Notes:

Shaded values exceed the British Columbia (BC) Contaminated Site Regulation (CSR) Generic Numerical Water Quality Standards (Schedule 3.2) to protect freshwater aquatic life.

Bolded values exceed the British Columbia (BC) Contaminated Site Regulation (CSR) Generic Numerical Water Quality Standards (Schedule 3.2) to protect marine and estuarine aquatic life.

Values preceded by < indicate a detection limit. Detection limits were screened against BC CSR standards using their full value.

1: BC CSR standard is calculated based on mean water hardness calculated from 'dissolved' mineral content – Hardness, mg equivalent CaCO3/L. Hardness is for the aquatic receiving environment.

2: The BC CSR standard for nitrite is calculated based on chloride concentration.

3: The BC CSR standard for hexavalent chromium (Cr(IV)) is conservatively applied to dissolved chromium.

4: BC CSR standard is applicable at all sites, irrespective of water use.

5: EPHw10-19 – Extractable Petroleum Hydrocarbons (nC10-nC19) in water includes all the extractable petroleum hydrocarbons with a carbon range from 10 to 19 obtained by the approved methods, where approved methods are specified by a

6: VHw6-10 – Volatile Hydrocarbons (nC6-nC10) in water are hydrocarbons that elute between n-hexane and n-decane obtained by approved methods, where approved methods are specified by a director's protocol.

7: LEPHw – Light Extractable Petroleum Hydrocarbons in water, is the sum of extractable petroleum hydrocarbons with a carbon range from 10 to 19 obtained by the approved methods minus the sum of napthalene and phenanthrene, where approved methods are specified by a director's protocol.

8: VPHw – Volatile Petroleum Hydrocarbons in water includes the sum of volatile hydrocarbons with a carbon range from 6 to 10 (VHw6-10) obtained by approved methods minus the sum of benzene, ethylbenzene, styrene, toluene and xylenes, where approved methods are specified by a director's protocol.

Notes:

Shaded values exceed the British Columbia (BC) Contaminated Site Regulation (CSR) Generic Numerical Water Quality Standards (Schedule 3.2) to protect freshwater aquatic life.

Bolded values exceed the British Columbia (BC) Contaminated Site Regulation (CSR) Generic Numerical Water Quality Standards (Schedule 3.2) to protect marine and estuarine aquatic life.

Values preceded by < indicate a detection limit. Detection limits were screened against BC CSR standards using their full value.

1: BC CSR standard is calculated based on mean water hardness calculated from 'dissolved' mineral content – Hardness, mg equivalent CaCO3/L. Hardness is for the aquatic receiving environment.

2: The BC CSR standard for nitrite is calculated based on chloride concentration.

3: The BC CSR standard for hexavalent chromium (Cr(IV)) is conservatively applied to dissolved chromium.

4: BC CSR standard is applicable at all sites, irrespective of water use.

5: EPHw10-19 – Extractable Petroleum Hydrocarbons (nC10-nC19) in water includes all the extractable petroleum hydrocarbons with a carbon range from 10 to 19 obtained by the approved methods, where approved methods are specified by a

6: VHw6-10 – Volatile Hydrocarbons (nC6-nC10) in water are hydrocarbons that elute between n-hexane and n-decane obtained by approved methods, where approved methods are specified by a director's protocol.

7: LEPHw – Light Extractable Petroleum Hydrocarbons in water, is the sum of extractable petroleum hydrocarbons with a carbon range from 10 to 19 obtained by the approved methods minus the sum of napthalene and phenanthrene, where approved methods are specified by a director's protocol.

8: VPHw – Volatile Petroleum Hydrocarbons in water includes the sum of volatile hydrocarbons with a carbon range from 6 to 10 (VHw6-10) obtained by approved methods minus the sum of benzene, ethylbenzene, styrene, toluene and xylenes, where approved methods are specified by a director's protocol.

