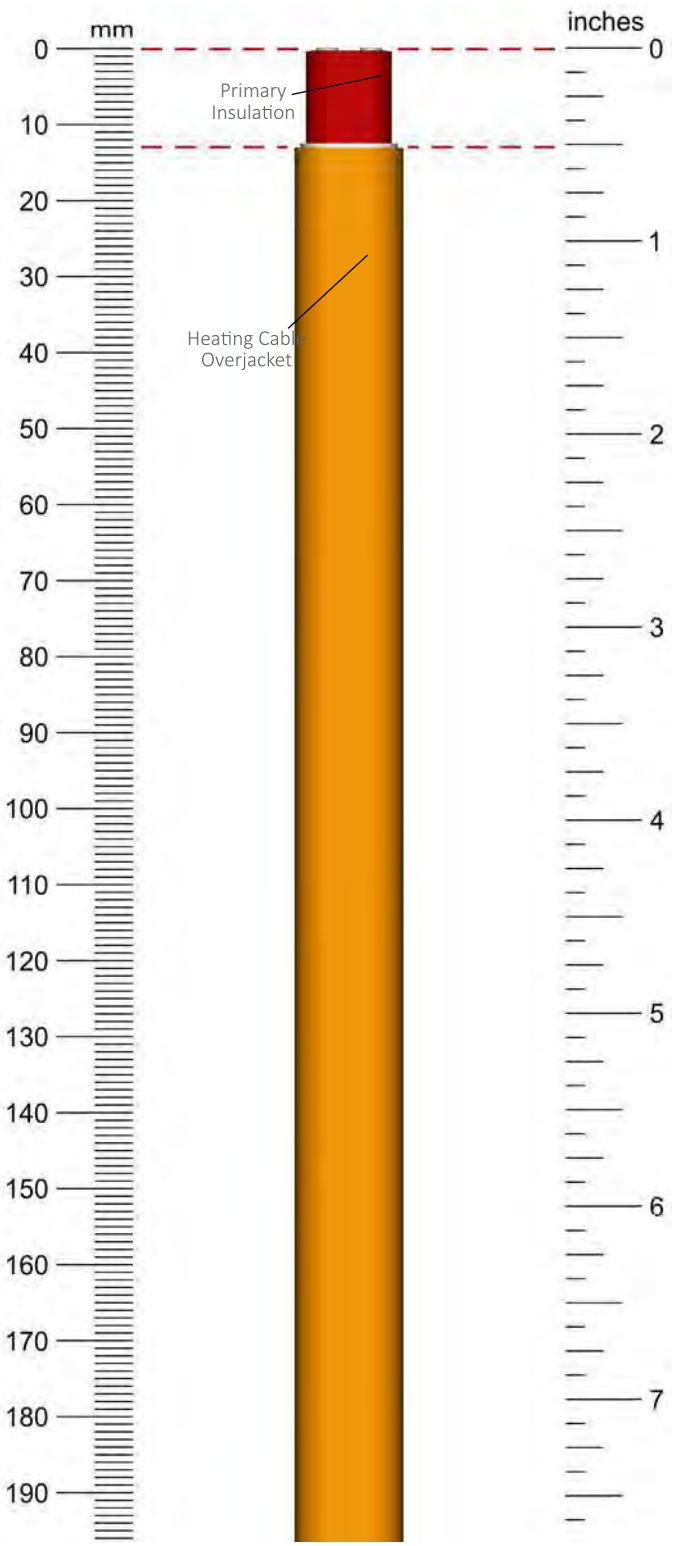


4d. Cut and remove fiberglass overlay and heating element. Push any remaining heating element wire under the primary insulation jacket.



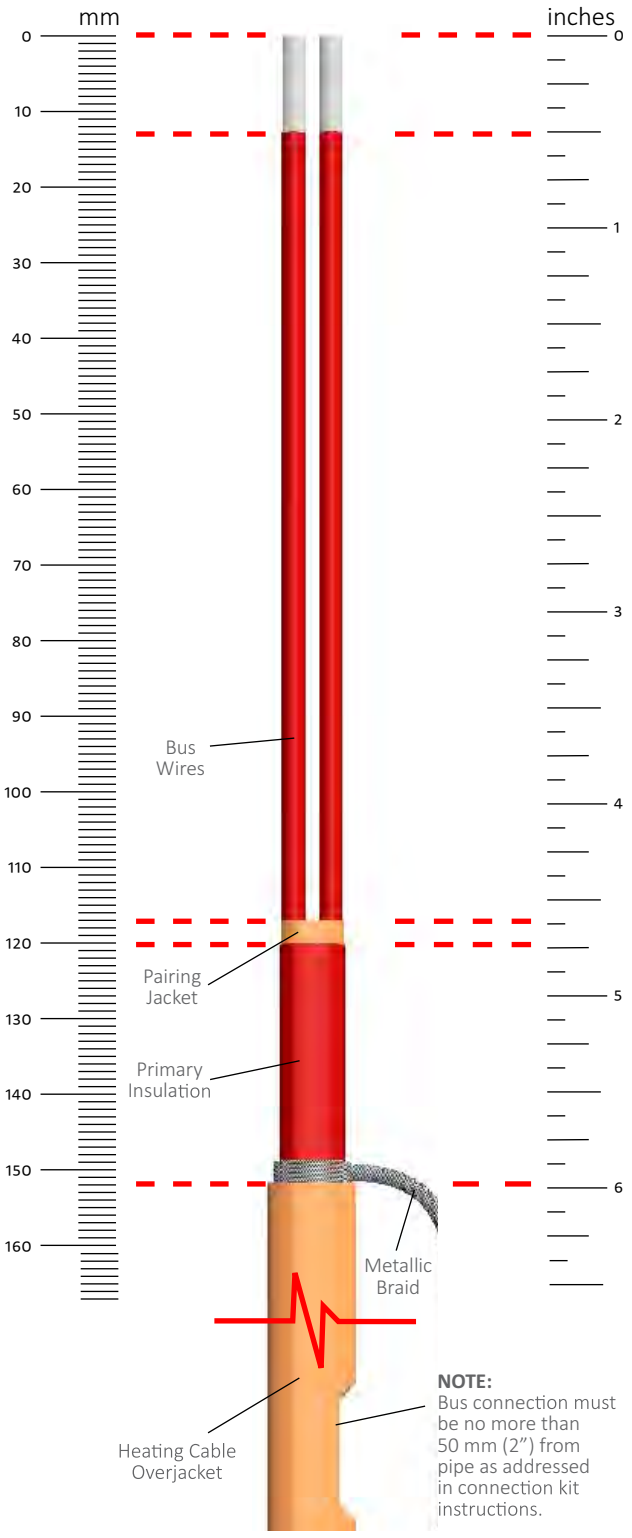
4e. Cut and remove pairing jacket. Stagger cut one of the bus wires.

Do not cut bus wire strands.

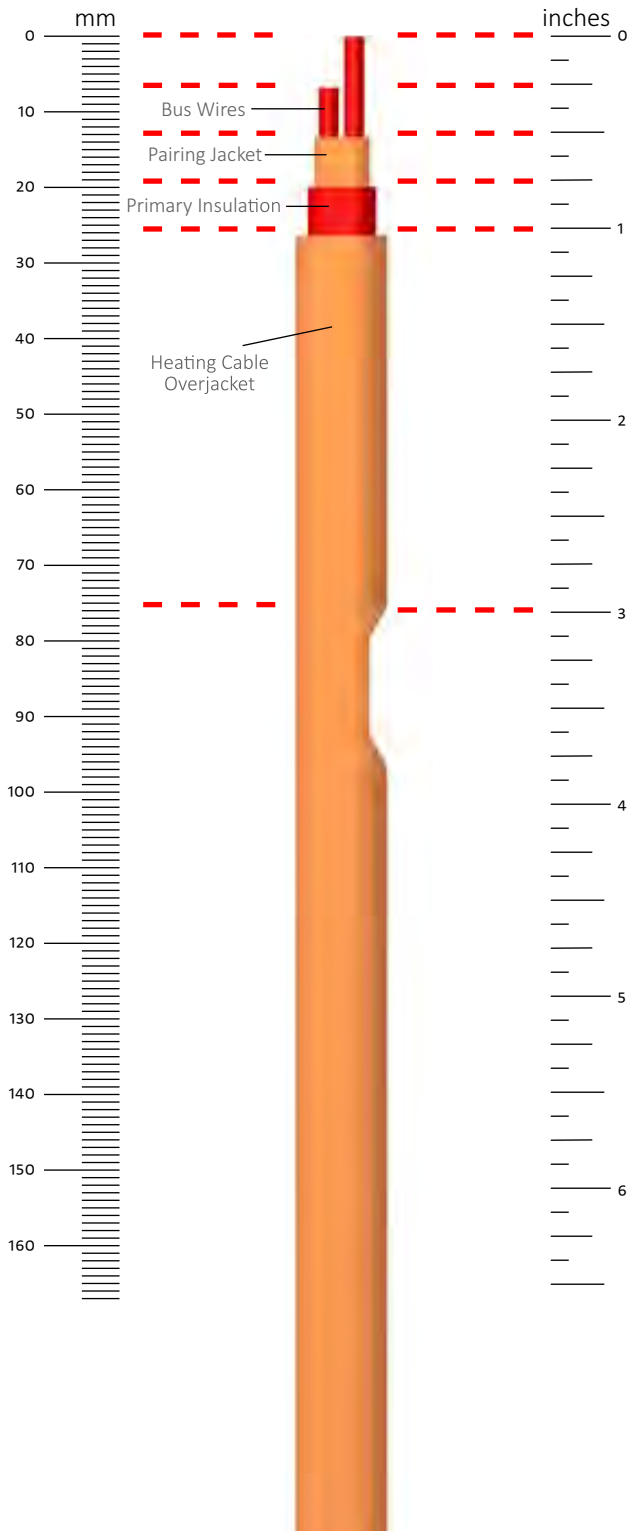


4f. Tape bus wires individually and then together. Continue taping to cover overjacket. Fill the end cap with RTV sealant and apply a circumferential bead to cable [minimum of 3 mm (0.12") wide]. Slide end cap onto end of cable.

Cable Take-off for BSX, RSX, HTSX, KSX, USX, and VSX-HT



For Power Connecton Boot Termination



For End Cap Termination

NOTE: Images may not be printed to scale.

Cable Take-off for HPT and FP Heating Cables

For Power Connection Boot Termination

For End Cap Termination

NOTE: Images may not be printed to scale.

Electric Heat Tracing

INSTALLATION, MAINTENANCE, & TROUBLESHOOTING

THERMON

About These Instructions

The installation instructions within this document describe the installation of Thermon trace heating systems in typical piping applications and are suitable for use with the flexible trace heating products listed on this page.

These instructions are not intended for mineral-insulated (MI) trace heaters. Instructions and documentation for other products and applications may be found at www.thermon.com.

For translations of this document in languages other than English, please contact Thermon. The English language version of this document shall govern.

IMPORTANT: To maintain warranty coverage of the trace heating system, the steps in these installation instructions, including testing, must be followed and documented on the Installation Report (page 12), wherever required in the text.

The National Electric Code and Canadian Electrical Code require ground-fault protection be provided for electric heat tracing .