Notes:

Shaded values exceed the British Columbia (BC) Contaminated Site Regulation (CSR) Generic Numerical Water Quality Standards (Schedule 3.2) to protect freshwater aquatic life.

Bolded values exceed the British Columbia (BC) Contaminated Site Regulation (CSR) Generic Numerical Water Quality Standards (Schedule 3.2) to protect marine and estuarine aquatic life.

Values preceded by < indicate a detection limit. Detection limits were screened against BC CSR standards using their full value.

1: BC CSR standard is calculated based on mean water hardness calculated from 'dissolved' mineral content – Hardness, mg equivalent CaCO3/L. Hardness is for the aquatic receiving environment.

2: The BC CSR standard for nitrite is calculated based on chloride concentration.

3: The BC CSR standard for hexavalent chromium (Cr(IV)) is conservatively applied to dissolved chromium.

4: BC CSR standard is applicable at all sites, irrespective of water use.

5: EPHw10-19 – Extractable Petroleum Hydrocarbons (nC10-nC19) in water includes all the extractable petroleum hydrocarbons with a carbon range from 10 to 19 obtained by the approved methods, where approved methods are specified by a

6: VHw6-10 – Volatile Hydrocarbons (nC6-nC10) in water are hydrocarbons that elute between n-hexane and n-decane obtained by approved methods, where approved methods are specified by a director's protocol.

7: LEPHw – Light Extractable Petroleum Hydrocarbons in water, is the sum of extractable petroleum hydrocarbons with a carbon range from 10 to 19 obtained by the approved methods minus the sum of napthalene and phenanthrene, where approved methods are specified by a director's protocol.

8: VPHw – Volatile Petroleum Hydrocarbons in water includes the sum of volatile hydrocarbons with a carbon range from 6 to 10 (VHw6-10) obtained by approved methods minus the sum of benzene, ethylbenzene, styrene, toluene and xylenes, where approved methods are specified by a director's protocol.

Notes:

Shaded values exceed the British Columbia (BC) Contaminated Site Regulation (CSR) Generic Numerical Water Quality Standards (Schedule 3.2) to protect freshwater aquatic life.

Bolded values exceed the British Columbia (BC) Contaminated Site Regulation (CSR) Generic Numerical Water Quality Standards (Schedule 3.2) to protect marine and estuarine aquatic life.

Values preceded by < indicate a detection limit. Detection limits were screened against BC CSR standards using their full value.

1: BC CSR standard is calculated based on mean water hardness calculated from 'dissolved' mineral content – Hardness, mg equivalent CaCO3/L. Hardness is for the aquatic receiving environment.

2: The BC CSR standard for nitrite is calculated based on chloride concentration.

3: The BC CSR standard for hexavalent chromium (Cr(IV)) is conservatively applied to dissolved chromium.

4: BC CSR standard is applicable at all sites, irrespective of water use.

5: EPHw10-19 – Extractable Petroleum Hydrocarbons (nC10-nC19) in water includes all the extractable petroleum hydrocarbons with a carbon range from 10 to 19 obtained by the approved methods, where approved methods are specified by a

6: VHw6-10 – Volatile Hydrocarbons (nC6-nC10) in water are hydrocarbons that elute between n-hexane and n-decane obtained by approved methods, where approved methods are specified by a director's protocol.

7: LEPHw – Light Extractable Petroleum Hydrocarbons in water, is the sum of extractable petroleum hydrocarbons with a carbon range from 10 to 19 obtained by the approved methods minus the sum of napthalene and phenanthrene, where approved methods are specified by a director's protocol.

8: VPHw – Volatile Petroleum Hydrocarbons in water includes the sum of volatile hydrocarbons with a carbon range from 6 to 10 (VHw6-10) obtained by approved methods minus the sum of benzene, ethylbenzene, styrene, toluene and xylenes, where approved methods are specified by a director's protocol.