Types of Heating Cables

Self-Regulating Heating Cables:

BSX™ Self-Regulating Heating Cable
(refer to Form TEP0067)

RSX™ Self-Regulating Heating Cable
(refer to Form TEP0004)

KSX™ Self-Regulating Heating Cable
(refer to Form TEP0072)

HTSX™ Self-Regulating Heating Cable
(refer to Form TEP0074)

USX™ Self-Regulating Heating Cable
(refer to Form TEP0239)

VSX-HT™ Self-Regulating Heating Cable
(refer to Form TEP0208)

Power-Limiting Heating Cable:

HPT™ Power-Limiting Heating Cable
(refer to Form TEP0011)

Parallel Constant Watt Heating Cable:

FP Parallel Constant Watt Heating Cable
(refer to Form TEP0016)

Series Constant Watt Heating Cables:

TEK™ Series Constant Watt Heating Cable
(refer to Form TEP0021)

HTEK™ Series Constant Watt Heating Cable
(refer to Form TEP0022)

For insulated externally heated surfaces, lower T-class systems may be obtained by utilizing stabilized designs or controlled designs using methods described in IEC/IEEE/EN 60079-30-1, Clause 4.5, using CompuTrace Electric Heat Tracing Design Software or by Thermon Engineering.

Safety and Site Practice

- Installation shall be carried out under the supervision of a qualified person.
- Persons involved in the installation and testing of electric trace heating systems shall be suitably trained in all special techniques required, including:
  - the purpose and function of the electrical trace heating system,
  - its associated power supply and control equipment, and
  - how to recognize and avoid the hazards associated with its operation and maintenance.
- All personnel shall use all appropriate personal protective equipment (PPE), including protective clothing, to protect against potential arc flash and shock hazards.
- All personnel shall comply with all applicable safety and health guidelines, including Thermon requirements, the regulations outlined in the NEC and CEC, and EN/IEC/IEEE 60079-30-2 for hazardous areas (as applicable), and any other applicable national and local electric codes.
- During installation, the trace heating system parameters shall be verified. Tests shall be performed in the field **and documented in the Installation Report** (page 12) as instructed.

Complete Electric Heat Tracing System

A complete electric heat tracing system will typically include the following components[1]:

1. Electric heat tracing cable[2] (self-regulating, power-limiting, parallel constant watt or series constant watt).
2. Power connection kit.
3. RTD sensor or control thermostat[3].
4. In-line/T-splice kit (permits two or three cables to be spliced together).
5. Cable end termination.
6. Attachment tape (use on 12” (30 cm) intervals or as required by code or specification).
7. “Electric Heat Tracing” label (peel-and-stick label attaches to insulation vapor barrier on 10’ intervals or as required by code or specification).
8. Thermal insulation[4] and vapor barrier (by others).

The absence of any of these items can cause a system to malfunction or represent a safety hazard.

Notes

1 See Page 3 for trace heater types and references for approvals.
2 Power connections must be used with correctly-installed certified enclosures that are suitable for the application (such as Terminator™). When connecting certified terminals using associated accessories, the required creepage distances and clearances shall be observed.
3 Temperature control is recommended for all freeze-protection and temperature-maintenance trace heating applications.
4 All heat-traced lines must be thermally insulated.

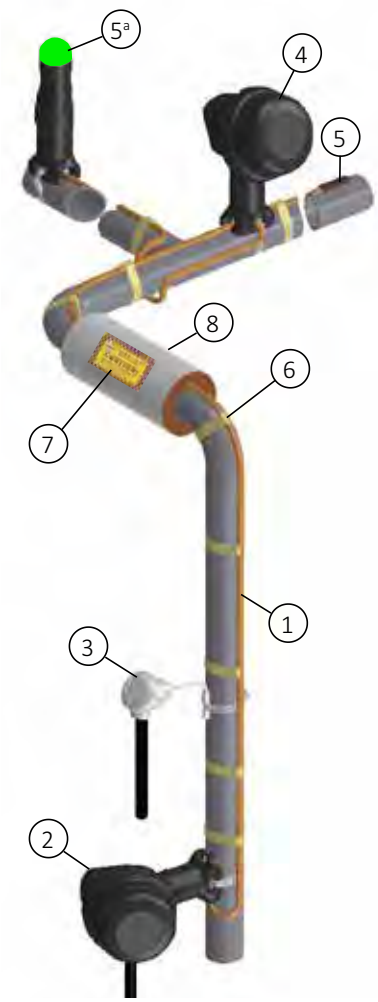

Illustration A: Typical Trace Heating Installation

Trace Heating System Design

- The design of electrical resistance trace heating systems shall be overseen by persons knowledgeable of trace heating, following the design methodology for explosive atmospheres as specified by Thermon Engineering or CompuTrace Electric Heat Tracing Design Software.
- For insulated externally heated surfaces, lower T-class systems may be obtained by utilizing stabilized designs or controlled designs using methods described in IEC/IEEE/EN 60079-30-1, Clause 4.5, using CompuTrace Electric Heat Tracing Design Software or by Thermon Engineering. The system design parameters, including the resulting T-class, shall be retained as a record of system documentation for each design for at least as long as the system is in use. The parameters in the system documentation shall be checked during commissioning of the system.
- The stabilized design method may be used for self-regulating, power-limiting, and constant-watt heating cables without a limiting device.
- Series heating cable output and T-rating are dependent upon several variables, including supply voltage, cable resistance, and temperature conditions.

Upon Receiving the Trace Heater

1. Make sure that the correct type (including the correct nominal power output and voltage level) has been received.

   All flexible trace heaters, of the types covered in this document, are printed with the catalog number, voltage rating and power output (in W/m or W/ft) on the jacket. To verify the year of construction, please contact Thermon with the batch code number printed on the trace heater jacket.

2. **Record the reel number, reel length, trace heater type, and nominal power output and voltage in the Pre-Installation section of the Installation Report** (page 12).
3. Visually inspect cable for any damage incurred during shipment. **Note any observed damage** in the Installation Report.
4. Perform the Insulation Resistance (IR) Test, described on this page, to confirm the trace heater's electrical integrity. **Record the reading** in the Installation Report.
5. Store the trace heater in a dry location.

Before Installing

- Be sure all piping and equipment to be traced have been completely installed and pressure-tested.
- Ensure that all surface areas where the trace heater is to be installed are reasonably clean. Remove any dirt, rust, and scale with a wire brush. Remove oil and grease films with a suitable solvent.
- De-energize power sources before installation.
- Keep ends of trace heaters and kit components dry before and during the installation.

Insulation Resistance (IR) Testing

The insulation resistance (IR) test establishes the electrical integrity of the trace heater. For the flexible trace heaters covered in this document, the IR test should be performed with a megger capable of delivering a voltage of at least 500 Vdc. It is strongly recommended that polymeric insulated trace heaters should be tested at 2500 Vdc.

1. If not done already, prepare the conductors of the trace heater according to the instructions accompanying the power and end termination kit(s) provided with the system.
2. Connect the megger's positive lead to the cable bus wires, shorted together.
3. Connect the megger's negative lead to the metallic braid.
4. Set the megger test voltage to at least 500 Vdc.
5. Energize the megger for 60 seconds.
6. Readings of at least 20 MΩ are acceptable.

Readings below 20 MΩ usually indicate that the electrical insulation of the trace heater has been compromised.

Check the trace heater for signs of physical damage between the braid and the heating element. Small cuts or scuff marks on the outer jacket will not affect the megger reading unless there is penetration through the braid and dielectric insulation jacket.

Initial Trace Heater Installation

- Begin installing the trace heater at the proposed end-of-circuit location, following the guidance in the isometric system diagrams (if provided).
- Lay out the trace heater on the pipe, at the 4 or 8 o'clock position (Illustration B), securing it tightly against the pipe with attachment tape. Wrap bands of tape around the trace heater and pipe at intervals of 12" (30 cm) or less, keeping the trace heater in close contact with the pipe.
- If accessibility is a problem, the trace heater may be installed at the 10 or 2 o'clock position.
- Refer to Table 1 (page 7) to estimate the number of rolls of attachment tape required, based on the pipe length and diameter[1].
- A continuous covering of aluminum foil tape may also be required under special circumstances, including:
  - where spray or foam[2] thermal insulation will be applied,
  - where nonmetallic piping is used, or
  - design requirements dictate the use of aluminum tape.
- Allow extra length of trace heater for power connections, splices, and any in-line heat sinks, such as valves, flanges, and supports (Illustration C). See page 7 and page 8 for details on how to properly install the trace heater at these sites and the allowance of trace heater required.
- Install temperature sensors at least 90° away from trace heater locations.
- **CAUTION**: For series constant-watt trace heaters (HTEK, TEK, TESH), do not allow the heating portion of the trace heater to touch, cross over, or overlap itself.
- **CAUTION**: Do not exceed the trace heater's specified minimum bend radius. Refer to product's specification sheets for the minimum bend radius of a specific trace heater type.

Notes

1 Table 1 assumes circumferential bands every 30 cm along the length of the piping.
2 Verify that the curing temperature of the insulation is less than the exposure temperature of the trace heater.

Illustration B: Heating Cable vs. Sensor Location

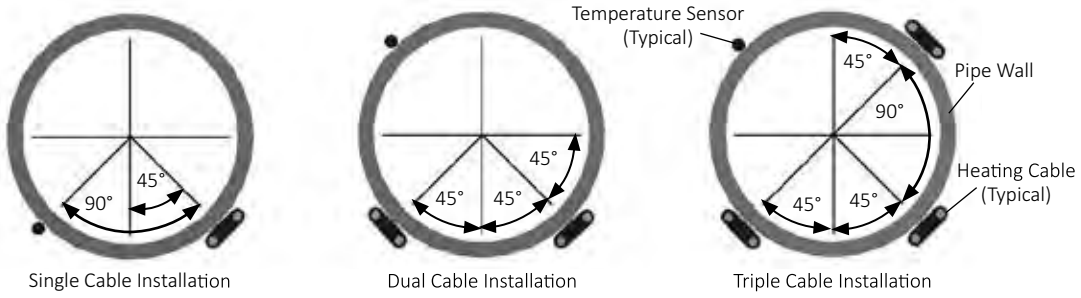

Illustration C: Temporary Installation

Tape Length	Pipe Diameter in Inches															
	½"-1"	1¼"	1½"	2"	3"	4"	6"	8"	10"	12"	14"	16"	18"	20"	24"	30"
36 yd	130'	115'	110'	95'	75'	65'	50'	40'	35'	30'	26'	23'	21'	19'	16'	13'
60 yd	215'	195'	180'	160'	125'	105'	80'	65'	55'	50'	43'	38'	35'	31'	27'	22'

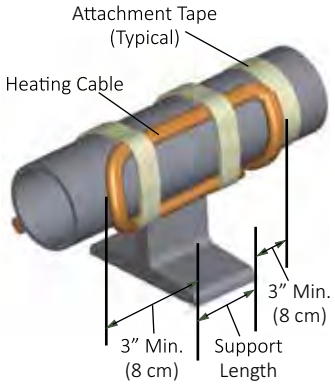
Installation on Elbows, Pipe Supports, and Flanges

- **Elbows**: Locate the trace heater on the outside radius of the elbow (Illustration D). Secure the trace heater to the pipe with attachment tape on each side of the elbow.
- **Pipe Supports**: For uninsulated pipe supports, allow twice the length of the support, plus an additional 40 cm of trace heater. Install the trace heater in a loop, following Illustration E as a guide. Insulated pipe supports do not require additional length of trace heater.
- **Flanges**: Loop the trace heater around the pipe on each side of, and adjacent to, the flange (Illustration F). Be sure to keep the trace heater in close contact with the flange throughout the length of the bend.

Refer to Table 2 (page 8) for typical flange allowances.