Notes:

Shaded values exceed the British Columbia (BC) Contaminated Site Regulation (CSR) Generic Numerical Water Quality Standards (Schedule 3.2) to protect freshwater aquatic life.

Bolded values exceed the British Columbia (BC) Contaminated Site Regulation (CSR) Generic Numerical Water Quality Standards (Schedule 3.2) to protect marine and estuarine aquatic life.

Values preceded by < indicate a detection limit. Detection limits were screened against BC CSR standards using their full value.

1: BC CSR standard is calculated based on mean water hardness calculated from 'dissolved' mineral content – Hardness, mg equivalent CaCO3/L. Hardness is for the aquatic receiving environment.

2: The BC CSR standard for nitrite is calculated based on chloride concentration.

3: The BC CSR standard for hexavalent chromium (Cr(IV)) is conservatively applied to dissolved chromium.

4: BC CSR standard is applicable at all sites, irrespective of water use.

5: EPHw10-19 – Extractable Petroleum Hydrocarbons (nC10-nC19) in water includes all the extractable petroleum hydrocarbons with a carbon range from 10 to 19 obtained by the approved methods, where approved methods are specified by a

6: VHw6-10 – Volatile Hydrocarbons (nC6-nC10) in water are hydrocarbons that elute between n-hexane and n-decane obtained by approved methods, where approved methods are specified by a director's protocol.

7: LEPHw – Light Extractable Petroleum Hydrocarbons in water, is the sum of extractable petroleum hydrocarbons with a carbon range from 10 to 19 obtained by the approved methods minus the sum of napthalene and phenanthrene, where approved methods are specified by a director's protocol.

8: VPHw – Volatile Petroleum Hydrocarbons in water includes the sum of volatile hydrocarbons with a carbon range from 6 to 10 (VHw6-10) obtained by approved methods minus the sum of benzene, ethylbenzene, styrene, toluene and xylenes, where approved methods are specified by a director's protocol.

Notes:

Shaded values exceed the British Columbia (BC) Contaminated Site Regulation (CSR) Generic Numerical Water Quality Standards (Schedule 3.2) to protect freshwater aquatic life.

Bolded values exceed the British Columbia (BC) Contaminated Site Regulation (CSR) Generic Numerical Water Quality Standards (Schedule 3.2) to protect marine and estuarine aquatic life.

Values preceded by < indicate a detection limit. Detection limits were screened against BC CSR standards using their full value.

1: BC CSR standard is calculated based on mean water hardness calculated from 'dissolved' mineral content – Hardness, mg equivalent CaCO3/L. Hardness is for the aquatic receiving environment.

2: The BC CSR standard for nitrite is calculated based on chloride concentration.

3: The BC CSR standard for hexavalent chromium (Cr(IV)) is conservatively applied to dissolved chromium.

4: BC CSR standard is applicable at all sites, irrespective of water use.

5: EPHw10-19 – Extractable Petroleum Hydrocarbons (nC10-nC19) in water includes all the extractable petroleum hydrocarbons with a carbon range from 10 to 19 obtained by the approved methods, where approved methods are specified by a

6: VHw6-10 – Volatile Hydrocarbons (nC6-nC10) in water are hydrocarbons that elute between n-hexane and n-decane obtained by approved methods, where approved methods are specified by a director's protocol.

7: LEPHw – Light Extractable Petroleum Hydrocarbons in water, is the sum of extractable petroleum hydrocarbons with a carbon range from 10 to 19 obtained by the approved methods minus the sum of napthalene and phenanthrene, where approved methods are specified by a director's protocol.

8: VPHw – Volatile Petroleum Hydrocarbons in water includes the sum of volatile hydrocarbons with a carbon range from 6 to 10 (VHw6-10) obtained by approved methods minus the sum of benzene, ethylbenzene, styrene, toluene and xylenes, where approved methods are specified by a director's protocol.