Illustration D: Pipe Elbow

Illustration E: Uninsulated Pipe Support



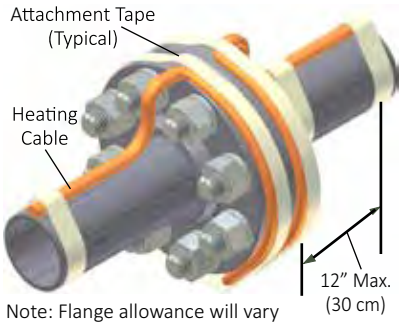


Illustration F: Pipe Flange

Note: Flange allowance will vary based on method of insulating flange and adjacent piping.

Circuit Layout on Support

Note . . .

1. Only applicable for pipe ≥ 50mm.

Installation on Valves and Pumps

- Valves, pumps, and other miscellaneous equipment require additional passes of trace heater to offset the increased heat loss that occurs at these sites.
- Refer to the isometric system drawings, provided by Thermon Engineering, for allowances specific to each line and circuit.

  Allowances for typical valves and pumps are provided in Table 2.
- Install the trace heaters using a looping technique, using Illustrations G and H as a guide, such that the valve or pump may be removed for required service and maintenance.
- Keep the trace heater in close contact with the pipe and heat sink areas, to compensate for additional heat loss.

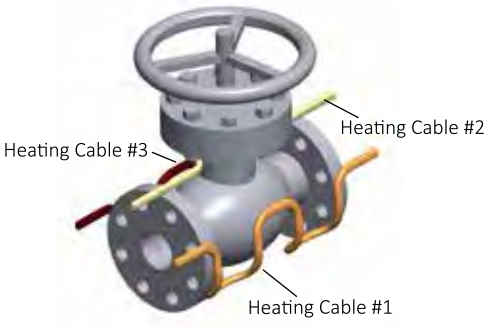

Table 2: Valve and Pump Allowances[1]

Pipe Size	Valve Allowance			Pump Allowance		Flange Allowance
	Screwed or Welded	Flanged	Butterfly	Screwed	Flanged	
½"	6"	1'	0	1'	2'	1’ 3"
¾"	9"	1' 6"	0	1' 6"	3'	1’ 6"
1"	1'	2'	1'	2'	4'	1’ 6”
1¼"	1' 6"	2'	1'	3'	4' 6"	2’ 0"
1½"	1' 6"	2' 6"	1' 6"	3'	5'	2’ 0"
2"	2'	2' 6"	2'	4'	5' 6"	2’ 3"
3"	2' 6"	3' 6"	2' 6"	5'	7'	2’ 3"
4"	4'	5'	3'	8'	10'	2’ 9"
6"	7'	8'	3' 6"	14'	16'	3’ 3"
8"	9' 6"	11'	4'	19'	22'	3’ 9"
10"	12' 6"	14'	4'	25'	28'	4’ 3"
12"	15'	16' 6"	5'	30'	33'	5’ 0"
14"	18'	19' 6"	5' 6"	36'	39'	5’ 6"
16"	21' 6"	23'	6'	43'	46'	6’ 0"
18"	25' 6"	27'	6' 6"	51'	54'	6’ 6"
20"	28' 6"	30'	7'	57'	60'	7’ 3"
24"	34'	36'	8'	68'	72'	8’ 3"
30"	40'	42'	10'	80'	84'	10’ 0"

Note

1. The valve allowance given is the total amount of additional cable to be installed on the valve. If multiple tracers are used, total valve allowance may be divided among the individual tracers. The total valve allowance may be alternated among tracers for multiple valves in a heat trace circuit. Allowances are for 150 pound valves. More cable is required for higher rated valves. Refer to heat trace isometric drawing for project specific allowances.

Completing the Trace Heater Installation

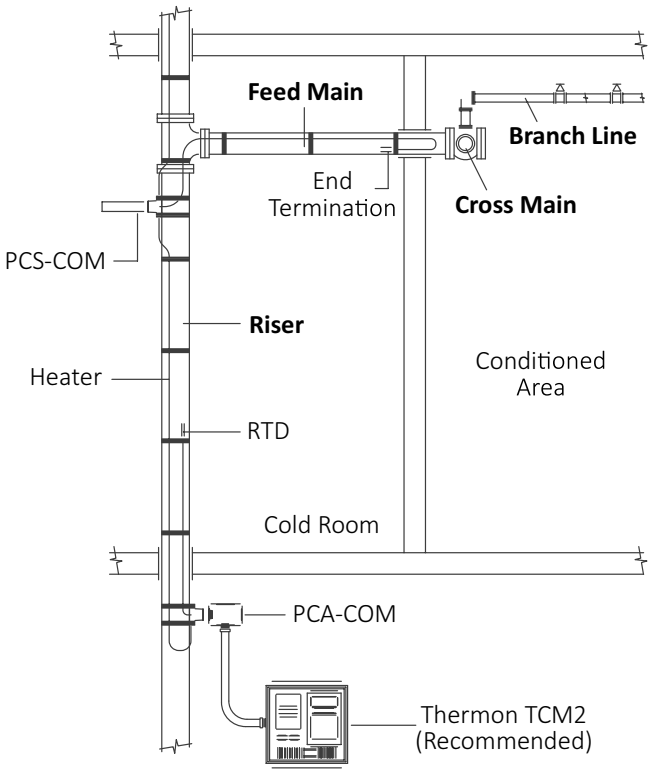
1. Secure the end-of-circuit termination kit and work back toward the power supply (Illustration I).
2. Keep the trace heater in secure contact with the pipe, using bands of attachment tape at least every 30 cm.
3. Secure any required temperature sensors to the pipe using attachment tape.
4. Complete any required splice connections in accordance with the installation instructions provided with the splice kit.
5. Install any power connection kits in accordance with the detailed installation instructions provided with the kit.
6. Connect the metallic braid of the trace heater to a suitable earthing/ground terminal.
7. Before completing the power connections, perform an Insulation Resistance (IR) Test (page 5) and **record the result in the After Installation** section of the Installation Report (page 12). The recorded value shall not be less than 20 MΩ.
8. **Record the line number and all other associated circuit information** in the After Installation section of the Installation Report.

Illustration I: Final Cable Attachment

Installing Thermal Insulation

Properly installed and well-maintained thermal insulation is critical to the performance of the trace heating system. Without proper insulation, heat losses are generally too high to be offset by a conventional heat tracing system.

1. Properly insulate all heat sinks, including pipe supports, hangers, flanges, and in most cases, valve bonnets.
2. Install a protective vapor barrier over the insulation, regardless of the type or thickness of insulation used. The vapor barrier protects the insulation from moisture intrusion and physical damage and ensures the proper performance of the trace heating system.
3. Seal all penetrations around the vapor barrier.
4. After ensuring that the insulation is weather-tight, **document the completion of the insulation** in the After Installation of Thermal Insulation section of the Installation Report (page 12).



After Installing Thermal Insulation

The presence of trace heaters shall be made evident by posting of caution signs or markings at appropriate locations and/or at frequent intervals along the circuit.

1. Apply the provided peel-and-stick “Electric Heat Tracing- Caution” labels along the pipe, on the outermost surface of the thermal insulation or vapor barrier, at intervals of 3 m or less.
2. Apply the caution labels at any other appropriate locations, such as valves.

Installation Guidelines for Fire Protection Systems

1. Where above ground water-filled supply pipes, risers, system risers or feed mains pass through open areas, cold rooms, passageways, or other areas exposed to freezing temperatures, the pipe shall be protected against freezing in accordance with NPFA 13, "Standard for the Installation of Sprinkler Systems".
2. Thermon's BSX Self-Regulating Heating Cables are approved for use on Fire Protection System Piping feed mains, risers, and cross mains. This application approval includes piping which connects between buildings in unheated areas, piping located in unheated areas or piping through coolers or freezers. As with all heat traced piping systems, thermal insulation is required to ensure the heating system can compensate for heat losses.
3. In accordance with IEEE 515.1 guidelines, the use of ambient sensing control with low temperature and continuity monitoring as a minimum for all fire protection piping heat tracing systems is required. Thermon recommends the use of the Thermon TCM2 electronic controller for these applications, having capability of annunciating the following faults/alarms locally as well as remotely:
   - Ground / Earth fault
   - Low temperature
   - High temperature
   - Sensor failure
   - Controller failure
   - Low current
   - Circuit fault
   - High temperature limit controller, if provided.
4. Pipe sections that lie in different ambient conditions (e.g. inside the building (heated areas) and outside the building) should not be under the same temperature control zone.
5. The heat tracing system shall be designed to maintain the pipe temperatures between 4°C and 38°C, or if necessary for the installation, an additional 'Hi Temp' limit sensor should be included to limit the runaway pipe temperature within 55°C or 8°C below the sprinkler temperature rating, whichever is lower. A low-temperature alarm with contacts for a remote annunciation shall be provided for each fire sprinkler line trace heating circuit with a set-point of 2°C.
6. The alarms of sprinkler system temperature/electrical control shall be connected to a fire detection alarm system monitoring.
7. Both of the two basic sprinkler system types i.e. wet (where the branch lines are always filled with water) and dry type (where the sprinkler head/sensor activates the upstream control valve) require heat tracing for the branch lines up to the sprinkler head. In case of dry type, the tracing is meant to keep the empty branch pipes above freezing point, so that when upstream control valve operates the pipe body does not cool down the incoming water.
8. Trace heating systems for fire sprinkler systems shall be permanently connected to the power supply.
9. The heat tracer braid shall be connected to earth / ground terminal at every termination and suitable external grounding.
10. If backup power is being provided for the building electrical systems, it shall also provide backup power supply for the trace heating system or equivalent.

THE NFPA DEFINES THE FOLLOWING:

Branch Lines—The pipes in which the sprinklers are placed, either directly or through risers.

Cross Mains—The pipes supplying the branch lines, either directly or through risers.

Feed Mains—The pipes supplying cross mains, either directly or through risers.

Risers—The vertical supply pipes in a sprinkler system.

Circuit Protection Requirements

- Each branch circuit must use over-current protection that isolates all appropriate power conductors from the supply (typically circuit breakers).
- Ground fault equipment protection is required for each circuit.
- For typical installations (with TT and TN grounding systems), the means of protection must include a residual current protective device for each branch circuit.
- For fixed-level earth/ground-fault circuit interrupters, a minimum 30 mA trip level is recommended. The preferred trip level for adjustable devices is 30 mA above any inherent capacitive leakage characteristic of the heater, as specified by Thermon Engineering.
- Where conditions of maintenance and supervision ensure that only qualified persons will service the installed systems, and continued circuit operation is necessary for the safe operation of the equipment or processes, ground-fault detection without interruption is acceptable if alarmed in a manner to assure an acknowledged response.
- For IT grounding systems, a means of protection against ground faults is required that includes an electrical insulation monitoring device that shall disconnect the supply whenever the electrical resistance is not greater than 50 ohms/volt of rated voltage.

Final Inspection

1. After installing the thermal insulation and vapor barrier **BUT BEFORE ENERGIZING THE CIRCUIT**, repeat the IR test to verify that the trace heater has not been damaged during installation. **Record the IR value** in the After Installation of Thermal Insulation section of the Installation Report (page 12).
2. For Series Heating Cables, measure the electric loop resistance and **record the resistance values** in the Installation Report.
3. Ensure that all junction boxes, temperature controllers, cable glands, etc., are properly secured.
4. If a temperature controller is used, force the circuit on and energize the circuit at the rated voltage.
5. After 5 minutes, measure the voltage, current, pipe temperature, and ambient temperature. **Record these values in the Final Commissioning section of the Installation Report**.
6. If a control device is used, verify its settings to ensure that the maximum surface temperature does not exceed the system T-rating, in accordance with IEC/IEEE/EN 60079-30-1, Clause 4.

Documentation Retention

The trace heating system documentation shall be retained for each trace heating circuit for as long as the system is in use. This includes:

- System Design Parameters And T-Class
- Isometric Circuit Diagrams
- Maintenance Records
- Operating History
- These Instructions
- All Other Documentation Provided By Thermon

NOTE: All Insulation Resistance (IR) values shall be at least 20 MΩ for a successful installation.

Maintenance and Repair

- Once the system has been successfully installed, an ongoing preventive maintenance program should be implemented, using qualified personnel. The trace heating system should be inspected and tested on a regular basis, at least once per year.
- Keep records of the operating and maintenance history for each circuit, including all test results performed during maintenance and inspection. Record-keeping during scheduled maintenance will help to establish a "normal" range of operation. Insulation resistance readings that deviate from the normal range may indicate problems with a circuit.
- If the system fails any test, refer to the troubleshooting guide below to address the issue. De-energize the affected circuits and make the necessary repairs immediately.

Before maintenance, repair, or modification

CAUTION: Consult the trace heating system documentation prior to maintenance, repair, or modification.

1. Identify the circuit or equipment to be de-energized and all possible sources of electrical energy supplies to the specific circuit and equipment.
2. De-energize all power sources.
3. Apply lockout/tagout devices according to established procedures.
4. Test for the absence of voltage with an approved voltmeter (where the voltmeter is tested on a known circuit voltage prior to and immediately following application).
5. For protection against the accidental energizing of supply conductors, apply temporary jumpers rated for the available fault duty between each supply conductor and earth/ground.

NOTE: In the event of an ground fault or over-current interruption, devices shall not be reset until the cause of the trip has been investigated by qualified personnel.

After maintenance, repair, or modification

1. Test the operation of each affected circuit.
2. The insulation resistance of the trace heater shall be measured and recorded and shall not be less than 20 MΩ.
3. Visually verify that all circuit-disconnect devices are open before reconnecting power.

Troubleshooting Guide

This troubleshooting guide aims to help to diagnose and resolve many issues on-site.

Many problems with electric trace heating systems can be attributed to two causes:

- Wet, damaged, or missing insulation. Visually inspect the insulation along the entire length of the circuit, making sure that it is intact and dry throughout.
- Physical damage incurred from recent repairs and maintenance to any in-line or nearby equipment.

Other possible causes are listed below, with their symptoms and potential remedies.

If any circuit is suspected to be damaged, de-energize the circuit and perform the Insulation Resistance Test outlined on page 5. Readings below 20 MΩ indicate that the trace heater may be physically damaged.

Symptom	Possible Cause	Remedy
No heat/no current	• Loss of power/voltage	• Check the circuit breaker and electrical connections
	• Controller setpoint too low	• Verify/adjust setpoint
	• High-temperature limit switch activated	• May require manual reset to re-enable trace heating circuit
	• "Open" series heating circuit	• Repair or replace circuit[1]
	• Controller failure	• Repair sensor or controller[2]

Symptom	Possible Cause	Remedy
Low system temperature	• Controller setpoint too low	• Verify/adjust setpoint
	• Temperature sensor located too close to trace heater or other heat source; may be accompanied by excessive cycling of control relays/contacts	• Relocate sensor
	• Insulation material and/or thickness different than designed	• Replace insulation; increase insulation thickness (if dry); review design[3]
	• Ambient temperature lower than designed	• Install higher-output trace heater; increase insulation thickness; review design[3]
	• Low voltage (check at power connection point)	• Adjust voltage to meet design requirements[3]
Low temperature in sections	• Wet, damaged, or missing insulation	• Repair or replace insulation and barrier
	• Trace heater damaged	• Repair or replace section; splice kits are available from Thermon
	• Heat sinks (valves, pumps, pipe supports, etc.)	• Insulate heat sinks or increase passes of tracing on heat sinks
	• Significant changes in elevation along length of the heat-traced pipe	• Consider dividing heating circuit into separate, independently controlled segments
High system temperature	• Controller “on” continuously	• Adjust setpoint or replace sensor[2]
	• Controller fails with contacts closed	• Replace sensor or controller[2]
	• Sensor located on uninsulated pipe or too close to heatsink	• Relocate sensor to an area representative of conditions along length of pipe
	• Backup heating circuit controller “on” continuously	• Adjust setpoint or replace backup controller
Excessive cycling	• Temperature sensor located too close to trace heater or other heat source; may be accompanied by low system temperature	• Relocate sensor
	• Ambient temperature near controller setpoint	• Temporarily alter controller setpoint
	• Connected voltage too high	• Lower voltage
	• Trace heater output too high (overdesign)	• Install lower-output trace heater or lower the voltage
	• Controller differential too narrow	• Widen the differential or replace controller to avoid premature contact failure
Temperature variations along pipe	• Inconsistent trace heater installation along pipe	• Check consistency of trace heater installation, especially at heat sinks
	• Inconsistent trace heater performance	• Compare calculated power per unit length (W x A/length) for the measured pipe temperature with designed trace heater output for the same temperature; regional damage to trace heater can cause partial failure
	• Unanticipated flow patterns or process operating temperatures	• Redistribute heating circuits to accommodate existing flow patterns; confirm process conditions

Notes

1 Flexible, polymer-jacketed trace heaters (such as those covered in this document) may be field-spliced. Mineral-insulated (MI) trace heaters typically require replacement.

2 Mechanical thermostat sensors cannot be repaired or replaced. RTD and thermocouple sensors may be replaced. Some controllers have replaceable contacts/relays or may require a manual reset if a “trip-off” condition was detected.

3 Before making any changes to system parameters, consult Thermon for the impact on trace heater performance.

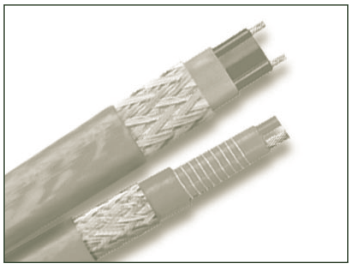
Electric Heat Tracing

Maintenance and Troubleshooting Guide for Frost Heave Prevention

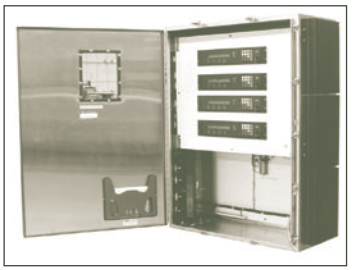


THERMON®

The Heat Tracing Specialists®

Introduction

A complete electric heat tracing system will typically include the following components:



1. Electric heat tracing cable (self-regulating and parallel constant watt).

2. Power and end termination kit.

3. Temperature controller.

The absence of any of these items can cause a system to malfunction or represent a safety hazard.

Cable Testing

After a heat tracing circuit has been installed and fabricated, the heating cable should be tested to ensure electrical resistance integrity. The cable should be tested with at least a 500 Vdc megohmmeter (megger) between the heating cable bus wires and the heating cable metallic braid. It is recommended that the test voltage for polymer-insulated heating cables be 2500 Vdc.

After properly terminating the cable, connect the positive lead of the megger to the bus wires and the negative lead to the metallic braid. The minimum acceptable level for the megger reading for any polymer-insulated heat tracing cable is **20 megohms**.

Final Inspection

The heating circuit can now be tested for proper operation. This includes measuring and recording the connected voltage, steady-state current draw, length and type of cable. (See the Inspection Report Form.)

Maintenance

Once the heat tracing system has been installed, an ongoing preventive maintenance program should be implemented using qualified personnel. Support documentation providing general information and an operating history of the specific circuits in the system should be maintained.

The results of the operational testing described above form the testing “base line” or normal range. Subsequent measurements should be recorded periodically and compared to this base-line data to help identify potential malfunctions.

Troubleshooting

The following information is intended to assist in troubleshooting electric heat tracing systems. The primary objective is to provide an enhanced understanding of the elements of a successful heat tracing installation.

If an electric heat tracing circuit is suspected to be damaged, a dielectric insulation resistance (megger) test should be performed using a 2500 Vdc megohmmeter for polymer-insulated heating cables. Periodic testing with accurate records will establish a "normal" range of operation (refer to the Inspection Report Form). Dielectric insulation resistance readings which deviate from the normal range can quickly reveal a damaged circuit.

I. No heat/no current	A. Loss of power (voltage)	A. Restore power to tracing circuit (check circuit breaker and electrical connections). Poorly made terminations can cause EPD-type breakers to trip unexpectedly
	B. Controller setpoint too low	B. Adjust setpoint
	C. Controller failure	C. Repair sensor or controller
II. Low system temperature	A. Controller setpoint too low	A. Adjust setpoint
	B. Low voltage (check at power connection point)	B. Adjust voltage to meet design requirements [1]
III. High system temperature	A. Controller "on" continuously	A. Adjust setpoint or replace sensor
	B. Controller failed with contacts closed	B. Replace sensor or controller
IV. Excessive cycling	A. Controller differential too narrow	A. Widen differential or replace controller to avoid premature contact failure

Notes . . .

1. The operation of most electric heat tracing cables is dramatically affected by changes in the supply voltage. Before making any changes, consult the cable manufacturer with information on the alternate voltages available. Otherwise, cable failure and/or an electrical safety hazard may result in some situations.

ADJUSTABLE CONTROL THERMOSTATS

APPLICATION

The E4X/7-35235JB and E4X/7-200600JB are designed for use as adjustable control thermostats for freeze protection and temperature maintenance applications requiring pipewall or tankwall sensing. The design of the thermostats permits their use as a junction box for connecting the heating cable to power by using the optional mounting kit (TM4X for ordinary locations or TM7 for Division 2 hazardous locations). Both thermostats feature an epoxy-coated cast aluminum NEMA 4X/NEMA 7 enclosure to provide watertight, dust tight, corrosion-resistant and explosion-proof protection to the thermostat switch. The differentiating factors between the two thermostats are the adjustable control range and maximum bulb exposure temperature.

The E4X/7-35235JB and E4X/7-200600JB thermostats are approved for use in both ordinary (nonclassified) and hazardous (classified) locations.

E4X/7-35235JB / E4X/7-200600JB

RATINGS

Voltage rating.....125/240/277/480 Vac
Switch rating.....30/30/25/15 amps
Switch type.....SPST[1]
Electrical connection[2].....screw terminals on switch
Adjustable control range
- E4X/7-35235JB..... 35°F to 235°F (2°C to 113°C)
- E4X/7-200600JB..... 200°F to 600°F (93°C to 316°C)

Maximum control differential
- E4X/7-35235JB.....9°F (5°C)
- E4X/7-200600JB.....15°F (9°C)

Maximum bulb exposure temperature
- E4X/7-35235JB.....300°F (149°C)
- E4X/7-200600JB.....650°F (343°C)

Bulb dimensions..... 1/4” x 6-3/8” (6.4 x 162 mm)
Bulb material.....nickel-plated copper
Capillary length.....6’ (1.8 m)
Capillary material.....nickel-plated copper
Capillary armor.....flexible stainless steel

Notes

1. The National Electrical Code, Article 427-56(b) states: “Temperature- controlled switching devices which do not have an “off” position shall not be required to open all ungrounded conductors and shall not be permitted to serve as the disconnecting means.” The E4X/7-35235JB and E4X/7-200600JB thermostats have no “off” position and therefore may be used for switching one conductor of a two-phase heating circuit.
2. The E4X/7-35235JB and E4X/7-200600JB utilize two 1” NPT conduit hub openings for the mounting expediter and incoming power. The thermostats include an internal grounding terminal and are available with an optional TB2F terminal block.