Appendix 3.7-1: Groundwater Quality Results

Notes:

Shaded values exceed the British Columbia (BC) Contaminated Site Regulation (CSR) Generic Numerical Water Quality Standards (Schedule 3.2) to protect freshwater aquatic life.

Bolded values exceed the British Columbia (BC) Contaminated Site Regulation (CSR) Generic Numerical Water Quality Standards (Schedule 3.2) to protect marine and estuarine aquatic life.

Values preceded by < indicate a detection limit. Detection limits were screened against BC CSR standards using their full value.

1: BC CSR standard is calculated based on mean water hardness calculated from 'dissolved' mineral content – Hardness, mg equivalent CaCO3/L. Hardness is for the aquatic receiving environment.

2: The BC CSR standard for nitrite is calculated based on chloride concentration.

3: The BC CSR standard for hexavalent chromium (Cr(IV)) is conservatively applied to dissolved chromium.

4: BC CSR standard is applicable at all sites, irrespective of water use.

5: EPHw10-19 – Extractable Petroleum Hydrocarbons (nC10-nC19) in water includes all the extractable petroleum hydrocarbons with a carbon range from 10 to 19 obtained by the approved methods, where approved methods are specified by a

6: VHw6-10 – Volatile Hydrocarbons (nC6-nC10) in water are hydrocarbons that elute between n-hexane and n-decane obtained by approved methods, where approved methods are specified by a director's protocol.

7: LEPHw – Light Extractable Petroleum Hydrocarbons in water, is the sum of extractable petroleum hydrocarbons with a carbon range from 10 to 19 obtained by the approved methods minus the sum of napthalene and phenanthrene, where approved methods are specified by a director's protocol.

8: VPHw – Volatile Petroleum Hydrocarbons in water includes the sum of volatile hydrocarbons with a carbon range from 6 to 10 (VHw6-10) obtained by approved methods minus the sum of benzene, ethylbenzene, styrene, toluene and xylenes, where approved methods are specified by a director's protocol.

Notes:

Shaded values exceed the British Columbia (BC) Contaminated Site Regulation (CSR) Generic Numerical Water Quality Standards (Schedule 3.2) to protect freshwater aquatic life.

Bolded values exceed the British Columbia (BC) Contaminated Site Regulation (CSR) Generic Numerical Water Quality Standards (Schedule 3.2) to protect marine and estuarine aquatic life.

Values preceded by < indicate a detection limit. Detection limits were screened against BC CSR standards using their full value.

1: BC CSR standard is calculated based on mean water hardness calculated from 'dissolved' mineral content – Hardness, mg equivalent CaCO3/L. Hardness is for the aquatic receiving environment.

2: The BC CSR standard for nitrite is calculated based on chloride concentration.

3: The BC CSR standard for hexavalent chromium (Cr(IV)) is conservatively applied to dissolved chromium.

4: BC CSR standard is applicable at all sites, irrespective of water use.

5: EPHw10-19 – Extractable Petroleum Hydrocarbons (nC10-nC19) in water includes all the extractable petroleum hydrocarbons with a carbon range from 10 to 19 obtained by the approved methods, where approved methods are specified by a

6: VHw6-10 – Volatile Hydrocarbons (nC6-nC10) in water are hydrocarbons that elute between n-hexane and n-decane obtained by approved methods, where approved methods are specified by a director's protocol.

7: LEPHw – Light Extractable Petroleum Hydrocarbons in water, is the sum of extractable petroleum hydrocarbons with a carbon range from 10 to 19 obtained by the approved methods minus the sum of napthalene and phenanthrene, where approved methods are specified by a director's protocol.

8: VPHw – Volatile Petroleum Hydrocarbons in water includes the sum of volatile hydrocarbons with a carbon range from 6 to 10 (VHw6-10) obtained by approved methods minus the sum of benzene, ethylbenzene, styrene, toluene and xylenes, where approved methods are specified by a director's protocol.