TM4X optional mounting kit (purchased separately) components include:

- Pipe-mounted expediter
- 2 stainless steel pipe attachment bands.
- Heater cable grommet
- 2 power connection boots
- RTV adhesive
- Wire fasteners and grounding lug

TM7 optional mounting kit (purchased separately) components include:

- Pipe-mounted expediter
- Cable seal assembly
- 2 stainless steel pipe attachment bands
- Heater cable grommet
- 2 power connection boots
- RTV adhesive
- Wire fasteners and grounding lug

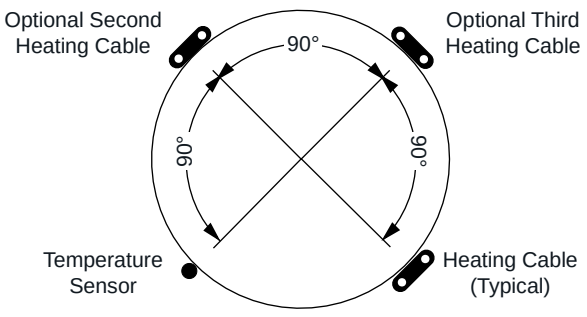
PRODUCT SPECIFICATIONS

E4X/7-35235JB and E4X/7-200600JB

ADJUSTABLE CONTROL THERMOSTATS

The following installation procedures are suggested guidelines for the installation of a Thermon mechanical thermostat. They are not intended to preclude the use of other methods utilizing accepted engineering or field construction practices.

UPON RECEIVING THERMOSTAT

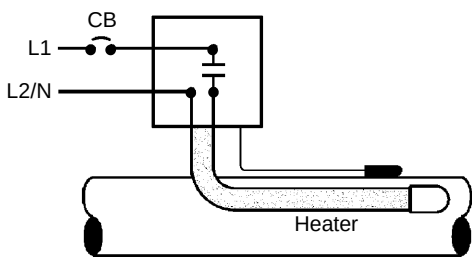


1. Upon receiving thermostat, check to make sure the proper type has been received.
2. Store in a dry place.

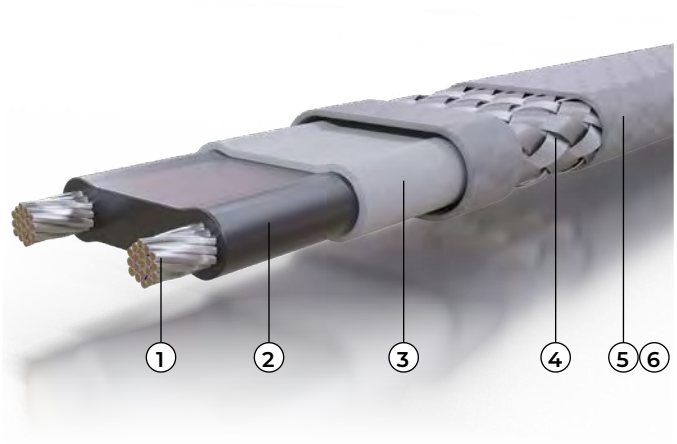
APPLICATIONS

1. Mechanical thermostats are used for freeze protection or temperature maintenance of piping, tanks and instrumentation.
2. Thermostat may be installed in ordinary (nonclassified) and hazardous (classified) locations depending on the specific approvals. Ensure that thermostat/junction box combination is suitable for the area classification. If installed in classified (hazardous) locations, approved explosion-proof seal fittings shall be installed on all electrical wire entries.
3. Check the line voltage and the heater circuit current to be sure that the ratings of the thermostat are not exceeded.
4. Mount the thermostat/junction box vertically upright and in a position that will prevent condensation from draining into the enclosure from the connected conduit.

THERMOSTAT CONNECTIONS



- When a line sensing controller is specified, the sensor should be placed at least 90° around the circumference from the heating cable, or at least 2” (5 cm) from the cable. Mount the bulb in a location that is representative of the overall system temperature away from valves, pipe supports, nozzles, or other heat sinks. Fasten the bulb, capillary and flexible armor (where provided) securely to the pipe/vessel with fiber or metallic tape, being sure that the entire length of the bulb is in intimate contact with the pipe surface. The bulb may be covered with a parallel pass of metallic tape to enhance heat transfer. The thermostat may require more than one support point. Prevent kinking of the capillary.
- For line sensing control, a leg of the heating circuit is to be connected in series with the control contacts as shown in the illustration below. Seal all thermal insulation penetrations after installation to prevent moisture intrusion.
- For ambient sensing control, a leg of the heating circuit should be connected in series with the control contacts as shown in the illustration below. When using an ambient sensing temperature controller, the mounting location should be representative of the coldest region, and the sensing element should not be exposed to direct sunlight or any additional heat source.



Heating Cable vs. Sensor Location (Line Sensing Control)

5. **All electric power supply circuits should be disconnected and locked out prior to beginning wiring of the thermostat/junction box.**
6. Set the thermostat dial to the control set point, and complete the electrical wiring. The heating system should not be energized prior to the circuit being properly tested.
7. Once the piping or vessel is insulated and in service, the temperature of the process fluid may be measured and compared with the control set point. Adjust the set point where necessary.
8. **Power should always be disconnected and a lockout/tagout procedure performed prior to opening the thermostat/junction box enclosure for maintenance.**
9. Any modification to the enclosure or deviation from these procedures may affect unit’s rating or approvals. Contact factory if modifications are necessary.
10. If recalibration becomes necessary, contact factory for procedures/assistance.

TYPICAL WIRING DIAGRAM

PRODUCT DATASHEET
BSX™
SELF-REGULATING HEAT TRACING

APPLICATION

BSX self-regulating heating cables are designed to provide freeze protection or process temperature maintenance to metallic and nonmetallic piping, tanks and equipment. The heat output of BSX cable varies in response to the surrounding conditions along the entire length of a circuit. Whenever the heat loss of the insulated pipe, tank or equipment increases (as ambient temperature drops), the heat output of the cable increases. Conversely, when the heat loss decreases (as the ambient temperature rises or product flows), the cable reacts by reducing its heat output. BSX cables are approved for use in ordinary (nonclassified) areas and hazardous (classified) areas.

RATINGS

Available watt densities	10, 16, 26, 33 W/m @ 10°C (3, 5, 8, 10 W/ft @ 50°F)
Supply voltages	110-120 or 208-277 Vac
Max. maintenance temperature	65°C (150°F)
Max. continuous exposure temperature	
Power-off	85°C (185°F)
Minimum installation temperature	-51°C (-60°F)
Minimum bend radius	
@ -15°C (5°F)	10 mm (0.38”)
@ -60°C (-76°F)	32 mm (1.25”)
T-rating [1]	
10, 16, 26 W/m (3, 5, 8 W/ft)	T6 85°C (185°F)
33 W/m (10 W/ft)	T5 100°C (212°F)

Notes
1. T-rating per the National Electrical Code and Canadian Electrical Code.

CONSTRUCTION

1 Nickel-plated copper bus wires (16 AWG)

2 Radiation cross-linked semiconductive heating matrix

3 Radiation cross-linked dielectric insulation

4 Tinned copper braid

5 Polyolefin overjacket provides additional protection for cable and braid where exposure to aqueous inorganic chemicals is expected.

OPTIONS

6 FOJ Fluoropolymer overjacket over tinned copper braid provides additional protection to cable and braid where exposure to organic chemicals or corrosives is expected.

BASIC ACCESSORIES

Thermon offers system accessories designed specifically for rapid, trouble-free installation of Thermon heating cables.

All cables require a connection kit to comply with approval requirements. Information on accessories to complete a heater circuit installation can be found in the “Heating Cable Systems Accessories” product specification sheet (Form TEP0010).

Thermon • 100 Thermon Dr • PO Box 609 San Marcos, TX 78667-0609 • Phone: 512-396-5801 • 1-800-820-4328

Notes

1. For more precise power output values as a function of pipe temperature, refer to CompuTrace®.
2. Based on the trip current characteristic of Type QOB or Type QO equipment protection devices. For devices with other trip current characteristics, contact Thermon.
3. The maximum circuit length is for one continuous length of cable, not the sum of segments of cable. Refer to CompuTrace® design software or contact Thermon for current loading of segments.

CIRCUIT BREAKER SIZING [2]

Maximum circuit lengths for various circuit breaker amperages are shown below. Breaker sizing should be based on the National Electrical Code, Canadian Electrical Code or any other applicable code. The National Electrical Code and Canadian Electrical Code require ground-fault protection of equipment for each branch circuit supplying electric heating equipment. Check local codes for ground-fault protection requirements.

1. SCOPE

The present document describes the control philosophy, general principles and detailed operation of the Oily Water Treatment Package 01-A-6417.

2. REFERENCE DOCUMENTS

DOCUMENT DESCRIPTION	DOC. No.
P&ID	350106-PO-11417-02-SD-000033
CAUSE AND EFFECT CHARTS	350106-PO-11417-02-SD-000036
RANGE, ALARM, TIMER & TRIP SETTING LIST	350106-PO-11417-02-SD-000062
PROCESS & SIZING CALCULATIONS	350106-PO-11417-02-SD-000070

3. GLOSSARY AND DEFINITIONS

DCS	Distributed Control System
UCP	Unit Control Panel
PLC	Programmable logic controller
PHASE	It indicates generic status of the package. During each phase valves that must be open, running of pumps, enabled alarms and duration time phase are strictly decided by process requirements and established by sequence charts
AUTOMATIC OPERATION	Package follows logic implemented by PLC
MANUAL OPERATION	Specific sequence phase is initiated manually by operator. Package remains in this phase until another commands is selected
CPI	Corrugated Plate Interceptor
MCC	Motor Control Center
LCS	Local Control Station
HMI	Human Machine Interface
HS	Hand Switch
CPI pack	Corrugated Plate Interceptor - Coalescer pack

4. UNIT DESCRIPTION

The Oily Water Treatment Package 01-A-6417 is provided for the removal of free and dispersed oil and settleable & suspended solids from the oily water received from Oily Water Storage Tank 01-T-6469. The Oily Water Storage Tank 01-T-6469 (by others) collects the oily water from oily water sumps.

The PACKAGE INLET FEED PUMP 01-P-6417-21 A/B (provided loose by Artes and installed by MDR in upstream package) take suction from the Oily Water Storage Tank 01-T-6469 and feeds the Oily Water Treatment Package (at TP 201) with a fixed flowrate of 30 m^3/hr.

The Oily Water Treatment Package 01-A-6417 duty is a 12 hour batch operation.

The Oily Water Treatment Package is mainly composed by:

- Two PACKAGE INLET FEED PUMPS 01-P-6417-21 A/B (2x100% (1 DTY, 1 STB)) - Positive displacement type [Note 1]

- One CPI SEPARATOR 01-H-6417-41 (1X100%)

- Two TREATED WATER FORWARDING PUMPS 01-P-6417-22 A/B (2 x 100 % (1DTY-1STB)) – Centrifugal type

4.1 CPI SEPARATOR 01-H-6417-41

The CPI SEPARATOR 01-H-6417-41 is designed to separate oil with droplet size of 60 microns and bigger at a maximum flowrate of 30m3/hr. The flowrate is monitored by flow transmitter 01-FT-64237.

It is equipped with CPI pack and a motorized belt skimmer.

When the oil-water flows through the CPI pack, the oil rises to the liquid surface while the suspended solids settle to the bottom of the separator (hopper). The skimmer automatically starts when the package starts and is operating continuously collecting the oil on the surface and depositing it to the skimmed oil compartment (which is part of CPI separator). Process interlock will close 01-XV-64098 (MDR scope) when belt oil skimmer (Z-6417-61) is not operating. Skimmer motor Run Feedback (01-XXL-64226A) is used for this control interlock.

The recovered oil (concentration 70%) is stored in the skimmed oil compartment, which will be emptied periodically (approximately after 10 batch operations of 12 hours) by a vacuum truck equipped with vacuum suction pump (by Client). The level in skimmed oil compartment is monitored by level transmitter 01-LT-64232 type guided wave radar. The skimmed oil compartment is also

equipped with a sight glass for local indication. In case the skimmed oil compartment is not emptied when required, it is provided with a safety margin in order to guarantee additional 5 batch operations of 12 hours before the overflow. High High level by 01-LT-64232 stops PACKAGE INLET FEED PUMP 01-P-6417-21 A/B to avoid the overflow.

The sludge stored in the hopper is at 1% concentration therefore cannot be detected with a level transmitter. The hopper is emptied of the sludge periodically (after every single batch operation of 12 hours) by a vacuum truck equipped with vacuum suction pump for off-site disposal (by Client). The hopper is equipped with a sight glass for local indication. In case the hopper is not emptied when required, it is provided with a safety margin in order to guarantee additional 6 hours of operation. After this time in operation sludge dragging in treated effluent could occur.

4.3 TREATED WATER

The treated water from the separator overflows the weir directly into the treated water compartment (which is part of CPI separator). The treated water compartment is emptied using the TREATED WATER FORWARDING PUMP 01-P-6417-22 A/B (one on line one in standby), that is started/stopped using the guided wave radar level transmitter 01-LT-64231, and is disposed via outlet line to Howe Sound (by others). To protect the pump the level transmitter 01-LT-64233 will stop FORWARDING PUMP 01-P-6417-22 A/B in case of Low Low level. The pump stop is managed by UCP 01-UCP-A6417-01.

The discharge line of TREATED WATER FORWARDING PUMP 01-P-6417-22 A/B is equipped with two oil in water analysers 01-AT-64241 / 01-AT-64242 and ON/OFF valves 01-XV-64244 (OFF-SPEC line) and 01-XV-64243 (treated water line). In case of off-spec water (high alarm at 10.5 ppm), the ON/OFF valve 01-XV-64244 will open and the ON/OFF valve 01-XV-64243 will close in order to route the water back to Storage Tank 01-T-6469 for additional treatment. When the water meets the specification (normal value ≤ 10 ppm) the discharge line is automatically reversed closing valve 01-XV-64244 and opening valve 01-XV-64243.

4.6 WINTERIZATION

The PACKAGE INLET FEED PUMP 01-P-6417-21 A/B and TREATED WATER FORWARDING PUMP 01-P-6417-22 A/B and related piping, valves and instrumentation are provided with electric heat tracing and insulation in order to maintain a minimum operating temperature of 10°C.

The CPI SEPARATOR 01-H-6417-41 is provided with electric heat tracing, insulation and electrical heaters 01-HE-6417-31 and 01-HE-6417-32 in order to maintain a minimum operating temperature of 10°C.

The electrical heater 01-HE-6417-31 is energized/deenergized by temperature transmitter 01-TT-64235 while the electrical heater 01-HE-6417-32 is energized/deenergized by temperature transmitter 01-TT-64236. The energized/deenergized temperatures are respectively 10°C and 38°C

4.7 UCP & POWER DISTRIBUTION BOARD

The Oily Water Treatment Package 01-A-6417 is controlled by UCP 01-UCP-A6417-01 PLC based (located in remote building) and is connected to the DCS (by others). The package can be operated in Automatic or Manual mode of operation or can be put in OFF-line mode. The UCP controls the operation of the package and is equipped with a local HMI panel as interface between the PLC and the operator. The operator using the HMI panel can monitor or modify the operation of the Package.

The PACKAGE INLET FEED PUMPS 01-P-6417-21 A/B are installed upstream of the package and are powered by MCC (by others) connected to UCP 01-UCP-A6417-01.

The Oily Water Treatment Package 01-A-6417 is equipped with a local Power Distribution Board installed in local cabinet positioned within the package. The Power Distribution Board feeds all electrical items within the package (i.e driver of forwarding pumps, skimmer motor, heaters, heat tracing, instruments etc.). The Power Distribution Board is equipped with the following buttons on the front face of the panel:

- SELECTOR LOCAL-O-REMOTE: using the Hand Switch, the operator can select “REMOTE” (controlled by PLC) or “LOCAL” (controlled by operator) or “O” OFF-line.

- EMERGENCY STOP BUTTON: if emergency stop button is pressed, the whole package will go in OFF-line mode.

- GREEN LAMP START: Steady green lamp when it is operating.

- RED LAMP STOP: Steady red lamp when it is not operating.

- ORANGE LAMP FAULT: Steady orange lamp when it is FAULT.

- START HS: using the Hand Switch, the operator can START the unit (only if SELECTOR LOCAL-0-REMOTE is in LOCAL)

- STOP HS: using the Hand Switch, the operator can STOP the unit (only if SELECTOR LOCAL-0-REMOTE is in LOCAL)

The LOCAL operation is possible during the Automatic and Manual mode of operation only for the item not in service and only for maintenance purpose. In case the process requires the unit to be put in service while in LOCAL mode, an alarm will be energized at the UCP. All interlocks are by-passed during the LOCAL mode leaving the item under the responsibility of the operator.

5. OPERATION MODE

The Oily Water Treatment Package 01-A-6417 is controlled by UCP and can be operated in Automatic or Manual mode of operation or can be put in OFF-line mode using the AUTO / MAN / OFF selectors on HMI:

- AUTO: Automatic mode of operation through UCP
- MAN: Manual mode of operation through UCP
- OFF: off-line

In Automatic mode there is only one phase that is the "SERVICE". During the "SERVICE" phase in Automatic mode all unit operations/equipment (pumps, skimmers heaters , etc.) are controlled started/stopped by the UCP.

In Manual mode there is only the "SERVICE" phase but with the difference that operator controls all equipment operations (Start/Stop the pumps, skimmer and electrical heaters) regardless of set point. In Manual mode, in case any set point is reached the pumps, skimmer and electrical heaters will not automatically Start/Stop. The operator must take action to start/stop or energize the equipment to insure proper operation of the unit.

Automatic mode of operation shall be the normal mode of operation. Manual mode of operation is provided only for flexibility and maintenance purposes.

5.1 AUTOMATIC MODE OF OPERATION

To operate the package in automatic mode the operator shall perform the following actions:

1) Select all items in REMOTE with Local-O-Remote switch from LCS (LCS provided in the POWER DISTRIBUTION BOARD)

2) Select START on HMI panel of UCP

3) Select AUTO in the HMI panel of UCP (Respective signalization of AUTO mode will be displayed in the HMI panel)

The package will start to operate in SERVICE phase (SERVICE phase will be displayed in the HMI panel) and will continue if not tripped by automatic process conditions or manually stopped by operator selecting MAN or OFF on the HMI panel of UCP.

At unit start up, all timers start counting. In case the operator selects MAN mode the timers continue the counting. If the operator selects OFF the timers are frozen. The reset of the timers happens when the set-point is reached.

During the SERVICE phase in AUTO mode, all items are controlled by the UCP and the operator can only monitor the package operation.

The current status of all variables are displayed on the HMI panel as well as, all alarms and set points.

UNIT STARTUP PERMISSIVES	
NON-CONFORMITY ALARM 01-XA-64010	Not activated
EMERGENCY STOP BUTTON HZS on LCS	Not activated
PACKAGE INLET FEED PUMP 01-P-6417-21 A/B	At least one pump selected in REMOTE and not in FAULT
OIL SKIMMER 01-Z-6417-61	Selected in REMOTE and not in FAULT
01-LT-64231 01-LT-64232	HH alarm not active
TREATED WATER FORWARDING PUMP 01-P-6417-22 A/B	At least one pump selected in REMOTE and not in FAULT
01-XV-64243 01-XV-64244	One XV opened and the other one is closed

5.2 MANUAL MODE OF OPERATION FROM UCP HMI

To operate the package in manual mode the operator shall perform the following actions:

1) Select all items in REMOTE with Local-O-Remote switch from LCS (LCS provided in the POWER DISTRIBUTION BOARD)

2) Select START on the HMI panel

3) Select MAN in the HMI panel (MAN mode will be displayed in the HMI panel)

The package will start to operate in SERVICE phase (SERVICE phase will be displayed in the HMI panel) and will continue if not tripped by automatic process conditions or manually stopped by operator selecting AUTO or OFF in the HMI panel of UCP.

At unit startup all timers start counting, in case the operator selects AUTO mode the timers continue the counting. If the operator selects OFF the timers are frozen. The reset of the timers happens when the set-point is reached.

During the SERVICE phase in MAN mode, in case any set point is reached, the items will not automatically start/stop and the operator shall control the package operation using the start/stop selector provided for each item in the HMI panel.

The current status of all variables are displayed on the HMI panel as well as, all alarms and set points.

5.3 OFF-LINE

To put the unit in OFF-line the operator shall select OFF on the HMI panel (OFF mode will be displayed in the HMI panel).

When OFF mode is selected, all items are stopped and all timers are frozen.

Operator can restart the SERVICE phase by simply selecting AUTO or MAN on the HMI panel, the timers will continue counting.

5.4 INTERFACE WITH PLANT DCS

The UCP communicates with the plant DCS via Modbus TCP/IP communication for monitoring the complete package at the DCS operator workstation.

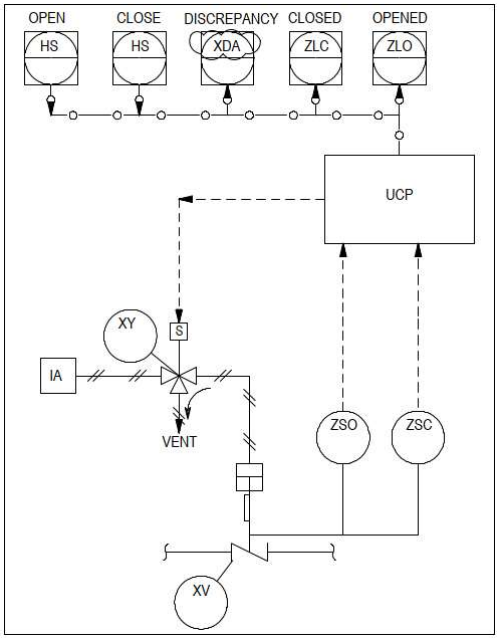
In addition to redundant interface with plant DCS, UCP shall also has following interfaces :

1. Interface with plant AMS - Simplex connection (from HART Mux in UCP)

2. Time Synchronization (NTP) - Simplex connection

5.5 ROTATING EQUIPMENT

All pumps are redundant with one on line and one in standby.



The on line equipment is started and stopped automatically through the UCP sequence. The standby equipment is started in case the on line equipment fails during operation.

It is not required to switch on-line and standby pumps to equalize run time. On-line and standby pumps are switched only in case the on line pump fails or during maintenance.

In case of discrepancy between command and feedback signal (time delay for feedback signals shall be adjustable during commissioning of the plant) or on line and stand by equipment are both in operation a Non-Conformity alarm will be generated by the UCP and the sequence is stopped. The operator must manually check the unit for the cause of the alarm. After the resolution of the problem the operator must select "RESET" button in UCP and the sequence has to be started where it has been stopped.

5.6 ON/OFF valve

The following typical is expected for the ON/OFF valve within the package:

The On-Off valve includes two limit switches to indicate full open and full closed position.

The field actuator is commanded through the UCP sequence or Open/Close selector in UCP.

When OFF mode is selected, the ON/OFF valve is in its fail safe position i.e. fail close.

During transition the ON/OFF valve in open position will close first and then the required valve will open.

Non-Conformity alarm for “irregular valve position” will be generated by the UCP in case of mismatch between the commands from UCP and the actual status of each valve, or in case of incongruence of limit switches (both on or both off). In the case of irregular valve position, the sequence is stopped. Once the alarm occurs the operator must manually check the unit for the cause of the alarm. After the resolution of the problem the operator must select "RESET" button in UCP and the sequence has to be started where it has been stopped.

6. PROCESS INDICATIONS AND ALARMS

The process variables and alarms will be displayed on the UCP, as part of the standard configuration.

Other alarms and indications are a product of logic configuration and are specified as required in this document.

The following process variables and alarms will be displayed on the UCP, all set points can be adjusted on site.

INSTRUMENT TAG NO.	PROCESS VARIABLE	ACTION	SET POINT
01-FT-64237	High flow in CPI SEPARATOR 01-H-6417-41	Alarm – operator to check (Only if the persist for more than 5 seconds)	31 m3/h
01-TT-64235	High High temperature in CPI SEPARATOR 01-H-6417-41	Alarm – operator to check (Only if the persist for more than 5 seconds)	39°C
01-TT-64235	High temperature in CPI SEPARATOR 01-H-6417-41	STOP heater 01-HE-6417-31	38°C
01-TT-64235	Low temperature in CPI SEPARATOR 01-H-6417-41	START heater 01-HE-6417-31	10°C
01-TT-64235	Low Low temperature in CPI SEPARATOR 01-H-6417-41	Alarm – operator to check (Only if the persist for more than 5 seconds)	9°C
01-TT-64236	High High temperature in CPI SEPARATOR 01-H-6417-41 (TREATED WATER COMPARTMENT)	Alarm – operator to check (Only if the persist for more than 5 seconds)	39°C
01-TT-64236	High temperature in CPI SEPARATOR 01-H-6417-41 (TREATED WATER COMPARTMENT)	STOP heater 01-HE-6417-32	38°C

01-TT-64236	Low temperature in CPI SEPARATOR 01-H-6417-41 (TREATED WATER COMPARTMENT)	START heater 01-HE-6417-32	10°C
01-TT-64236	Low Low temperature in CPI SEPARATOR 01-H-6417-41 (TREATED WATER COMPARTMENT)	Alarm – operator to check (Only if the persist for more than 5 seconds)	9°C
01-LT-64231	High High level in CPI SEPARATOR 01-H-6417-41 (TREATED WATER COMPARTMENT)	ALARM and STOP PACKAGE INLET FEED PUMP 01-P-6417-21 A/B	2600 mm 87%
01-LT-64231	High level in CPI SEPARATOR 01-H-6417-41 (TREATED WATER COMPARTMENT)	START TREATED WATER FORWARDING PUMP 01-P-6417-22 A/B	2450 mm 82%
01-LT-64231	Low level in CPI SEPARATOR 01-H-6417-41 (TREATED WATER COMPARTMENT)	Alarm – operator to check	850 mm 28%
01-LT-64233	Low Low level in CPI SEPARATOR 01-H-6417-41 (TREATED WATER COMPARTMENT)	STOP TREATED WATER FORWARDING PUMP 01-P-6417-22 A/B	700 mm 24%
01-LT-64232	High High level in CPI SEPARATOR 01-H-6417-41 (SKIMMED OIL COMPARTMENT)	ALARM and STOP PACKAGE INLET FEED PUMP 01-P-6417-21 A/B	1600 mm 80%
01-LT-64232	High level in CPI SEPARATOR 01-H-6417-41 (SKIMMED OIL COMPARTMENT)	Alarm – operator to check	700 mm 35%
01-LT-64232	Low level in CPI SEPARATOR 01-H-6417-41 (SKIMMED OIL	Alarm – operator to check	100 mm 5%

	COMPARTMENT)		
01-AT-64241	High oil concentration in treated water (offspec)	Alarm and OPEN 01-XV-64244 and CLOSE 01-XV-64243 (Only if the persist for more than 5 seconds)	10.5 ppm (Note 2)
01-AT-64241	Low oil concentration in treated water	AUTO OPEN 01-XV-64243 and CLOSE 01-XV-64244	<=10 ppm (Note 2)
01-AT-64242	High oil concentration in treated water (offspec)	Alarm and OPEN 01-XV-64244 and CLOSE 01-XV-64243 (Only if the persist for more than 5 seconds)	10.5 ppm (Note 2)
01-AT-64242	Low oil concentration in treated water	AUTO OPEN 01-XV-64243 and CLOSE 01-XV-64244	<=10 ppm (Note 2)
01-T-64235	Timer for sludge removal	Alarm – operator to check	12 hours
01-T-64236	Timer for oil removal	Alarm – operator to check	10 batch operations

Notes:

1. All timers and set points are adjustable and can be changed through UCP HMI with the following password protected level accesses:

   a. Operator: access to change parameters with Supervisor authorization;

   b. Supervisor: free access to change parameters with next communication to Configurator / Engineer;

   c. Configurator / Engineer: free access to change parameters with next communication to Supervisor.

2. Just one AT is required for the action.

7. ENGINEERING LAPTOP

The laptop is provided loose with carrying case and as per following details.

- Brand and Model

Notebook Dell Latitude

- Processor

13th Gen Intel® Core™ i7-1355U (12 MB cache, 10 cores, 12 threads, up to 5.0 GHz Turbo)

- Operating System

Windows 11 Pro, English, Dutch, French, German, Italian

- Graphics Card

Integrated Intel® Iris® Xe or UHD Graphics for i7-1355U Processor

- Display

15.6", FHD 1920x1080, 60Hz, WVA/IPS, Non-Touch, Anti-Glare, 250 nit, NTSC 45%, FHD+IR Camera, WLAN

- Memory

16 GB: 2 x 8 GB, DDR4, 3200 MT/s

- Storage

256 GB, M.2 2230, PCIe NVMe, SSD, Class 35

- Keyboard

English UK backlit keyboard with numeric keypad, 100-key

- Ports

1 USB 3.2 Gen 2 Type-C® port with DisplayPort Alt mode/Power Delivery

2 USB 3.2 Gen 1 port

1 USB 3.2 Gen 1 port with PowerShare

1 HDMI 1.4 port

1 universal audio port

1 power-adapter port

1 RJ-45 Ethernet port

- Slots

1 microSIM slot (On computers with WWAN configuration)

1 wedge-shaped lock slot

- Camera

720p at 30 fps HD camera

1080p at 30 fps FHD + IR camera

1080p at 30 fps FHD

Dual-array microphones

- Audio and Speakers

Stereo speakers with Waves MaxxAudio® Pro, Realtek ALC3204 Audio Controller, 2 W x 2 = 4 W total

- Wireless

Intel® Wi-Fi 6E AX211, 2x2, 802.11ax, Bluetooth® wireless card

- Primary Battery

3 Cell, 54 Wh, ExpressCharge™, ExpressCharge™ Boost capable

- Power

65W AC rugged adapter, 4.5mm barrel, E4

The notebook is provided with the following licensed software installed:

1) FactoryTalk View (Allen-Bradley / Rockwell-Automation)

2) Studio 5000 (Allen-Bradley / Rockwell-Automation)

DOCUMENT TITLE: **Cause and Effect Charts**

SUPPLIER DOCUMENT REVIEW STATUS

Purchaser's review of Supplier's documents does not relieve Supplier of the responsibility for correctness under the Purchase Order. Permission to proceed does not constitute acceptance of design, detail and calculations, test methods or materials developed or selected by the Supplier and does not relieve the Supplier from full compliance with the Purchase Order or any other obligations, nor detract from any of the Purchaser's rights.

Purchaser's Review Stamp

Woodfibre LNG	WLNG Review Approval Status
Code 2	Accepted with Comments — Work may proceed subject to incorporation of minor comments.
By: c_asantana	Date: July 22, 2024

MCDERMOTT	Woodfibre LNG EPFC Project Project No. 350106
Engineering Review Status Code 1 - No Comments	By: parveen.parveen Date: July 9, 2024
These comments do not relieve the supplier of his responsibility to meet the requirements of the PO.	

Should the Supplier consider that any comments made by the Purchaser change the Scope of Supply, the Supplier shall advise the price and delivery implications of such changes within five working days of receipt. The Supplier must not incorporate such changes without prior approval of the Purchaser of the revised price and/or delivery period. RETROSPECTIVE CLAIMS WILL NOT BE CONSIDERED.

This document consists of this front sheet plus 1 number of pages.

Sample class definitions: F=field sample, M=monitoring sample.
Values preceded by # are non-detectable results omitted from statistical calculations because the reporting limit is greater than the 2 times the maximum detected value for a dissolved (D) metal parameter.

Values set equal to 0 are non-detectable results that are not detectable in > 95% of the reported results for a dissolved (D) metal parameter.

All other non-detectable results are set equal to the reporting limit value.
Blank cells indicate a result is not reported for that parameter.

Sample class definitions: F=field sample, M=monitoring sample.
Values preceded by # are non-detectable results omitted from statistical calculations because the reporting limit is greater than the 2 times the maximum detected value for a dissolved (D) metal parameter.

Values set equal to 0 are non-detectable results that are not detectable in > 95% of the reported results for a dissolved (D) metal parameter.

All other non-detectable results are set equal to the reporting limit value.
Blank cells indicate a result is not reported for that parameter.

Sample class definitions: F=field sample, M=monitoring sample.
Values preceded by # are non-detectable results omitted from statistical calculations because the reporting limit is greater than the 2 times the maximum detected value for a dissolved (D) metal parameter.

Values set equal to 0 are non-detectable results that are not detectable in > 95% of the reported results for a dissolved (D) metal parameter.

All other non-detectable results are set equal to the reporting limit value.
Blank cells indicate a result is not reported for that parameter.

Sample class definitions: M=monitoring sample.
"<" indicates the result is below the specified reporting limit.
Blank cells indicate a result is not reported for that parameter.

Appendix 4.3-2: Construction Non-Contaminated Contact Water Quality

Sample class definitions: M=monitoring sample.
"<" indicates the result is below the specified reporting limit.
Blank cells indicate a result is not reported for that parameter.

Appendix 4.3-2: Construction Non-Contaminated Contact Water Quality

Sample class definitions: M=monitoring sample.
"<" indicates the result is below the specified reporting limit.
Blank cells indicate a result is not reported for that parameter.

Appendix 4.3-2: Construction Non-Contaminated Contact Water Quality

Sample class definitions: M=monitoring sample.
"-" indicates a total (T) metal parameter was not detectable or an organic parameter was not reported, therefore a loading rate was not calculated.
Values are set equal to zero for a total (T) metal parameter if it is less than the corresponding dissolved metal value.
Values are set equal to zero for an organic parameter if it is not-detectable.

Appendix 4.3-3: TSS Loading Rates and Statistical Summary

Sample class definitions: M=monitoring sample.
"-" indicates a total (T) metal parameter was not detectable or an organic parameter was not reported, therefore a loading rate was not calculated.
Values are set equal to zero for a total (T) metal parameter if it is less than the corresponding dissolved metal value.
Values are set equal to zero for an organic parameter if it is not-detectable.

Appendix 4.3-3: TSS Loading Rates and Statistical Summary

Sample class definitions: M=monitoring sample.
"-" indicates a total (T) metal parameter was not detectable or an organic parameter was not reported, therefore a loading rate was not calculated.
Values are set equal to zero for a total (T) metal parameter if it is less than the corresponding dissolved metal value.
Values are set equal to zero for an organic parameter if it is not-detectable.

Appendix 7: QP Forms

APPENDIX 7.1-1: QUALIFIED PROFESSIONAL DECLARATIONS OF CONFLICT OF INTEREST AND DECLARATIONS OF COMPETENCY FORMS

BRITISH COLUMBIA | Ministry of Environment and Climate Change Strategy

Conflict of Interest Disclosure Statement

A qualified professional [1] providing services to either the Ministry of Environment and Climate Change Strategy ("ministry"), or to a regulated person for the purpose of obtaining an authorization from the ministry, or pursuant to a requirement imposed under the *Environmental Management Act,* the *Integrated Pest Management Act* or the *Park Act* has a real or perceived conflict of interest when the qualified professional, or their relatives, close associates or personal friends have a financial or other interest in the outcome of the work being performed.

A real or perceived conflict of interest occurs when a qualified professional has

a) an ownership interest in the regulated person's business;

b) an opportunity to influence a decision that leads to financial benefits from the regulated person or their business other than a standard fee for service (e.g. bonuses, stock options, other profit sharing arrangements);

c) a personal or professional interest in a specific outcome;

d) the promise of a long term or ongoing business relationship with the regulated person, that is contingent upon a specific outcome of work;

e) a spouse or other family member who will benefit from a specific outcome; or

f) any other interest that could be perceived as a threat to the independence or objectivity of the qualified professional in performing a duty or function.

Qualified professionals who work under ministry legislation must take care in the conduct of their work that potential conflicts of interest within their control are avoided or mitigated. Precise rules in conflict of interest are not possible and professionals must rely on guidance of their professional associations, their common sense, conscience and sense of personal integrity.

Declaration

I Jane May, as a member of EGBC declare

Select one of the following:

☒ Absence from conflict of interest

Other than the standard fee I will receive for my professional services, I have no financial or other interest in the outcome of this Technical Assessment Report for Stormwater Effluent from WLNG Facility. I further declare that should a conflict of interest arise in the future during the course of this work, I will fully disclose the circumstances in writing and without delay to Sean Babulic, B.C. Energy Regulator, erring on the side of caution.

BRITISH COLUMBIA | Ministry of Environment and Climate Change Strategy

☐ Real or perceived conflict of interest

Description and nature of conflict(s):

_____

_____

_____

I will maintain my objectivity, conducting my work in accordance with my Code of Ethics and standards of practice.

In addition, I will take the following steps to mitigate the real or perceived conflict(s) I have disclosed, to ensure the public interest remains paramount:

_____

_____

_____

Further, I acknowledge that this disclosure may be interpreted as a threat to my independence and will be considered by the statutory decision maker accordingly.

This conflict of interest disclosure statement is collected under section 26(c) of the *Freedom of Information and Protection of Privacy Act* for the purposes of increasing government transparency and ensuring professional ethics and accountability. By signing and submitting this statement you consent to its publication and its disclosure outside of Canada. This consent is valid from the date submitted and cannot be revoked. If you have any questions about the collection, use or disclosure of your personal information please contact the Ministry of Environment and Climate Change Strategy Headquarters Office at 1-800-663-7867.

[1]*Qualified Professional, in relation to a duty or function under ministry legislation, means an individual who*

a) is registered in British Columbia with a professional association, is acting under that organization's code of ethics, and is subject to disciplinary action by that association, and

b) through suitable education, experience, accreditation and knowledge, may reasonably be relied on to provide advice within his or her area of expertise, which area of expertise is applicable to the duty or function.

Ministry of
Environment and
Climate Change Strategy

Declaration of Competency

The Ministry of Environment and Climate Change Strategy relies on the work, advice, recommendations and in some cases decision making of qualified professionals[1], under government's professional reliance regime. With this comes an assumption that professionals who undertake work in relation to ministry legislation, regulations and codes of practice have the knowledge, experience and objectivity necessary to fulfill this role.

1. Name of Qualified Professional Jane May

   Title Senior Chemical Engineer

2. Are you a registered member of a professional association in B.C.? ☒ Yes ☐ No

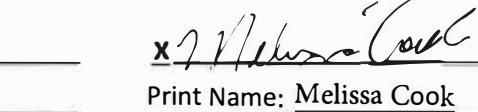
   Name of Association: EGBC Registration # 54903

3. Brief description of professional services:

   Author of Section 4.2 and Section 6, and reviewer of Section 1 and Section 2 of the WLNG Operations WDA Technical Assessment Report.

This declaration of competency is collected under section 26(c) of the *Freedom of Information and Protection of Privacy Act* for the purposes of increasing government transparency and ensuring professional ethics and accountability. By signing and submitting this statement you consent to its publication and its disclosure outside of Canada. This consent is valid from the date submitted and cannot be revoked. If you have any questions about the collection, use or disclosure of your personal information please contact the Ministry of Environment and Climate Change Strategy Headquarters Office at 1-800-663-7867.

Declaration



I am a qualified professional with the knowledge, skills and experience to provide expert information, advice and/or recommendations in relation to the specific work described above.

[1] *Qualified Professional, in relation to a duty or function under ministry legislation, means an individual who*

a) *is registered in British Columbia with a professional association, is acting under that organization's code of ethics, and is subject to disciplinary action by that association, and*

b) *through suitable education, experience, accreditation and knowledge, may reasonably be relied on to provide advice within his or her area of expertise, which area of expertise is applicable to the duty or function.*

BRITISH COLUMBIA | Ministry of Environment and Climate Change Strategy

Conflict of Interest Disclosure Statement

A qualified professional [1] providing services to either the Ministry of Environment and Climate Change Strategy ("ministry"), or to a regulated person for the purpose of obtaining an authorization from the ministry, or pursuant to a requirement imposed under the *Environmental Management Act*, the *Integrated Pest Management Act* or the *Park Act* has a real or perceived conflict of interest when the qualified professional, or their relatives, close associates or personal friends have a financial or other interest in the outcome of the work being performed.

A real or perceived conflict of interest occurs when a qualified professional has

a) an ownership interest in the regulated person's business;

b) an opportunity to influence a decision that leads to financial benefits from the regulated person or their business other than a standard fee for service (e.g. bonuses, stock options, other profit sharing arrangements);

c) a personal or professional interest in a specific outcome;

d) the promise of a long term or ongoing business relationship with the regulated person, that is contingent upon a specific outcome of work;

e) a spouse or other family member who will benefit from a specific outcome; or

f) any other interest that could be perceived as a threat to the independence or objectivity of the qualified professional in performing a duty or function.

Qualified professionals who work under ministry legislation must take care in the conduct of their work that potential conflicts of interest within their control are avoided or mitigated. Precise rules in conflict of interest are not possible and professionals must rely on guidance of their professional associations, their common sense, conscience and sense of personal integrity.

Declaration

I Jordi Helsen (Print Full Name), as a member of Engineers and Geoscientists BC (Print Name of Professional Association)

declare

Select one of the following:

☒ Absence from conflict of interest

Other than the standard fee I will receive for my professional services, I have no financial or other interest in the outcome of this Technical Assessment Report for Stormwater Effluent from WLNG Facility. I further declare that should a conflict of interest arise in the future during the course of this work, I will fully disclose the circumstances in writing and without delay to Sean Babulic B.C. Energy Regulator, erring on the side of caution.

Declaration of Competency

The Ministry of Environment and Climate Change Strategy relies on the work, advice, recommendations and in some cases decision making of qualified professionals[1], under government's professional reliance regime. With this comes an assumption that professionals who undertake work in relation to ministry legislation, regulations and codes of practice have the knowledge, experience and objectivity necessary to fulfill this role.

1. Name of Qualified Professional: Ruidong Zhang

   Title: Principal Civil Engineer

2. Are you a registered member of a professional association in B.C.? ☒ Yes ☐ No

   Name of Association: Engineers and Geoscientists BC Registration # 44685

3. Brief description of professional services:

   Reviewer Stormwater Drainage Philosophy, Reviewed/Stamped drawings for Stormwater Management/Discharge Works

This declaration of competency is collected under section 26(c) of the *Freedom of Information and Protection of Privacy Act* for the purposes of increasing government transparency and ensuring professional ethics and accountability. By signing and submitting this statement you consent to its publication and its disclosure outside of Canada. This consent is valid from the date submitted and cannot be revoked. If you have any questions about the collection, use or disclosure of your personal information please contact the Ministry of Environment and Climate Change Strategy Headquarters Office at 1-800-663-7867.

Declaration

I am a qualified professional with the knowledge, skills and experience to provide expert information, advice and/or recommendations in relation to the specific work described above.

[1] *Qualified Professional, in relation to a duty or function under ministry legislation, means an individual who*

a) is registered in British Columbia with a professional association, is acting under that organization's code of ethics, and is subject to disciplinary action by that association, and

b) *through suitable education, experience, accreditation and knowledge, may reasonably be relied on to provide advice within his or her area of expertise, which area of expertise is applicable to the duty or function.*

BRITISH COLUMBIA | Ministry of Environment and Climate Change Strategy

Conflict of Interest Disclosure Statement

A qualified professional [1] providing services to either the Ministry of Environment and Climate Change Strategy ("ministry"), or to a regulated person for the purpose of obtaining an authorization from the ministry, or pursuant to a requirement imposed under the *Environmental Management Act,* the *Integrated Pest Management Act* or the *Park Act* has a real or perceived conflict of interest when the qualified professional, or their relatives, close associates or personal friends have a financial or other interest in the outcome of the work being performed.

A real or perceived conflict of interest occurs when a qualified professional has

a) an ownership interest in the regulated person's business;

b) an opportunity to influence a decision that leads to financial benefits from the regulated person or their business other than a standard fee for service (e.g. bonuses, stock options, other profit sharing arrangements);

c) a personal or professional interest in a specific outcome;

d) the promise of a long term or ongoing business relationship with the regulated person, that is contingent upon a specific outcome of work;

e) a spouse or other family member who will benefit from a specific outcome; or

f) any other interest that could be perceived as a threat to the independence or objectivity of the qualified professional in performing a duty or function.

Qualified professionals who work under ministry legislation must take care in the conduct of their work that potential conflicts of interest within their control are avoided or mitigated. Precise rules in conflict of interest are not possible and professionals must rely on guidance of their professional associations, their common sense, conscience and sense of personal integrity.

Declaration

I Louis J. Garces, as a member of McDermott International Inc. declare

Select one of the following:

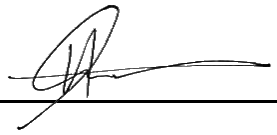
☒ Absence from conflict of interest

Other than the standard fee I will receive for my professional services, I have no financial or other interest in the outcome of this Technical Assessment Report for Stormwater Effluent from WLNG Facility. I further declare that should a conflict of interest arise in the future during the course of this work, I will fully disclose the circumstances in writing and without delay to Sean Babulic, B.C. Energy Regulator, erring on the side of caution.

Ministry of Environment and Climate Change Strategy

☐ Real or perceived conflict of interest

Description and nature of conflict(s):



I will maintain my objectivity, conducting my work in accordance with my Code of Ethics and standards of practice.

In addition, I will take the following steps to mitigate the real or perceived conflict(s) I have disclosed, to ensure the public interest remains paramount:

Further, I acknowledge that this disclosure may be interpreted as a threat to my independence and will be considered by the statutory decision maker accordingly.

This conflict of interest disclosure statement is collected under section 26(c) of the *Freedom of Information and Protection of Privacy Act* for the purposes of increasing government transparency and ensuring professional ethics and accountability.
